CONTENTS

PHYSICS

1. Units, Measurement and Dimensions	3-14
2. Scalar and Vectors	15-23
3. Motion in 1, 2 & 3 Dimensions and Projectile Motion	24-44
4. Newton's Laws of Motion and Friction	45-62
5. Circular Motion	63-72
6. Work, Energy and Power	73-83
7. Centre of Mass, Momentum and Collision	84-94
8. Rotational Motion	95-106
9. Gravitation	107-118
10. Simple Harmonic Motion	119-131
11. Fluid Mechanics	132-146
12. Elasticity	147-155
13. Waves Motion	156-164
14. Sound Wave	165-174
15. Heat, Temperature and Calorimetry	175-184
16. Physics for Gaseous State	185-194
17. Laws of Thermodynamics	195-205
18. Transmission	206-214
19. Ray Optics	215-233
20. Waves Optics	234-242
21. Electric Charge	243-251
22. Gauss's Law and Electric Potential Theory	252-262
23. Electric Capacitor	263-270
24. Current Electricity	271-288
25. Magnetic Field	289-300
26. Magnetostatics	301-310
27. Electromagnetic Induction (EMI)	311-318
28. Alternating Current and EM Wave	319-330

29. Cathode Ray, Photoelectric Effect of Light and X-Rays	331-340
30. Atomic Structure	341-348
31. Nucleus	349-357
32. Semiconductor Devices and Logic Gates	358-375
33. Universe	376-380

CHEMISTRY

1. Some Basic Concepts of Chemistry	383-394
2. Atomic Structure	395-408
3. Nuclear Chemistry	409-416
4. Chemical Bonding	417-431
5. Periodic Properties	432-441
6. States of Matter	442-454
7. Chemical Thermodynamics	455-466
8. Chemical and Ionic Equilibria	467-480
9. Chemical Kinetics	481-491
10. Solution	492-501
11. Adsorption and Colloidal System	502-510
12. Redox Reactions	511-517
13. Electrochemistry	518-529
14. Hydrogen	530-537
15. <i>s</i> -Block Elements	538-549
16. Metallurgy	550-558
17. <i>p</i> -Block Elements - I (Group 13 and 14)	559-567
18. <i>p</i> -Block Elements - II	568-586
19. <i>d</i> - and <i>f</i> -Block Elements	587-597
20. Coordination Compounds and Organometallics	598-607
21. General Organic Chemistry	608-625

22. Purification and Estimation of Organic Compounds	626-631	10. Linear Inequality	861-866
23. Hydrocarbons	632-650	11. Trigonometry	867-897
24. Halogen Derivatives of Hydrocarbon	651-663	12. Rectangular Coordinates and Straight Line	898-913
25. Alcohols, Phenols and Ethers	664-678	13. The Circle	914-928
26. Aldehydes and Ketones	679-695	14. Conic Sections	929-952
27. Carboxylic Acid and Its Derivatives	696-706	15. Three Dimensional Geometry	953-967
28. Nitrogen Containing Compounds	707-720	16. Limits, Continuity and Differentiability	968-986
29. Polymers, Biomolecules and Chemistry in Action	721-738	17. Differential Coefficients	987-998
30. Qualitative Analysis	739-743	18. Applications of Derivatives	999-1013
31. Stereochemistry	744-756	19. Indefinite Integral	1014-1024
		20. Definite Integrals and Its Applications	1025-1039
		21. Differential Equations	1040-1053
		22. Probability	1054-1069
		23. Vector Algebra	1070-1085
		24. Statistics	1086-1096
		25. Linear Programming	1097-1102

MATHEMATICS

1. Complex Numbers	759-769		
2. Quadratic Equation	770-779		
3. Sequences and Series	780-792		
4. Exponential and Logarithmic Series	793-800		
5. Permutations and Combinations	801-811		
6. Binomial Theorem and Mathematical Induction	812-823		
7. Matrices	824-832		
8. Determinant	833-846		
9. Sets, Relations and Functions	847-860		
		• English Proficiency	1105-1143
		• Logical Reasoning	1147-1191
		• Practice Sets (1-5)	1195-1251
		• Solved Paper 2017	1-29
		• Solved Paper 2018	1-34
		• Solved Paper 2019	1-31
		• Solved Paper 2020	1-34
		• Solved Paper 2021	1-28

SYLLABUS

PART I PHYSICS

1. Units & Measurement

- 1.1 Units (Different systems of units, SI units, fundamental and derived units)
- 1.2 Dimensional Analysis
- 1.3 Precision and significant figures
- 1.4 Fundamental measurements in Physics (Vernier calipers, screw gauge, Physical balance etc.)

2. Kinematics

- 2.1 Properties of vectors
- 2.2 Position, velocity and acceleration vectors
- 2.3 Motion with constant acceleration
- 2.4 Projectile motion
- 2.5 Uniform circular motion
- 2.6 Relative motion

3. Newton's Laws of Motion

- 3.1 Newton's laws (free body diagram, resolution of forces)
- 3.2 Motion on an inclined plane
- 3.3 Motion of blocks with pulley systems
- 3.4 Circular motion – centripetal force
- 3.5 Inertial and non-inertial frames

4. Impulse and Momentum

- 4.1 Definition of impulse and momentum
- 4.2 Conservation of momentum
- 4.3 Collisions
- 4.4 Momentum of a system of particles
- 4.5 Center of mass

5. Work and Energy

- 5.1 Work done by a force
- 5.2 Kinetic energy and work-energy theorem
- 5.3 Power
- 5.4 Conservative forces and potential energy
- 5.5 Conservation of mechanical energy

6. Rotational Motion

- 6.1 Description of rotation (angular displacement, angular velocity and angular acceleration)
- 6.2 Rotational motion with constant angular acceleration
- 6.3 Moment of inertia, Parallel and perpendicular axes theorems, rotational kinetic energy
- 6.4 Torque and angular momentum
- 6.5 Conservation of angular momentum
- 6.6 Rolling motion

7. Gravitation

- 7.1 Newton's law of gravitation
- 7.2 Gravitational potential energy, Escape velocity
- 7.3 Motion of planets – Kepler's laws, satellite motion

8. Mechanics of Solids and Fluids

- 8.1 Elasticity
- 8.2 Pressure, density and Archimedes' principle
- 8.3 Viscosity and Surface Tension
- 8.4 Bernoulli's theorem

9. Oscillations

- 9.1 Kinematics of simple harmonic motion
- 9.2 Spring mass system, simple and compound pendulum
- 9.3 Forced & damped oscillations, resonance

10. Waves

- 10.1 Progressive sinusoidal waves
- 10.2 Standing waves in strings and pipes
- 10.3 Superposition of waves, beats
- 10.4 Doppler Effect

11. Heat and Thermodynamics

- 11.1 Kinetic theory of gases
- 11.2 Thermal equilibrium and temperature

- 11.3 Specific heat, Heat Transfer - Conduction, convection and radiation, thermal conductivity, Newton's law of cooling
- 11.4 Work, heat and first law of thermodynamics
- 11.5 2nd law of thermodynamics, Carnot engine Efficiency and Coefficient of performance.

12. Electrostatics

- 12.1 Coulomb's law
- 12.2 Electric field (discrete and continuous charge distributions)
- 12.3 Electrostatic potential and Electrostatic potential energy
- 12.4 Gauss' law and its applications
- 12.5 Electric dipole
- 12.6 Capacitance and dielectrics (parallel plate capacitor, capacitors in series and parallel)

13. Current Electricity

- 13.1 Ohm's law, Joule heating
- 13.2 D.C circuits – Resistors and cells in series and parallel, Kirchoff's laws, potentiometer and Wheatstone bridge,
- 13.3 Electrical Resistance (Resistivity, origin and temperature dependence of resistivity).

14. Magnetic Effect of Current

- 14.1 Biot-Savart's law and its applications
- 14.2 Ampere's law and its applications
- 14.3 Lorentz force, force on current carrying conductors in a magnetic field
- 14.4 Magnetic moment of a current loop, torque on a current loop, Galvanometer and its conversion to voltmeter and ammeter

15. Electromagnetic Induction

- 15.1 Faraday's law, Lenz's law, eddy currents
- 15.2 Self and mutual inductance

- 15.3 Transformers and generators
- 15.4 Alternating current (peak and rms value)
- 15.5 AC circuits, LCR circuits

16. Optics

- 16.1 Laws of reflection and refraction
- 16.2 Lenses and mirrors
- 16.3 Optical instruments – telescope and microscope
- 16.4 Interference – Huygen's principle, Young's double slit experiment
- 16.5 Interference in thin films
- 16.6 Diffraction due to a single slit
- 16.7 Electromagnetic waves and their characteristics (only qualitative ideas), Electromagnetic spectrum
- 16.8 Polarization – states of polarization, Malus' law, Brewster's law

17. Modern Physics

- 17.1 Dual nature of light and matter – Photoelectric effect, De-Broglie wavelength
- 17.2 Atomic models – Rutherford's experiment, Bohr's atomic model
- 17.3 Hydrogen atom spectrum
- 17.4 Radioactivity
- 17.5 Nuclear reactions Fission and fusion, binding energy

18. Electronic Devices

- 18.1 Energy bands in solids (qualitative ideas only), conductors, insulators and semiconductors;
- 18.2 Semiconductor diode – I-V characteristics in forward and reverse bias, diode as a rectifier; I-V characteristics of LED, photodiode, solar cell, and Zener diode; Zener diode as a voltage regulator.
- 18.3 Junction transistor, transistor action, characteristics of a transistor; transistor as an amplifier (common emitter configuration) and oscillator
- 18.4 Logic gates (OR, AND, NOT, NAND and NOR). Transistor as a switch.

PART II CHEMISTRY

1. States of Matter

- 1.1 Measurement Physical quantities and SI units, Dimensional analysis, Precision, Significant figures.
- 1.2 Chemical Reactions Laws of chemical combination, Dalton's atomic theory; Mole concept; Atomic, molecular and molar masses; Percentage composition empirical & molecular formula; Balanced chemical equations & stoichiometry
- 1.3 Three states of matter, intermolecular interactions, types of bonding, melting and boiling points Gaseous state: Gas Laws, ideal behavior, ideal gas equation, empirical derivation of gas equation, Avogadro number, Kinetic theory – Maxwell distribution of velocities, Average, root mean square and most probable velocities and relation to temperature, Diffusion; Deviation from ideal behaviour – Critical temperature, Liquefaction of gases, van der Waals' equation.
- 1.4 Liquid State Vapour pressure, surface tension, viscosity.
- 1.5 Solid State Classification; Space lattices & crystal systems; Unit cell in two dimensional and three dimensional lattices, calculation of density of unit cell – Cubic & hexagonal systems; Close packing; Crystal Structures Simple AB and AB₂ type ionic crystals, covalent crystals – diamond & graphite, metals. Voids, number of atoms per unit cell in a cubic unit cell, Imperfections- Point defects, non-stoichiometric crystals; Electrical, magnetic and dielectric properties; Amorphous solids qualitative description. Band theory of metals, conductors, semiconductors and insulators, and *n*- and *p*- type semiconductors.

2. Atomic Structure

- 2.1 Introduction Radioactivity, Subatomic particles; Atomic number, isotopes and isobars, Thompson's model and its limitations, Rutherford's picture of atom and its limitations; Hydrogen atom spectrum and Bohr model and its limitations.
- 2.2 Quantum Mechanics Wave-particle duality de-Broglie relation, Uncertainty principle; Hydrogen atom: Quantum numbers and wavefunctions, atomic orbitals and their shapes (*s*, *p*, and *d*), Spin quantum number.

- 2.3 Many Electron Atoms Pauli exclusion principle; Aufbau principle and the electronic configuration of atoms, Hund's rule.
- 2.4 Periodicity Brief history of the development of periodic tables Periodic law and the modern periodic table; Types of elements: *s*, *p*, *d*, and *f* blocks; Periodic trends: ionization energy, atomic, and ionic radii, inter gas radii, electron affinity, electro negativity and valency. Nomenclature of elements with atomic number greater than 100.

3. Chemical Bonding & Molecular Structure

- 3.1 Valence Electrons, Ionic Bond Lattice Energy and Born-Haber cycle; Covalent character of ionic bonds and polar character of covalent bond, bond parameters
- 3.2 Molecular Structure Lewis picture & resonance structures, VSEPR model & molecular shapes
- 3.3 Covalent Bond Valence Bond Theory- Orbital overlap, Directionality of bonds & hybridization (*s*, *p* & *d* orbitals only), Resonance; Molecular orbital theory- Methodology, Orbital energy level diagram, Bond order, Magnetic properties for homonuclear diatomic species (qualitative idea only).
- 3.4 Metallic Bond Qualitative description.
- 3.5 Intermolecular Forces Polarity; Dipole moments; Hydrogen Bond.

4. Thermodynamics

- 4.1 Basic Concepts Systems and surroundings; State functions; Intensive & Extensive Properties; Zeroth Law and Temperature
- 4.2 First Law of Thermodynamics Work, internal energy, heat, enthalpy, heat capacities and specific heats, measurements of *U* and *H*, Enthalpies of formation, phase transformation, ionization, electron gain; Thermochemistry; Hess's Law, Enthalpy of bond dissociation, combustion, atomization, sublimation, solution and dilution
- 4.3 Second Law Spontaneous and reversible processes; entropy; Gibbs free energy related to spontaneity and non-spontaneity, non-mechanical work; Standard free energies of formation, free energy change and chemical equilibrium
- 4.4 Third Law Introduction

5. Physical and Chemical Equilibria

- 5.1 Concentration Units Mole Fraction, Molarity, and Molality
- 5.2 Solutions Solubility of solids and gases in liquids, Vapour Pressure, Raoult's law, Relative lowering of vapour pressure, depression in freezing point; elevation in boiling point; osmotic pressure, determination of molecular mass; solid solutions, abnormal molecular mass, van't Hoff factor. Equilibrium: Dynamic nature of equilibrium, law of mass action
- 5.3 Physical Equilibrium Equilibria involving physical changes (solid-liquid, liquid-gas, solid-gas), Surface chemistry, Adsorption, Physical and Chemical adsorption, Langmuir Isotherm, Colloids and emulsion, classification, preparation, uses.
- 5.4 Chemical Equilibria Equilibrium constants (K_p , K_c), Factors affecting equilibrium, Le-Chatelier's principle.
- 5.5 Ionic Equilibria Strong and Weak electrolytes, Acids and Bases (Arrhenius, Lewis, Lowry and Bronsted) and their dissociation; degree of ionization, Ionization of Water; ionization of polybasic acids, pH; Buffer solutions; Henderson equation, Acid-base titrations; Hydrolysis; Solubility Product of Sparingly Soluble Salts; Common Ion Effect.
- 5.6 Factors Affecting Equilibria Concentration, Temperature, Pressure, Catalysts, Significance of ΔG and ΔG° in Chemical Equilibria.

6. Electrochemistry

- 6.1 Redox Reactions Oxidation-reduction reactions (electron transfer concept); Oxidation number; Balancing of redox reactions; Electrochemical cells and cell reactions; Standard electrode potentials; EMF of Galvanic cells; Nernst equation; Factors affecting the electrode potential; Gibbs energy change and cell potential; Secondary cells; dry cells, Fuel cells; Corrosion and its prevention.
- 6.2 Electrolytic Conduction Electrolytic Conductance; Specific and molar conductivities; variations of conductivity with concentration, Kohlrausch's Law and its application, Electrolysis, Faraday's laws of electrolysis; Coulometer; Electrode potential and electrolysis, Commercial production of the chemicals, NaOH, Na, Al, Cl_2 & F_2 .

7. Chemical Kinetics

- 7.1 Aspects of Kinetics Rate and Rate expression of a reaction; Rate constant; Order and molecularity of the reaction; Integrated rate expressions and half life for zero and first order reactions.
- 7.2 Factor Affecting the Rate of the Reactions Concentration of the reactants, catalyst; size of particles, Temperature dependence of rate constant concept of collision theory (elementary idea, no mathematical treatment); Activation energy; Catalysis, Surface catalysis, enzymes, zeolites; Factors affecting rate of collisions between molecules.
- 7.3 Mechanism of Reaction Elementary reactions; Complex reactions; Reactions involving two/three steps only.
- 7.4 Surface Chemistry Adsorption Physisorption and chemisorption; factors affecting adsorption of gases on solids; catalysis: homogeneous and heterogeneous, activity and selectivity: enzyme catalysis, colloidal state: distinction between true solutions, colloids and suspensions; lyophilic, lyophobic multi molecular and macromolecular colloids; properties of colloids; Tyndall effect, Brownian movement, electrophoresis, coagulations; emulsions – types of emulsions.

8. Hydrogen and s-block Elements

- 8.1 Hydrogen Element Unique position in periodic table, occurrence, isotopes; Dihydrogen: preparation, properties, reactions, and uses; Molecular, saline, ionic, covalent, interstitial hydrides; Water: Properties; Structure and aggregation of water molecules; Heavy water; Hydrogen peroxide: preparation, reaction, structure & use, Hydrogen as a fuel.
- 8.2 s-block Elements Abundance and occurrence; Anomalous properties of the first elements in each group; diagonal relationships; trends in the variation of properties (ionization energy, atomic & ionic radii).
- 8.3 Alkali Metals Lithium, sodium and potassium: occurrence, extraction, reactivity, and electrode potentials; Biological importance; Reactions with oxygen, hydrogen, halogens water and liquid ammonia; Basic nature of oxides and hydroxides; Halides; Properties and uses of compounds such as NaCl, Na_2CO_3 , NaHCO_3 , NaOH, KCl and KOH.

- 8.4 Alkaline Earth Metals Magnesium and calcium: Occurrence, extraction, reactivity and electrode potentials; Reactions with O_2 , H_2O , H_2 and halogens; Solubility and thermal stability of oxo salts; Biological importance of Ca and Mg; Preparation, properties and uses of important compounds such as CaO , $Ca(OH)_2$, plaster of Paris, $MgSO_4$, $MgCl_2$, $CaCO_3$, and $CaSO_4$; Lime and limestone, cement.

9. *p*-, *d*- and *f*-block Elements

- 9.1 General Abundance, distribution, physical and chemical properties, isolation and uses of elements; Trends in chemical reactivity of elements of a group; electronic configuration, oxidation states; anomalous properties of first element of each group.
- 9.2 Group 13 Elements Boron, Properties and uses of borax, boric acid, boron hydrides & halides. Reaction of aluminium with acids and alkalis;
- 9.3 Group 14 Elements Carbon, carbon catenation, physical & chemical properties, uses, allotropes (graphite, diamond, fullerenes), oxides, halides and sulphides, carbides; Silicon: Silica, silicates, silicone, silicon tetrachloride, Zeolites, and their uses
- 9.4 Group 15 Elements Dinitrogen; Preparation, reactivity and uses of nitrogen; Industrial and biological nitrogen fixation; Compound of nitrogen; Ammonia: Haber's process, properties and reactions; Oxides of nitrogen and their structures; Properties and Ostwald's process of nitric acid production; Fertilizers – NPK type; Production of phosphorus; Allotropes of phosphorus; Preparation, structure and properties of hydrides, oxides, oxoacids (elementary idea only) and halides of phosphorus, phosphine.
- 9.5 Group 16 Elements Isolation and chemical reactivity of dioxygen; Acidic, basic and amphoteric oxides; Preparation, structure and properties of ozone; Allotropes of sulphur; Preparation/production properties and uses of sulphur dioxide and sulphuric acid; Structure and properties of oxides, oxoacids (structures only), hydrides and halides of sulphur.
- 9.6 Group 17 and group 18 Elements Structure and properties of hydrides, oxides, oxoacids of halogens (structures only); preparation, properties & uses of chlorine & HCl; Inter halogen compounds; Bleaching Powder; Uses of Group 18 elements, Preparation, structure and reactions of xenon fluorides, oxides, and oxoacids.
- 9.7 *d*-Block Elements General trends in the chemistry of first row transition elements; Metallic character; Oxidation state; ionization enthalpy; Ionic radii; Color; Catalytic properties; Magnetic properties; Interstitial compounds; Occurrence and extraction of iron, copper, silver, zinc, and mercury; Alloy formation; Steel and some important alloys; preparation and properties of $CuSO_4$, $K_2Cr_2O_7$, $KMnO_4$, Mercury halides; Silver nitrate and silver halides; Photography.
- 9.8 *f*-Block Elements Lanthanoids and actinoids; Oxidation states and chemical reactivity of lanthanoids compounds; Lanthanide contraction and its consequences, Comparison of actinoids and lanthanoids.
- 9.9 Coordination Compounds Coordination number; Ligands; Werner's coordination theory; IUPAC nomenclature; Application and importance of coordination compounds (in qualitative analysis, extraction of metals and biological systems e.g. chlorophyll, vitamin B_{12} , and hemoglobin); Bonding: Valence-bond approach, Crystal field theory (qualitative); Stability constants; Shapes, color and magnetic properties; Isomerism including stereoisomerisms; Organometallic compounds.

10. Principles of Organic Chemistry and Hydrocarbons

- 10.1 Classification General Introduction, classification based on functional groups, trivial and IUPAC nomenclature. Methods of purification: qualitative and quantitative.
- 10.2 Electronic Displacement in a Covalent Bond Inductive, resonance effects, and hyperconjugation; free radicals; carbocations, carbanions, nucleophiles and electrophiles; types of organic reactions, free radical halogenations.
- 10.3 Alkanes and Cycloalkanes Structural isomerism, general properties and chemical reactions, free radical halogenation, combustion and pyrolysis.

- 10.4 Alkenes and Alkynes General methods of preparation and reactions, physical properties, electrophilic and free radical additions, acidic character of alkynes and (1,2 and 1,4) addition to dienes.
- 10.5 Aromatic Hydrocarbons Sources; properties; isomerism; resonance delocalization; aromaticity; polynuclear hydrocarbons; IUPAC nomenclature; mechanism of electrophilic substitution reaction, directive influence and effect of substituents on reactivity; carcinogenicity and toxicity.
- 10.6 Haloalkanes and Haloarenes Physical properties, nomenclature, optical rotation, chemical reactions and mechanism of substitution reaction. Uses and environmental effects; di, tri, tetrachloromethanes, iodoform, freon and DDT.
- 10.7 Petroleum Composition and refining, uses of petrochemicals.

11. Stereochemistry

- 11.1 Introduction Chiral molecules; optical activity; polarimetry; R,S and D,L configurations; Fischer projections; enantiomerism; racemates; diastereomerism and meso structures.
- 11.2 Conformations Ethane conformations; Newman and Sawhorse projections.
- 11.3 Geometrical isomerism in alkenes

12. Organic Compounds with Functional Groups Containing Oxygen and Nitrogen

- 12.1 General Nomenclature, electronic structure, important methods of preparation, identification, important reactions, physical and chemical properties, uses of alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, nitro compounds, amines, diazonium salts, cyanides and isocyanides.
- 12.2 Specific Reactivity of α -hydrogen in carbonyl compounds, effect of substituents on α -carbon on acid strength, comparative reactivity of acid derivatives, mechanism of nucleophilic addition and dehydration, basic character of amines, methods of preparation, and their separation, importance of diazonium salts in synthetic organic chemistry.

13. Biological, Industrial and Environmental Chemistry

- 13.1 The Cell Concept of cell and energy cycle.
- 13.2 Carbohydrates Classification; Monosaccharides; Structures of pentoses and hexoses; Anomeric carbon; Mutarotation; Simple chemical reactions of glucose, Disaccharides: reducing and nonreducing sugars – sucrose, maltose and lactose; Polysaccharides: elementary idea of structures of starch, cellulose and glycogen.
- 13.3 Proteins Amino acids; Peptide bond; Polypeptides; Primary structure of proteins; Simple idea of secondary, tertiary and quaternary structures of proteins; Denaturation of proteins and enzymes.
- 13.4 Nucleic Acids Types of nucleic acids; Primary building blocks of nucleic acids (chemical composition of DNA & RNA); Primary structure of DNA and its double helix; Replication; Transcription and protein synthesis; Genetic code.
- 13.5 Vitamins Classification, structure, functions in biosystems; Hormones
- 13.6 Polymers Classification of polymers; General methods of polymerization; Molecular mass of polymers; Biopolymers and biodegradable polymers; methods of polymerization (free radical, cationic and anionic addition polymerizations); Copolymerization: Natural rubber; Vulcanization of rubber; Synthetic rubbers. Condensation polymers.
- 13.7 Pollution Environmental pollutants; soil, water and air pollution; Chemical reactions in atmosphere; Smog; Major atmospheric pollutants; Acid rain; Ozone and its reactions; Depletion of ozone layer and its effects; Industrial air pollution; Green house effect and global warming; Green Chemistry, study for control of environmental pollution.
- 13.8 Chemicals in medicine, health-care and food: Analgesics, Tranquilizers, antiseptics, disinfectants, anti-microbials, anti-fertility drugs, antihistamines, antibiotics, antacids; Preservatives, artificial sweetening agents, antioxidants, soaps and detergents.

14. Theoretical Principles of Experimental Chemistry

- 14.1 Volumetric Analysis Principles; Standard solutions of sodium carbonate and oxalic acid; Acidbase titrations; Redox reactions involving KI, H_2SO_4 , Na_2SO_3 , $\text{Na}_2\text{S}_2\text{O}_3$ and H_2S ; Potassium permanganate in acidic, basic and neutral media; Titrations of oxalic acid, ferrous ammonium sulphate with KMnO_4 , $\text{K}_2\text{Cr}_2\text{O}_7/\text{Na}_2\text{S}_2\text{O}_3$, $\text{Cu(II)}/\text{Na}_2\text{S}_2\text{O}_3$.
- 14.2 Qualitative Analysis of Inorganic Salts Principles in the determination of the cations Pb^{2+} , Cu^{2+} , As^{3+} , Mn^{2+} , Al^{3+} , Zn^{2+} , Co^{2+} , Ca^{2+} , Sr^{2+} , Ba^{2+} , Mg^{2+} , NH_4^+ , Fe^{3+} , Ni^{2+} and the anions CO_3^{2-} , S^{2-} , SO_4^{2-} , SO_3^{2-} , NO_2^- , NO_3^- , Cl^- , Br^- , I^- , PO_4^{3-} , CH_3COO^- , $\text{C}_2\text{O}_4^{2-}$.
- 14.3 Physical Chemistry Experiments Preparation and crystallization of alum, copper sulphate. Benzoic acid ferrous sulphate, double salt of alum and ferrous sulphate, potassium ferric sulphate; Temperature vs. solubility; Study of pH changes by common ion effect in case of weak acids and weak bases; pH measurements of some solutions obtained from fruit juices, solutions of known and varied concentrations of acids, bases and salts using pH paper or universal indicator; Lyophilic and lyophobic sols; Dialysis; Role of emulsifying agents in emulsification.
- Equilibrium studies involving ferric and thiocyanate ions (ii) $[\text{Co}(\text{H}_2\text{O})_6]^{2+}$ and chloride ions; Enthalpy determination for strong acid vs. strong base neutralization reaction
- (ii) hydrogen bonding interaction between acetone and chloroform; Rates of the reaction between (i) sodium thiosulphate and hydrochloric acid, (ii) potassium iodate and sodium sulphite (iii) iodide vs. hydrogen peroxide, concentration and temperature effects in these reactions.
- 14.4 Purification Methods Filtration, crystallization, sublimation, distillation, differential extraction, and chromatography. Principles of melting point and boiling point determination; principles of paper chromatographic separation – R_f values.
- 14.5 Qualitative Analysis of Organic Compounds Detection of nitrogen, sulphur, phosphorous and halogens; Detection of carbohydrates, fats and proteins in foodstuff; Detection of alcoholic, phenolic, aldehydic, ketonic, carboxylic, amino groups and unsaturation.
- 14.6 Quantitative Analysis of Organic Compounds Basic principles for the quantitative estimation of carbon, hydrogen, nitrogen, halogen, sulphur and phosphorous; Molecular mass determination by silver salt and chloroplatinate salt methods; Calculations of empirical and molecular formulae.
- 14.7 Principles of Organic Chemistry Experiments Preparation of iodoform, acetanilide, p-nitro acetanilide, di-benzyl acetone, aniline yellow, b-naphthol; Preparation of acetylene and study of its acidic character.
- 14.8 Basic Laboratory Technique Cutting glass tube and glass rod, bending a glass tube, drawing out a glass jet, boring of cork.

PART III

a. English Proficiency, b. Logical Reasoning

a. English Proficiency

This test is designed to assess the test takers' general proficiency in the use of English language as a means of self-expression in real life situations and specifically to test the test takers' knowledge of basic grammar, their vocabulary, their ability to read fast and comprehend, and also their ability to apply the elements of effective writing.

1. Grammar

- 1.1 Agreement, Time and Tense, Parallel construction, Relative pronouns
- 1.2 Determiners, Prepositions, Modals, Adjectives
- 1.3 Voice, Transformation
- 1.4 Question tags, Phrasal verbs

2. Vocabulary

- 2.1 Synonyms, Antonyms, Odd Word, One Word, Jumbled letters, Homophones, Spelling
- 2.2 Contextual meaning.
- 2.3 Analogy

3. Reading Comprehension

- 3.1 Content/Ideas
- 3.2 Vocabulary
- 3.3 Referents
- 3.4 Idioms/Phrases
- 3.5 Reconstruction (rewording)

4. Composition

- 4.1 Rearrangement
- 4.2 Paragraph Unity
- 4.3 Linkers/Connectives

b. Logical Reasoning

The test is given to the candidates to judge their power of reasoning spread in verbal and nonverbal areas. The candidates should be able to think logically so that they perceive the data accurately, understand the relationships correctly, figure out the missing numbers or words, and to apply rules to new and different contexts. These indicators are measured through performance on such tasks as detecting missing links, following directions, classifying words, establishing sequences, and completing analogies.

5. Verbal Reasoning

- 5.1 Analogy Analogy means correspondence.
In the questions based on analogy, a particular

relationship is given and another similar relationship has to be identified from the alternatives provided.

- 5.2 Classification Classification means to assort the items of a given group on the basis of certain common quality they possess and then spot the odd option out.
- 5.3 Series Completion Here series of numbers or letters are given and one is asked to either complete the series or find out the wrong part in the series.
- 5.4 Logical Deduction – Reading Passage Here a brief passage is given and based on the passage the candidate is required to identify the correct or incorrect logical conclusions.
- 5.5 Chart Logic Here a chart or a table is given that is partially filled in and asks to complete it in accordance with the information given either in the chart / table or in the question.

6. Non-verbal Reasoning

- 6.1 Pattern Perception Here a certain pattern is given and generally a quarter is left blank. The candidate is required to identify the correct quarter from the given four alternatives.
- 6.2 Figure Formation and Analysis The candidate is required to analyze and form a figure from various given parts.
- 6.3 Paper Cutting It involves the analysis of a pattern that is formed when a folded piece of paper is cut into a definite design.
- 6.4 Figure Matrix In this more than one set of figures is given in the form of a matrix, all of them following the same rule. The candidate is required to follow the rule and identify the missing figure.
- 6.5 Rule Detection Here a particular rule is given and it is required to select from the given sets of figures, a set of figures, which obeys the rule and forms the correct series.

PART IV MATHEMATICS

1. Algebra

- 1.1 Complex numbers, addition, multiplication, conjugation, polar representation, properties of modulus and principal argument, triangle inequality, roots of complex numbers, geometric interpretations; Fundamental theorem of algebra.
- 1.2 Theory of Quadratic equations, quadratic equations in real and complex number system and their solutions, relation between roots and coefficients, nature of roots, equations reducible to quadratic equations.
- 1.3 Arithmetic, geometric and harmonic progressions, arithmetic, geometric and harmonic means, arithmetico-geometric series, sums of finite arithmetic and geometric progressions, infinite geometric series, sums of squares and cubes of the first n natural numbers.
- 1.4 Logarithms and their properties.
- 1.5 Exponential series.
- 1.6 Permutations and combinations, Permutations as an arrangement and combination as selection, simple applications.
- 1.7 Binomial theorem for a positive integral index, properties of binomial coefficients, Pascal's triangle
- 1.8 Matrices and determinants of order two or three, properties and evaluation of determinants, addition and multiplication of matrices, adjoint and inverse of matrices, Solutions of simultaneous linear equations in two or three variables, elementary row and column operations of matrices,
- 1.9 Sets, Relations and Functions, algebra of sets applications, equivalence relations, mappings, one-one, into and onto mappings, composition of mappings, binary operation, inverse of function, functions of real variables like polynomial, modulus, signum and greatest integer.
- 1.10 Mathematical Induction
- 1.11 Linear Inequalities, solution of linear inequalities in one and two variables.

2. Trigonometry

- 2.1 Measurement of angles in radians and degrees, positive and negative angles, trigonometric ratios, functions and identities.
- 2.2 Solution of trigonometric equations.
- 2.3 Properties of triangles and solutions of triangles
- 2.4 Inverse trigonometric functions
- 2.5 Heights and distances

3. Two-dimensional Coordinate Geometry

- 3.1 Cartesian coordinates, distance between two points, section formulae, shift of origin.
- 3.2 Straight lines and pair of straight lines: Equation of straight lines in various forms, angle between two lines, distance of a point from a line, lines through the point of intersection of two given lines, equation of the bisector of the angle between two lines, concurrent lines.
- 3.3 Circles and family of circles : Equation of circle in various form, equation of tangent, normal & chords, parametric equations of a circle , intersection of a circle with a straight line or a circle, equation of circle through point of intersection of two circles, conditions for two intersecting circles to be orthogonal.
- 3.4 Conic sections : parabola, ellipse and hyperbola their eccentricity, directrices & foci, parametric forms, equations of tangent & normal, conditions for $y = mx + c$ to be a tangent and point of tangency.

4. Three Dimensional Coordinate Geometry

- 4.1 Co-ordinate axes and co-ordinate planes, distance between two points, section formula, direction cosines and direction ratios, equation of a straight line in space and skew lines.
- 4.2 Angle between two lines whose direction ratios are given, shortest distance between two lines.
- 4.3 Equation of a plane, distance of a point from a plane, condition for coplanarity of three lines, angles between two planes, angle between a line and a plane.

5. Differential Calculus

- 5.1 Domain and range of a real valued function, Limits and Continuity of the sum, difference, product and quotient of two functions, Differentiability.
- 5.2 Derivative of different types of functions (polynomial, rational, trigonometric, inverse trigonometric, exponential, logarithmic, implicit functions), derivative of the sum, difference, product and quotient of two functions, chain rule.
- 5.3 Geometric interpretation of derivative, Tangents and Normals.
- 5.4 Increasing and decreasing functions, Maxima and minima of a function.
- 5.5 Rolle's Theorem, Mean Value Theorem and Intermediate Value Theorem.

6. Integral Calculus

- 6.1 Integration as the inverse process of differentiation, indefinite integrals of standard functions.
- 6.2 Methods of integration: Integration by substitution, Integration by parts, integration by partial fractions, and integration by trigonometric identities.
- 6.3 Definite integrals and their properties, Fundamental Theorem of Integral Calculus, applications in finding areas under simple curves.
- 6.4 Application of definite integrals to the determination of areas of regions bounded by simple curves.

7. Ordinary Differential Equations

- 7.1 Order and degree of a differential equation, formulation of a differential equation whole general solution is given, variables separable method.

- 7.2 Solution of homogeneous differential equations of first order and first degree

- 7.3 Linear first order differential equations

8. Probability

- 8.1 Various terminology in probability, axiomatic and other approaches of probability, addition and multiplication rules of probability.
- 8.2 Conditional probability, total probability and Baye's theorem
- 8.3 Independent events
- 8.4 Discrete random variables and distributions with mean and variance.

9. Vectors

- 9.1 Direction ratio/cosines of vectors, addition of vectors, scalar multiplication, position vector of a point dividing a line segment in a given ratio.
- 9.2 Dot and cross products of two vectors, projection of a vector on a line.
- 9.3 Scalar triple products and their geometrical interpretations.

10. Statistics

- 10.1 Measures of dispersion
- 10.2 Measures of skewness and Central Tendency, Analysis of frequency distributions with equal means but different variances

11. Linear Programming

- 11.1 Various terminology and formulation of linear Programming
- 11.2 Solution of linear Programming using graphical method, feasible and infeasible regions, feasible and infeasible solutions, optimal feasible solutions (upto three nontrivial constraints)

1

Units, Measurement and Dimensions

Introduction

Science is a systematic attempt to understand natural phenomena in as much detail and depth as possible and use the knowledge, so gained to predict, modify and control the phenomena.

Every natural occurrence around us like the Sun, the wind, the planets, atmosphere, human body etc., follows some basic laws. To understand these laws, by observing natural occurrence is called **Physics**. These laws of physics are related and applicable to every aspect of life, thus understanding them leads to their applications in several fields for further development of society, which is also known as **technology**.

Physical Quantities

All those quantities which can be measured directly or indirectly and in terms of which the laws of Physics can be expressed, are called physical quantities. For example, length, mass, temperature, speed and force, electric current, etc.

Units of Physical Quantities

Unit of any physical quantity is its measurement compared to certain basic, arbitrarily chosen, internationally accepted reference standard. There are several systems of units like CGS (Centimetre, Gram and Second), FPS (Foot, Pound and Second) and MKS (Metre, Kilogram and Second).

Fundamental and Derived Units

The number of physical quantities is quite large. Thus, we may define a set of **fundamental** quantities and all other quantities may be expressed in terms of these fundamental quantities. These all other quantities are known as **derived quantities**. Units of fundamental and derived quantities are known as the **fundamental units** and **derived units**, respectively. A complete set of these units, both fundamental and derived units is known as the **system of units**.

System of Units

There are some systems used in units, can be defined as

1. **CGS System** (Centimetre, Gram, Second) is often used in scientific work. This system measures, length in centimetre (cm), mass in gram (g) and time in second (s).
2. **FPS System** (Foot, Pound, Second) It is also called the British Unit System. This unit measures, length in foot (foot), mass in gram (pound) and time in second (s).
3. **MKS System** (Metre, Kilogram, Second) This system measures length in metre(m), mass in kilogram (kg) and time in second (s).
4. **SI Units** (International System of Units) A variety of system of units (CGS, FPS and MKS) leads to the need of a unique system of units which is accepted world-wide. So, in 1971, a system of units named SI (System International in French) was developed and recommended by general conference on weights and measures. It is an extended version of the MKS system. SI system has seven fundamental units and two supplementary units, which are as follows

The two supplementary units of SI system are

- (i) **Radian for Plane Angle** Angle subtended by an arc at the centre of the circle having length equal to radius of circle has unit radians. It is denoted by **rad**.
- (ii) **Steradian for Solid Angle** It is the solid angle which has the vertex at the centre of the sphere and cut-off an area of the surface of sphere equal to that of square with sides of length equal to radius of sphere. It is expressed in unit steradian and denoted by **sr**.

Precision of Measuring Instruments

Measurement is the foundation of all experimental science and technology. The instruments used for measurement in any experiment is called measuring instruments.

Accuracy, Precision and Resolution of an Instrument

- (i) **Accuracy** An instrument is said to be the accurate, if the physical quantity measured by a measuring instrument resembles very close to its true value.
- (ii) **Precision** An instrument is said to have high degree of precision, if the value measured by it remains unchanged, however large number of times it may have been repeated.
- (iii) **Resolution** It stands for the minimum reading, which an instrument can read.

Least Count (LC)

The least count of a measuring instrument is the least value, that can be measured using the instrument. It is denoted as LC.

Least Count of Certain Measuring Instruments

- Vernier calliper, Least count = $\frac{1 \text{ mm}}{10 \text{ divisions}} = 0.1 \text{ mm}$

- Screw gauge, Least count = $\frac{\text{Value of 1 pitch scale reading}}{\text{Total number of head scale divisions}}$

$$\text{Least count} = \frac{1 \text{ mm}}{100 \text{ divisions}} = 0.01 \text{ mm}$$

- Travelling microscope,

$$\text{Least count} = \frac{\text{Value of 1 main scale division}}{\text{Total number of vernier scale divisions}} = \frac{0.5 \text{ mm}}{50 \text{ divisions}} = 0.01 \text{ mm}$$

- Spectrometer, Least count = $\frac{0.5 \text{ degree}}{30 \text{ divisions}} = \frac{30^\circ}{30 \text{ divisions}} = 1^\circ$

$$1 \text{ degree (angle)} = 60' \text{ and } 1' = 60''$$

Errors in Measurement

The uncertainty in results of every measurement by any measuring instruments, is called **error in measurement**. There can be several causes of errors like instrumental errors, imperfection in experimental techniques or procedures, error caused by random changes in temperature, pressure, humidity etc. In systematic errors, mean of many separate measurement differs significantly.

Calculation of Magnitude of Errors

(i) True Value

It is the mean of observed values.

$$\therefore a_{\text{true}} = a_{\text{mean}} = \frac{a_1 + a_2 + a_3 + \dots + a_n}{n} = \frac{1}{n} \sum_{i=1}^n a_i$$

where, $a_1, a_2, \dots, a_n$ are observed values and n is the number of observations.

(ii) Absolute Error

Absolute error of a particular measurement is the difference between mean of observed value and true value.

Absolute error,

$$\Delta a_1 = a_{\text{mean}} - a_1,$$

$$\Delta a_2 = a_{\text{mean}} - a_2,$$

$$\vdots \quad \vdots \quad \vdots$$

and

$$\Delta a_n = a_{\text{mean}} - a_n$$

(iii) Mean Absolute Error

The arithmetic mean of the magnitudes of different values of absolute errors, is known as the mean absolute error.

∴ Mean absolute error,

$$\Delta a_{\text{mean}} = \frac{|\Delta a_1| + |\Delta a_2| + \dots + |\Delta a_n|}{n}$$

The final result of measurement can be written as $a = a_{\text{mean}} \pm \Delta a_{\text{mean}}$. This implies that value of a is likely to lie as $a_{\text{mean}} + \Delta a_{\text{mean}}$ and $a_{\text{mean}} - \Delta a_{\text{mean}}$.

(iv) Relative or Fractional Error

The ratio of the mean value of absolute error and the true value, is known as the mean relative error.

$$\begin{aligned} \text{Mean relative error} &= \frac{\text{Mean absolute error}}{\text{Mean value of measurement}} \\ &= \frac{\Delta a_{\text{mean}}}{a_{\text{mean}}} \end{aligned}$$

(v) Percentage Error

When relative error is expressed in terms of percentage, then relative error is called the percentage error.

Hence,

$$\text{Percentage error} = \frac{\Delta a_{\text{mean}}}{a_{\text{mean}}} \times 100\%$$

Combination of Errors

- (i) **Sum of errors** (Z) of two physical quantities A and B , where ΔA and ΔB are their absolute errors, is

$$\Delta Z = \pm (\Delta A + \Delta B)$$

- (ii) **Difference of errors** (Z) of two physical quantities A and B , where ΔA and ΔB are their absolute errors, is

$$\Delta Z = \pm (\Delta A + \Delta B)$$

- (iii) **Errors of a product** If $Z = AB$, then

$$\frac{\Delta Z}{Z} = \pm \left(\frac{\Delta A}{A} + \frac{\Delta B}{B} \right)$$

- (iv) **Errors of a quotient** If $Z = \frac{A}{B}$, then

$$\frac{\Delta Z}{Z} = \left(\frac{\Delta A}{A} \right) + \left(\frac{\Delta B}{B} \right)$$

Significant Figures

Significant figure in the measured value of a physical quantity tells the number of digits in which we have confidence. All accurately known digits in a measurement plus the first (only one uncertain digit together in a measured value form significant figures). Larger the number of significant figures obtained in a measurement, greater is the accuracy of the measurement.

Rules for Counting Significant Figures

- All the non-zero digits are significant. In 2.738, the number of significant figures is 4.
- All the zeroes between two non-zero digits are significant, no matter where the decimal point is, if at all. As examples, 209 and 3.002 have 3 and 4 significant figures respectively.
- If the measurement of number is less than 1, the zero (es) on the right of decimal point and to the left of the first non-zero digit are non-significant. In 0.00807, first three underlined zeroes are non-significant and the number of significant figures is only 3.
- The terminal or trailing zero (es) in a number without a decimal point are not significant. Thus, $12.3 = 1230\text{cm} = 12300\text{mm}$ has only 3 significant figures.
- The trailing zero (es) in number with a decimal point are significant. Thus, 3.800 kg has 4 significant figures.
- A choice of change of units does not change the number of significant digits or figures in a measurement.

Rules for Arithmetic Operations with Significant Figures

- In addition or subtraction, the final results should retain as many decimal places as there are in the number with the least decimal place. As an example sum of 423.5 g, 164.92 g and 24.381 g is 612.801 g, but it should be expressed as 612.8 g only because the least precise measurement (423.5 g) is correct to only one decimal place.
- In multiplication or division, the final result should retain as many significant figures, as are there in the original number with the least significant figures. For example, suppose an expression is performed like

$$\frac{24.3 \times 1243}{44.65} = 676.481522$$

Rounding the above result upto three significant figures, the result would become 676.

Rules for Rounding off the Uncertain Digits

Result of arithmetic computation, we get a number having more digits than the appropriate number of significant figures, then these uncertain digits are rounded off as per the rules given ahead.

- (i) The preceding digit is raised by 1, if the insignificant digit to be dropped is more than 5 and is left unchanged, if the latter is less than 5.
e.g. 18.764 will be rounded off to 18.8 and 18.74 to 18.7.
- (ii) If the insignificant figure is 5 and the preceding digit is even, then the insignificant digit is simply dropped. However, if the preceding digit is odd, then it is raised by one, so as to make it even. e.g. 17.845 will be rounded off to 17.84 and 17.875 to 17.88.

Dimensions of Physical Quantities

The dimensions of a physical quantity are the power to which the base quantities are raised to represent that quantity. The expression which shows how and which base quantities represent the dimensions of a physical quantity, is called the **dimensional formula**. e.g. for volume, dimensional formula is $[M^0L^3T^0]$. An equation, where a physical quantity is equated with its dimensional formula is called **dimensional equation**. e.g. dimensional equation for force is

$$[F] = [MLT^{-2}]$$

Principle of Homogeneity of Dimensions

According to this principle, a correct dimensional equation must be homogeneous,

i.e. dimensions of all the terms in a physical expression must be same.

$$LHS = RHS$$

Dimensional analysis can be used in conversion of units, to check the dimensional correctness of physical relation and to establish relation among various physical quantities.

Dimensional Analysis and Its Applications

Dimensional analysis help us in deducing certain relations among different quantities. Main applications of dimensional analysis are as follows:

To check the correctness of a given physical equation

If both sides of a physical relation have same dimensions, then the relation is dimensionally correct. Dimensional analysis is also used to deduce relation among the physical quantities, i.e. if the dimensions of physical quantities on both sides is known, then we can deduce relations correlating the quantities with these dimensions.

To convert a physical quantity from one system to another

Let dimensional formula of a given physical quantity be $[M^aL^bT^c]$. If a physical quantity is known in one system of unit (n_1). Then, we can relate it with another system of unit (n_2) as below

$$\frac{n_1}{n_2} = \left[\frac{M_1}{M_2} \right]^a \left[\frac{L_1}{L_2} \right]^b \left[\frac{T_1}{T_2} \right]^c$$

NOTE Here, a system having base units $[M_1, L_1, T_1]$ the numerical value of the given quantity be n_1 , and the numerical value n_2 in another unit system having the base units M_2, L_2, T_2 .

Practice Exercise

- Which one is not a unit of time?
a. Leap year b. Year c. Shake d. Light year
- The height of the building is 50 ft. The same in millimetre is
a. 560 mm b. 285 mm
c. 1786.8 mm d. 15240 mm
- Which of the following is the most precise device for measuring length?
a. A vernier calliper with 20 divisions of the sliding scale
b. An optical instrument that can measure length within wavelength of light
c. A screw gauge of pitch 1 mm and 100 divisions on the circular scale
d. None of the above
- The radius of hydrogen atom in ground state is 5×10^{-11} m. Find the radius of hydrogen atom in fermimetre. (1 fm = 10^{-15} m).
a. 5×10^4 fm b. 2×10^4 fm
c. 5×10^2 fm d. 5×10^6 fm
- One nautical mile is 6080 ft. The same in kilometre is
a. 0.9 km b. 0.8 km
c. 1.85 km d. None of these
- The area of a room is 10 m^2 . The same in ft^2 is
a. 107.6 ft^2 b. 77 ft^2
c. 77.6 ft^2 d. None of these
- The density of iron is 7.87 g/cm^3 . If the atoms are spherical and closely packed. The mass of iron atom is 9.27×10^{-26} kg. What is the volume of an iron atom?
a. $1.18 \times 10^{-29} \text{ m}^3$ b. $2.63 \times 10^{-29} \text{ m}^3$
c. $1.73 \times 10^{-28} \text{ m}^3$ d. $0.53 \times 10^{-29} \text{ m}^3$
- In the previous question, what is the distance between the centres of adjacent atoms?
a. $2.82 \times 10^{-9} \text{ m}$ b. $0.282 \times 10^{-9} \text{ m}$
c. $0.63 \times 10^{-9} \text{ m}$ d. $6.33 \times 10^{-9} \text{ m}$
- The world's largest cut diamond is the first star of Africa (mounted in the British Royal Sceptre and kept in the tower of London). Its volume is 1.84 cubic inch. What is its volume in cubic metre?
a. $30.2 \times 10^{-6} \text{ m}^3$ b. 33.28 m^2
c. 4.8 m^3 d. None of these
- Crane is British unit of volume.
(One crane = 170.474 litre). Convert crane into SI unit.
a. 0.170474 m^3 b. 17.0474 m^3
c. 0.0017474 m^3 d. 1704.74 m^3
- The nearest star to our solar system is 4.29 light year away. How much is this distance in terms of parsecs?
a. 1.32 b. 3.21 c. 2.31 d. 3.12
- The concorde is the fastest airlines used for commercial service. It can cruise at 1450 mile per hour (about two times the speed of sound or in other words, mach 2). What is it in m/s?
a. 644.4 m/s b. 80 m/s
c. 40 m/s d. None of these
- One light year is defined as the distance travelled by light in one year. The speed of light is 3×10^8 m/s. Find the same in metre.
a. 3×10^{12} m b. 9.461×10^{15} m
c. 3×10^{15} m d. None of these
- The acceleration of a car is 10 mile per hour per second. The same in $\frac{\text{ft}}{\text{s}^2}$ is
a. $1.467 \frac{\text{ft}}{\text{s}^2}$ b. $14.67 \frac{\text{ft}}{\text{s}^2}$
c. 40 ft/s^2 d. None of these
- The speed of light in vacuum is 3×10^8 m/s. How many nanosecond does it take to travel one metre in a vacuum?
a. 8 ns b. $\frac{10}{3}$ ns
c. 3.34 ns d. None of these
- The time taken by an electron to go from ground state to excited state is one shake (one shake = 10^{-8} s). Find this time in nanosecond.
a. 10 ns b. 4 ns c. 2 ns d. 25 ns
- The time between human heart beat is 8×10^{-1} s. How many heart beats are measured in one minute?
a. 75 b. 60 c. 82 d. 64
- The age of the universe is 5×10^{17} s. Find the age of universe in year.
a. 158×10^6 year b. 158×10^9 year
c. 158×10^8 year d. 158×10^{11} year
- Assuming the length of the day uniformly increases by 0.001 second per century. Calculate the net effect on the measure of time over 20 centuries.
a. 3.2 hour b. 2.1 hour c. 2.4 hour d. 5 hour
- Find the number of molecules of H_2O in 90 g of water.
a. 35.6×10^{23} molecules b. 41.22×10^{23} molecules
c. 27.2×10^{23} molecules d. 30.11×10^{23} molecules

21. The mass of Earth is 5.98×10^{24} kg. The average atomic weight of atoms that make up Earth is 40 u. How many atoms are there in Earth?
 a. 9×10^{51} b. 9×10^{49} c. 9×10^{46} d. 9×10^{55}
22. One amu is equivalent to 931 MeV energy. The rest mass of electron is 9.1×10^{-31} kg. The mass equivalent energy is (Here, 1 amu = 1.67×10^{-27} kg)
 a. 0.5073 MeV b. 0.693 MeV
 c. 4.0093 MeV d. None of these
23. One atomic mass unit in amu = 166×10^{-27} kg. The atomic weight of oxygen is 16. Find the mass of one atom of oxygen.
 a. 26.56×10^{-27} kg b. 10.53×10^{-27} kg
 c. 74×10^{-27} kg d. 2.73×10^{-27} kg
24. One horse power is equal to
 a. 746 W b. 756 W c. 736 W d. 766 W
25. If $E = mc^2$
 where, m = mass of the body, c = speed of light
 Guess the name of physical quantity E .
 a. Energy b. Power
 c. Momentum d. None of these
26. One calorie of heat is equivalent to 4.2 J. BTU (British Thermal Unit) is equivalent to 1055 J. The value of one BTU in calorie is
 a. 251.2 cal b. 200 cal
 c. 263 cal d. None of these
27. It is claimed that the two cesium clocks, if allowed to run for 100 yr, free from any disturbance, may differ by only about 0.02s. Which of the following is the correct fractional error?
 a. 10^{-9} b. 10^{-5} c. 10^{-13} d. 10^{-11}
28. Which of the following is the average mass density of sodium atom assuming, its size to be about 2.5 Å (Use the known values of Avogadro's number and the atomic mass of sodium).
 a. 0.64×10^3 kg/m³ b. 8.0×10^2 kg/m³
 c. 8.6×10^3 kg/m³ d. 6.4×10^5 kg/m³
29. Electron volt is the unit of energy (1 eV = 1.6×10^{-19} J). In H-atom, the binding energy of electron in first orbit is 13.6 eV. The same in joule (J) is
 a. 10×10^{-19} J b. 21.76×10^{-19} J
 c. 13.6×10^{-19} J d. None of these
30. 1 mm of Hg pressure is equivalent to one torr and one torr is equivalent to 133.3 N/m². The atmospheric pressure in mm of Hg pressure is
 a. 70 mm b. 760 mm
 c. 3.76 mm d. None of these
31. One bar is equivalent to 10^5 N/m². The atmosphere pressure is 1.013×10^5 N/m². The same in bar is
 a. 1.88 bar b. 1.013 bar
 c. 2.013 bar d. None of these
32. 1 revolution is equivalent to 360°. The value of 1 revolution per minute is
 a. 2π rad/s b. 0.1047 rad/s
 c. 3.14 rad/s d. None of these
33. The height of a man is 5.87532 ft. But measurement is correct upto three significant figures. The correct height is
 a. 5.86 ft b. 5.87 ft
 c. 5.88 ft d. 5.80 ft
34. $4.32 \times 2.0 = \dots\dots\dots$
 a. 8.64 b. 8.6
 c. 8.60 d. 8.640
35. $4.338 + 4.835 \times 3.88 \div 3.0$ is equal to
 a. 10.6 b. 10.59
 c. 10.5912 d. 10.591267
36. 10×2.88 is equal to
 a. 2.88 b. 2.880
 c. 2.9 d. None of these
37. 100×2.88 is equal to
 a. 2.88 b. 2.880
 c. 2.9 d. None of these
38. If v = velocity of a body, c = speed of light. Then, the dimension of $\frac{v}{c}$ is
 a. $[M^0L^0T^0]$ b. $[MLT^{-1}]$
 c. $[ML^2T^{-2}]$ d. None of these
39. The expression for centripetal force depends upon mass of body, speed of the body and the radius of circular path. Find the expression for centripetal force.
 a. $F = \frac{mv^2}{2r^3}$ b. $F = \frac{mv^2}{r}$
 c. $F = \frac{mv^2}{r^2}$ d. $F = \frac{m^2v^2}{2r}$
40. The maximum static friction on a body is $F = \mu N$. Here, N = normal reaction force on the body, μ = coefficient of static friction. The dimensions of μ is
 a. $[MLT^{-2}]$ b. $[M^0L^0T^0\theta^{-1}]$
 c. dimensionless d. None of these
41. What are dimensions of Young's modulus of elasticity?
 a. $[ML^{-1}T^{-2}]$ b. $[MLT^{-2}]$
 c. $[MLT^{-1}]$ d. None of these
42. The surface tension is $T = \frac{F}{l}$, then the dimensions of surface tension is
 a. $[MLT^{-2}]$ b. $[MT^{-2}]$
 c. $[M^0L^0T^0]$ d. None of these
43. The dimension of heat capacity is
 a. $[L^2T^{-2}\theta^{-1}]$ b. $[ML^2T^{-2}\theta^{-1}]$
 c. $[M^{-1}L^2T^{-2}\theta^{-1}]$ d. None of these

44. If $\Delta H = mL$, where m is mass of body.
 ΔH = total thermal energy supplied to the body
 L = latent heat of fusion.
 Find the dimensions of latent heat of fusion.
 a. $[ML^2T^{-2}]$ b. $[L^2T^{-2}]$ c. $[M^0L^0T^{-2}]$ d. $[ML^0T^{-1}]$
45. Solar constant is defined as energy received by Earth per cm^2 per minute. Find the dimensions of solar constant.
 a. $[ML^2T^{-3}]$ b. $[M^2L^0T^{-1}]$ c. $[MT^{-3}]$ d. $[MLT^{-2}]$
46. The unit of electric permittivity is $\frac{C^2}{Nm^2}$. Find the dimensions of electric permittivity.
 a. $[A^2M^{-1}L^{-3}T^4]$ b. $[AM^{-1}L^{-3}T^4]$
 c. $[A^2M^{-1}L^{-3}T^0]$ d. $[A^2M^0L^{-3}T^4]$
47. A physical relation is $\varepsilon = \varepsilon_0 \varepsilon_r$
 where, ε = electric permittivity of a medium
 ε_0 = electric permittivity of vacuum
 ε_r = relative permittivity of medium
 What are dimensions of relative permittivity?
 a. $[ML^2T^{-2}]$ b. $[M^0L^2T^{-3}]$
 c. $[M^0L^0T^0]$ d. $[M^0L^0T^{-1}]$
48. The dimensions of $\frac{1}{2} \varepsilon E^2$ are same as
 a. energy density (energy per unit volume)
 b. energy
 c. power
 d. None of the above
49. The electric flux is given by scalar product of electric field strength and area. What are the dimensions of electric flux?
 a. $[A^{-2}ML^3T^{-2}]$ b. $[A^{-1}ML^3T^{-2}]$
 c. $[A^{-1}ML^3T^{-3}]$ d. $[A^0M^2LT^{-1}]$
50. Electric displacement is given by $D = \varepsilon E$
 Here,
 ε = electric permittivity
 E = electric field strength.
 Find the dimensions of electric displacement.
 a. $[AML^{-2}T]$ b. $[AL^{-2}T^{-1}]$
 c. $[AL^{-2}T]$ d. None of these
51. The energy stored in an electric device known as capacitor, is given by $U = \frac{q^2}{2C}$
 where, U = energy stored in capacitor
 C = capacity of capacitor
 q = charge on capacitor
 Find the dimensions of capacity of the capacitor
 a. $[A^2M^{-1}L^{-2}T^4]$
 b. $[AM^{-1}L^{-2}T^4]$
 c. $[A^2M^{-2}L^{-2}T^4]$
 d. $[A^0M^0L^{-2}T^4]$
52. The work done by a battery is $W = \varepsilon \Delta q$, where
 Δq = charge transferred by battery ε = emf of the battery. What are dimensions of emf of battery?
 a. $[A^{-2}M^0L^0T^{-2}]$ b. $[A^{-2}ML^2T^{-3}]$
 c. $[A^0M^2T^{-3}]$ d. $[A^{-1}ML^2T^{-3}]$
53. The expression for drift speed is $v_d = \frac{J}{ne}$.
 Here, J = current density,
 n = number of electrons per unit volume,
 $e = 1.6 \times 10^{-19} \text{unit}$
 The unit and dimensions of e are
 a. coulomb and $[AT]$
 b. ampere per second and $[AT^{-1}]$
 c. no sufficient information
 d. None of the above
54. The unit of current element is ampere-metre. Find the dimensions of current element.
 a. $[AML]$ b. $[AML^2T]$
 c. $[MLT^2]$ d. $[AL]$
55. The magnetic force on a point moving charge is $\mathbf{F} = q(\mathbf{v} \times \mathbf{B})$.
 Here, q = electric charge
 $\mathbf{v}$ = velocity of the point charge
 $\mathbf{B}$ = magnetic field
 The dimensions of $\mathbf{B}$ is
 a. $[AMLT^{-1}]$
 b. $[A^{-1}MLT^{-2}]$
 c. $[A^{-1}MT^{-2}]$
 d. None of these
56. What are dimensions of $\frac{E}{B}$?
 a. $[LT^{-1}]$ b. $[LT^{-2}]$
 c. $[MLT^{-1}]$ d. $[ML^2T^{-1}]$
57. What are the dimensions of $\mu_0 \varepsilon_0$?
 Here, μ_0 = magnetic permeability in vacuum,
 ε_0 = electric permittivity in vacuum
 a. $[ML^{-2}T^{-2}]$ b. $[L^{-2}T^{-2}]$
 c. $[L^{-2}T^2]$ d. None of these
58. In the formula, $a = 3bc^2$ 'a' and 'c' have dimensions of electric capacitance and magnetic induction, respectively. What are dimensions of 'b' in MKS system?
 a. $[M^{-3}L^{-2}T^4Q^4]$ b. $[M^{-3}T^4Q^4]$
 c. $[M^{-3}T^3Q]$ d. $[M^{-3}L^2T^4Q^{-4}]$
59. Find the dimensions of $\frac{R}{L}$.
 Here, R = electric resistance
 L = self-inductance
 a. $[T^{-2}]$ b. $[T^{-1}]$
 c. $[ML^{-1}]$ d. $[T]$

60. The magnetic energy stored in an inductor is given by $E = \frac{1}{2} L^a I^b$. Find the value of 'a' and 'b'.

Here, L = self-inductance, I = electric current.

- a. $a = 3, b = 0$ b. $a = 2, b = 1$
c. $a = 0, b = 2$ d. $a = 1, b = 2$

61. In L - R circuit, $I = I_0 [1 - e^{-t/\lambda}]$

Here, I = electric current in the circuit. Then,

- a. the dimensions of I_0 and λ are same
b. the dimensions of t and λ are same
c. the dimensions of I and I_0 are not same
d. All of the above

62. A physical quantity u is given by the

$$\text{relation } u = \frac{B^2}{2\mu_0}.$$

Here, B = magnetic field strength

μ_0 = magnetic permeability of vacuum

The name of physical quantity u is

- a. energy b. energy density
c. pressure d. None of these
63. The energy of a photon depends upon Planck's constant and frequency of light. Find the expression for photon energy.
- a. $E = h\nu$ b. $E = \frac{h}{\nu}$
c. $E = \frac{\nu}{h}$ d. $E = h\nu^2$
64. If energy of photon is $E \propto h^a c^b \lambda^d$.

Here, h = Planck's constant, c = speed of light and
 λ = wavelength of photon

Then, the value of a, b and d are

- a. 1, 1, 1 b. 1, -1, 1
c. 1, 1, -1 d. None of these
65. The radius of nucleus is $r = r_0 A^{1/3}$, where A is mass number. The dimensions of r_0 is
- a. $[MLT^{-2}]$ b. $[M^0L^0T^{-1}]$
c. $[M^0LT^0]$ d. None of these
66. The power of lens is $P = \frac{1}{f'}$ where f is focal length of

the lens. The dimensions of power of lens is

- a. $[LT^{-2}]$ b. $[M^0L^{-1}T^0]$
c. $[M^0L^0T^0]$ d. None of these

67. The dimensions of frequency is

- a. $[T^{-1}]$ b. $[M^0L^0T]$
c. $[M^0L^0T^{-2}]$ d. None of these

68. The dimensions of wavelength is

- a. $[M^0L^0T^0]$ b. $[M^0LT^0]$
c. $[M^0L^{-1}T^0]$ d. None of these

69. The optical path difference is defined as $\Delta x = \frac{2\pi}{\lambda}$.

What are dimensions of optical path difference?

- a. $[M^0L^{-1}T^0]$ b. $[M^1L^1T^0]$
c. $[ML^0T^1]$ d. $[ML^{-2}T]$

70. The unit of intensity of a wave is $\frac{W}{m^2}$? What are dimensions of intensity of wave?

- a. $[MT^{-3}]$ b. $[AML^0T^{-2}]$
c. $[M^0L^{-1}T^{-2}]$ d. None of these

71. If $x = \frac{a \sin \theta + b \cos \theta}{a + b}$, then

- a. the dimensions of x and a are same
b. the dimensions of a and b are not same
c. x is dimensionless
d. None of the above

72. $\int \frac{dv}{\sqrt{2nv - v^2}} = a^n \sin^{-1} \left[\frac{x}{a} - 1 \right]$ on the basis of

dimensional analysis, the value of n is

- a. 0 b. -2
c. 3 d. None of these

Find the value of following on the basis of significant figure rule

73. Calculate the fractional error $\left(\frac{\Delta x}{x} \right)$, if $x = a^n$.

- a. $\pm \left(\frac{\Delta a}{a} \right)^n$ b. $\pm n \left(\frac{\Delta a}{a} \right)$
c. $\pm n \log_e \frac{\Delta a}{a}$ d. $\pm n \log \frac{\Delta a}{a}$

74. The relation gives the value of 'x' $x = \frac{a^3 b^3}{c\sqrt{d}}$.

Find the percentage error in 'x', if the percentage error in a, b, c and d are 2%, 1%, 3%, and 4%, respectively.

- a. $\pm 8\%$ b. $\pm 10\%$ c. $\pm 12\%$ d. $\pm 14\%$

BITSAT Archives

- For the equation $F \propto A^a v^b d^c$, where F is the force, A is the area, v is the velocity and d is the density, the values of a, b and c are, respectively [2014]
a. 1, 2, 1 b. 2, 1, 1 c. 1, 1, 2 d. 0, 1, 1
- If edge lengths of a cuboid are measured to be 1.2 cm, 1.5 cm and 1.8 cm, then volume of the cuboid is [2014]
a. 3.240 cm^3 b. 3.24 cm^3 c. 3.2 cm^3 d. 3.0 cm^3
- If the force is given by $F = at + bt^2$ with t as time. The dimensions of a and b are [2012]
a. $[\text{MLT}^{-4}]$ and $[\text{MLT}^{-2}]$ b. $[\text{MLT}^{-3}]$ and $[\text{MLT}^{-4}]$
c. $[\text{ML}^2\text{T}^{-3}]$ and $[\text{ML}^2\text{T}^{-2}]$ d. $[\text{ML}^2\text{T}^{-3}]$ and $[\text{ML}^3\text{T}^{-4}]$
- The dimensional formula for inductance is [2012]
a. $[\text{ML}^2\text{T}^{-2}\text{A}^{-2}]$ b. $[\text{ML}^2\text{TA}^{-2}]$
c. $[\text{ML}^2\text{T}^{-1}\text{A}^{-2}]$ d. $[\text{ML}^2\text{T}^{-2}\text{A}^{-1}]$
- A cube has a side of length $1.2 \times 10^{-2} \text{ m}$. Calculate its volume. [2011]
a. $1.7 \times 10^{-6} \text{ m}^3$ b. $1.73 \times 10^{-6} \text{ m}^3$
c. $1.70 \times 10^{-6} \text{ m}^3$ d. $1.732 \times 10^{-6} \text{ m}^3$
- The dimensions of the quantity hc (where, $h = \frac{h}{2\pi}$) is [2010]
a. $[\text{ML}^2\text{T}^{-1}]$ b. $[\text{MLT}^{-1}]$
c. $[\text{ML}^3\text{T}^{-2}]$ d. $[\text{ML}^2\text{T}^{-1}]$
- A resistor of $10 \text{ k}\Omega$ has a tolerance of 10% and another resistor of $20 \text{ k}\Omega$ has a tolerance of 20%. The tolerance of the series combination is nearly [2009]
a. 10% b. 20% c. 15% d. 17%
- The energy (E), angular momentum (L) and universal gravitational constant (G) are chosen as fundamental quantities. The dimensions of universal gravitational constant in the dimensional formula of Planck's constant (h) is [2008]
a. zero
b. -1
c. $5/3$
d. 1
- In the relation $p = \frac{\alpha}{\beta} e^{-\frac{az}{k\theta}}$, where p is the pressure, z the distance, k is Boltzmann constant and θ is the temperature, the dimensional formula of β will be
a. $[\text{M}^0\text{L}^2\text{T}^0]$ b. $[\text{ML}^2\text{T}]$ [2007]
c. $[\text{ML}^0\text{T}^{-1}]$ d. $[\text{ML}^2\text{T}^{-1}]$
- A physical quantity is given by $X = [\text{M}^a\text{L}^b\text{T}^c]$. The percentage error in measurement of M, L and T are α, β and γ , respectively. Then, the maximum % error in the quantity X is [2006]
a. $\alpha\alpha + b\beta + c\gamma$
b. $\alpha\alpha + b\beta - c\gamma$
c. $\frac{a}{\alpha} + \frac{b}{\beta} + \frac{c}{\gamma}$
d. None of the above
- Which one of the following is not a unit of Young's modulus? [2006]
a. Nm^{-1}
b. Nm^{-2}
c. dyne cm^{-2}
d. mega pascal

Answer with Solutions

Practice Exercise

- (d) leap year, year and shake are units of time and light year is the unit of distance.
- (d) $n_1 u_1 = n_2 u_2$
 $\therefore n_2 = \frac{n_1 u_1}{u_2} \Rightarrow \frac{50 \text{ ft}}{\text{mm}} = \frac{50 \times 12 \times 2.54 \text{ cm}}{0.1 \text{ cm}} = 15240 \text{ mm}$
 $\therefore 50 \text{ ft} = 15240 \text{ mm}$
- (b) An optical instrument gives most precise measurement.
- (a) $\therefore 10^{-15} \text{ m} = 1 \text{ fm}$
 $\therefore 1 \text{ m} = 10^{15} \text{ fm}$
 $\therefore 5 \times 10^{-11} \text{ m} = 5 \times 10^{-11} \times 10^{15} \text{ fm} = 5 \times 10^4 \text{ fm}$
- (c) $\therefore n_1 u_1 = n_2 u_2$
or $6080 \text{ ft} = n_2 \text{ km}$

$$\text{or } 6080 \times 12 \times 2.54 \text{ cm} = n_2 \times 10^3 \times 100 \text{ cm}$$

$$\therefore n_2 = \frac{6080 \times 12 \times 2.54}{10^5} = 185 \text{ km}$$

- (a) $n_1 u_1 = n_2 u_2$
 $\therefore n_2 = \frac{n_1 u_1}{u_2} = \frac{10 \text{ m}^2}{\text{ft}^2} = \frac{10 \times (100 \text{ cm})^2}{(12 \times 2.54 \text{ cm})^2} = 107.6 \text{ ft}^2$
- (a) Volume = $\frac{\text{mass}}{\text{density}} = \frac{9.27 \times 10^{-26} \times 10^{-3} \text{ g}}{7.87 \text{ g/cm}^3} = 118 \times 10^{-29} \text{ m}^3$
- (b) Volume = $\frac{4}{3} \pi r^3 = 118 \times 10^{-29}$
 $\Rightarrow r = 1.409 \times 10^{-10}$

So, distance between centre of adjacent atoms is $0.282 \times 10^{-9} \text{ m}$.

9. (a) $n_1 u_1 = n_2 u_2$

$$\therefore n_2 = \frac{n_1 u_1}{u_2} = \frac{1.84 \text{ (inch)}^3}{\text{m}^3} = \frac{1.84 (2.54)^3 \text{ cm}^3}{(100 \text{ cm})^3}$$

$$= 30.2 \times 10^{-6} \text{ m}^3$$

10. (a) 1 crane = 170.474 litre

SI unit of volume is m^3 .

Using, 1 litre = 10^{-3} m^3

or 1 litre = 10^{-3} m^3

$$170.474 \text{ litre} = 170.474 \times 10^{-3} \text{ m}^3 = 0.170474 \text{ m}^3$$

11. (a) Distance = 4.29 light year.

$$= 4.29 \times 9.46 \times 10^{15} \text{ m}$$

$$[\because 1 \text{ light year} = 9.46 \times 10^{15} \text{ m}]$$

$$= \frac{4.29 \times 9.46 \times 10^{15}}{3.08 \times 10^{16}} \text{ parsec}$$

$$[\because 1 \text{ parsec} = 3.08 \times 10^{16} \text{ m}]$$

$$= 132 \text{ parsec}$$

12. (a) $n_1 u_1 = n_2 u_2$

$$\therefore n_2 = \frac{n_1 u_1}{u_2} = \frac{1450 \text{ mile}}{\text{m/s hour}} = \frac{1450 \text{ s mile}}{\text{m hour}}$$

$$= \frac{1450 \text{ s} \times 1.6 \text{ km}}{10^{-3} \text{ km } 60 \times 60 \text{ s}} = 644.4 \text{ m/s}$$

13. (b)

14. (a) $n_1 u_1 = n_2 u_2$

or $\frac{10 \text{ mile}}{\text{hour second}} = n_2 \frac{\text{ft}}{\text{s}^2}$

or $\frac{10 \times 1760 \times 3 \text{ ft}}{60 \times 60 \text{ s}^2} = n_2 \frac{\text{ft}}{\text{s}^2}$

$$\therefore n_2 = 1467 \text{ ft/s}^2$$

15. (b) $t = \frac{s}{v} = \frac{1}{3 \times 10^8} = \frac{1}{3} \times 10^{-8} \text{ s}$

$$= \frac{1}{3} \times \frac{10^{-8}}{10^{-9}} \text{ ns} = \frac{10}{3} \text{ ns}$$

16. (a) $\therefore n_1 u_1 = n_2 u_2$

$$1 \times \text{shake} = n_2 \text{ s}$$

or $10^{-8} \text{ s} = n_2 \text{ s}$

$$\therefore n_2 = 10 \text{ ns}$$

17. (a) $n = \frac{t}{8 \times 10^{-1} \text{ s}} = \frac{1 \text{ minute}}{8 \times 10^{-1} \text{ s}} = \frac{60 \text{ s}}{8 \times 10^{-1} \text{ s}} = \frac{600}{8} = 75$

18. (c) $n_1 u_1 = n_2 u_2$

or $5 \times 10^{17} \text{ s} = n_2 \text{ year}$

$$\therefore n_2 = \frac{5 \times 10^{17} \text{ s}}{\text{year}} = \frac{5 \times 10^{17} \text{ s}}{365 \times 24 \times 60 \times 60 \text{ s}} = 158 \times 10^8 \text{ year}$$

19. (b) The length of day after 20 century is 24 hour and 0.21 s

$$\therefore \text{The change in time, } \Delta t = \frac{0.21 \times 365 \times 100 \text{ hour}}{60 \times 60}$$

$$= 2.1 \text{ hour}$$

20. (d) $\therefore 18 \text{ g of H}_2\text{O} = 6.022 \times 10^{23} \text{ molecules}$

$$\therefore 1 \text{ g of H}_2\text{O} = \frac{6.022 \times 10^{23}}{18}$$

$$\therefore 90 \text{ g of H}_2\text{O} = \frac{6.022 \times 10^{23}}{18} \times 90$$

$$= 30.110 \times 10^{23} \text{ molecules}$$

21. (b) $n = \frac{m}{M} = \frac{5.98 \times 10^{24}}{40 \times 166 \times 10^{-27}} = 9 \times 10^{49}$

22. (a) The mass of electron = $\frac{9.1 \times 10^{-31}}{1.67 \times 10^{-27}} \text{ (amu)}$

$$\therefore E = \frac{9.1 \times 10^{-31}}{1.67 \times 10^{-27}} \times 931 \text{ MeV} = 0.5073 \text{ MeV}$$

23. (a) The mass of one atom of oxygen,

$$m = 16 \text{ amu} = 16 \times 166 \times 10^{-27} \text{ kg} = 26.56 \times 10^{-27} \text{ kg}$$

24. (a) 25. (a)

26. (a) $\therefore 4.2 \text{ J} = 1 \text{ cal}$

$$\therefore 1 \text{ J} = \frac{1}{4.2} \text{ cal} \therefore 1055 \text{ J} = \frac{1}{4.2} \times 1055 \text{ cal} = 251.2 \text{ cal}$$

27. (d) Time interval = 100 years

$$= 100 \times 365 \times 24 \times 60 \times 60 \text{ s}$$

$$= 3.155 \times 10^9 \text{ s}$$

Difference in time = 0.2 s

$$\therefore \text{Fractional error} = \frac{\text{Difference in time (s)}}{\text{Time interval (s)}}$$

$$= \frac{0.2}{3.155 \times 10^9} = 6.34 \times 10^{-12} = 10 \times 10^{-12} \approx 10^{-11}$$

28. (a) Average radius of sodium atom,

$$r = 2.5 \text{ \AA} = 2.5 \times 10^{-10} \text{ m}$$

$$\therefore \text{Volume of sodium atom} = \frac{4}{3} \pi r^3$$

$$= \frac{4}{3} \times 3.14 \times (2.5 \times 10^{-10})^3 = 65.42 \times 10^{-30} \text{ m}^3$$

Mass of a mole of sodium = 23 g = $23 \times 10^{-3} \text{ kg}$

One mole contains 6.023×10^{23} atoms, hence the mass of sodium atom,

$$M = \frac{23 \times 10^{-3}}{6.023 \times 10^{23}} \text{ kg} = 3.82 \times 10^{-26} \text{ kg}$$

$\therefore$ Average mass density of sodium atom

$$\rho = \frac{M}{V} = \frac{3.82 \times 10^{-26}}{65.42 \times 10^{-30}} \text{ kg m}^{-3} = 0.64 \times 10^3 \text{ kg m}^{-3}$$

29. (b) $\therefore 1 \text{ eV} = 1.6 \times 10^{-19} \text{ J}$

$$\therefore 13.6 \text{ eV} = 13.6 \times 1.6 \times 10^{-19} \text{ J} = 21.76 \times 10^{-19} \text{ J}$$

30. (b) 1 atm = $1.013 \times 10^5 \text{ N/m}^2$

$$\therefore 133.3 \text{ N/m}^2 = 1 \text{ mm of Hg}$$

$$\therefore 1 \text{ N/m}^2 = \frac{1}{133.3} \text{ mm of Hg} = 1.013 \times 10^5 \text{ N/m}^2$$

$$= \frac{1}{133.3} \times 1.013 \times 10^5 \text{ mm of Hg} = 760 \text{ mm of Hg}$$

$$31. (b) 1 \text{ bar} = 10^5 \text{ N/m}^2 \\ = 1.013 \times 10^5 \text{ N/m}^2 = \frac{1.013 \times 10^5}{10^5} \text{ bar} = 1.013 \text{ bar}$$

$$32. (b) 1 \frac{\text{rev}}{\text{min}} = \frac{1 \times 2\pi \text{ rad}}{60 \text{ s}} = \frac{\pi}{30} \text{ rad/s} = 0.1047 \text{ rad/s}$$

$$33. (a) \quad 34. (b) \quad 35. (a) \quad 36. (c) \quad 37. (a) \quad 38. (a)$$

$$39. (b) F = m^a v^b r^c \\ [\text{MLT}^{-2}] = [\text{M}^0 \text{T}^0]^a [\text{M}^0 \text{LT}^{-1}]^b [\text{M}^0 \text{LT}^0]^c \\ [\text{MLT}^{-2}] = [\text{M}^a \text{L}^{b+c} \text{T}^{-b}] \\ \Rightarrow \quad a = 1, b + c = 1 \text{ and } b = 2 \\ 2 + c = 1 \text{ and } c = -1 \\ F = mv^2 r^{-1} \Rightarrow F = \frac{mv^2}{r}$$

$$40. (c) \because F = \mu N \quad \therefore \mu = \frac{F}{N} \\ \therefore [\mu] = \left[\frac{F}{N} \right] = \frac{[\text{MLT}^{-2}]}{[\text{MLT}^{-2}]} = \text{dimensionless}$$

$$41. (a) \text{ Young's modulus of elasticity, } Y = \frac{\text{stress}}{\text{strain}} \\ \therefore [Y] = \left[\frac{F}{A \Delta l} \right] = \left[\frac{Fl}{A \Delta l} \right] = \frac{[\text{MLT}^{-2} \text{L}]}{[\text{L}^2 \text{L}]} = [\text{ML}^{-1} \text{T}^{-2}]$$

$$42. (b) T = \frac{F}{l} = \frac{[\text{MLT}^{-2}]}{[\text{M}^0 \text{LT}^0]} = [\text{ML}^0 \text{T}^{-2}]$$

$$43. (b) \Delta H = c \Delta \theta \\ \therefore c = \frac{\Delta H}{\Delta \theta} = \frac{[\text{ML}^2 \text{T}^{-2}]}{[\theta]} = [\text{ML}^2 \text{T}^{-2} \theta^{-1}]$$

$$44. (b) \Delta H = mL \quad \therefore [L] = \frac{\Delta H}{m} = \frac{[\text{ML}^2 \text{T}^{-2}]}{[\text{M}]} = [\text{L}^2 \text{T}^{-2}]$$

$$45. (c) \text{ Unit} = \frac{\text{energy}}{\text{cm}^2 \text{ minute}} = \frac{[\text{ML}^2 \text{T}^{-2}]}{[\text{L}^2 \text{T}]} \\ \therefore \text{The dimensions of solar constant} = [\text{MT}^{-3}]$$

$$46. (a) \text{ Unit of } \epsilon = \frac{\text{C}^2}{\text{Nm}^2} \\ \text{Dimensions of } \epsilon = \frac{[(\text{AT})^2]}{[\text{MLT}^{-2} \text{L}^2]} = [\text{A}^2 \text{M}^{-1} \text{L}^{-3} \text{T}^4]$$

$$47. (c) \epsilon = \epsilon_0 \epsilon_r \Rightarrow \epsilon_r = \frac{\epsilon}{\epsilon_0} \\ \text{Relative permittivity is the ratio of } \epsilon \text{ and } \epsilon_0, \text{ hence it is dimensionless.} \\ \text{i.e.} \quad [\text{M}^0 \text{L}^0 \text{T}^0]$$

$$48. (a)$$

$$49. (c) \text{ Electric flux is } \phi = \mathbf{E} \cdot \mathbf{S} = ES \cos \theta \\ \therefore [\phi] = \frac{\text{N}}{\text{C}} \text{m}^2 = \frac{\text{MLT}^{-2} \times \text{L}^2}{\text{AT}} = [\text{A}^{-1} \text{ML}^3 \text{T}^{-3}]$$

$$50. (c) D = \epsilon E \\ \text{Unit of } D = \frac{\text{C}^2}{\text{Nm}^2} \frac{\text{N}}{\text{C}} \quad \therefore [D] = \left(\frac{\text{C}}{\text{m}^2} \right) = \frac{\text{AT}}{\text{L}^2} = [\text{AL}^{-2} \text{T}]$$

$$51. (a) U = \frac{q^2}{2C}$$

$$\therefore C = \frac{q^2}{2U} \quad \therefore [C] = \frac{[\text{AT}]^2}{[\text{ML}^2 \text{T}^{-2}]} = [\text{A}^2 \text{M}^{-1} \text{L}^{-2} \text{T}^4]$$

$$52. (d) W = \epsilon \Delta q \\ \Rightarrow \epsilon = \frac{W}{q} = \frac{[\text{ML}^2 \text{T}^{-2}]}{[\text{M}^0 \text{L}^0 \text{AT}]} \Rightarrow [\epsilon] = [\text{ML}^2 \text{A}^{-1} \text{T}^{-3}]$$

$$53. (a) \because v_d = \frac{J}{ne} \\ [e] = \left[\frac{J}{nv_d} \right] = \frac{[\text{AL}^{-2}]}{\left[\frac{1}{\text{L}^3} \right] [\text{LT}^{-1}]} = [\text{AT}] = \text{amp-second} = \text{coulomb}$$

$$54. (d) \text{ Dimensions of current element are [ampere-metre]} \\ = [\text{AL}]$$

$$55. (c) \because \mathbf{F} = q\mathbf{v} \times \mathbf{B} \text{ or } F = qvB \sin \theta \\ \therefore [B] = \left[\frac{F}{qv} \right] = \frac{[\text{MLT}^{-2}]}{[\text{ATLT}^{-1}]} = [\text{A}^{-1} \text{MT}^{-2}]$$

$$56. (a) \text{ The unit of } \frac{E}{B} = \frac{\text{N/C}}{\text{N/Am}} = \frac{\text{N Am}}{\text{C N}} = \frac{\text{Am}}{\text{C}} = \frac{\text{Am}}{\text{As}} = \frac{\text{m}}{\text{s}} \\ \therefore \frac{E}{B} = \left[\frac{\text{m}}{\text{s}} \right] = \left[\frac{\text{L}}{\text{T}} \right] = [\text{LT}^{-1}]$$

$$57. (c) \text{ As we know the speed of light, } c = \frac{1}{\sqrt{\mu_0 \epsilon_0}} \\ \text{or } c^2 = \frac{1}{\mu_0 \epsilon_0} \quad \therefore \mu_0 \epsilon_0 = \frac{1}{c^2} = \frac{1}{[\text{LT}^{-1}]^2} = [\text{L}^{-2} \text{T}^2]$$

$$58. (a)$$

$$59. (b) \because \frac{L}{R} = \text{time constant} \\ \therefore \frac{[L]}{[R]} = [\text{T}] \Rightarrow \frac{[R]}{[L]} = [\text{T}^{-1}]$$

$$60. (d) E = \frac{1}{2} L^a I^b \\ [E] = [\text{ML}^2 \text{T}^{-2}], [L] = [\text{ML}^2 \text{T}^{-2} \text{A}^{-2}], [I] = [\text{M}^0 \text{L}^0 \text{T}^0 \text{A}]$$

Using principle of Homogeneity,

$$[\text{ML}^2 \text{T}^{-2}] = [\text{ML}^2 \text{T}^{-2} \text{A}^{-2}]^a [\text{M}^0 \text{L}^0 \text{T}^0 \text{A}]^b$$

$$[\text{MLT}^{-2}] = [\text{M}^a \text{L}^{2a} \text{T}^{-2a} \text{A}^{-2a+b}]$$

$$\Rightarrow a = 1 \text{ and } -2a + b = 0 \Rightarrow b = 2$$

$$61. (b) \text{ Exponent has no dimensions.}$$

$$\therefore [e^{-t/\lambda}] = [\text{M}^0 \text{L}^0 \text{T}^0]$$

$$\text{or } \left[-\frac{t}{\lambda} \right] = [\text{M}^0 \text{L}^0 \text{T}^0] \text{ or } [t] = [\lambda] \quad \therefore [\lambda] = [\text{T}]$$

Hence, (b) is correct

$$62. (b) u = \frac{B^2}{2\mu}$$

$$\text{Unit of } u = \frac{(\text{N/Am})^2}{\text{N/A}^2} = \frac{\text{N}^2 \text{A}^2}{\text{NA}^2 \text{m}^2} = \frac{\text{N}}{\text{m}^2} = \frac{\text{Nm}}{\text{m}^3} = \frac{\text{J}}{\text{m}^3} \\ = \text{energy per unit volume} = \text{energy density}$$

$$63. (a) E = h^a \nu^b \quad \dots(i) \\ \text{where, } h = \text{Planck's constant and } \nu = \text{frequency.}$$

$$[E] = [ML^2T^{-2}], [v] = [M^0L^0T^{-1}] \text{ and } [h] = [ML^2T^{-1}]$$

$$\text{From Eq. (i), } [ML^2T^{-2}] = [ML^2T^{-1}]^a [M^0L^0T^{-1}]^b$$

$$[ML^2T^{-2}] = [M^aL^{2a}T^{-a-b}]$$

$$\Rightarrow a = 1 \text{ and } -a - b = -2 \Rightarrow a + b = 2 \Rightarrow b = 1$$

$$\Rightarrow E = hv$$

$$64. (c) \quad 65. (b) \quad 66. (b) \quad 67. (a) \quad 68. (a) \quad 69. (a)$$

$$70. (a) \text{ Unit} = \frac{W}{m^2} = \frac{J}{sm^2}$$

$$\therefore [\text{Intensity of wave}] = \frac{[ML^2T^{-2}]}{[TL^2]} = [MT^{-3}]$$

$$71. (c) x = \frac{a \sin \theta + b \cos \theta}{a + b}$$

$$\therefore [x] = \left[\frac{a \sin \theta}{a + b} \right] = \left[\frac{b \cos \theta}{a + b} \right] \text{ or } [x] = \text{dimensionless}$$

$$72. (a) [LHS] = [RHS]$$

$$\text{or } \left[\frac{dv}{\sqrt{2av - v^2}} \right] = \left[a^n \sin^{-1} \left(\frac{x}{a} - 1 \right) \right] \text{ or } \frac{[dv]}{[\sqrt{v^2}]} = [a^n]$$

$$\text{or } \frac{[dv]}{[v]} = [a^n] \text{ or } [M^0L^0T^0] = [a^n] \therefore n = 0$$

$$73. (b) \quad x = a^n \quad \therefore \frac{\Delta x}{x} = \pm n \frac{\Delta a}{a}$$

$$74. (d)$$

BITSAT Archives

$$1. (a) [MLT^{-2}] = [L^{2a}] \times [L^{bT^{-b}}] [M^c L^{-3c}] = [M^c L^{2a+b-3c} T^{-b}]$$

Comparing powers of M, L and T, on both sides, we get

$$c = 1, 2a + b - 3c = 1, -b = -2 \text{ or } b = 2$$

$$\text{Also, } 2a + 2 - 3(1) = 1 \Rightarrow 2a = 2 \text{ or } a = 1$$

$$\therefore \text{ This is } 1, 2, 1$$

$$2. (a) \text{ Volume of cuboid} = l \times b \times h = 1.8 \times 1.5 \times 1.2 \text{ cm}^3 \\ = 2.70 \times 1.2 = 3.240 \text{ cm}^3$$

Using concept of significant figures, product is reported in number of significant figures present in measurement which has least number of significant figures, here all measurement have 2 significant figures.

$$\text{So, volume} = 3.2 \text{ cm}^3$$

(Keeping 2 significant figures only)

$$3. (b) \text{ Dimension of } at = \text{Dimension of } F$$

$$[at] = [F] \Rightarrow [a] = \left[\frac{F}{t} \right]$$

$$[b] = \left[\frac{MLT^{-2}}{T} \right] \Rightarrow [a] = [MLT^{-3}]$$

$$\text{Dimension of } bt^2 = \text{Dimension of } F$$

$$[bt^2] = [F] \Rightarrow [b] = \left[\frac{F}{t^2} \right]$$

$$[b] = \left[\frac{MLT^{-2}}{T^2} \right] \Rightarrow [b] = [MLT^{-4}]$$

$$4. (a) \text{ EMF induced in an electrical circuit}$$

$$e = L \frac{dl}{dt} \quad (\text{numerically})$$

$$\text{or } L = e \frac{dt}{dl} = \frac{W}{Q} \cdot \frac{dt}{dl} \quad \left(\because e = V = \frac{W}{Q} \right)$$

$$= \frac{Wdt}{lt \cdot dl} = \frac{[ML^2T^{-2}][T]}{[A][T][A]} = [ML^2T^{-2}A^{-2}]$$

$$5. (a) \text{ Volume, } V = l^3 = (1.2 \times 10^{-2} \text{ m})^3 = 1.728 \times 10^{-6} \text{ m}^3$$

Since length (l) has two significant figure, the volume (V) will also have two significant figure.

Therefore, the correct answer is $V = 1.7 \times 10^{-6} \text{ m}^3$

$$6. (c) hc = E\lambda = [ML^2T^{-2}] [L] = [ML^3T^{-2}]$$

$$7. (d) r_1 = 10 \text{ k}\Omega, \Delta r_1 = \frac{10}{100} \times 10 = 1 \text{ k}\Omega$$

$$r_2 = 20 \text{ k}\Omega, \Delta r_2 = \frac{20}{100} \times 20 = 4 \text{ k}\Omega$$

$$\text{Maximum tolerance} = \Delta r_1 + \Delta r_2 = 1 + 4 = 5$$

$$r_1 + r_2 = 10 + 20 = 30 \text{ k}\Omega$$

$$\% \text{ age of tolerance} = \frac{5}{30} \times 100 = 16.67\% = 17\%$$

$$8. (a) h \propto G^x L^y E^z$$

Write the dimensions on both sides

$$[ML^2T^{-1}] \propto [M^{-1}L^3T^{-2}]^x [ML^2T^{-1}]^y [ML^2T^{-2}]^z$$

$$[ML^2T^{-1}] = k [M^{-1}L^3T^{-2}]^x [ML^2T^{-1}]^y [ML^2T^{-2}]^z$$

Comparing the powers, we get

$$1 = -x + y + z \quad \dots(i)$$

$$2 = 3x + 2y + 2z \quad \dots(ii)$$

$$-1 = -2x - y - 2z \quad \dots(iii)$$

On solving Eqs. (i), (ii) and (iii), we get

$$x = 0$$

$$9. (a) \text{ In given equation, } \frac{\alpha z}{k\theta} \text{ should be dimensionless.}$$

$$\therefore \alpha = \frac{k\theta}{z}$$

$$\Rightarrow [a] = \frac{[ML^2T^{-2}K^{-1} \times K]}{[L]} = [MLT^{-2}]$$

$$\text{and } p = \frac{\alpha}{\beta} \Rightarrow [p] = \left[\frac{\alpha}{\beta} \right] = \left[\frac{MLT^{-2}}{ML^{-1}T^{-2}} \right] = [M^0L^2T^0]$$

$$10. (a) X = [M^a L^b T^c]$$

$$\text{Maximum percentage error} = a\alpha + b\beta + c\gamma$$

$$11. (a) Y = \frac{\text{stress}}{\text{strain}} = \text{N/m}^2 \text{ or pascal} \quad [\text{in SI system}]$$

$$\text{and } y = \frac{\text{dyne}}{\text{cm}^2} \quad [\text{in CGS system}]$$

Thus, Nm^{-1} is not the unit of Young's modulus.

2

Scalar and Vectors

Physical Quantity

Physical quantity is that which can be measured by available apparatus.

Scalar and Vector Quantities

A **scalar quantity** is one whose specification is completed with its magnitude only. Two or more than two similar scalar quantities can be added according to the ordinary rules of algebra. e.g., mass, distance, speed, energy etc.

A **vector quantity** is a quantity that has magnitude as well as direction. Not all physical quantities have a direction. Temperature, energy, mass, and time, for example, do not “point” in the spatial sense. We call such quantities scalars, and we deal with them by the rules of ordinary algebra.

Vector quantities can be added according to the **law of parallelogram or triangle law**.

A vector quantity can be represented by an arrow. The front end (arrow head) represents the direction and length of the arrow gives its magnitude.

NOTE ***Orthogonal vectors** If two or more vectors are perpendicular to each other, then they are known as orthogonal vectors.*

***Unit vector** A vector of unit magnitude and whose direction is same as the given vector is called unit vector. Basically, unit vector represents the direction of the given vector.*

*Consider a vector **A**. This vector is represented as*

Vector = (Magnitude of the vector) $\times$ (Direction of the vector)

i.e.

$$A = |A| \hat{A}$$

So,

$$\hat{A} = \frac{A}{|A|}$$

*where, $\hat{A}$ is a **unit vector** drawn in the direction of **A**.*

Unit vector is a dimensionless physical quantity. Unit vectors along X, Y and Z-axes are $\hat{i}$, $\hat{j}$ and $\hat{k}$ respectively.

Laws of Vector Addition

There are three laws for the addition of vectors

- Triangle law of vector addition
- Parallelogram law of vector addition
- Polygon law of vector addition

Triangle Law of Vector Addition

If two vectors are represented both in magnitude and direction by the two sides of a triangle taken in the same order, then the resultant of these vectors is represented both in magnitude and direction by the third side of the triangle taken in reverse order as shown below.

i.e. $\mathbf{R} = \mathbf{A} + \mathbf{B} = \mathbf{B} + \mathbf{A}$

The resultant $\mathbf{R}$ can be calculated as

$$R = \sqrt{A^2 + B^2 + 2AB\cos\theta}$$

If θ is the angle between $\mathbf{A}$ and $\mathbf{B}$, then

$$|\mathbf{A} + \mathbf{B}| = \sqrt{A^2 + B^2 + 2AB\cos\theta}$$

If $\mathbf{R}$ makes an angle α with $\mathbf{A}$, then $\tan\alpha = \frac{B\sin\theta}{A + B\cos\theta}$

Parallelogram Law of Vector Addition

According to parallelogram law of vector addition, if two vectors acting on a particle are represented in magnitude and direction by two adjacent sides of a parallelogram, then the diagonal of the parallelogram represents the magnitude and direction of the resultant of the two vectors acting on the particle.

i.e. $\mathbf{OA} + \mathbf{AC} = \mathbf{OC}$; $\mathbf{A} + \mathbf{B} = \mathbf{R}$

Magnitude of the resultant $\mathbf{R}$ is given by

$$R = \sqrt{A^2 + B^2 + 2AB\cos\theta}$$

Here, θ = Angle between $\mathbf{A}$ and $\mathbf{B}$. So, the direction of $\mathbf{R}$ can be found by angle α or β of $\mathbf{R}$ with $\mathbf{A}$ and $\mathbf{B}$.

Here, $\tan\alpha = \frac{B\sin\theta}{A + B\cos\theta}$

$$\Rightarrow \tan\beta = \frac{A\sin\theta}{B + A\cos\theta}$$

Polygon Law of Vector Addition

If a number of non-zero vectors are represented by the $(n - 1)$ sides of an n sided polygon taken in same order then the resultant is given by the closing side or the n th side of the polygon taken in opposite order. So,

$$\mathbf{R} = \mathbf{A} + \mathbf{B} + \mathbf{C} + \mathbf{D} + \mathbf{E}$$

Subtraction of Vectors

Negative of a vector $(-\mathbf{v})$ is a vector of the same magnitude as vector $\mathbf{v}$ but pointing in a direction opposite to that of $\mathbf{v}$.

Therefore,

$$\mathbf{u} - \mathbf{v} = \mathbf{u} + (-\mathbf{v})$$

NOTE If the vectors form a closed n sided polygon with all the sides in the same order, then the resultant is 0.

Vector in three dimension

If $\mathbf{r} = x\hat{i} + y\hat{j} + z\hat{k}$

$$(a) |\mathbf{r}| = \sqrt{x^2 + y^2 + z^2}$$

(b) Let $\mathbf{r}$ makes α, β and γ angles with x -axis, y -axis and z -axis respectively, then

$$\cos\alpha = \frac{x}{\sqrt{x^2 + y^2 + z^2}}, \cos\beta = \frac{y}{\sqrt{x^2 + y^2 + z^2}}$$

$$\text{and } \cos\gamma = \frac{z}{\sqrt{x^2 + y^2 + z^2}}$$

$$(c) \cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$$

$\therefore$ Lami's theorem

$$\frac{a}{\sin\alpha} = \frac{b}{\sin\beta} = \frac{c}{\sin\gamma}$$

The Scalar Product or Dot Product

The scalar product of two vectors **a** and **b** in Fig. (a) is written as **a** · **b** and is defined to be

$$\mathbf{a} \cdot \mathbf{b} = ab \cos \phi \quad \dots(i)$$

where, ϕ is the angle between the vectors **a** and **b**.

Because of the notation, **a** · **b** is also known as the **dot product** and is spelled as “a dot b.”

- (i) Dot product of the vectors with itself is equal to the square of the magnitude of the vector.

$$\mathbf{a} \cdot \mathbf{a} = \mathbf{a} \cdot \mathbf{a} \cos 0^\circ \Rightarrow \mathbf{a} \cdot \mathbf{a} = a^2 \quad (\cos 0^\circ = 1)$$

If $\theta = 180^\circ$, i.e. vectors are anti-parallel.

$$\begin{aligned} \text{Then, } \mathbf{a} \cdot \mathbf{b} &= ab(-1) \quad [\because \cos 180^\circ = -1] \\ \mathbf{a} \cdot \mathbf{b} &= -ab \end{aligned}$$

i.e. If two vectors are anti-parallel then their dot product equals the negative product of the magnitudes of vectors.

If $\theta = 90^\circ$, i.e. vectors are perpendicular.

$$\mathbf{a} \cdot \mathbf{b} = ab \cos 90^\circ = ab(0) = 0$$

Vectors are perpendicular $\Leftrightarrow$ Dot product = 0

- (ii) If $\mathbf{a} = a_x \hat{i} + a_y \hat{j} + a_z \hat{k}$ and $\mathbf{b} = b_x \hat{i} + b_y \hat{j} + b_z \hat{k}$ and θ

is the angle between **a** and **b**, then $\cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{ab}$ where,

$$\mathbf{a} \cdot \mathbf{b} = ab \cos \theta$$

The component of **a** parallel to **b** in the vector form is

$$\mathbf{c} = \frac{(\mathbf{a} \cdot \mathbf{b}) \mathbf{b}}{|\mathbf{b}|^2}$$

The component of **a** perpendicular to **b** in vector form is

$$\mathbf{d} = \mathbf{a} - \left(\frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{b}|^2} \right) \mathbf{b}$$

If angle between **A** and **B** is θ , then

- (a) Angle between **-A** and **B** is $(180^\circ - \theta)$
 (b) Angle between **A** and **-B** is $(180^\circ - \theta)$
 (c) Angle between **-A** and **-B** is θ

Important Points

- The dot product of force **F** and displacement **s** gives work (scalar quantity), i.e. $\mathbf{F} \cdot \mathbf{s} = W$.
- The dot product of force (**F**) and velocity (**v**) is equal to power (scalar quantity), i.e. $\mathbf{F} \cdot \mathbf{v} = P$.
- The dot product of magnetic induction (**B**) and area vector (**A**) is equal to the magnetic flux (ϕ) linked with the surface (scalar quantity) $\mathbf{B} \cdot \mathbf{A} = \phi_B$

The Vector Product or Cross Product

The vector product of **a** and **b**, written as **a** × **b**, produces a third vector **c** whose magnitude is $c = ab \sin \phi$

where, ϕ is the smaller of the two angles between **a** and **b**.

Because of the notation, **a** × **b** is also known as the **cross product**, and it is spelled as “a cross b”.

- (i) If two vectors are perpendicular to each other, we have $\theta = 90^\circ$ and therefore, $\sin \theta = 1$. So that, $\mathbf{a} \times \mathbf{b} = ab \hat{n}$.

- (ii) The vectors **a**, **b** and **a** × **b** thus form a right handed system of mutually perpendicular vectors. It follows at once from the above that in case of the orthogonal triad of unit vectors $\hat{i}$, $\hat{j}$ and $\hat{k}$ (each perpendicular to each other).

$$\hat{i} \times \hat{j} = -\hat{j} \times \hat{i} = \hat{k}$$

$$\hat{j} \times \hat{k} = -\hat{k} \times \hat{j} = \hat{i}$$

and

$$\hat{k} \times \hat{i} = -\hat{i} \times \hat{k} = \hat{j}$$

Cross Product of Two Vectors in Determinant Form

For two vectors **a** and **b**, their cross product is given by

$$\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_x & a_y & a_z \\ b_x & b_y & b_z \end{vmatrix},$$

where,

$$\mathbf{a} = a_x \hat{i} + a_y \hat{j} + a_z \hat{k}$$

and

$$\mathbf{b} = b_x \hat{i} + b_y \hat{j} + b_z \hat{k}.$$

Practice Exercise

1. An insect moves on a circular path of radius 7 m. Find the maximum magnitude of displacement of the insect.

a. 7 m b. 14π m c. 7π m d. 14 m

2. In previous problem, if the insect moves with constant speed 10 m/s. Find the minimum time to achieve maximum magnitude of displacement.

a. 10 s b. 2 s c. 1.4 s d. 2.2 s

3. Two forces of magnitudes 3 N and 4 N are acted on a body. The ratio of magnitude of minimum and maximum resultant force on the body, is

a. $\frac{3}{4}$ b. $\frac{4}{3}$
c. $\frac{1}{7}$ d. None of these

4. A vector **a** makes 30° and **b** makes 120° angle with the x-axis. The magnitude of these vectors are 3 unit and 4 unit, respectively. The magnitude of resultant vector is

a. 3 unit b. 4 unit c. 5 unit d. 1 unit

5. If two forces of equal magnitude 4 units acting at a point and the angle between them is 120° , then find the magnitude and direction of the sum of the two vectors

a. 4, $\theta = \tan^{-1}(1.73)$ b. 4, $\theta = \tan^{-1}(0.73)$
c. 2, $\theta = \tan^{-1}(1.73)$ d. 6, $\theta = \tan^{-1}(0.73)$

6. If $\frac{|\mathbf{a} + \mathbf{b}|}{|\mathbf{a} - \mathbf{b}|} = 1$, then the angle between **a** and **b** is

a. 0° b. 45° c. 90° d. 60°

7. The angle between **A** and the resultant of **(A + B)** and **(A - B)** will be

a. 0° b. $\tan^{-1}\left(\frac{A}{B}\right)$
c. $\tan^{-1}\left(\frac{B}{A}\right)$ d. $\tan^{-1}\left(\frac{A - B}{A + B}\right)$

8. Three forces are acted on a body. Their magnitudes are 3 N, 4 N and 5 N. Then,

a. the acceleration of body must be zero
b. the acceleration of body may be zero
c. the acceleration of the body must not be zero
d. None of the above

9. In the given figure, **O** is the centre of regular pentagon **ABCDE**. Five forces each of magnitude F_0 are acted as shown in figure. The resultant force is

a. $5F_0$ b. $5F_0 \cos 72^\circ$
c. $5F_0 \sin 72^\circ$ d. zero

10. **ABCD** is a parallelogram, and **a, b, c** and **d** are the position vector of vertices **A, B, C** and **D** of a parallelogram, choose the correct option.

a. $\mathbf{c} + \mathbf{b} = \mathbf{d} - \mathbf{a}$ b. $\mathbf{c} - \mathbf{b} = \mathbf{d} - \mathbf{a}$
c. $\mathbf{c} - \mathbf{c} = \mathbf{d} - \mathbf{a}$ d. None of these

11. A man walks 4 km due West, 500 m due South finally 750 m in South-West direction. Find the distance and magnitude of displacement travelled by the man.

a. 4646.016 m and 5250 m b. 5250 m and 4646.016 m
c. 4550.016 m and 2300 m d. None of these

12. Calculate the resultant force, when four force of 30 N due East, 20 N due North, 50 N due West and 40 N due South, are acted upon a body.

a. $20\sqrt{2}$ N, 60° , South of West
b. $20\sqrt{2}$ N, 45° , South of West
c. $20\sqrt{2}$ N, 45° , South of East
d. $20\sqrt{2}$ N, 45° , South of East

13. A block of 150 kg is placed on an inclined plane with an angle of 60° . Calculate of the weight parallel to the inclined plane.

a. 1300 N b. 1400 N c. 1100 N d. 750 N

14. A cat is situated at a point **A** (0, 3, 4) and rat is situated at point **B** (5, 0, -8). The cat is free to move but the rat is always at rest. Find the minimum distance travelled by cat to catch the rat.

a. 5 unit b. 12 unit c. 13 unit d. 17 unit

15. An insect fly start from one corner of a cubical room and reaches at diagonally opposite corner. The magnitude or displacement of the insect is $40\sqrt{3}$ ft. Find the volume of cube.

a. $64\sqrt{3}$ ft³ b. 1600 ft³
c. 64000 ft³ d. None of these

16. In above problem, if the insect does not fly but crawls. What is the minimum distance travelled by the insect?

a. 89.44 ft b. 95.44 ft
c. 40 ft d. 80 ft

17. If a particle is moving on an elliptical path given by $\mathbf{r} = b \cos \omega t \hat{i} + a \sin \omega t \hat{j}$, then find its radial acceleration along **r**.

a. $\omega \mathbf{r}$ b. $\omega^2 \mathbf{r}$
c. $-\omega^2 \mathbf{r}$ d. None of these

18. Obtain the magnitude and direction cosines of vector $(\mathbf{A} - \mathbf{B})$, if $\mathbf{A} = 2\hat{i} + 3\hat{j} + \hat{k}$, $\mathbf{B} = 2\hat{i} + 2\hat{j} + 3\hat{k}$
- a. $0, \frac{1}{\sqrt{5}}, \frac{-2}{\sqrt{5}}$ b. $0, \frac{2}{\sqrt{5}}, \frac{1}{\sqrt{5}}$
 c. $0, 0, \frac{1}{\sqrt{5}}$ d. None of these
19. The vertices of a quadrilateral are $A(1, 2, -1)$, $B(-4, 2, -2)$, $C(4, 1, -5)$ and $D(2, -1, 3)$. Forces of magnitude 2, 3, 2 N are acting at point A along the lines AB, AC, AD , respectively. Find their resultant.
- a. $\frac{10\hat{i} - 9\hat{j} + 6\hat{k}}{\sqrt{26}}$ b. $\left(\frac{\hat{i} - 9\hat{j} - 6\hat{k}}{\sqrt{26}} \right)$
 c. $\frac{\hat{i} - 9\hat{j} + 16\hat{k}}{\sqrt{26}}$ d. $\frac{\hat{i} - 19\hat{j} + 6\hat{k}}{\sqrt{26}}$
20. A force $\mathbf{F} = a\hat{i} + b\hat{j} + c\hat{k}$ is acted upon a body of mass m . If the body starts from rest and was at the origin initially, find its new coordinate after time t .
- a. $\frac{at^2}{2m}, \frac{bt^2}{2m}, \frac{ct^2}{2m}$ b. $\frac{at^2}{2m}, \frac{2bt^2}{m}, \frac{ct^2}{2m}$
 c. $\frac{at^2}{m}, \frac{bt^2}{m}, \frac{ct^2}{2m}$ d. None of these
21. The angle between vector $\mathbf{a} = 2\hat{i} + \hat{j} - 2\hat{k}$ and $\mathbf{b} = 3\hat{i} - 4\hat{j}$ is equal to
- a. $\cos^{-1}\left(\frac{3}{15}\right)$ b. $\cos^{-1}\left(\frac{1}{15}\right)$
 c. zero d. $\cos^{-1}\frac{2}{15}$
22. The resultant of two vectors $\mathbf{P}$ and $\mathbf{Q}$ is $\mathbf{R}$. If the vector $\mathbf{Q}$ is reversed, then the resultant becomes $\mathbf{S}$, then choose the correct option.
- a. $R^2 + S^2 = 2(P^2 - Q^2)$ b. $R^2 + S^2 = 2(P^2 + Q^2)$
 c. $R^2 + S^2 = (P^2 - Q^2)$ d. $R^2 - S^2 = 2(P^2 + Q^2)$
23. For what value of x , will the two vectors $\mathbf{A} = 2\hat{i} + 2\hat{j} - x\hat{k}$ and $\mathbf{B} = 2\hat{i} - \hat{j} - 3\hat{k}$ are perpendicular to each other?
- a. $x = -2/3$ b. $x = 3/2$ c. $x = -4/3$ d. $x = 2/3$
24. Calculate the work done by a force $\mathbf{F} = (\hat{i} + 2\hat{j} + 3\hat{k})$ N to displace a body from position A to position B . The position vector of A is $\mathbf{r}_1 = (\hat{i} + 3\hat{j} + \hat{k})$ m and the position vector of B is $\mathbf{r}_2 = (2\hat{i} + 2\hat{j} + 3\hat{k})$ m.
- a. 5 J b. 3 J c. 2 J d. 10 J
25. If $\mathbf{c} = \mathbf{a} \times \mathbf{b}$, then
- a. the direction of $\mathbf{c}$ changes, when the angle between $\mathbf{a} \times \mathbf{b}$ increases up to θ ($\theta < 180^\circ$)
 b. the direction of $\mathbf{c}$ changes, when the angle between $\mathbf{a}$ and $\mathbf{b}$ decreases up to θ ($\theta > 0^\circ$)
 c. the direction of $\mathbf{c}$ does not change, when the angle between $\mathbf{a}$ and $\mathbf{b}$ increases
 d. None of the above
26. The unit vector perpendicular to vectors $\mathbf{a} = 3\hat{i} + \hat{j}$ and $\mathbf{b} = 2\hat{i} - \hat{j} - 5\hat{k}$ is
- a. $\pm \frac{(\hat{i} - 3\hat{j} + \hat{k})}{\sqrt{11}}$ b. $\pm \frac{3\hat{i} + \hat{j}}{\sqrt{11}}$
 c. $\pm \frac{(2\hat{i} - \hat{j} - 5\hat{k})}{\sqrt{30}}$ d. None of these
27. If three vectors along coordinate axes represent the adjacent sides of a cube of length b , then the unit vector along its diagonal passing through the origin will be
- a. $\frac{\hat{i} + \hat{j} + \hat{k}}{\sqrt{2}}$ b. $\frac{\hat{i} + \hat{j} + \hat{k}}{\sqrt{3}b}$ c. $\hat{i} + \hat{j} + \hat{k}$ d. $\frac{\hat{i} + \hat{j} + \hat{k}}{\sqrt{3}}$
28. Choose the correct option $\mathbf{A} \times \mathbf{B} = \mathbf{C}$.
- (i) $\mathbf{C}$ is perpendicular to $\mathbf{A}$
 (ii) $\mathbf{C}$ is perpendicular to $\mathbf{B}$
 (iii) $\mathbf{C}$ is perpendicular to $(\mathbf{A} + \mathbf{B})$
 (iv) $\mathbf{C}$ is perpendicular to $(\mathbf{A} \times \mathbf{B})$
- a. Only (i) and (ii) are correct
 b. Only (ii) and (iv) are correct
 c. (i), (ii) and (iii) are correct
 d. All of the above
29. Find the vector area of a triangle whose vertices are a, b and c .
- a. $\frac{1}{2}(b \times c + c \times a + a \times b)$ b. $\frac{1}{3}(b \times c + c \times a + a \times b)$
 c. $\frac{1}{3}(b \times c + a \times c + b \times a)$ d. None of these
30. If three vectors $xa - 2b + 3c$, $-2a + yb - 4c$ and $-zb + 3c$ are coplanar, where a, b and c are unit (or any) vectors, then
- a. $xy + 3zx - 3z = 4$ b. $2xy - 3zx - 3z - 4 = 0$
 c. $4xy - 3zx - 3z = 4$ d. $xy - 2zx - 3z - 4 = 0$
31. A force $\mathbf{F} = (2\hat{i} + 3\hat{j} - \hat{k})$ N is acting on a body at a position $\mathbf{r} = (6\hat{i} + 3\hat{j} - 2\hat{k})$. Calculate the torque about the origin.
- a. $(3\hat{i} + 2\hat{j} + 12\hat{k})$ Nm b. $(9\hat{i} + 2\hat{j} + 7\hat{k})$ Nm
 c. $(\hat{i} + 2\hat{j} + 12\hat{k})$ Nm d. $(3\hat{i} + 12\hat{j} + \hat{k})$ Nm
32. Find the values of x and y for which vectors $\mathbf{A} = (6\hat{i} + x\hat{j} - 2\hat{k})$ and $\mathbf{B} = (5\hat{i} - 6\hat{j} - y\hat{k})$ are parallel.
- a. $x = 0, y = \frac{2}{3}$ b. $x = -\frac{36}{5}, y = \frac{5}{3}$
 c. $x = -\frac{15}{3}, y = \frac{23}{5}$ d. $x = \frac{36}{5}, y = \frac{15}{4}$
33. Find the area of the parallelogram determined by $\mathbf{A} = 2\hat{i} + \hat{j} - 3\hat{k}$ and $\mathbf{B} = 12\hat{j} - 2\hat{k}$
- a. 42 b. 56
 c. 38 d. 74

34. Choose the correct option.
 a. $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) + \mathbf{b} \times (\mathbf{c} \times \mathbf{a}) + \mathbf{c} \times (\mathbf{a} \times \mathbf{b}) = 0$
 b. $\mathbf{a} \times (\mathbf{c} \times \mathbf{b}) + \mathbf{b} \times (\mathbf{c} \times \mathbf{a}) + \mathbf{c} \times (\mathbf{a} \times \mathbf{b}) = 0$
 c. $\mathbf{a} \times (\mathbf{c} \times \mathbf{b}) + \mathbf{b} \times (\mathbf{c} \times \mathbf{a}) - \mathbf{c} \times (\mathbf{a} \times \mathbf{b}) = 0$
 d. None of the above
35. The three conterminous edges of a parallelepiped are
 $\mathbf{a} = 2\hat{\mathbf{i}} - 6\hat{\mathbf{j}} + 3\hat{\mathbf{k}}, \mathbf{b} = 5\hat{\mathbf{j}}, \mathbf{c} = -2\hat{\mathbf{i}} + \hat{\mathbf{k}}$
 Calculate the volume of parallelepiped.
 a. 36 cubic units b. 45 cubic units
 c. 40 cubic units d. 54 cubic units
36. If the three vectors are coplanar, then find x .
 $\mathbf{A} = \hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}, \mathbf{B} = x\hat{\mathbf{j}} + 3\hat{\mathbf{k}}, \mathbf{C} = 7\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 11\hat{\mathbf{k}}$
 a. 36/21 b. -51/32 c. 51/32 d. -36/21
37. A particle is moving along a circular path with a constant speed 30 m/s. What is change in velocity of a particle, when it describe an angle of 90° at the centre of the circle.
 a. zero b. $30\sqrt{2}$ m/s c. $60\sqrt{2}$ m/s d. $30\sqrt{2}$ m/s
38. One day in still air, a motor-cyclist riding north at 30 m/s, suddenly the wind starts blowing Westward with a velocity 50 m/s, then calculate the apparent velocity with which the motor-cyclist will move.
 a. 58.3 m/s b. 65.4 m/s c. 73.2 m/s d. 53.8 m/s
39. Calculate the distance travelled by the car, if a car travels 4 km towards north at an angle of 45° to the east and then travels a distance of 2 km towards north at an angle of 135° to the east.
 a. 6 km b. 8 km
 c. 5 km d. 2 km
40. On one rainy day a car starts moving with a constant acceleration of 1.2 m/s^2 . If a toy monkey is suspended from the ceiling of the car by a string, then find the angle with the vertical with the string be now inclined.
 a. $\tan^{-1}(0.25)$
 b. $\tan^{-1}(0.63)$
 c. $\tan^{-1}(0.12)$
 d. $\tan^{-1}(\sqrt{3})$

BITSAT Archives

1. If $\mathbf{A}$ and $\mathbf{B}$ denote the sides of a parallelogram and its area is $\frac{1}{2} AB$ (A and B are magnitude of $\mathbf{A}$ and $\mathbf{B}$ respectively), the angle between $\mathbf{A}$ and $\mathbf{B}$ is [2014]
 a. 30° b. 45°
 c. 60° d. 90°
2. A vector $\mathbf{F}_1$ acts along positive x-axis. If its vector product with another $\mathbf{F}_2$ is zero, then $\mathbf{F}_2$ could be [2009]
 a. $4\hat{\mathbf{j}}$ b. $(\hat{\mathbf{k}} + \hat{\mathbf{j}})$
 c. $(\hat{\mathbf{j}} + \hat{\mathbf{k}})$ d. $-4\hat{\mathbf{i}}$
3. The component of vector $\mathbf{A} = a_x \hat{\mathbf{i}} + a_y \hat{\mathbf{j}} + a_z \hat{\mathbf{k}}$ along the direction of $\hat{\mathbf{i}} - \hat{\mathbf{j}}$ is [2008]
 a. $a_x - a_y + a_z$ b. $a_x - a_y$
 c. $(a_x - a_y) / \sqrt{2}$ d. $(a_x + a_y + a_z)$
4. If $\mathbf{A} \cdot \mathbf{B} = \mathbf{A} \times \mathbf{B}$, then angle between $\mathbf{A}$ and $\mathbf{B}$ is [2006]
 a. 45° b. 30° c. 60° d. 90°
5. If $\mathbf{a} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}$ and $\mathbf{b} = 3\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$, then the angle between the vectors $\mathbf{a} + \mathbf{b}$ and $\mathbf{a} - \mathbf{b}$ is [2005]
 a. 60° b. 90° c. 45° d. 55°

Answer with Solutions

Practice Exercise

1. (d) The maximum magnitude of displacement

$$= |\mathbf{AB}| = 2r = 14 \text{ m}$$

2. (d) Time = $\frac{\text{Distance}}{\text{Speed}} = \frac{\pi r}{10} = \frac{22}{7} \times \frac{7}{10} = 2.2 \text{ s}$

3. (c) $F_1 = 3 \text{ N}$ and $F_2 = 4 \text{ N}$

$$F_{\max} = F_1 + F_2 = (3 + 4) = 7 \text{ N}$$

$$F_{\min} = F_2 - F_1 = 4 - 3 = 1 \text{ N}$$

$$\Rightarrow \frac{F_{\min}}{F_{\max}} = \frac{1}{7}$$

4. (c) The figure shown as described in the question.

According to parallelogram law of vectors,

$$R = \sqrt{a^2 + b^2 + 2ab \cos \alpha}$$

$$= \sqrt{3^2 + 4^2 + 2 \times 3 \times 4 \cos 90^\circ} = 5 \text{ units}$$

5. (a) $|\mathbf{R}| = |\mathbf{a} + \mathbf{b}| = \sqrt{4^2 + 4^2 + 2(4)(4) \cos 120^\circ}$

$$|\mathbf{R}| = 4$$

Let θ = angle between $\mathbf{a} + \mathbf{b}$ with x -axis

$$\theta = \tan^{-1} \left(\frac{4 \sin(120^\circ)}{4 + 4 \cos(120^\circ)} \right) = \tan^{-1} \left(\frac{3.464}{2} \right) = \tan^{-1}(1.73)$$

6. (c) $\frac{|\mathbf{a} + \mathbf{b}|}{|\mathbf{a} - \mathbf{b}|} = 1$

or $|\mathbf{a} + \mathbf{b}| = |\mathbf{a} - \mathbf{b}|$

or $\sqrt{a^2 + b^2 + 2ab \cos \alpha} = \sqrt{a^2 + b^2 - 2ab \cos \alpha}$

or $a^2 + b^2 + 2ab \cos \alpha = a^2 + b^2 - 2ab \cos \alpha$

or $4ab \cos \alpha = 0$ or $\cos \alpha = 0$

or $\alpha = 90^\circ$

7. (a) $\mathbf{R} = (\mathbf{A} + \mathbf{B}) + (\mathbf{A} - \mathbf{B})$

$$\mathbf{R} = 2\mathbf{A}$$

The angle between $\mathbf{A}$ and $2\mathbf{A}$ is zero, because they are parallel vectors.

8. (b) The magnitude of three forces 3N, 4N and 5N will be zero, if these vectors from a close polygon will all the sides in the same order as shown in figure.

Hence, option (b) is correct.

9. (d) According to polygon law, resultant force will be zero.

10. (b) As shown in figure, according to condition given in question.

$\mathbf{BC} = \mathbf{c} - \mathbf{b}$

$\mathbf{AD} = \mathbf{d} - \mathbf{a}$

but $\mathbf{BC} = \mathbf{AD}$

$\therefore \mathbf{c} - \mathbf{b} = \mathbf{d} - \mathbf{a}$

11. (b) The given figure shows the direction of motion of man.

Here, distance = 4000 + 750 + 500 = 5250 m

Here, $x = -4000 - 750 \cos 45^\circ = -4530.33$

$y = -500 - 750 \sin 45^\circ = -1030.33$

$$\therefore |\mathbf{s}| = \sqrt{x^2 + y^2}$$

$$= \sqrt{20523889.9 + 1061580.08} = 4646.016 \text{ m}$$

12. (b) Effective force along West (x) = (50 - 30) = 20 N

Effective force along South, (y) = 40 - 20 = 20 N

Resultant = $R = \sqrt{x^2 + y^2} = \sqrt{20^2 + 20^2} = 20\sqrt{2} \text{ N}$

$$\tan \theta = \frac{y}{x} = 1 = \tan 45^\circ \Rightarrow \theta = \frac{\pi}{4} = 45^\circ$$

13. (a) Component parallel to inclined plane, is $150g \sin 60^\circ$.

$$= \frac{1500 \sqrt{3}}{2} = 1299 \approx 1300 \text{ N}$$

14. (c) The minimum distance

= The magnitude of displacement of cat = $|\mathbf{r}_B - \mathbf{r}_A|$

Here, $\mathbf{r}_B = 5\hat{i} - 8\hat{k}$, $\mathbf{r}_A = 3\hat{j} + 4\hat{k}$

$$\therefore \mathbf{s} = \mathbf{r}_B - \mathbf{r}_A = 5\hat{i} - 3\hat{j} - 12\hat{k}$$

$$\therefore |\mathbf{s}| = \sqrt{(5)^2 + (-3)^2 + (-12)^2}$$

$$= \sqrt{25 + 9 + 144}$$

$$= 13.34 \approx 13 \text{ unit}$$

15. (c) Here, $\sqrt{3}a = 40\sqrt{3} \text{ ft}$

$$\therefore a = 40 \text{ ft}$$

$$\therefore \text{Volume} = a^3 = (40 \text{ ft})^3 = 64000 \text{ ft}^3$$

16. (a) Distance = $\sqrt{(40)^2 + (40 + 40)^2}$
- $$= \sqrt{1600 + 6400} = 89.44 \text{ ft}$$

17. (a) $\frac{d\mathbf{r}}{dt} = -b\omega \sin \omega t \hat{i} + a\omega \cos \omega t \hat{j}$

$$\frac{d^2\mathbf{r}}{dt^2} = -b\omega^2 \sin \omega t \hat{i} + a\omega^2 \cos \omega t \hat{j}$$

$$\frac{d^2\mathbf{r}}{dt^2} = -\omega^2 [b \cos \omega t \hat{i} + a \sin \omega t \hat{j}] = -\omega^2 \mathbf{r}$$

18. (a) $(\mathbf{A} - \mathbf{B}) = 2\hat{i} + 3\hat{j} + \hat{k} - 2\hat{i} - 2\hat{j} - 3\hat{k} = \hat{j} - 2\hat{k}$

$$|\mathbf{A} - \mathbf{B}| = \sqrt{1 + 4} = \sqrt{5}$$

Direction cosines = $\frac{0}{\sqrt{5}}, \frac{1}{\sqrt{5}}, \frac{-2}{\sqrt{5}}$

19. (b) $\mathbf{F}_1 = 2 \left[\frac{(-4 - 1)\hat{i} + (2 - 2)\hat{j} + (-2 + 1)\hat{k}}{(-5)^2 + (0)^2 + (-1)^2} \right]$

$$\mathbf{F}_1 = 2 \left(\frac{-5\hat{i} - \hat{k}}{\sqrt{26}} \right)$$

$$\mathbf{F}_2 = 3 \left[\frac{(4-1)\hat{i} + (1-2)\hat{j} + (-5+1)\hat{k}}{(1)^2 + (-3)^2 + (-4)^2} \right]$$

$$\mathbf{F}_2 = 3 \left[\frac{3\hat{i} - \hat{j} - 4\hat{k}}{\sqrt{26}} \right]$$

$$\mathbf{F}_3 = 2 \left[\frac{(2-1)\hat{i} + (-1-2)\hat{j} + (3+1)\hat{k}}{(1)^2 + (-3)^2 + (4)^2} \right]$$

$$\mathbf{F}_3 = 2 \left[\frac{\hat{i} - 3\hat{j} + 4\hat{k}}{\sqrt{26}} \right]$$

$$\begin{aligned} \mathbf{F}_R &= \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 \\ &= \frac{1}{\sqrt{26}} [-10\hat{i} - 2\hat{k} + 9\hat{i} - 3\hat{j} - 12\hat{k} + 2\hat{i} - 6\hat{j} + 8\hat{k}] \\ &= \frac{1}{\sqrt{26}} [\hat{i} - 9\hat{j} - 6\hat{k}] \end{aligned}$$

20. (a) $\mathbf{F} = m\mathbf{A} \Rightarrow \mathbf{A} = \frac{1}{m} (a\hat{i} + b\hat{j} + c\hat{k})$

Distance travelled,

$$\mathbf{s} = \mathbf{u}t + \frac{1}{2} \mathbf{A}t^2$$

$$\mathbf{s} = 0 \times t + \frac{1}{2} \frac{1}{m} (a\hat{i} + b\hat{j} + c\hat{k}) t^2$$

$$\mathbf{s} = (a\hat{i} + b\hat{j} + c\hat{k}) \frac{t^2}{2m}$$

21. (d) $\therefore \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \cos \theta$

$$\begin{aligned} \therefore \cos \theta &= \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|} = \frac{(2\hat{i} + \hat{j} - 2\hat{k}) \cdot (3\hat{i} - 4\hat{j})}{\sqrt{2^2 + 1^2 + (-2)^2} \sqrt{(3)^2 + (-4)^2}} \\ &= \frac{6-4}{3 \times 5} = \frac{2}{15} \Rightarrow \theta = \cos^{-1} \left(\frac{2}{15} \right) \end{aligned}$$

22. (b)

23. (a)

24. (a)

25. (c) $\mathbf{c} = \mathbf{a} \times \mathbf{b}$

$\mathbf{c}$ is perpendicular to $\mathbf{a}$ and $\mathbf{b}$ as show in figure. The direction of $\mathbf{c}$ does not change when the angle between $\mathbf{a}$ and $\mathbf{b}$ is increases or decreases.

26. (a) $\mathbf{a} = 3\hat{i} + \hat{j}$ and $\mathbf{b} = 2\hat{i} - \hat{j} - 5\hat{k}$

$$\begin{aligned} \mathbf{a} \times \mathbf{b} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & 1 & 0 \\ 2 & -1 & -5 \end{vmatrix} = (-5)\hat{i} - (-15-0)\hat{j} + (-3-2)\hat{k} \\ &= -5\hat{i} + 15\hat{j} - 5\hat{k} \end{aligned}$$

$$\mathbf{R} = \mathbf{a} \times \mathbf{b} = -5(\hat{i} - 3\hat{j} + \hat{k})$$

$$\hat{\mathbf{R}} = \frac{\hat{i} - 3\hat{j} + \hat{k}}{\sqrt{(1)^2 + (-3)^2 + (1)^2}} = \frac{\hat{i} - 3\hat{j} + \hat{k}}{\sqrt{11}}$$

27. (d) Diagonal vector $\mathbf{A} = b\hat{i} + b\hat{j} + b\hat{k}$

or $A = \sqrt{b^2 + b^2 + b^2} = \sqrt{3}b$

$$\therefore \hat{\mathbf{A}} = \frac{\mathbf{A}}{A} = \frac{\hat{i} + \hat{j} + \hat{k}}{\sqrt{3}}$$

28. (c) $\mathbf{A} \times \mathbf{B} = \mathbf{C}$

It is clear from the figure that $\mathbf{C}$ is perpendicular to $\mathbf{A}$ and $\mathbf{B}$, and $\mathbf{C}$ is parallel to $\mathbf{A} \times \mathbf{B}$.

29. (a) Vector area of triangle $= \frac{1}{2} (\mathbf{BC} \times \mathbf{BA})$

$$\begin{aligned} &= \frac{1}{2} [(c-b) \times (a-b)] = \frac{1}{2} [c \times a - b \times a + b \times b - c \times b] \\ &= \frac{1}{2} [c \times a + b \times c + a \times b] \end{aligned}$$

30. (d) Condition of coplanarity, $\begin{vmatrix} x & -2 & 3 \\ -2 & y & -4 \\ 0 & -z & 3 \end{vmatrix} = 0$

$$\Rightarrow x(2y - 4z) + 2(-4 - 0) + 3(2z - 0) = 0$$

$$\Rightarrow 2xy - 4zx - 8 + 6z = 0$$

$$\Rightarrow xy - 2zx - 4 + 3z = 0$$

31. (a) $\boldsymbol{\tau} = \mathbf{r} \times \mathbf{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 6 & 3 & -2 \\ 2 & 3 & -1 \end{vmatrix}$

$$= \hat{i}(-3+6) - \hat{j}(-6+4) + \hat{k}(18-6)$$

$$\boldsymbol{\tau} = (3\hat{i} + 2\hat{j} + 12\hat{k}) \text{ Nm}$$

32. (b) Condition for parallel vectors, $\mathbf{A} \times \mathbf{B} = 0$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 6 & x & -2 \\ 5 & -6 & -y \end{vmatrix} = 0$$

$$= \hat{i}(-xy - 12) - \hat{j}(-6y + 10) + \hat{k}(-36 - 5x) = 0$$

$$\text{or } xy = -12, +6y = 10 - 36 = 5x \Rightarrow x = -\frac{36}{5}, y = \frac{5}{3}$$

$$\begin{aligned}
 33. (a) \mathbf{A} \times \mathbf{B} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 1 & -3 \\ 0 & 12 & -2 \end{vmatrix} \\
 &= \hat{i}(-2 + 36) - \hat{j}(-4 - 0) + \hat{k}(24 - 0) \\
 &= 34\hat{i} + 4\hat{j} + 24\hat{k} \\
 |\mathbf{A} \times \mathbf{B}| &= \sqrt{1156 + 16 + 576} = 41.81 \approx 42
 \end{aligned}$$

34. (a) From vector triple product,

$$\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - (\mathbf{a} \cdot \mathbf{b}) \mathbf{c} \quad \dots(i)$$

$$\mathbf{b} \times (\mathbf{c} \times \mathbf{a}) = (\mathbf{b} \cdot \mathbf{a}) \mathbf{c} - (\mathbf{b} \cdot \mathbf{c}) \mathbf{a} \quad \dots(ii)$$

$$\mathbf{c} \times (\mathbf{a} \times \mathbf{b}) = (\mathbf{c} \cdot \mathbf{b}) \mathbf{a} - (\mathbf{c} \cdot \mathbf{a}) \mathbf{b} \quad \dots(iii)$$

Now adding Eqs. (i), (ii) and (iii), we get

$$\Rightarrow \mathbf{a} \times (\mathbf{b} \times \mathbf{c}) + \mathbf{b} \times (\mathbf{c} \times \mathbf{a}) + \mathbf{c} \times (\mathbf{a} \times \mathbf{b}) = 0$$

$$\begin{aligned}
 35. (c) \text{ Volume, } V &= \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = \begin{vmatrix} 2 & -6 & 3 \\ 0 & 5 & 0 \\ -2 & 0 & 1 \end{vmatrix} \\
 &= 2(5 - 0) + 6(0) + 3(+10) = 10 + 30 = 40 \text{ cubic units}
 \end{aligned}$$

36. (b) The three vectors are coplanar, if their scalar triple product is zero.

$$\text{i.e. } \mathbf{A} \cdot (\mathbf{B} \times \mathbf{C}) = 0 = \begin{vmatrix} 1 & -2 & 3 \\ 0 & x & 3 \\ 7 & 3 & -11 \end{vmatrix} = 0$$

$$(1)[-x(11) - 9] + 2(0 - 21) + 3(0 - 7x) = 0$$

$$-11x - 9 - 42 - 21x = 0 \Rightarrow -32x - 51 = 0 \Rightarrow x = -\frac{51}{32}$$

$$37. (b) \Delta v = |\mathbf{v}_2 - \mathbf{v}_1|$$

$$\begin{aligned}
 |v_1| &= |v_2| = v \\
 |\Delta v| &= \sqrt{v^2 + v^2 - 2v \cos 90^\circ} \\
 &= \sqrt{2} v = 30\sqrt{2} \text{ m/s}
 \end{aligned}$$

38. (a) Here, $\theta = 90^\circ$

Let v' = apparent velocity

$$\begin{aligned}
 v' &= \sqrt{30^2 + 50^2 + 2(50)(30) \cos 90^\circ} \\
 &= \sqrt{900 + 2500} \\
 v' &= 58.3 \text{ m/s}
 \end{aligned}$$

39. (a) As the distance is a scalar quantity. So, total distance travelled = $4 + 2 = 6 \text{ km}$

40. (c) Let mass of toy = m

$$\begin{aligned}
 \tan \theta &= \frac{H}{V} = \frac{m(1.2)}{m(10)} \\
 \theta &= \tan^{-1}(0.12)
 \end{aligned}$$

BITSAT Archives

1. (a) Area of parallelogram = $|\mathbf{A} \times \mathbf{B}|$

$$AB \sin \theta = \frac{1}{2} AB \Rightarrow \sin \theta = \frac{1}{2} \Rightarrow \theta = 30^\circ$$

2. (d) Let $\mathbf{F}_1 = x\hat{i}$

As, $\mathbf{F}_1 \times \mathbf{F}_2 = 0$ and only $\hat{i} \times \hat{i} = 0$

$$\therefore \mathbf{F}_2 = -4\hat{i}$$

3. (c) Let $\mathbf{B} = \hat{i} - \hat{j}$

Then, component of vector $\mathbf{A}$ along $\mathbf{B} = \frac{\mathbf{A} \cdot \mathbf{B}}{|\mathbf{B}|}$

$$= \frac{(a_x \hat{i} + a_y \hat{j} + a_z \hat{k}) \cdot (\hat{i} - \hat{j})}{|\hat{i} - \hat{j}|} = \frac{a_x - a_y}{\sqrt{2}}$$

4. (a) $\mathbf{A} \cdot \mathbf{B} = |\mathbf{A}| |\mathbf{B}| \cos \theta \Rightarrow AB \cos \theta = AB \sin \theta$

$$\tan \theta = 1 \Rightarrow \tan \theta = \tan 45^\circ \Rightarrow \theta = 45^\circ$$

5. (b) Given that, $\mathbf{a} = \hat{i} + 2\hat{j} - 3\hat{k}$

and $\mathbf{b} = 3\hat{i} - \hat{j} + 2\hat{k}$

$$\text{Now, } \mathbf{a} + \mathbf{b} = \hat{i} + 2\hat{j} - 3\hat{k} + 3\hat{i} - \hat{j} + 2\hat{k} = 4\hat{i} + \hat{j} - \hat{k}$$

$$\text{and } \mathbf{a} - \mathbf{b} = (\hat{i} + 2\hat{j} - 3\hat{k}) - (3\hat{i} - \hat{j} + 2\hat{k}) = -2\hat{i} + 3\hat{j} - 5\hat{k}$$

Let θ be the angle between $\mathbf{a} + \mathbf{b}$ and $\mathbf{a} - \mathbf{b}$.

$$\begin{aligned}
 \therefore \cos \theta &= \frac{(\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} - \mathbf{b})}{|\mathbf{a} + \mathbf{b}| |\mathbf{a} - \mathbf{b}|} = \frac{(4\hat{i} + \hat{j} - \hat{k}) \cdot (-2\hat{i} + 3\hat{j} - 5\hat{k})}{|4\hat{i} + \hat{j} - \hat{k}| \cdot |-2\hat{i} + 3\hat{j} - 5\hat{k}|} \\
 &= \frac{-8 + 3 + 5}{\sqrt{16 + 1 + 1} \sqrt{4 + 9 + 25}} = 0 \Rightarrow \theta = 90^\circ
 \end{aligned}$$

3

Motion in 1, 2 & 3 Dimensions and Projectile Motion

Motion

If the position of an object is continuously changing with respect to its surroundings with time, then it is said to be in the state of motion. A bird flying in air, a train moving on rails, a ship sailing on water, are some of the examples of motion.

Motion in a Straight Line

The motion of a point object in a straight line is one-dimensional motion. During such motion, the point object occupies definite position on the path at each instant of time t .

Distance and Displacement

Distance It is the total length of the path travelled by a particle in a given interval of time. It is a scalar quantity having unit metre or centimetre.

Displacement It is the shortest distance between initial and final positions with the direction from initial to final position. It is a vector quantity having unit metre or centimetre.

Mathematically, it is equal to difference of position vectors, i.e. $\Delta r = |r_2 - r_1|$, while distance is actual path length, i.e. ABC as shown in figure.

The displacement of motion may be zero or negative but path length or distance can never be negative.

NOTE Magnitude of displacement is less than or equal to distance.

Thus, $|\text{Displacement}| \leq \text{Distance}$.

Speed

It is defined as the total path length (i.e. actual distance covered) divided by total time taken by the object

$$\text{i.e. Speed} = \frac{\text{Total path length}}{\text{Total time taken}}$$

So, speed is a scalar quantity. It gives no idea about the direction of motion of the object. Hence, speed of the object can be zero or positive but never negative.

Average Speed

Average speed of an object is defined as the ratio of the total distance travelled by the object to the total time taken, i.e.

$$\text{Average speed} = \frac{\text{Total distance travelled}}{\text{Total time taken}}$$

Average speed of particles in different cases is discussed below

Case I If a particle travels distances s_1, s_2, s_3 etc., with speeds v_1, v_2, v_3 etc., in same direction, then distance travelled $= s_1 + s_2 + s_3 + \dots$

$$\text{Total time taken} = \frac{s_1}{v_1} + \frac{s_2}{v_2} + \frac{s_3}{v_3} + \dots$$

$$\text{Average speed, } v_{av} = \frac{s_1 + s_2 + \dots}{\left(\frac{s_1}{v_1} + \frac{s_2}{v_2} + \dots\right)}$$

If $s_1 = s_2 = s$, i.e. the body covers equal distance with different speeds, then

$$\begin{aligned} v_{av} &= \frac{2s}{s\left[\frac{1}{v_1} + \frac{1}{v_2}\right]} \\ &= \frac{2v_1v_2}{v_1 + v_2} \end{aligned}$$

It means average speed is equal to harmonic mean of individual speeds.

Case II If a particle travels with speeds v_1, v_2, v_3 etc., during time intervals t_1, t_2, t_3 etc., then total distance travelled, $s = v_1t_1 + v_2t_2 + \dots$

$$\text{Total time taken} = t_1 + t_2 + t_3 + \dots$$

So, average speed,

$$v_{av} = \frac{v_1t_1 + v_2t_2 + v_3t_3 + \dots}{t_1 + t_2 + t_3 + \dots}$$

Case III If $t_1 = t_2 = t_3 = \dots = t_n$, then we have

$$v_{av} = \frac{(v_1 + v_2 + \dots + v_n)t}{nt} = \frac{v_1 + v_2 + \dots + v_n}{n}$$

It means average speed is equal to arithmetic mean of individual speeds.

Velocity

It is defined as the ratio of displacement and the corresponding time interval taken by the object, i.e.

$$\text{Velocity} = \frac{\text{Displacement}}{\text{Time interval}}$$

Different types of velocity are given below

(i) **Variable Velocity** An object is said to have variable velocity, if either its speed or its direction or both change w.r.t. time.

(ii) **Average Velocity** Average velocity is defined as ratio of change in position (displacement) to the time interval (Δt).

$$\begin{aligned} \text{Average velocity, } v &= \frac{\text{Total displacement}}{\text{Total time taken}} \\ &= \frac{x_2 - x_1}{t_2 - t_1} = \frac{\Delta x}{\Delta t} \end{aligned}$$

(iii) **Instantaneous Velocity** Instantaneous velocity is defined as the velocity at a particular instant of time. Instantaneous velocity at particular instant of time t is

$$v_i = \lim_{\Delta t \rightarrow 0} \frac{\Delta x}{\Delta t} = \frac{dx}{dt}$$

Acceleration

Acceleration of an object is defined as the rate of change of velocity. It is a vector quantity having unit m/s^2 or ms^{-2} . Acceleration can be positive, zero or negative. Positive acceleration means velocity increasing with time, zero acceleration means velocity is uniform, while negative acceleration (retardation) means velocity is decreasing with time.

Average and Instantaneous Acceleration

Average acceleration is defined as the change in velocity (Δv) divided by the time interval (Δt).

Let us consider the motion of a particle. Suppose that, the particle has velocity v_1 at $t = t_1$ and at a later time $t = t_2$ it has velocity v_2 . Thus, the average acceleration during the time interval $\Delta t = t_2 - t_1$, is

$$a_{av} = \frac{v_2 - v_1}{t_2 - t_1} = \frac{\Delta v}{\Delta t}$$

On a plot of velocity *versus* time, the average acceleration is the slope of the straight line connecting the points (v_2, t_2) and (v_1, t_1) .

If the time interval approaches zero, average acceleration is known as **instantaneous acceleration**. Mathematically,

$$a = \lim_{\Delta t \rightarrow 0} \frac{\Delta v}{\Delta t} = \frac{dv}{dt}$$

When a body is moving with a constant acceleration, then acceleration time graph is a straight line.

Negative acceleration is known as retardation. It indicates that velocity is decreasing with respect to time.

Uniformly Accelerated Motion

A motion in which change in velocity in each unit of time is constant, is called as uniformly accelerated motion. For a uniformly accelerated motion ($\mathbf{a} = \text{constant}$), equations of motion are as follows

Kinematic equations of motion

$$\mathbf{v} = \mathbf{u} + \mathbf{a}t \quad \dots(i)$$

$$\mathbf{s} = \mathbf{u}t + \frac{1}{2}\mathbf{a}t^2 \quad \dots(ii)$$

$$\text{and} \quad \mathbf{v} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{u} + 2\mathbf{a} \cdot \mathbf{s} \quad \dots(iii)$$

$$v^2 = u^2 + 2as$$

where, $\mathbf{u}$ = initial velocity, $\mathbf{v}$ = velocity at time t ,

$\mathbf{s}$ = displacement of particle at time t .

If motion is described in one dimension, so vector sign ($\rightarrow$) need not be used.

Sign convention for Fig. (a) motion in the vertical direction, and Fig. (b) motion in the horizontal direction is shown in figure.

Non-uniformly Accelerated Motion

When motion of a particle is not uniform, i.e. acceleration of particle is not constant or acceleration is a function of time, then following relations hold for one-dimensional motion.

$$(i) \quad v = \frac{ds}{dt}$$

$$(ii) \quad a = \frac{dv}{dt} = v \frac{dv}{ds}$$

$$(iii) \quad ds = v dt \text{ and}$$

$$(iv) \quad dv = a dt \text{ or } v dv = a ds$$

Such problems can be solved either by differentiation or integration by applying some boundary conditions.

Free Fall Acceleration

An important example of a straight line motion with constant acceleration, is that of an object rising or falling freely near the earth's surface.

The constant acceleration equation describes this motion but we make two changes in notation, (1) we refer the motion to the vertical y -axis with $+y$ vertically up, and (2) we replace a with g , where g is the magnitude of the free fall acceleration. Near earth's surface, $g = 9.8 \text{ ms}^{-2}$ (32 fts^{-2})

Some Special Cases

- If an object starts from rest and moves with a uniform acceleration, then displacement covered by it in time t is directly proportional to t^2 , i.e. $s \propto t^2$ and if a body starts from rest and moves with a uniform acceleration, then displacement covered by it in successive seconds will be in the ratio of odd natural number, i.e. $s_{1st} : s_{2nd} : s_{3rd} = 1 : 3 : 5 \dots$

When particle covers one-third distance at speed v_1 , next one-third at speed v_2 and last one-third at speed v_3 , then

$$v_{av} = \frac{3v_1v_2v_3}{v_1v_2 + v_2v_3 + v_3v_1}$$

- If a particle is accelerated for time t_1 with acceleration a_1 and for time t_2 with acceleration a_2 , then average acceleration is

$$a_{av} = \frac{a_1t_1 + a_2t_2}{t_1 + t_2}$$

- If an object is moving with uniform acceleration, then
Instantaneous acceleration = Uniform acceleration
= Average acceleration
- If a particle is moving with constant acceleration from point A to B in a straight line. If u and v are corresponding velocities at A and B respectively, then velocity at the mid-point of A

$$\text{and B is } v_0 = \sqrt{\frac{u^2 + v^2}{2}}.$$

Graphs

Graphs in One-Dimensional Motion

Graphs can be generalised on the basis of position-time and velocity-time in one-dimensional motion with uniform velocity and uniform acceleration.

Displacement-Time Graph

Different cases	s-t Graph	Characteristics
At rest		Slope of s-t graph $\left(\frac{ds}{dt}\right)$ is zero, i.e. zero velocity.
Uniform motion $a = 0$		Slope of s-t graph is constant, i.e. $v = \text{constant}$, $a = 0$
Uniformly accelerated motion with $u = 0, s = 0$, at $t = 0$		Slope of s-t graph is increasing, i.e. positive value.
Uniformly retarded motion		Slope of s-t graph is decreasing, i.e. negative value.

Velocity-Time Graph

Different cases	v-t Graph	Characteristics
Uniform motion		(i) $\theta = 0^\circ$ (ii) $v = \text{constant}$ Slope of v-t graph $\left(\frac{dv}{dt}\right)$ is zero, i.e. acceleration is zero.
Uniformly accelerated motion with $u = 0, s = 0$ at $t = 0$	 $a = \frac{v-u}{t} = \frac{v}{t} = \text{constant}$	Slope of v-t graph is constant.
Uniformly decelerated motion	 $v = u - at$	Slope of v-t graph is negative (retarded)
Non-uniformly accelerated motion		Slope of v-t graph increases with time. v is increasing, so acceleration is increasing.
Non-uniformly decelerating motion		v is decreasing so acceleration is decreasing.

NOTE Slope of s-t graph $= \frac{ds}{dt} = \tan\theta$

where, θ is the angle made by the tangent at any point (with time axis) on the graph taken anti-clockwise.

Relative Motion

If the velocity of two bodies are known w.r.t. a common frame of reference, then the velocity of one of the two bodies can be measured w.r.t. the second body.

Let us consider, if the velocities of the two bodies A and B w.r.t. earth are $\mathbf{v}_A$ and $\mathbf{v}_B$, then the relative velocity of A w.r.t. B is $\mathbf{v}_{AB} = \mathbf{v}_A - \mathbf{v}_B$

Similarly, we see that $\mathbf{v}_{AB} = -\mathbf{v}_{BA}$

Also, acceleration of A w.r.t. B is

$$\mathbf{a}_{AB} = \mathbf{a}_A - \mathbf{a}_B$$

and

$$\mathbf{a}_{AB} = -\mathbf{a}_{BA}$$

If a car moves from west to east (the direction of motion of the earth) $v_C = v_{CE} + v_E$

and if the car moves from east to west (opposite to the motion of the earth) $v_C = v_{CE} - v_E$

where, v_C and v_E are the velocities of car and the earth respectively with respect to an inertial frame of reference.

Also, note that the earth is assumed as the rotating frame which is a non-inertial one.

Relative Motion in Two Dimensions

The description of the motion of an object in two or three dimensions depends on the choice of the coordinate system. Figure shows two reference frames in two dimensions. The vectors $\mathbf{r}_{PA}$ and $\mathbf{r}_{PB}$ are the position vectors of the object P in reference frame A and in reference frame B , respectively. Vector $\mathbf{r}_{BA}$ is the position of observer B (located at the origin of reference frame B) w.r.t. frame A . The position vector of the object P in reference frame B can be obtained from the position vector in reference frame A .

The velocity and acceleration of the object P are therefore,

$$\mathbf{v}_{PA} = \mathbf{v}_{BA} + \mathbf{v}_{PB} \quad \text{and} \quad \mathbf{a}_{PA} = \mathbf{a}_{BA} + \mathbf{a}_{PB}$$

For crossing the river in the shortest time, the boat should sail perpendicular to the flow. If the width of the river is d and v is the velocity of the boat in still water, then

$$t = \frac{d}{v} \quad \text{and} \quad OC = \sqrt{d^2 + \left(v_r \times \frac{d}{v}\right)^2}$$

For crossing the river by the shortest distance, the boat moves such that the horizontal component of the velocity balances the speed of flow. Time of crossing,

$$t = \frac{d}{\sqrt{v^2 - v_r^2}}$$

where, v_r = velocity of river flow

Applications of the Concept of Relative Motion

(i) Rain Problems

In this case, the three velocities with which we have to deal are

$\mathbf{v}_{RG}$ → velocity of rain w.r.t. ground

$\mathbf{v}_{MG}$ → velocity of man w.r.t. ground

$\mathbf{v}_{RM}$ → velocity of rain w.r.t. man

From the equation of relative motion,

$$\mathbf{v}_{RM} = \mathbf{v}_{RG} - \mathbf{v}_{MG} \quad \text{OR} \quad \mathbf{v}_{RM} + \mathbf{v}_{MG} = \mathbf{v}_{RG}$$

From this equation we can construct a vector diagram, which would be very helpful in solving the questions.

The vector diagram for a particular situation is shown in figure.

From sine law,

$$\frac{|\mathbf{v}_{MG}|}{\sin \gamma} = \frac{|\mathbf{v}_{RM}|}{\sin \beta} = \frac{|\mathbf{v}_{RG}|}{\sin(\pi - \alpha)}$$

Remember $|\mathbf{v}_{MG}|$, $|\mathbf{v}_{RM}|$ or $|\mathbf{v}_{RG}|$ are not representing the length of triangles.

(ii) River Boat Problems

In this case, we have to deal with the following velocities.

$\mathbf{v}_{SR}$ → velocity of swimmer/steamer/boat w.r.t. river /water/stream

$\mathbf{v}_{RG}$ → Velocity of river/water/stream w.r.t. ground.

$\mathbf{v}_{SG}$ → Velocity of swimmer steamer/boat w.r.t. ground.

From relative motion equation $\mathbf{v}_{SR} + \mathbf{v}_{RG} = \mathbf{v}_{SG}$

For the situation shown in the figure, a boat is crossing the river and it is heading (moving) along AP as shown in the figure then the time taken by the boat to cross the river is

$$t = \frac{d}{|\mathbf{v}_{SR} \cos \theta|}$$

and it will reach the point Q due to river flow. The distance $BQ = (|\mathbf{v}_{RG}| - |\mathbf{v}_{SR}| \sin \theta)t$ is termed as **drift**.

(iii) Aeroplane Problems

Here the following velocities are to be analysed

$\mathbf{v}_{PA}$ → velocity of plane w.r.t. air.

$\mathbf{v}_{AG}$ → velocity of air w.r.t. ground.

$\mathbf{v}_{PG}$ → velocity of plane w.r.t. ground.

The relative motion equation would be as shown in figure.

$$\mathbf{v}_{PG} = \mathbf{v}_{PA} + \mathbf{v}_{AG}$$

Projectile Motion

We considered objects moving along straight line paths, such as the x -axis. Now, let us look at some cases in which an object moves in a plane. By this we mean that the object has a motion in both the x and the y -directions simultaneously.

Which is another way of saying, it moves in two dimensions. The motion of a particle thrown in a vertical plane, making an angle with the horizontal ($\neq 90^\circ$), is an example of two-dimensional motion. This is called **projectile motion**.

Time of Flight

It is defined as the total time for which the projectile

remains in air, $T = \frac{2u \sin \theta}{g}$

Maximum Height

It is defined as the maximum vertical distance covered by

projectile, $H = \frac{u^2 \sin^2 \theta}{2g}$

Horizontal Range

It is defined as the maximum distance covered in horizontal

distance, $R = \frac{u^2 \sin 2\theta}{g}$

- Horizontal range is maximum when it is thrown at an angle of 45° from the horizontal $R_{\max} = \frac{u^2}{g}$
- For angle of projection θ and $(90^\circ - \theta)$ the horizontal range is same.

A Projectile Fired Horizontally from a Certain Height

Let a particle be projected horizontally with a velocity u from a height h above the ground. Then, taking the point of projection O as the origin, horizontal direction as x -axis and vertically upward direction as y -axis, we find that

(i) Equation of trajectory is $y = \frac{g}{2u^2} x^2$

which represents the equation of a parabola.

(ii) Time taken by the projectile to reach the ground

$$T = \sqrt{\frac{2h}{g}}$$

The time is the same as that taken by an object falling freely from the same height.

(iii) Horizontal range, $AB = R = uT = u \sqrt{\frac{2h}{g}}$

(iv) Velocity of projectile at any instant of time t is $\mathbf{v} = (u\hat{i} + gt\hat{j}) \Rightarrow v = \sqrt{u^2 + g^2t^2}$ and $\tan\beta = \frac{gt}{u}$

A Projectile Fired at an Angle of Elevation θ from the Ground

Let a particle be projected at an angle of elevation θ from the ground level at point O with an initial velocity $\mathbf{u}$. The velocity may be resolved into (i) a horizontal component $u_x = u \cos\theta$ and (ii) a vertical component $u_y = u \sin\theta$. Moreover, here, $a_x = 0$ and $a_y = -g$. From these values of $\mathbf{u}$ and $\mathbf{a}$, we get the following results.

(i) Equation of the trajectory, $y = x \tan\theta - \frac{g}{2u^2 \cos^2\theta} x^2$

which is the equation of a parabola, symmetric about the y -axis (i.e. vertical direction)

(ii) Vertical height covered, $h = \frac{u^2 \sin^2\theta}{2g}$

(iii) Time of flight, $T = \frac{2u \sin\theta}{g}$

For complementary angles ϕ and $(90^\circ - \phi)$, if T_ϕ and $T_{(90^\circ - \phi)}$ are the time of flight and R is the range, then

$$T_\phi T_{90^\circ - \phi} = \frac{2R_\phi}{g} = \frac{2R_{90^\circ - \phi}}{g} = \frac{2R}{g}$$

e.g., $T_{1^\circ} T_{89^\circ} = \frac{2R_{1^\circ}}{g} = \frac{2R_{89^\circ}}{g}$

(iv) Horizontal range, $R = OB = u_x T = \frac{u^2 \sin 2\theta}{g}$

For a given range R , there are two different angles of projection, one of them being the complement of the other (15° or 75° , 30° or 60°) as shown in figure. However, the vertical height and the time of flight will be different for the two values of θ .

(v) Maximum horizontal range

$$R_{\max} = \frac{u^2}{g}, \text{ when } \theta = 45^\circ$$

For a given speed of projection, R depends on θ , the angle of projection. Range will be maximum for a given speed of projection, when $\sin 2\theta = 1$, i.e. $2\theta = 90^\circ$ or $\theta = 45^\circ$. Hence, for maximum range, the angle of projection must be 45° .

(vi) **Velocity at any instant t** Let the instantaneous velocity be $\mathbf{v}$, inclined at an angle β with the horizontal. Then,

$$|\mathbf{v}| = \sqrt{v_x^2 + v_y^2} = \sqrt{(u \cos\theta)^2 + (u \sin\theta - gt)^2}$$

$$\text{and } \tan\beta = \frac{u \sin\theta - gt}{u \cos\theta}$$

If K is the kinetic energy at the point of launch, then kinetic energy at the highest point is

$$K' = \frac{1}{2} m v_x^2 = \frac{1}{2} m u^2 \cos^2\theta$$

$$\text{or } K' = K \cos^2\theta$$

(vii) **Relation between R and h** It is found that

$$\frac{R}{h} = 4 \cot\theta$$

and if $\theta = 45^\circ$, then $\frac{R_{\max}}{h_{\max}} = 4$

or $R_{\max} = 4h_{\max}$

(viii) **Two angles of projection for the same range** It is found that the range of a projectile is the same when it is projected either at an angle of elevation θ° or at an angle of $(90^\circ - \theta)$.

Practice Exercise

1. A cat wants to catch a rat. The cat follows the path whose equation is $x + y = 0$. But rat follows the path whose equation is $x^2 + y^2 = 4$. The coordinates of possible points of catching the rat are

a. $(\sqrt{2}, \sqrt{2})$ b. $(-\sqrt{2}, \sqrt{2})$ c. $(\sqrt{2}, \sqrt{3})$ d. $(0, 0)$

2. Speed is too velocity as

a. centimetre is too metre
b. force is too torque
c. velocity is too acceleration
d. distance is too displacement

3. A person travelling on a straight line moves with a uniform velocity v_1 for some time and with uniform velocity v_2 for the next the equal time. The average velocity v is given by

a. $v = \frac{v_1 + v_2}{2}$

b. $\frac{2}{v} = \frac{1}{v_1} + \frac{1}{v_2}$

c. $v = \sqrt{v_1 v_2}$

d. $\frac{1}{v} = \frac{1}{v_1} + \frac{1}{v_2}$

4. A car moves at 80 km in the first half of total time of motion and at 40 km in the later half. Its average speed is

a. 60 km/h b. 30 km/h
c. 120 km/h d. None of these

5. A particle moves with constant speed v along a regular hexagon $ABCDEF$ in same order. (i.e. A to B, B to C, C to D, D to E, E to F and F to A). The magnitude of average velocity for its motion from A to C is

a. v b. $\frac{v}{2}$
c. $\frac{\sqrt{3}v}{2}$ d. None of these

6. During the shooting of a superhit film 'MARD' Amitabh Bachchan was waiting for his beloved Amrita Singh with his dog. When he saw her approaching, the dog was excited and dashed to her than back to master and so on, never stopping. How far would you estimate the dog ran if his speed is 30 km/h and each of them walked at 4 km/h, starting 400 m apart?

a. 400 m b. 880 m c. 1500 m d. 30 km

7. Two particles start from the same point with different speeds but one moves along $y = a \sin \omega x$ and other moves along curve $y = a \cos \omega x$

a. they must collide after some time
b. they never collide with each other
c. they may collide at the point $P\left(\frac{\pi}{4\omega}, \frac{a}{\sqrt{2}}\right)$
d. they must collide at the point P

8. A sheet of wood moves over a smooth surface (shown in the figure). The magnitude of velocity of C is

a. v
b. $2v \cos \theta$
c. $2v \sin \theta$
d. $2v$

9. In the arrangement shown in figure, the ends P and Q of an inextensible string move downwards with uniform speed u . Pulleys A and B are fixed. The mass m moves upwards with a speed

a. $2u \cos \theta$ b. $\frac{u}{\cos \theta}$ c. $\frac{2u}{\cos \theta}$ d. $u \cos \theta$

10. In the given figure, find the speed of pulley P.

11. A link AB is moving in a vertical plane. At a certain instant when the link is inclined 60° to the horizontal the point A is moving horizontally at 3 m/s, while B is moving in the vertical direction. What is the velocity of B?

a. $\frac{1}{\sqrt{3}}$ m/s b. $2\sqrt{3}$ m/s
c. $\sqrt{3}$ m/s d. $\frac{\sqrt{3}}{2}$ m/s

12. Two intersecting straight lines move parallel to themselves with speeds 3 m/s and 4 m/s, respectively. The speed of the point of intersection of the lines, if the angle between them is 90° will be

a. 5 m/s b. 3 m/s
c. 4 m/s d. None of these

13. The displacement-time graph is shown in figure. The instantaneous velocity is negative at the point

a. D b. F c. C d. E

14. In the given $x-t$ curve,

a. the velocity at A is zero but at B is non-zero
b. the velocity at A and B are zero
c. the velocity at A and B are non-zero
d. the directions of velocity at A and B are definite

15. Which of the following speed-time graph exists in the nature?

d. All of the above

16. Two particles describe the same circle of radius a in the same sense with the same speed v . What is their relative angular velocity?

a. v/a b. $2v/a$ c. $v/2a$ d. va

17. A particle of mass m is initially situated at the point P inside a hemispherical surface of radius r as shown in figure. A horizontal acceleration of magnitude a_0 is suddenly produced on the particle in the horizontal direction. If gravitational acceleration is neglected, the time taken by particle to touch the sphere again is

a. $\sqrt{\frac{4r \sin \alpha}{a_0}}$

b. $\sqrt{\frac{4r \tan \alpha}{a_0}}$

c. $\sqrt{\frac{4r \cos \alpha}{a_0}}$

d. None of these

18. A particle starts with a velocity of 2 m/s and moves in a straight line with a retardation of 0.1 m/s^2 . The time that it takes to describe 15 m is

a. 10 s in its backward journey
b. 30 s in its forward journey
c. 10 s in its forward journey
d. 30 s in its backward journey
e. Both (b) and (c) are correct

19. A particle starts from rest with acceleration 2 m/s^2 . The acceleration of the particle decreases down to zero uniformly during time-interval of 4 s. The velocity of particle after 2 s is

a. 3 m/s b. 4 m/s c. zero d. 8 m/s

20. An aeroplane moves 400 m towards north, 300 m towards west and then 1200 m vertically upwards. Then, its displacement from the initial position is

a. 1300 m b. 1400 m
c. 1500 m d. 1600 m

21. The displacement of a particle is given by $x = (t - 2)^2$ where, x is in metres and t in seconds. The distance covered by the particle in first 4 s is

a. 4 m b. 8 m
c. 12 m d. 16 m

22. A person walks up a stalled escalator in 90 s when standing on the same escalator, now moving, he is carried in 60 s. The time it would take him to walk up the moving escalator will be

a. 27 s b. 72 s c. 18 s d. 36 s

23. A body starts from rest and moves with a constant acceleration. The ratio of distance covered in the n th second to the distance covered in n second is

a. $\frac{2}{n} - \frac{1}{n^2}$ b. $\frac{1}{n^2} - \frac{1}{n}$ c. $\frac{2}{n^2} - \frac{1}{n}$ d. $\frac{2}{n} + \frac{1}{n^2}$

24. A particle moving with a uniform acceleration along a straight line covers distances a and b in successive intervals of p and q second. The acceleration of the particle is

a. $\frac{pq(p+q)}{2(bp-aq)}$ b. $\frac{2(aq-bp)}{pq(p-q)}$ c. $\frac{bp-aq}{pq(p-q)}$ d. $\frac{2(bp-aq)}{pq(p+q)}$

25. A body moves along x -axis with velocity v_x at position x . If the plot v_x-x is an ellipse with major axis $2A$ and minor axis $2v_0$, the maximum acceleration has a modulus

a. $\frac{v_0^2}{A}$

b. $\frac{A}{v_0^2}$

c. $v_0 A$

d. None of these

26. The distance time graph of a particle at time t makes angle 45° with respect to time axis. After 1s, it makes angle 60° with respect to time axis. What is the acceleration of the particle?

a. $(\sqrt{3} - 1)$ unit

b. $(\sqrt{3} + 1)$ unit

c. $\sqrt{3}$ unit

d. 1 unit

27. The velocity-time plot for a particle moving on a straight line is shown in the figure, then

- a. the particle has a constant acceleration
 b. the particle has never turned around
 c. the average speed in the interval 0 to 10 s is the same as the average speed in the interval 10 s to 20 s
 d. Both (a) and (c) are correct
28. The acceleration of a train between two stations 2 km apart is shown in the figure. The maximum speed of the train is

- a. 60 m/s b. 30 m/s c. 120 m/s d. 90 m/s
29. A body is at rest at $x = 0$, it starts moving in the positive x -direction with a constant acceleration. At the same instant another body passes through $x = 0$ moving in the positive x -direction with a constant speed. The position of the first body is given by $x_1(t)$ after time t and that of the second body by $x_2(t)$ after the same time interval. Which of the following graphs correctly describes $(x_1 - x_2)$ as a function of time t ?

30. A particle moves in a straight line, so that after t second, the distance x from a fixed point O on the line is given by $x = (t - 2)^2(t - 5)$. Then,
- a. after 2 s, velocity of particle is zero
 b. after 2 s, the particle reaches at O
 c. the acceleration is negative, when $t < 3$ s
 d. All of the above

31. A bee flies in a line from a point A to another point B in 4 s with a velocity of $|t - 2|$ m/s. The distance between A and B in metre is

a. 2 b. 4 c. 6 d. 8

32. The velocity of a particle is $v = v_0 + gt + ft^2$. If its position is $x = 0$ at $t = 0$, then its displacement after unit time ($t = 1$) is

a. $v_0 + 2g + 3f$ b. $v_0 + \frac{g}{2} + \frac{f}{3}$
 c. $v_0 + g + f$ d. $v_0 + \frac{g}{2} + f$

33. A particle located at $x = 0$ at time $t = 0$, starts moving along the positive x -direction with a velocity v that varies as $v = \alpha \sqrt{x}$. The displacement of the particle varies with time as

a. t^2 b. t c. $t^{1/2}$ d. t^3

34. A particle moves as such whose acceleration is given by $a = 3 \sin 4t$, then

a. the initial velocity of the particle must be zero
 b. the acceleration of the particle becomes zero after each interval of $\frac{\pi}{4}$ second
 c. the particle does not come at its initial position after some time
 d. the particle must move on a circular path

35. A particle moves along a straight line such that its position x at any time t is $x = 3t^2 - t^3$, where x is in metre and t in second, then

a. at $t = 0$ acceleration is 6 m/s^2
 b. $x-t$ curve has maximum at 8 m
 c. $x-t$ curve has maximum at 2 s
 d. Both (a) and (c) are correct

36. The motion of a body falling from rest in a resting medium is described by the equation $\frac{dv}{dt} = a - bv$, where a and b are constant. The velocity at any time t is

a. $a(1 - b^{2t})$ b. $\frac{a}{b}(1 - e^{-bt})$
 c. abe^{-t} d. $ab^2(1 - t)$

37. A rectangular box is sliding on a smooth inclined plane of inclination θ . At $t = 0$, the box starts to move on the inclined plane. A bolt starts to fall from point A . Find the time after which bolt strikes the bottom surface of the box.

a. $\sqrt{\left(\frac{2l}{g \cos \alpha}\right)}$ b. $\sqrt{\left(\frac{2l}{g \sin \alpha}\right)}$
 c. $\sqrt{\left(\frac{2l}{g}\right)}$ d. $\sqrt{\left(\frac{l}{g}\right)}$

38. A car starting from rest, accelerates at the rate f through a distance s , then continues at constant speed for time t and then decelerates at the rate $\frac{f}{2}$ to come to rest. If the total distance travelled is $15s$, then
 a. $s = ft$ b. $s = \frac{1}{6}ft^2$ c. $s = \frac{1}{72}ft^2$ d. $s = \frac{1}{4}ft^2$

39. An object moves, starting from rest through a resistive medium, such that its acceleration is related to velocity as $a = 3 - 2v$. Then,

- a. the terminal velocity is 1.5 unit
 b. the terminal velocity is 3 unit
 c. the slope of $a - v$ graph is not constant
 d. initial acceleration is 2 unit

40. If the velocity of a moving particle, $v \propto x^n$, where x is the displacement, then

- a. when $x = 0$, the velocity and acceleration are zero
 b. $n > \frac{1}{2}$
 c. $n < \frac{1}{2}$
 d. Both (a) and (b) are correct

41. A particle is projected vertically upward in vacuum with a speed 40 m/s, then velocity of particle when it reaches at maximum height 2 s before, is

(Take, $g = 10 \text{ m/s}^2$)

- a. 20 m/s b. 4.2 m/s
 c. 9.8 m/s d. None of these

42. A juggler keeps on moving four balls in the air throws the balls in regular interval of time. When one ball leaves his hand (speed = 20 m/s), the position of other balls will be (Take, $g = 10 \text{ m/s}^2$)

- a. 10 m, 20 m, 10 m b. 15 m, 20 m, 15 m
 c. 5 m, 15 m, 20 m d. 5 m, 10 m, 20 m

43. Balls are thrown vertically upward in such a way that the next ball is thrown when the previous one is at the maximum height. If the maximum height is 5 m, the number of balls thrown per minute will be (Take, $g = 10 \text{ m/s}^2$)

- a. 60 b. 40 c. 50 d. 120

44. A ball is dropped vertically from a height d above the ground. It hits the ground and bounces up vertically to a height $d/2$. Neglecting subsequent motion and air resistance, its speed v varies with the height h above the ground as

45. A ball is projected vertically upwards. If resistance due to air is ignored, then which of the following graphs represent the velocity-time graph of the ball during its flight?

46. An object is thrown upward with a velocity u , then displacement-time graph is

47. A balloon going upward with a velocity of 12 m/s is at a height of 65 m from the earth surface at any instant. Exactly at this instant a packet drops from it. How much time will the packet take in reaching the surface of earth? (Take $g = 10 \text{ m/s}^2$)

- a. 7.5 s b. 10 s
 c. 5 s d. None of these

48. A stone is released from a balloon moving upward with velocity v_0 at height h at $t = 0$. Which of the following graph is best representation of velocity-time graph for the motion of stone?

49. For Q. 48, draw speed-time graph.

50. A particle P is at the origin starts with velocity $\mathbf{u} = (2\hat{i} - 4\hat{j})$ m/s with constant acceleration $(3\hat{i} + 5\hat{j})$ m/s². After travelling for 2 s, its distance from the origin is
 a. 10 m b. 10.2 m c. 9.8 m d. 11.7 m
51. At an instant t , the coordinates of a particles are $x = at^2$, $y = bt^2$ and $z = 0$. The magnitude of velocity of particle at an instant t is
 a. $t\sqrt{a^2 + b^2}$ b. $\frac{v}{\sqrt{2}}$ c. $\frac{v}{\sqrt{3}}$ d. $2t\sqrt{a^2 + b^2}$
52. If $x = a(\cos \theta + \theta \sin \theta)$ and $y = a(\sin \theta - \theta \cos \theta)$ and θ increases at uniform rate ω . The velocity of particle is
 a. $a\omega$ b. $\frac{a^2\theta}{\omega}$ c. $\frac{a\theta}{\omega}$ d. $a\theta\omega$
53. A particle is moving with velocity $\mathbf{v} = k(Y\hat{i} + X\hat{j})$, where k is a constant. The general equation for its path is
 a. $Y = X^2 + \text{constant}$ b. $Y^2 = X + \text{constant}$
 c. $XY = \text{constant}$ d. $Y^2 = X^2 + \text{constant}$
54. A light rigid rod is placed on a smooth horizontal surface. Initially the end A begins to move vertically upward with constant velocity v_0 and centre of the rod upward with a velocity $v_0/2$ having downward acceleration $a_0/2$, the other end moves downward with
 a. zero initial velocity having zero acceleration
 b. zero initial velocity having a_0 downward acceleration
 c. non-zero initial velocity and zero acceleration
 d. None of the above
55. At the top of the trajectory of a projectile, the directions of its velocity and acceleration are
 a. parallel to each other
 b. inclined to each other at an angle of 45°
 c. anti-parallel to each other
 d. perpendicular to each other
56. A projectile is thrown at an angle of $\theta = 45^\circ$ to the horizontal, reaches a maximum height of 16 m, then
 a. its velocity at the highest point is zero
 b. its range is 64 m
 c. it is thrown at an angle of 30° , its range will decrease
 d. (b) and (c) both are correct
57. A heavy stone is thrown from a cliff of height h in a given direction. The speed with which it hits the ground (air resistance may be neglected)
 a. must depend on the speed of projection
 b. must be larger than the speed of projection
 c. must be independent of the speed of projection
 d. (a) and (b) both are correct
58. A particle of mass m is projected with a velocity v moving at an angle of 45° with the horizontal. The magnitude of angular momentum of projectile about the point of projection when the particle is at its maximum height h is

- a. zero b. $\frac{mvh}{\sqrt{2}}$
 c. $\frac{mvh^2}{\sqrt{2}}$ d. None of these

59. Two particles are projected vertically upwards with the same velocity on two different planets with accelerations due to gravities g_1 and g_2 respectively. If they fall back to their initial points of projection after lapse of time t_1 and t_2 respectively. Then,
 a. $t_1 t_2 = g_1 g_2$ b. $t_1 g_1 = t_2 g_2$
 c. $\frac{t_1 g_2}{t_2 g_1} = 2$ d. $t_1^2 + t_2^2 = g_1 + g_2$
60. A point P moves in counter-clockwise direction on a circular path as shown in the figure. The movement of P is such that it sweeps out a length $s = t^3 + 5$, where s is in metre and t is in second. The radius of the path is 20 m. The acceleration of P when $t = 2$ s is nearly.

- a. 13 ms^{-2} b. 12 ms^{-2} c. 7.2 ms^{-2} d. 14 ms^{-2}
61. A number of particles are projected from a given point with equal velocities in different directions in the same vertical plane. At any instant, they will lie on
 a. parabola b. circle c. hyperbola d. rectangle
62. Rain water is falling vertically downward with velocity v . When velocity of wind is u in horizontal direction, water is collected at the rate of $R \text{ m}^3/\text{s}$. When velocity of wind becomes $2u$ in horizontal direction. The rate of collection of water in vessel is
 a. R b. $\frac{R}{2}$
 c. $2R$ d. $\frac{R\sqrt{4u^2 + v^2}}{\sqrt{u^2 + v^2}}$
63. A ball projected from ground at an angle of 45° just clears a wall in front. If point of projection is 4 m from the foot of wall and ball strikes the ground at a distance of 6 m on the other side of the wall, the height of the wall is
 a. 4.4 m b. 2.4 m c. 3.6 m d. 1.6 m
64. The maximum range of a bullet fired from a toy pistol mounted on a car at rest is $R_0 = 40$ m. What will be the acute angle of inclination of the pistol for maximum range when the car is moving in the direction of firing with uniform velocity $v = 20 \text{ m/s}$, on a horizontal surface? ($g = 10 \text{ m/s}^2$)
 a. 30° b. 60°
 c. 75° d. 45°

65. Figure shows four paths for a kicked football. Ignoring the effect of air on the flight, rank the paths according to initial horizontal velocity component highest first.

a. 1, 2, 3, 4 b. 2, 3, 4, 1 c. 3, 4, 1, 2 d. 4, 3, 2, 1

66. A body is projected at an angle θ with the horizontal. When it is at the highest point, the ratio of the potential and kinetic energies of the body is
- a. $\tan \theta$ b. $\tan^2 \theta$
c. $\cot \theta$ d. $\cot^2 \theta$

67. A particle is projected at an angle 60° with the horizontal with a speed 10 m/s. Then, latus rectum is (Take, $g = 10 \text{ m/s}^2$)

a. 5 m b. 15 m
c. 10 m d. 0

68. A projectile is thrown at an angle θ such that it is just able to cross a vertical wall at its highest point of journey as shown in the figure. The angle θ at which the projectile is thrown is given by

a. $\tan^{-1}\left(\frac{1}{\sqrt{3}}\right)$ b. $\tan^{-1}(\sqrt{3})$
c. $\tan^{-1}\left(\frac{2}{\sqrt{3}}\right)$ d. $\tan^{-1}\left(\frac{\sqrt{3}}{2}\right)$

69. Two cars move in the same direction along parallel roads. One of them is a 200 m long travelling with a velocity of 20 m/s. The second one is 800 m long travelling with a velocity of 7.5 m/s. How long will it take for the first car to overtake the second car?
- a. 20 s b. 40 s
c. 60 s d. 80 s
70. A motorboat covers the distance between two spots on the river banks in $t_1 = 8 \text{ h}$ and $t_2 = 12 \text{ h}$ in down stream and upstream respectively. The time required for the boat to cover this distance in still water will be
- a. 6.9 h b. 9.6 h c. 69 s d. 96 s

71. For a man who wants to cross the river with the shortest path AB , find the angle θ (see figure).

a. $\sin^{-1}\left(\frac{3}{4}\right)$
b. $\sin^{-1}\left(\frac{4}{3}\right)$
c. 30°
d. Given situation is not possible

72. To a person going towards East in a car with a velocity of 25 km/h, a train appears to move towards North with a velocity of $25\sqrt{3}$ km/h. The actual velocity of the train will be

a. 25 km/h b. 50 km/h
c. 5 km/h d. 53 km/h

73. A man can swim with a speed of 4 km/h in still water. How long does he take to cross a river 1 km wide, if the river flows steadily 3 km/h and he makes his strokes normal to the river current. How far down the river does he go, when he reaches the other bank?
- a. 800 m b. 900 m
c. 400 m d. 750 m

74. Rain drops fall vertically at a speed of 20 m/s. At what angle do they fall on the wind screen of a car moving with a velocity of 15 m/s, if the wind screen velocity inclined at an angle of 23° to the vertical?

$$\left(\cot^{-1} \frac{4}{3} \approx 37^\circ\right)$$

a. 60° b. 30°
c. 45° d. 90°

75. A bus moves over a straight level road with a constant acceleration a . A boy in the bus drops a ball out side. The acceleration of the ball with respect to the bus and the earth are respectively
- a. a and g
b. $a + g$ and $g - a$
c. $\sqrt{a^2 + g^2}$ and g
d. $\sqrt{a^2 + g^2}$ and a

BITSAT Archives

1. A train accelerating uniformly from rest attains a maximum speed of 40 ms^{-1} in 20 s. It travels at this speed for 20 s and is brought to rest with uniform retardation in further 40 s. What is the average velocity during this period? [2014]

a. 80 m/s b. 25 m/s c. 40 m/s d. 30 m/s

2. A ball is projected upwards from the top of tower with a velocity 50 m/s making an angle 30° with the horizontal. The height of tower is 70 m. After how many seconds from the instant of throwing will the ball reach the ground? [2014]

a. 2 s b. 5 s c. 7 s d. 9 s

3. A ball thrown upward from the top of a tower with speed v reaches the ground in t_1 sec. If this ball is thrown downward from the top of the same tower with speed v it reaches the ground in t_2 sec. In what time, the ball shall reach the ground, if it is allowed to fall freely under gravity from the top of the tower? [2014]

a. $\frac{t_1 + t_2}{2}$ b. $\frac{t_1 - t_2}{2}$ c. $\sqrt{t_1 t_2}$ d. $t_1 + t_2$

4. A man runs at a speed of 4 m/s to overtake a standing bus. When he is 6 m behind the door at $t = 0$, the bus moves forward and continuous with a constant acceleration of 1.2 m/s^2 . The man reaches the door in time t . Then, [2013]

a. $4t = 6 + 0.6 t^2$ b. $1.2 t^2 = 4t$
c. $4t^2 = 1.2 t$ d. $6 + 4t = 0.2 t^2$

5. For a given velocity, a projectile has the same range R for two angles of projection if t_1 and t_2 are the time of flight in the two cases, then [2012]

a. $t_1 t_2 \propto R$ b. $t_1 t_2 \propto R^2$ c. $t_1 t_2 \propto \frac{1}{R^2}$ d. $t_1 t_2 \propto \frac{1}{R}$

6. A body moves with uniform acceleration, then which of the following graph is correct? [2012]

7. One second after the projection, a stone moves at an angle of 45° with the horizontal. Two seconds from the start, it is travelling horizontally, its angle of projection with the horizon is (given, $g = 10 \text{ ms}^{-2}$) [2010]

a. 60° b. $\tan^{-1}(4)$ c. $\tan^{-1}(3)$ d. $\tan^{-1}(2)$

8. A body covers a total distance of $3s$. The first s is covered with a velocity u the second s with v and the last s with ω . Then, the average velocity during the whole journey is [2010]

a. $\frac{u + v + \omega}{3}$ b. $\frac{3uv\omega}{u + v + \omega}$
c. $\frac{3uv\omega}{uv + v\omega + u\omega}$ d. zero

9. Do we observe the time variation of position is nature as shown in the graph? [2009]

a. Yes b. No c. Often d. Rarely

10. If a body is projected with an angle θ to the horizontal, then [2008]

a. its velocity is always perpendicular to its acceleration
b. its velocity becomes zero at its maximum height
c. its velocity makes zero angle with the horizontal at its maximum height
d. the body just before hitting the ground, the direction of velocity coincides with the acceleration

11. Velocity-time ($v-t$) graph for a moving object is shown in the figure. Total displacement of the object during the time interval when there is non-zero acceleration and retardation is [2007]

a. 60 m b. 50 m c. 30 m d. 40 m

12. At the top of the trajectory of a projectile, the direction of its velocity and acceleration are [2007]

a. perpendicular to each other
b. parallel to each other
c. inclined to each other at an angle of 45°
d. anti-parallel to each other

13. At what point of a projectile motion, acceleration and velocity are perpendicular to each other? [2006]

a. At the point of projection
b. At the point of drop
c. At the top most point
d. Anywhere in between the point of projection and top most point

14. From the top of a tower of two stones, whose masses are in the ratio 1 : 2 are thrown on straight up with an initial speed u and the second straight down with the same speed u . Then, neglecting air resistance [2005]

a. the heavier stone hits the ground with a higher speed
b. the lighter stone hits the ground with a higher speed
c. both the stone will have the same speed when they hit the ground
d. the speed cannot be determined with the given data

Answer with Solutions

Practice Exercise

1. (b) The paths of rat and cat are shown in figure. The possible points of catching the rat by the cat are $A(x_1, y_1)$ and $B(x_2, y_2)$. From figure,

$OA = OB = \text{radius of circle} = 2 \text{ unit}$

$$\therefore x_1 = -OA \sin 45^\circ = -\frac{2}{\sqrt{2}} = -\sqrt{2}$$

$$\text{and } y_1 = OA \sin 45^\circ = \sqrt{2}$$

Similarly for point B , $x_2 = \sqrt{2}$, $y_2 = -\sqrt{2}$

Alternate

Let the catching point of rat by cat is $P(x_1, y_1)$.

The coordinates of point P satisfy the both equations.

$$\therefore x_1 + y_1 = 0$$

$$\therefore y_1 = -x_1 \quad \dots(i)$$

$$\text{For rate, } x_1^2 + y_1^2 = 4$$

$$\text{or } x_1^2 + (-x_1)^2 = 4$$

$$\therefore 2x_1^2 = 4$$

$$\therefore x_1 = \pm \sqrt{2}$$

The corresponding values of $y_1 = \mp \sqrt{2}$

$\therefore$ The possible coordinates of point P are $(\sqrt{2}, -\sqrt{2})$ and $(-\sqrt{2}, \sqrt{2})$.

2. (d) Speed is too velocity = $\frac{\text{m/s}}{\text{m/s}} = \text{No unit}$

Similarly, distance is too displacement = $\frac{\text{m}}{\text{m}} = \text{No unit}$

3. (a)

$$4. (a) \text{ Average speed} = \frac{\text{Total distance}}{\text{Total time}}$$

$$\text{Here, } s_1 = 80 \times \frac{t}{2} \text{ and } s_2 = 40 \times \frac{t}{2}$$

$$s_1 = 40t \text{ and } s_2 = 20t$$

$$\text{Total distance} = s_1 + s_2 = 40t + 20t$$

$$\therefore \text{Total time} = \frac{t}{2} + \frac{t}{2} = t$$

$$\therefore \text{Average speed} = \frac{40t + 20t}{t} = 60 \text{ km/h}$$

5. (c) Average velocity = $\frac{\text{Total displacement}}{\text{Total time}}$

$$\mathbf{v}_{av} = \frac{\mathbf{AC}}{t} \therefore |\mathbf{v}_{av}| = \frac{AC}{t}$$

The time taken by particle to reach from A to C is

$$t = \frac{AB + BC}{v} = \frac{2a}{v}$$

$$\text{In } \triangle ABC, \cos 120^\circ = \frac{a^2 + a^2 - AC^2}{2a^2} \text{ or } -\frac{1}{2} = \frac{2a^2 - AC^2}{2a^2}$$

$$\therefore AC = \sqrt{3}a \therefore |\mathbf{v}_{av}| = \frac{\sqrt{3}a}{\frac{2a}{v}} = \frac{\sqrt{3}}{2}v$$

6. (c) 7. (c)

8. (c) From figure of problem, horizontal components of velocities vanish.

Hence, net velocity is $v' = 2v \sin \theta$

9. (b) Here, $\frac{dx}{dt} = u$

From figure, $l^2 + y^2 = x^2$

$$2y \frac{dy}{dt} = 2x \frac{dx}{dt} \text{ or } \frac{dy}{dt} = \frac{x}{y} u = \frac{u}{\cos \theta} \left(\because \frac{y}{x} = \cos \theta \right)$$

10. (c) The total length of string is

$$l = 2x + 2\sqrt{\left(\frac{d^2}{4} + y^2\right)} + 2x \quad \dots(i)$$

Differentiating of Eq. (i) on both sides with respect to t ,

$$0 = 4 \frac{dx}{dt} + \frac{2y}{\sqrt{\frac{d^2}{4} + y^2}} \frac{dy}{dt}$$

$$\text{or } 4v + 2 \cos \theta \frac{dy}{dt} = 0 \quad \text{or } \frac{dy}{dt} = -\frac{2v}{\cos \theta}$$

11. (c) The situation of problem is shown in figure. Let the length of link AB is l . From figure,

$$x_A^2 + x_B^2 = l^2$$

$$\text{or } 2x_A \frac{dx_A}{dt} + 2x_B \frac{dx_B}{dt} = 0$$

$$\text{or } -x_A v_A + x_B v_B = 0 \quad \left(\because \frac{dx_A}{dt} = -v_A \right)$$

because x_A decreases with respect to time.

$$\therefore v_B = \frac{x_A v_A}{x_B} = v_A \cot 60^\circ$$

$$= \frac{v_A}{\sqrt{3}} = \frac{3}{\sqrt{3}} = \sqrt{3} \text{ m/s}$$

12. (a) The velocity of intersection point is

$$v = \sqrt{v_x^2 + v_y^2} = \sqrt{3^2 + 4^2} = 5 \text{ m/s}$$

13. (d) The slope of displacement-time graph gives velocity. At the point E in the given graph slope is negative. Hence, instantaneous velocity will be negative corresponding to point E .

14. (b) The slope of $x-t$ graph gives velocity. The tangents at points A and B on the given graph are parallel to X -axis. So, the slopes of the graph at points A and B are zero. Hence, velocities at A and B are zero.

15. (b) Speed never be negative. Hence, (b) is correct.

16. (a) The situation is shown in figure.

The relative angular velocity is

$$\omega_{\text{rel}} = \frac{\left[\begin{array}{c} \text{The relative velocity of component} \\ \text{of velocity in perpendicular direction} \\ \text{of line joining the particles} \end{array} \right]}{\text{The shortest distance between particles}} = \frac{2v}{2a} = \frac{v}{a}$$

17. (c) Let the particle touches the sphere at the point A .

Let $PA = l$

$$\therefore PB = \frac{l}{2}$$

$$\text{In } \triangle OPB, \cos \alpha = \frac{PB}{r}$$

$$\therefore PB = r \cos \alpha$$

$$\text{or } \frac{l}{2} = r \cos \alpha$$

$$\therefore l = 2r \cos \alpha$$

$$\text{But, } l = \frac{1}{2} a_0 t^2$$

$$\therefore t = \sqrt{\left(\frac{2l}{a_0} \right)} = \sqrt{\left(\frac{2 \times 2r \cos \alpha}{a_0} \right)}$$

$$= \sqrt{\left(\frac{4r \cos \alpha}{a_0} \right)}$$

18. (e) Let the particle returns back after time $t = t_0$.

For this, $v = 0$, at $t = t_0$

$$\therefore v = u + at \quad \text{or } 0 = 2 - 0.1t_0$$

$$\therefore t_0 = \frac{2}{0.1} = 20 \text{ s} \quad \left(\because s = ut + \frac{1}{2} at^2 \right)$$

$$\text{or } 15 = 2t - \frac{1}{2} 0.1t^2 \quad \text{or } 30 = 4t - 0.1t^2$$

$$\text{or } 300 = 40t - t^2 \quad \text{or } t^2 - 40t + 300 = 0$$

$$\therefore t = \frac{40 \pm \sqrt{1600 - 1200}}{2 \times 1} = \frac{40 \pm 20}{2}$$

$$\therefore t = 30 \text{ s or } 10 \text{ s}$$

19. (a)

20. (a) Given, $x = 400 \text{ m}$, $y = 300 \text{ m}$, $z = 1200 \text{ m}$

$$\therefore r = \sqrt{x^2 + y^2 + z^2} = \text{magnitude of displacement}$$

$$= \sqrt{(400)^2 + (300)^2 + (1200)^2}$$

$$= 10^2 \sqrt{16 + 9 + 144} = 1300 \text{ m}$$

21. (b) Here, $x = (t - 2)^2$

$$\text{Velocity } v = \frac{dx}{dt} = 2(t - 2) \text{ m/s}$$

$$\text{Acceleration, } a = \frac{dv}{dt} = 2 \text{ ms}^{-2} \quad (\text{i.e. uniform})$$

When $t = 0$, $v = -4 \text{ m/s}$

$$t = 2 \text{ s}, v = 0$$

$$t = 4 \text{ s}, v = 4 \text{ m/s}$$

Velocity (v) -time (t) graph of this motion is as shown in figure.

Distance travelled = area AOB + area BCD

$$= \frac{4 \times 2}{2} + \frac{4 \times 2}{2} = 8 \text{ m}$$

22. (d) Let the walking distance is l .

$$\therefore v_1 = \text{velocity of person} = \frac{l}{90}$$

$$v_2 = \text{the velocity of escalator} = \frac{l}{60}$$

$\therefore$ The resulting velocity of person on moving escalator is

$$\begin{aligned} v &= v_1 + v_2 \\ \therefore t &= \frac{l}{v_1 + v_2} = \frac{l}{\frac{l}{60} + \frac{l}{90}} \\ t &= \frac{1}{\frac{3}{60} + \frac{2}{90}} = \frac{180}{5} = 36 \text{ s} \end{aligned}$$

23. (a) Here, $s_n = \frac{1}{2}an^2$

s_{nth} = distance travelled in n second – distance travelled in $(n-1)$ second

$$s_{nth} = \left(\frac{2n-1}{2}\right)a \quad \therefore \frac{s_{nth}}{s_n} = \frac{2n-1}{n^2} = \frac{2}{n} - \frac{1}{n^2}$$

24. (b) According to problem, when $s = a$, $t = p$

$$\therefore s = ut + \frac{1}{2}ft^2 \quad [\text{Here, } f = \text{acceleration}]$$

$$\text{or} \quad a = up + fp^2$$

$$\text{or} \quad a = up + \frac{fp^2}{2} \quad \dots(i)$$

For $s = b$, $t = q$

$$b = uq + \frac{fq^2}{2} \quad \dots(ii)$$

After solving Eqs. (i) and (ii), we get $f = \frac{2(aq - bp)}{pq(p - q)}$

25. (a) The corresponding equation is $\frac{x^2}{A^2} + \frac{v^2}{v_0^2} = 1$

$$\text{or} \quad \frac{v^2}{v_0^2} = 1 - \frac{x^2}{A^2} \quad \dots(i)$$

Differentiating of Eq. (i) on both sides with respect to t ,

$$\frac{2v}{v_0^2} \frac{dv}{dt} = -\frac{2x}{A^2} \frac{dx}{dt}$$

$$\text{or} \quad \frac{2v}{v_0^2} \frac{dv}{dt} = -\frac{2x}{A^2} v \quad \text{or} \quad a = -\frac{v_0^2}{A^2} x$$

$$\therefore a_{\max} = -\frac{v_0^2}{A^2} x_{\max}$$

$$\begin{aligned} \therefore a_{\max} &= -\frac{v_0^2}{A^2} A \quad [\because x_{\max} = A] \\ &= -\frac{v_0^2}{A} \quad [\text{In the sense of magnitude}] \end{aligned}$$

26. (a) The slope of distance-time graph gives speed.

The change in velocity in one second

$$= \tan 60^\circ - \tan 45^\circ = \sqrt{3} - 1$$

$$\therefore \text{Acceleration} = \frac{\Delta v}{\Delta t} = \frac{\sqrt{3} - 1}{1} = (\sqrt{3} - 1) \text{ unit}$$

27. (d) The slope of velocity-time graph gives acceleration. Since, the given graph is straight line slope of graph is constant. Hence, acceleration is constant.

The area of given v - t graph between 0 to 10 s is same as between 10 s to 20 s.

28. (b) The area of a - t graph gives change in velocity. The area of the graph from 0 to 8 s

$$= v - u = \frac{1}{2} \times 4 \times 5 + 4 \times 5 = 30$$

But, $u = 0 \therefore v = 30 \text{ m/s}$

29. (b) As, $x_1(t) = \frac{1}{2}at^2$ and $x_2(t) = vt$

$$\therefore x_1 - x_2 = \frac{1}{2}at^2 - vt \quad [\text{parabola}]$$

Clearly, graph (b) represents it correctly.

30. (d) $\because x = (t-2)^2(t-5)$

$$v = \frac{dx}{dt} = (t-5) \frac{d}{dt}(t-2)^2 + (t-2)^2 \frac{d}{dt}(t-5)$$

$$\text{or} \quad v = (t-5)2(t-2) + (t-2)^2 = 2(t-5)(t-2) + (t-2)^2$$

$$\text{At } t = 2 \text{ s, } v = 0$$

$$\text{At } t = 2 \text{ s, } x = 0$$

$$a = \frac{dv}{dt} = \frac{d}{dt} \{2(t-5)(t-2) + (t-2)^2\}$$

$$= 2(t-5) + 2(t-2) + 2(t-2)$$

$$= 2t - 10 + 2t - 4 + 2t - 4 = 6t - 18$$

$$\text{When } t < 3, \quad \text{then } \frac{a+18}{6} < 3 \quad \text{or } a < 0$$

Hence, at $t < 3$, acceleration a will be negative.

31. (b) $\because v = |t-2| \text{ m/s}$

$$v = t - 2 \quad \text{when } t > 2 \text{ s}$$

$$v = 2 - t, \quad \text{when } t < 2 \text{ s}$$

$$\therefore a = \frac{dv}{dt} = 1 \text{ m/s}^2 \quad t > 2 \text{ s}$$

$$a = -1 \text{ m/s}^2 \quad t < 2$$

In the direction of motion from A to C, bee decelerates but from C to B, bee accelerates.

Let $AC = s_1$ $CB = s_2$

$$u_A = 2 \text{ m/s at } t = 0, u_C = 0 \text{ at } t = 2 \text{ s, } u_B = 2 \text{ m/s at } t = 4 \text{ s}$$

$$\therefore s_1 = \left(\frac{u_A + u_C}{2}\right)t_1, s_2 = \left(\frac{u_C + u_B}{2}\right)t_2$$

$$\therefore s = s_1 + s_2 = \left(\frac{2+0}{2}\right)2 + \left(\frac{0+2}{2}\right)2 = 4 \text{ m}$$

32. (b) As, $v = v_0 + gt + ft^2$ or $\frac{dx}{dt} = v_0 + gt + gt^2$ $\left(\because v = \frac{dx}{dt}\right)$

$$\Rightarrow dx = (v_0 + gt + ft^2)dt$$

$$\text{So, } \int_0^x dx = \int_0^1 (v_0 + gt + ft^2)dt \Rightarrow x = v_0 + \frac{g}{2} + \frac{f}{3}$$

33. (a) Given, $v = \alpha \sqrt{x}$

$$\text{or } \frac{dx}{dt} = \alpha \sqrt{x} \quad \text{or } \frac{dx}{\sqrt{x}} = \alpha dt$$

$$\text{On integrating } \int_0^x \frac{dx}{\sqrt{x}} = \int_0^t \alpha dt$$

[$\therefore$ at $t = 0$, $x = 0$ and let at any time t , particle is at x]

$$\Rightarrow \left. \frac{x^{1/2}}{1/2} \right|_0^x = \alpha t \text{ or } x^{1/2} = \frac{\alpha}{2} t \text{ or } x = \frac{\alpha^2}{4} \times t^2 \text{ or } x \propto t^2$$

34. (b) $a = 3 \sin 4t$

As the acceleration is a sin function, hence it is a periodic function and the acceleration of the particle becomes zero after each interval of $\frac{\pi}{4}$ seconds $\left[a = 3 \sin \left(4 \times \frac{\pi}{4}\right) = 0\right]$

35. (d) The given expression is $x = 3t^2 - t^3$

$$v = \frac{dx}{dt} = 6t - 3t^2, a = \frac{dv}{dt} = 6 - 6t$$

$$\text{At } t = 0, a = 6 \text{ m/s}^2$$

(c) For maximum of $x-t$ curve,

$$\frac{dx}{dt} = 0$$

$$\therefore 6t - 3t^2 = 0 \Rightarrow t = 2 \text{ s}$$

Hence, (c) is correct.

Hence, finally (d) is correct.

36. (b) $\because \frac{dv}{dt} = a - bv$

$$\text{or } \int_0^v \frac{dv}{a - bv} = \int_0^t dt \quad \text{or } -\frac{1}{b} [\log(a - bv)]_0^v = t$$

$$\text{or } \left(\frac{a - bv}{a}\right) = e^{-bt} \quad \text{or } 1 - \frac{b}{a}v = e^{-bt}$$

$$\therefore v = \frac{a}{b}(1 - e^{-bt})$$

Tricky approach According to homogeneity principle, the dimensions of left hand side should be equal to dimensions of right hand side. Options (a), (c) and (d) are dimensionally wrong. But, (b) is dimensionally correct.

37. (a) The actual acceleration of bolt

$$= \mathbf{a}_1 = -g \sin \hat{\alpha} \hat{i} - g \cos \hat{\alpha} \hat{j}$$

$$\mathbf{a}_2 = \text{The actual acceleration of box} = -g \sin \hat{\alpha} \hat{i}$$

$$\therefore \mathbf{s}_{\text{rel}} = -l \hat{j}, \mathbf{u}_{\text{rel}} = 0$$

$$\mathbf{s}_{\text{rel}} = \mathbf{u}_{\text{rel}} t + \frac{1}{2} \mathbf{a}_{\text{rel}} t^2$$

$$\text{or } -l \hat{j} = 0 + \frac{1}{2} (\mathbf{a}_1 - \mathbf{a}_2) t^2 \quad \therefore l = \frac{gt^2 \cos \alpha}{2}$$

$$\therefore t = \sqrt{\left(\frac{2l}{g \cos \alpha}\right)}$$

38. (c)

39. (a) The meaning of terminal velocity is constant velocity.

For constant velocity, acceleration should be zero

(i.e. $a = 0$)

$$\therefore a = 3 - 2v \quad \text{or } 0 = 3 - 2v$$

$$\therefore v = \frac{3}{2} = 1.5 \text{ unit}$$

40. (d) Here, $v \propto x^n$

$$\text{or } \frac{dx}{dt} = kx^n$$

$$\therefore \frac{d^2x}{dt^2} = knx^{n-1} \frac{dx}{dt}$$

$$\text{or } \frac{d^2x}{dt^2} = knx^{n-1} kx^n \quad \text{or } \frac{d^2x}{dt^2} = k^2 nx^{2n-1}$$

Since, at $a = 0$, $v = 0$

It means for moving the body, acceleration should be positive. For this

$$\therefore 2n - 1 > 0 \Rightarrow n > \frac{1}{2}$$

If $n < \frac{1}{2}$, particle remains in rest.

41. (a) At the maximum height, $v = 0$

$$\therefore v = u - gt \Rightarrow 0 = u - gt_0$$

$$\therefore t_0 = \frac{u}{g} = \frac{40}{10} = 4 \text{ s}$$

$$\therefore v = u - gt = 40 - 10(4 - 2) = 20 \text{ m/s}$$

42. (b)

$$h_1 = \frac{1}{2} gt^2 = \frac{1}{2} \times 10 \times 1^2 = 5 \text{ m}$$

$$h_2 = \frac{1}{2} gt^2 = \frac{1}{2} \times 10 \times 2^2 = 20 \text{ m}$$

From ground, 15 m, 20 m, 15 m (shown in figure).

43. (a) Let the time taken by ball to reach at maximum height is t_0 .

At maximum height, $v = 0$

$$\text{Here, } h = \frac{(u+v)t}{2} \quad \text{or } 5 = \frac{u}{2} t_0$$

$$\therefore t_0 = \frac{10}{u} \quad \dots(i)$$

But for upward motion, $v^2 = u^2 - 2gh$

$$\text{or } (0)^2 = u^2 - 2 \times 10 \times 5$$

$$\therefore u = \sqrt{2 \times 10 \times 5} = 10 \text{ m/s}$$

$$\therefore t_0 = \frac{10}{10} = 1 \text{ s}$$

$$\therefore \text{Number of balls per minute} = \frac{t}{t_0} = \frac{1 \text{ min}}{1 \text{ s}} = \frac{60 \text{ s}}{1 \text{ s}} = 60$$

44. (b)

45. (a) For the given condition, initial height $h = d$ and velocity of the ball is zero. When the ball moves downwards its velocity increases and it will be maximum when the ball hits the ground and just after the collision it becomes half and in opposite direction. As the ball moves upward, its velocity again decreases and becomes zero at height $\frac{d}{2}$.

This explanation match with graph (a).

46. (a)

47. (c) In this case, the motion of balloon is undergravity. So, acceleration is constant. Hence, kinematic equation

$$s = ut + \frac{1}{2} at^2$$

is applicable.

$$\text{Here, } s = -65 \hat{j}$$

$$a = g = -10 \hat{j}$$

$$u = 12 \hat{j}$$

$$\therefore -65 \hat{j} = 12t - \frac{1}{2} 10t^2 \hat{j}$$

$$\text{or } -65 = 12t - 5t^2$$

$$\therefore t = 5 \text{ s}$$

Remarks In this case, magnitude of displacement is not equal to distance.

48. (a) According to kinematic equation,

$$v = v_0 - gt$$

Upward direction is taken as positive and downward direction is taken as negative. Hence, $v-t$ graph is straight line having negative slope.

49. (b) 50. (b) 51. (d) 52. (d)

53. (d) Given, velocity $v = kY \hat{i} + kX \hat{j}$

$$\frac{dX}{dt} = kY, \frac{dY}{dt} = kX$$

$$\frac{dY}{dX} = \frac{dY}{dt} \times \frac{dt}{dX} = \frac{kX}{kY}$$

$$Y dY = X dX$$

$$\Rightarrow Y^2 = X^2 + C \quad (\text{where, } C = \text{constant})$$

54. (b)

55. (d) The trajectory is shown in figure. From figure, at the top, velocity and gravitational acceleration are mutually perpendicular to each other.

56. (d) The maximum height is $H = \frac{u^2 \sin^2 \theta}{2g}$

$$\text{or } 16 = \frac{u^2 \sin^2 45^\circ}{19.6}$$

$$\therefore u = \sqrt{16 \times 2 \times 19.6}$$

$$\begin{aligned} \text{But, } R &= \frac{u^2 \sin 2\theta}{g} \\ &= \frac{16 \times 2 \times 19.6 \sin 90^\circ}{9.8} = 64 \text{ m} \end{aligned}$$

When $\theta = 45^\circ$, $\sin 2\theta = 1$

But, when $\theta = 30^\circ$,

$$\sin 2\theta = \frac{\sqrt{3}}{2} = 0.866$$

So, at $\theta = 30^\circ$, range is lesser than that of at $\theta = 45^\circ$

57. (d) When the stone reaches at ground. The potential energy of stone decreases. This decrease in potential energy of stone. Hence, speed increases. Hence, (d) is correct.

58. (b) The angular momentum of a particle is given by

$$L = r \times mv$$

$$\therefore L = mvr \sin \theta$$

From figure, $L = rm(v \cos 45^\circ) \sin \theta = \frac{mv}{\sqrt{2}} (r \sin \theta)$

$$= \frac{mvh}{\sqrt{2}} \quad \left(\because \sin \theta = \frac{h}{r} \right)$$

59. (b) In the absence of air,

$$t = \text{time of flight} = 2 \times \text{time of ascent} = 2 \times \frac{u}{g} = \frac{2u}{g}$$

$$\therefore t_1 = \frac{2u}{g_1} \quad \dots(i)$$

$$\text{and } t_2 = \frac{2u}{g_2} \quad \dots(ii)$$

Now, from Eqs. (i) and (ii), we get

$$\therefore t_1 g_1 = t_2 g_2$$

60. (d) Given, $s = t^3 + 5$

$$\therefore \text{Speed, } v = \frac{ds}{dt} = 3t^2$$

and rate of change of speed $a_t = \frac{dv}{dt} = 6t$

$\therefore$ Tangential acceleration at $t = 2$ s

$$a_t = 6 \times 2 = 12 \text{ ms}^{-2}$$

and at $t = 2$ s, $v = 3(2)^2 = 12 \text{ ms}^{-1}$

$\therefore$ Centripetal acceleration, $a_c = \frac{v^2}{R} = \frac{144}{20} \text{ ms}^{-2}$

Net acceleration $= \sqrt{a_c^2 + a_t^2} = 14 \text{ ms}^{-2}$

61. (b) Let a particle is projected at an angle θ with horizontal (shown in figure)

At an instant t , the particle reaches at point $P(x, y)$.

$$\therefore x = (u \cos \theta)t$$

$$\therefore ut \cos \theta = x \quad \dots(i)$$

and $y = (u \sin \theta)t - \frac{1}{2}gt^2$

$$\therefore y = (u \sin \theta)t - \frac{1}{2}gt^2$$

$$\therefore ut \sin \theta = y + \frac{1}{2}gt^2 \quad \dots(ii)$$

Squaring Eqs. (i) and (ii) and then adding, we get

$$(ut \sin \theta)^2 + (ut \cos \theta)^2 = x^2 + \left(y + \frac{1}{2}gt^2\right)^2$$

$$\therefore u^2 t^2 = x^2 + y^2 + \frac{g^2 t^4}{4} + gt^2 y$$

$$x^2 + y^2 + \frac{g^2 t^4}{4} + gt^2 y - u^2 t^2 = 0$$

This is an equation of circle.

62. (a) The rate of storing water in vessel depends upon vertical component of velocity. In this problem, vertical component of velocity in both cases are same.

63. (c) As range $= 10 = \frac{u^2 \sin 2\theta}{g} \Rightarrow u^2 = 10g$

$\therefore u = 10 \text{ m/s}$ (as $g = 10 \text{ m/s}^2$)

$$Y = x \tan \theta - \frac{1}{2} \frac{gx^2}{v_0^2 \cos^2 \theta} = 4 \tan 45^\circ - \frac{1}{2} \frac{g \times 16}{2 \times 10^2 \cos^2 45^\circ}$$

$$= 4 \times 1 - \frac{1}{2} \frac{10 \times 16}{2 \times 10 \times 10 \times \frac{1}{2}} = 4 - 0.8 = 3.2 \text{ m}$$

64. (b)

65. (d)

66. (b) Potential energy PE

$$= mgh_{\max} = \frac{mg(u^2 \sin^2 \theta)}{2g} = \frac{mu^2 \sin^2 \theta}{2}$$

$$\text{KE} = \frac{1}{2} m(u \cos \theta)^2$$

$$\text{Hence, } \frac{\text{PE}}{\text{KE}} = \tan^2 \theta$$

67. (a) From review of concepts of the chapter

$$\text{Latusrectum} = \frac{2a^2 \cos^2 \alpha}{g} = \frac{2 \times 10^2 \times \cos^2 60^\circ}{10} = 5 \text{ m}$$

68. (c) We can write $\frac{R/2}{H} = \frac{\sqrt{3}H}{H} = \sqrt{3}$

$$\text{or } \frac{(v_0^2 \sin \theta \cos \theta)/g}{(v_0^2 \sin^2 \theta)/2g} = \sqrt{3}$$

$$2 \cot \theta = \sqrt{3} \Rightarrow \tan \theta = \frac{2}{\sqrt{3}}, \theta = \tan^{-1} \left(\frac{2}{\sqrt{3}} \right)$$

69. (d) From the figure, the relative displacement is

$$s_{\text{rel}} = (800 + 200) \text{ m} = 1000 \text{ m}$$

$$v_{\text{rel}} = v_1 - v_2 = (20 - 7.5) \text{ m/s} = 12.5 \text{ m/s}$$

$$\therefore t = \frac{s_{\text{rel}}}{v_{\text{rel}}} = \frac{1000}{12.5} = 80 \text{ s}$$

70. (b) Let the distance between spots A and B is l .

u = speed of river stream

v = speed of motorboat in still water

During downstream,

$$t_1 = \frac{l}{v + u} \quad \dots(i)$$

Similarly in upstream

$$t_2 = \frac{l}{v - u} \quad \dots(ii)$$

$$\text{In still water, } t = \frac{l}{v} \quad \dots(iii)$$

After solving Eqs. (i), (ii) and (iii), we get $t = 9.6 \text{ h}$

71. (d) For the man to cross the river from the shortest path,

$$V_m \sin \theta = v_r$$

$$\sin \theta = \frac{v_r}{v_m}$$

$$\sin \theta = \frac{4}{3}$$

$$\theta = \sin^{-1} \left(\frac{4}{3} \right)$$

But it is not possible, because $\sin \theta$ could not be greater than 1. Hence, the man could not cross the river from the shortest path AB.

72. (b) Let
- $\mathbf{v}_t$
- = actual velocity of train

 $\mathbf{v}_c$ = actual velocity of car $\therefore \mathbf{v}_{tc}$ = relative velocity of train with respect to car $\therefore \mathbf{v}_c = 25\hat{i}$ and $\mathbf{v}_{tc} = 25\sqrt{3}\hat{j}$ $\therefore \mathbf{v}_{tc} = \mathbf{v}_t - \mathbf{v}_c$ $\therefore \mathbf{v}_t = \mathbf{v}_{tc} + \mathbf{v}_c = 25\sqrt{3}\hat{j} + 25\hat{i}$ $\therefore v_t = \sqrt{(25\sqrt{3})^2 + (25)^2} = 25\sqrt{4} = 50 \text{ km/h}$

73. (d) Given, speed of man
- $v_m = 4 \text{ km/h}$

Speed of river $v_r = 3 \text{ km/h}$ Width of the river, $d = 1 \text{ km}$

Time taken by the man to cross the river,

$$t = \frac{\text{Width of the river}}{\text{Speed of the man}} = \frac{1 \text{ km}}{4 \text{ km/h}} = \frac{1}{4} \text{ h} = \frac{1}{4} \times 60 = 15 \text{ min}$$

Distance travelled along the river $= v_r \times t$

$$= 3 \times \frac{1}{4} = \frac{3}{4} \text{ km} = \frac{3000}{4} = 750 \text{ m}$$

74. (a) $\tan(90^\circ - \theta) = \frac{20}{15}$

$$\therefore \cot \theta = \frac{20}{15} = \frac{4}{3}$$

$$\Rightarrow \theta = 37^\circ$$

$$\therefore \alpha = 37^\circ + 23^\circ = 60^\circ$$

75. (c) Let
- $\mathbf{a}_{\text{rel}}$
- = acceleration of ball with respect to ground – acceleration of bus with respect to ground

$$= -g\hat{j} - a\hat{i}$$

$$\therefore |\mathbf{a}_{\text{rel}}| = \sqrt{g^2 + a^2}$$

BITSAT Archives

1. (b) (i)
- $v = u + at_1$

$$40 = 0 + a \times 20$$

$$a = 2 \text{ m/s}^2$$

$$v^2 - u^2 = 2as$$

$$40^2 - 0 = 2 \times 2s_1$$

$$\therefore s_1 = 400 \text{ m}$$

$$\text{(ii) } s_2 = v \times t_2 = 40 \times 20 = 800 \text{ m}$$

$$\text{(iii) } v = u + at$$

$$0 = 40 + a \times 40$$

$$\therefore a = -1 \text{ m/s}^2$$

$$0^2 - 40^2 = 2(-1)s_3$$

$$\therefore s_3 = 800 \text{ m}$$

$$\text{Total distance travelled} = s_1 + s_2 + s_3$$

$$= 400 + 800 + 800 = 2000 \text{ m}$$

$$\text{Total time taken} = 20 + 20 + 40 = 80 \text{ s}$$

$$\therefore \text{Average velocity} = \frac{2000}{80}$$

$$= 25 \text{ m/s}$$

2. (c) Taking vertical downward motion of projectile from point of projection to ground, we have

$$u = -50 \sin 30^\circ = -25 \text{ m/s}$$

$$a = +10 \text{ m/s}^2, s = 70 \text{ m}, t = ?$$

$$s = ut + \frac{1}{2}at^2$$

$$\text{So, } 70 = -25 \times t + \frac{1}{2} \times 10 \times t^2$$

$$\text{or } 5t^2 - 25t - 70 = 0 \text{ or } t^2 - 5t - 14 = 0$$

$$\text{On solving } = 7 \text{ s}$$

3. (c) $h = -vt_1 + \frac{1}{2}gt_1^2$ or $\frac{h}{t_1} = -v + \frac{1}{2}gt_1$... (i)

$$h = vt_2 + \frac{1}{2}gt_2^2 \text{ or } \frac{-h}{t_2} = -v + \frac{1}{2}gt_2 \text{ ... (ii)}$$

$$\therefore \frac{h}{t_1} + \frac{h}{t_2} = \frac{1}{2}g(t_1 + t_2)$$

$$\text{or } h = \frac{1}{2}gt_1t_2$$

For falling under gravity from the top of the tower

$$h = \frac{1}{2}gt^2$$

$$\therefore \frac{1}{2}gt_1t_2 = \frac{1}{2}gt^2 \Rightarrow t = \sqrt{t_1t_2}$$

4. (a) Let us draw the figure for given situation,

$$\Rightarrow 4t = 6 + \frac{1}{2} \times 12 \times t^2$$

$$\Rightarrow 4t = 6 + 0.6t^2$$

$$5. (a) \quad t_1 = \frac{2u \sin \alpha}{g}$$

$$t_2 = \frac{2u \sin(90^\circ - \alpha)}{g}$$

$$\text{So,} \quad t_1 \times t_2 = 2 \frac{u^2}{g^2} \sin 2\alpha$$

$$\text{or} \quad t_1 \times t_2 = \frac{2R}{g} \quad \left(\because R = \frac{u^2 \sin 2\alpha}{g} \right)$$

$$t_1 \times t_2 \propto R$$

6. (c) An object is said to be moving with a uniform acceleration, if its velocity changes by equal amount in equal intervals of time. The velocity-time graph of uniformly accelerated motion is a straight line inclined to time axis. Acceleration of an object in a uniformly accelerated motion in one dimension is equal to the slope of the velocity-time graph with time axis.

7. (d) When stone travels horizontally, then it must be at the maximum height.

$$\text{So,} \quad 2 = \frac{u \sin \theta}{g}$$

$$\Rightarrow \quad u \sin \theta = 20 \quad \dots(i)$$

$$\text{Also,} \quad \tan 45^\circ = \frac{u \sin \theta - g(1)}{u \cos \theta}$$

$$\Rightarrow \quad u \cos \theta = 20 - 10$$

$$\Rightarrow \quad u \cos \theta = 10 \quad \dots(ii)$$

Squaring of Eqs. (i) and (ii) and adding, we get

$$u = 10\sqrt{5} \text{ ms}^{-1} \text{ and } \tan \theta = 2$$

$$\Rightarrow \quad \theta = \tan^{-1}(2)$$

8. (c) Average velocity $v_{av} = \frac{\text{Total distance}}{\text{Total time}}$

$$\Rightarrow \quad v_{av} = \frac{s + s + s}{\frac{s}{u} + \frac{s}{v} + \frac{s}{\omega}} \Rightarrow v_{av} = \frac{3uv\omega}{u\omega + v\omega + u\omega}$$

9. (b) As x increases, time first increases and then decreases. This is not possible.

10. (c) Direction of velocity is always tangent to the path so at the top of trajectory, it is in horizontal direction.

11. (b) Total displacement of the object = Area (DABCE)
= Area of $\triangle ABC$ + Area of rectangle (ACED)

$$= \left[\frac{1}{2} \times (40 - 20) \times (4 - 1) \right] + [(40 - 20) \times 1]$$

$$= \frac{1}{2} \times 20 \times 3 + 20$$

$$= 30 + 20$$

$$= 50 \text{ m}$$

12. (a) Direction of velocity is always tangent to the path, so at the top of trajectory it is in horizontal direction and acceleration due to gravity is always in vertically downward direction.

Hence, $\mathbf{v}$ and $\mathbf{g}$ are perpendicular to each other.

13. (c) At the top most point of the projectile there is only horizontal component of velocity and acceleration due to gravity is vertically downward, so velocity and acceleration are perpendicular to each other.

14. (c)

4

Newton's Laws of Motion and Friction

Force

Force is an external effort in the form of push or pull which

- (i) generates or tends to generate motion in a body at rest,
- (ii) stops or tends to stop a body in motion,
- (iii) increases or decreases the magnitude of velocity of the moving body,
- (iv) changes the direction of motion of the body.

Classification of Forces

Based on the nature of interaction between two bodies, forces may be broadly classified as under

- (i) **Field forces** are those forces that act between two bodies separated by a distance without any actual contact. Gravitational force between two bodies and electrostatic force between two charges are the examples of field forces.
- (ii) **Contact forces** are those forces that act between two bodies in contact.
e.g. tension, normal reaction, friction, etc.

Inertia

It is an inherent property of all bodies, by virtue of which they cannot change by themselves their state of rest or of uniform motion along a straight line.

As inertia of a body is measured by the mass of the body. So, heavier the body, greater is the force required to change its state.

Newton's Laws of Motion

There are three laws of motion stated by Newton. These laws describe the relationship between a body and the forces acting upon it and its motion in response to said forces. Newton's laws are not valid in the non-inertial frames, they have to be modified by introducing the concept of pseudo force.

First Law or Law of Inertia

If the net force ΣF exerted on an object is zero, then the object continues in its original state of motion (or rest). That is, if $\Sigma F = 0$, an object at rest remains at rest and or object moving with constant velocity. This is **Newton's first law**.

Linear Momentum

The linear momentum of a body is defined as a product of mass and velocity of the body, i.e.

$$\mathbf{p} = m\mathbf{v}$$

Momentum is a vector quantity.

A body at rest cannot possess linear momentum and a moving body always possesses linear momentum.

Second Law

The acceleration of an object is directly proportional to the net force acting on it and is inversely proportional to its mass.

$$a = \frac{\Sigma F}{m}$$

This is the **Newton's second law**.

The above equation in vector form is $\Sigma \mathbf{F} = m\mathbf{a}$,

where $\mathbf{a}$ is the acceleration of the object, m is its mass and $\Sigma \mathbf{F}$ represents the vector sum of all the forces acting on the object.

It also states that the time rate of change of momentum of body is equal to the net external force exerted on that body

i.e.
$$\mathbf{F}_{\text{net}} = \frac{d\mathbf{p}}{dt}$$

If $F_1, F_2, F_3 \dots$ are the concurrent forces acting at the same point, then the point will be in equilibrium, if

$$F_1 + F_2 + F_3 \dots = 0$$

Impulse

- When a force of large magnitude acts on an object for a small time interval, the force is called impulsive force. In such cases, we measure the total effect of force.

- Impulse of a force is a measure of the total effect of force. Mathematically, impulse $\mathbf{J} = \mathbf{F}_{\text{av}} dt = \int_0^{\Delta t} \mathbf{F} dt$

- For a force-time ($F-t$) graph, the area under the graph gives the value of the impulse. As, $\mathbf{F} = \frac{d\mathbf{p}}{dt}$.

- Hence, impulse $\mathbf{J} = \int_0^{\Delta t} \mathbf{F} dt$
 $= \int_0^{\Delta t} \frac{d\mathbf{p}}{dt} dt = \int_{p_i}^{p_f} d\mathbf{p} = \mathbf{p}_f - \mathbf{p}_i$. This relation is known as the **impulse-momentum theorem**.

Third Law

If two objects interact, the force F_{12} which the object 1 exerts on object 2 is equal in magnitude but opposite in direction to the force F_{21} which the object 2 exerts on object 1. This is **Newton's third law**, i.e. $F_{12} = -F_{21}$

Conservation of Linear Momentum

According to the principle of conservation of linear momentum, if there is no external force acting on a system, then total momentum of the system remains constant.

According to second law of motion,

$$\mathbf{F} = \frac{d\mathbf{p}}{dt}$$

If no force is acting, then $\mathbf{F} = 0$.

So,
$$\frac{d\mathbf{p}}{dt} = 0 \Rightarrow \mathbf{p} = \text{constant}$$

$$m_1 v_1 = m_2 v_2 = \text{constant}$$

Connected Motion

The connected motion describes the relative motion between two objects whether it is between two blocks and a plane or it is between a block and an inclined plane.

- If two blocks of masses m_1 and m_2 are placed on a perfectly smooth surface and are in contact, then

Acceleration of the blocks,
$$a = \frac{F}{m_1 + m_2}$$

and the contact force (acting normally) between the two blocks is
$$f = m_2 a = \frac{F m_2}{(m_1 + m_2)}$$

- For a block of mass m placed on a fixed, perfectly smooth inclined plane of angle θ , the forces acting on the block are shown in the figure.

Obviously, here

$$\Rightarrow a = g \sin \theta$$

3. If a block of mass m is placed on a smooth movable wedge of mass M , which in turn is placed on smooth surface, then a force F is applied on the wedge, horizontally.

The acceleration of the wedge and the block is

$$a = \frac{F}{(M + m)}$$

Force on the block, $F = (M + m)a$

$$= (M + m)g \tan \theta$$

4. For a block system shown in the figure, acceleration of the system

$$a = \frac{F}{m_1 + m_2 + m_3}$$

Tension in the string

$$T_1 = (m_2 + m_3)a = \frac{F(m_2 + m_3)}{(m_1 + m_2 + m_3)}$$

and tension $T_2 = m_3a = \frac{Fm_3}{m_1 + m_2 + m_3}$

5. For a block system suspended freely from a rigid support as shown in the figure, the acceleration of the system $a = 0$.

Tension in the string,

$$T_1 = (m_1 + m_2 + m_3)g$$

$$T_2 = (m_2 + m_3)g$$

and

$$T_3 = m_3g$$

6. For a block system and a pulley shown in the figure, value of the acceleration of the system

$$a = \frac{(m_1 + m_2 - m_3)g}{(m_1 + m_2 + m_3)}$$

$$\text{Tension, } T_1 = \frac{2m_1m_3g}{(m_1 + m_2 + m_3)}$$

$$\text{Tension, } T_2 = \frac{2m_3(m_1 + m_2)g}{(m_1 + m_2 + m_3)} \text{ and}$$

$$\text{Tension, } T = 2T_2 = \frac{4m_3(m_1 + m_2)g}{(m_1 + m_2 + m_3)}$$

7. For the pulley and block arrangement shown in the figure, we have

Net acceleration

$$a = \frac{\text{Net accelerating force}}{\text{Total mass}} = \frac{(m_1 - m_2)g}{(m_1 + m_2 + M)}$$

$$\text{Tension, } T_1 = m_1(g - a) = \frac{(M + 2m_2)m_1g}{(M + m_1 + m_2)}$$

$$\text{and Tension, } T_2 = m_2(g + a) = \frac{(M + 2m_1)m_2g}{(M + m_1 + m_2)}$$

8. For the system of block and pulley, with a smooth inclined plane shown in the figure, we have

$$\text{Net acceleration, } a = \frac{(m_1 - m_2 \sin \theta)g}{(m_1 + m_2)}$$

If $m_1 g > m_2 g \sin \theta$
 and $a = \frac{(m_2 \sin \theta - m_1)g}{m_1 + m_2},$

If $m_1 g < m_2 g \sin \theta$
 and tension in the string

$$T = m_1(g - a) = \frac{m_1 m_2 (1 + \sin \theta)}{(m_1 + m_2)}$$

9. For a pulley and block system on a smooth double inclined plane as shown in the figure, we have

Net acceleration

$$a = \frac{(m_1 \sin \theta_1 - m_2 \sin \theta_2)g}{(m_1 + m_2)},$$

for $\theta_1 > \theta_2, m_1 > m_2$
 and tension in the string

$$T = m_1(g \sin \theta_1 - a) = \frac{m_1 m_2 (\sin \theta_1 + \sin \theta_2)g}{(m_1 + m_2)}$$

Lami's Theorem

For three concurrent forces in equilibrium position. If three forces acting at a point be in equilibrium, then each force is proportional to the sine of the angle between the other. Thus, if the forces are P, Q and R ; α, β, γ be the angles between Q and R, R and P, P and Q respectively, also the forces are in equilibrium, we have

$$\frac{P}{\sin \alpha} = \frac{Q}{\sin \beta} = \frac{R}{\sin \gamma}$$

Friction

The opposing force which comes into play when a body moves or tries to move over the surface of another body, is known as friction. Force of friction acts tangentially to the surface in contact. e.g. A ball rolling over the floor stops after sometime.

Types of Frictions

Force of friction can be classified into following types

Laws of Friction

1. Limiting friction is directly proportional to the normal reaction (R), i.e. $f_s \propto R$.
2. It acts opposite to the direction of body which is at the verge of moving over the other.
3. It depends upon the nature of the material and nature of the surface in contact.

Coefficient of Friction (μ)

It is defined as the division of the force of limiting friction (f_s) and normal reaction (R) between them.

i.e.
$$\mu = \frac{f_s}{R}$$

So, value of μ depends on (a) nature of the surface in contact i.e. dry or wet; rough or smooth, (b) material of the surface in contact.

Angle of Friction (θ)

It is defined as the angle between the normal reaction (R) and the resultant of the frictional force (f_s) and reaction R , as shown in figure.

In $\triangle AOB$,

$$\tan \theta = \frac{AB}{OB} = \frac{f_s}{R} = \frac{\mu_s R}{R} \text{ or } \tan \theta = \mu_s \Rightarrow \theta = \tan^{-1}(\mu_s)$$

i.e. coefficient of limiting friction between any two surfaces in contact is equal to tangent of the angle of friction between them.

Angle of Repose (α)

The minimum angle of inclination of a plane with the horizontal, such that a body placed on the plane just begins to slide down the inclined plane is known as the angle of repose or angle of sliding. From figure, we have

$$\mu mg \sin \alpha = F = \text{Force of limiting friction}$$

$$mg \cos \alpha = R = \text{Force of normal reaction}$$

So,
$$\frac{\mu mg \sin \alpha}{mg \cos \alpha} = \frac{F}{R}$$

$$\Rightarrow \tan \alpha = \frac{F}{R} = \frac{\mu R}{R} = \mu \Rightarrow \alpha = \tan^{-1}(\mu) \text{ or } \alpha = \theta$$

i.e. Angle of repose = Angle of friction

Some Important Points

- (i) When F increases, normal reaction shifts from centre of mass to right. At the time of toppling, normal reaction acts through point A . Also, the net force on the body gives acceleration of the centre of mass.

- (ii) If the body is in rest with respect to the surface, then $f_r < \mu_s N$.
 (iii) If the body is just in motion, then $f_r = \mu_s N$
 (iv) If the body is in motion, then $f_r = \mu_k N$
 (v) If some bodies have same accelerations, then they are taken as a system. If they do not move together, bodies are not taken as a system.
 (vi) The force of friction during pushing is greater than that of pulling in the same manner.
 (vii) It is misconception to say that friction always opposes the motion of the body. It only opposes the relative motion between surfaces.

$$mg - T = ma$$

- (viii) Gravitational force : Electromagnetic force : Strong force : Weak force = $1 : 10^{36} : 10^{38} : 10^{25}$

- (ix) For the equilibrium of a body on an inclined plane,

$$mg \sin \theta = \mu_s mg \cos \theta$$

$$\Rightarrow \mu_s = \tan \theta$$

In this case, $0 < \mu < 1$

- (x) The force acting on m_2 is $f_2 = \mu_2 m_2 g$.

If the system moves with the common acceleration, then

$$F - \mu_1(m_1 + m_2)g = (m_1 + m_2)a$$

$$f_2 = m_2 a$$

$$\mu_2 m_2 g = m_2 a$$

$$\therefore a = \mu_2 g$$

- (xi) If force is applied on upper block, $f_2 =$ limiting friction between m_1 and $m_2 = \mu_2 m_2 g$
 $f_1 =$ limiting friction between the surface and $m_1 = \mu_1(m_1 + m_2)g$

If $F > f_1$, then both blocks move with different acceleration and the maximum friction acts between the blocks. $F - f_2 = m_2 a_2$

$$F - \mu_2 m_2 g = m_2 a_2$$

$$N_2 = m_2 g$$

$$N_1 = N_2 + m_1 g = (m_1 + m_2)g$$

$$\therefore f_1 = \mu_1 N_1 = \mu_1(m_1 + m_2)g$$

$$f_2 = \mu_2 m_2 g$$

If $f_2 < f_1$, then m_1 remains in rest.

If $f_2 > f_1$, then m_1 moves in the direction of f_2 .

$$f_2 - f_1 = m_1 a_1$$

If $F < f_2$, then no relation is found between m_1 and m_2 . i.e. m_1 and m_2 move together.

If $F < f_1$, then the system is in rest.

If $F > f_1$, the system moves with the common acceleration a . In this case,

$$F - f_1 = (m_1 + m_2)a$$

$$\text{or } F - \mu_1(m_1 + m_2)g = (m_1 + m_2)a$$

Practice Exercise

- Two bodies have same mass and speed, then
 - their momentums are same
 - the ratio of momentums is not determined
 - the ratio of their magnitudes of momentum is one
 - Both a and b are correct
- In the superhit film 'Raja Hindustani' Amir khan greets his beloved by shaking hand, What kind of force do they exert?
 - Nuclear
 - Gravitational
 - Weak
 - Electromagnetic
- A heavy block of mass m is supported by a cord C attached to the ceiling, and another cord D is attached to the bottom of the block. If a sudden jerk is given to D , then
 - cord C breaks
 - cord D breaks
 - cord C and D both break
 - None of the cords breaks

- At time t second, a particle of mass 3 kg has position vector $\mathbf{r}$ metre, where $\mathbf{r} = 3t\hat{i} - 4\cos t\hat{j}$. Find the impulse of the force during the time interval $0 \leq t \leq \frac{\pi}{2}$
 - $12\hat{j}$ N-s
 - $9\hat{j}$ N-s
 - $4\hat{j}$ N-s
 - $14\hat{j}$ N-s
- Three blocks of masses $m_1 = 1\text{ kg}$, $m_2 = 2\text{ kg}$ and $m_3 = 3\text{ kg}$ are placed in contact on a horizontal frictionless plane as shown in figure. A force of 12 N is applied on m_1 . Acceleration of the system is
 - 12 m/s^2
 - 2 m/s^2
 - 6 m/s^2
 - 4 m/s^2
- A particle is acted upon by a force of constant magnitude which is always perpendicular to the velocity of the particle. The motion of the particle takes place in a plane. It follows that
 - its velocity is constant
 - its kinetic energy is constant
 - it moves in a circular path
 - Both b and c are correct
- A particle of mass m moves on the x -axis as follows. It starts from rest at $t = 0$ from the point $x = 0$ and comes to rest at $t = 1$ at the point $x = 1$. No other information is available about its motion at intermediate time ($0 < t < 1$). If α denotes the instantaneous acceleration of the particle, then
 - α cannot remain positive for all t in the interval $0 \leq t \leq 1$
 - $|\alpha|$ cannot exceed 2 at any point in its path
 - $|\alpha|$ be ≥ 4 at point or some points in its path
 - Both a and c are correct

- A 0.1 kg body moves at a constant speed of 10 m/s. It is pushed by applying a constant force for 2 s. Due to this force, it starts moving exactly in the opposite direction with a speed of 4 m/s. Then,
 - the deceleration of the body is 7 m/s^2
 - the magnitude of change in momentum is 1.4 kg-m/s
 - impulse of the force is 1.4 N-s
 - the force which acts on the ball is 0.7 N
 - All of the above
- Water jet issues water from a nozzle of 2 cm^2 cross-section with velocity 30 cm/s and strikes a plane surface placed at right angles to the jet. The force exerted on the plane is
 - 200 dyne
 - 400 dyne
 - 1800 dyne
 - None of the above
- The action and reaction forces referred to Newton's third law of motion
 - must act upon the same bodies
 - must act upon different bodies
 - need not to be equal in magnitude but must have the same line of action
 - must be equal in magnitude but need not have the same line of action
- A man is pulling a rope attached to a block on a smooth horizontal table. The tension in the rope will be the same at all points
 - if and only if the rope is not accelerated
 - if and only if the rope is massless
 - if either the rope is not accelerated or is massless
 - always
- A particle of mass m moves on the x -axis under the influence of a force of attraction towards the origin O given by $F = -\frac{k}{x^2}\hat{i}$. If the particle starts from rest at $x = a$. The speed of it will attain to reach at distance x from the origin O will be
 - $\sqrt{\frac{2k}{m}} \left[\frac{x-a}{ax} \right]^{1/2}$
 - $\sqrt{\frac{2k}{m}} \left[\frac{a+x}{ax} \right]^{1/2}$
 - $\sqrt{\frac{k}{m}} \left[\frac{ax}{x-a} \right]$
 - $\sqrt{\frac{m}{2k}} \left[\frac{a-x}{ax} \right]^{1/2}$

13. A particle is on a smooth horizontal plane. A force F is applied whose F - t graph is given. Then,

- a. at t_1 , acceleration is constant
 b. initially body must be in rest
 c. at t_2 , acceleration is constant
 d. initially acceleration is zero
 e. both c and d are correct
14. A force F is applied to the initially, stationary cart. The variation of force with time is shown in the figure. The speed of cart at $t = 5$ s is

- a. 10 m/s b. 8.33 m/s c. 2 m/s d. zero
15. The mass m is placed on a body of mass M . There is no friction. The force F is applied on M and it moves with acceleration a . Then, the force on the top body is
- a. F b. ma
 c. $F - ma$ d. None of these
16. Three identical blocks each of mass M are along a frictionless table and a force F is acting as shown. Which of the following statements is false?
- a. The net vertical force on block A is zero
 b. The net force on block A is $\frac{F}{3}$
 c. The acceleration of block C is $\frac{F}{3M}$
 d. The force of interaction between A and B is $\frac{2F}{3}$
17. A 40 N block is supported by two ropes. One rope is horizontal and the other makes an angle of 30° with the ceiling. The tension in the rope attached to the ceiling is approximately
- a. 80 N b. 40 N c. 34.6 N d. 46.2 N
18. A weight w is suspended from the midpoint of a rope, whose ends are at the same level. In order to make the rope perfectly horizontal, the force applied to each of its ends must be
- a. less than w b. equal to w
 c. equal to $2w$ d. infinitely large
19. A ring of mass 5 kg sliding on a frictionless vertical rod connected by a block B of mass 10 kg by the help of a massless string.

Then, at the equilibrium of the system, the value of θ is

- a. 30° b. 60°
 c. 90° d. 0°
20. A body of mass 10 kg is to be raised by a massless string from rest to rest, through a height 9.8 m. The greatest tension which the string can safely bear is 20 kg-wt. The least time of ascent is
- a. 1 s
 b. 3 s
 c. 4 s
 d. None of the above
21. Which of the following expression correctly represents T_1 and T_2 if the system is given an upward acceleration by a pulling up mass A?

- a. $T_1 = M_A(a - g) + M_B(a - g)$, $T_2 = M_B(a - g)$
 b. $T_1 = M_A(g - a) + M_B(g - a)$, $T_2 = M_B(g - a)$
 c. $T_1 = M_A(g + a) + M_B(g + a)$, $T_2 = M_B(g + a)$
 d. $T_1 = M_A(g + a)$, $T_2 = M_B(g + a)$
22. A chain consisting of 5 links each of mass 0.1 kg is lifted vertically with a constant acceleration of 2.5 m/s^2 as shown in the figure. The force of interaction between the top link and the link immediately below it, will be
- a. 6.15 N
 b. 4.92 N
 c. 3.69 N
 d. 2046 N
23. In the given figure,
- a. acceleration of m_1 and m_2 are same
 b. the magnitude of relative acceleration of m_1 with respect to m_2 is twice the magnitude of acceleration of m_1
 c. the velocities of m_1 and m_2 are same
 d. the speed of m_1 and m_2 are not same

24. The actual acceleration of body A is a . Then,

- the acceleration of B is a
- the acceleration of B is $2a$
- the magnitude of relative acceleration of B with respect to A is $\sqrt{2}a$
- the momentum of A may be equal to that of B

25. In the given ideal pulley system,

- tension in string is zero
- pulleys B and C rotate counter anti-clockwise and the pulley A clockwise
- A and B are same and is equal to g
- All of the above

26. Pulleys and strings are massless. The horizontal surface is smooth. The acceleration of the block A is

- $\frac{F}{m}$
- $\frac{F}{2m}$
- $\frac{F}{4m}$
- zero

27. For the system shown in the figure, the pulleys are light and frictionless. The tension in the string will be

- $\frac{2}{3}mg \sin \theta$
- $\frac{3}{2}mg \sin \theta$
- $\frac{1}{2}mg \sin \theta$
- $2mg \sin \theta$

28. In the given figure,

- both masses always remain in same level
- after sometime, A is lower than B
- after sometime, B is lower than A
- no sufficient information

29. Observer O_1 is in a lift going upwards and O_2 is on the ground. Both apply Newton's law and measure normal reaction on the body

- both measure the same value
- both measure zero
- both measure different value
- no sufficient data

30. A particle is found to be at rest when seen from frame S_1 and moving with a constant velocity when seen from another frame S_2 .

Mark the possible points from the following.

- Both the frames are inertial
- Both the frames are non-inertial
- S_1 is non-inertial and S_2 is inertial
- Both a and b are correct

31. A block of mass 10 kg is suspended through two light springs which are balanced as shown in the figure. Then,

- both the scales will read 10 kg
- both the scales will read 5 kg
- the upper scale will read 10 kg and the lower zero
- the readings may be of any value but their sum will be 10 kg

32. The normal reaction on a body placed in a lift moving up with constant acceleration 2 m/s^2 is 120 N . Mass of body is (Take, $g = 10\text{ m/s}^2$)

- 10 kg
- 15 kg
- 12 kg
- 5 kg

33. A block of mass m is moving on a wedge with the acceleration a_0 . The wedge is moving with the acceleration a_1 . The magnitude of pseudo force on the block is

a. ma_0 b. ma_1 c. $m\sqrt{a_0^2 + a_1^2}$ d. $m\left(\frac{a_1 + a_0}{2}\right)$

34. A point mass m is moving along inclined plane with acceleration a with respect to smooth triangular block. The triangular block is moving horizontally with acceleration a_0 . The value of a is

a. $g \sin \theta + a_0 \cos \theta$ b. $g \sin \theta - a_0 \cos \theta$
c. $g \cos \theta - a_0 \sin \theta$ d. $g \cos \theta - a_0 \tan \theta$

35. A uniform fine chain of length l is suspended with lower end just touching a horizontal table. Find the pressure on the table, when a length x has reached the table.

a. mgx b. $2mgx$ c. $3mgx$ d. $\frac{mgx}{2}$

36. A uniform chain is coiled up on a horizontal plane and one end passes over a small light pulley at a height 'a' above the plane. Initially, a length 'b' hangs freely on the other side. If $b = 2a$, then

a. the end descends with a constant acceleration $g/3$
b. the end descends with acceleration depends upon hanging position
c. acceleration cannot be determined
d. acceleration is variable

37. A mass m is placed over a spring of spring constant k , the acceleration of mass at the lowest position is

a. g
b. zero
c. $\left(\frac{kx}{m} - g\right)$, where x is compression in spring
d. None of the above

38. In the figure, the ball A is released from rest when the spring is at its natural length. For the block B of mass M to leave contact with the ground at some stage, the minimum mass of A must be

a. $2M$
b. M
c. $\frac{M}{2}$
d. a function of M and the force constant of the spring

39. A bicycle is in motion. When it is not pedaled, the force of friction exerted by the ground on the two wheels is such that it acts

a. in the backward direction on the front wheel and in the forward direction on the rear wheel

b. in the forward direction on the front wheel and in the backward direction on rear wheel
c. in the backward direction on both the front and the rear wheels
d. in the forward direction on both the front and the rear wheels

40. If a body of mass m is moving on a rough horizontal surface of coefficient of kinetic friction μ , the net electromagnetic force exerted by surface on the body is

a. $mg\sqrt{1+\mu^2}$ b. μmg c. mg d. $mg\sqrt{1-\mu^2}$

41. A block is placed on a rough floor and a horizontal force F is applied on it. The force of friction by the floor on the block is measured for different values of F and a graph is plotted between them

a. the graph is a straight line of slope 45°
b. the graph is a straight line parallel to the F -axis
c. the graph is a straight line of slope 45° for small F and a straight line parallel to the F -axis for large F
d. there is a small kink on the graph

42. When a body is in rest in the condition of a horizontal applied force. Then, the slope of force and friction from graph is

a. 1 b. μ c. 0 d. -1

43. Look at the situation, when the body is in air and is moving with pure translation. This situation is shown in the figure. What happens, when the body hits the surface?

a. Sliding friction will act in the backward direction
b. The velocity of the point of contact gradually decreases
c. The sliding friction acts in such a way so as to try to make the point of contact velocity of the body same as that of the surface
d. Both a and b are correct

44. Let F , F_N and f denote the magnitudes of the contact force, normal force and the frictional force exerted by one surface on the other kept in contact. If one of these is zero, then

a. $F > F_N$ b. $F > f$
c. $F_N - f < F_N + f$ d. All of these

45. A car starts from rest to cover a distance s . The coefficient of friction between the road and the tyres is μ . The minimum time in which the car can cover the distance is proportional to

a. μ b. $\sqrt{\mu}$ c. $\frac{1}{\mu}$ d. $\frac{1}{\sqrt{\mu}}$

46. A block of mass 1 kg is placed on a wedge shown in figure. Find out minimum coefficient of friction between wedge and block to stop the block on it.

- a. 0.6 b. 0.9 c. 1 d. 0.2
47. A body of mass 2 kg is placed on rough horizontal plane. The coefficient of friction between body and plane is 0.2. Then,

- a. body will move in forward direction if $F = 5 \text{ N}$
 b. body will move in backward direction with acceleration 0.5 m/s^2 if force $F = 3 \text{ N}$
 c. if $F = 3 \text{ N}$, then body will be in rest condition
 d. Both a and c are correct
48. Two blocks of masses $M = 3 \text{ kg}$ and $m = 2 \text{ kg}$ are in contact on a horizontal table. A constant horizontal force $F = 5 \text{ N}$ is applied to block M as shown. There is a constant frictional force of 2 N between the table and the block m but no frictional force between the table and the first block M , then acceleration of the two blocks is
- a. 0.4 ms^{-2} b. 0.6 ms^{-2} c. 0.8 ms^{-2} d. 1 ms^{-2}
49. The coefficient of static friction between the bodies A and B is 0.30. Determine minimum stopping distance that the body A can have from a speed of 70 km/h with constant deceleration if the body B is not to slip forward

- a. 3 m b. 30.3 m c. 70 km d. 63 m
50. In the given figure, force of friction on body is

- a. towards left b. towards right
 c. either left or right d. no sufficient data

51. A piece of ice slides down a rough inclined plane at 45° inclination in twice the time that it takes to slide down an identical but frictionless inclined plane. What is the coefficient of friction between ice and incline?

a. $\frac{3}{7 \cot \theta}$ b. $\frac{4}{7 \cot \theta}$ c. $\frac{3}{4 \cot \theta}$ d. $\frac{7}{9 \cot \theta}$

52. Consider the situation shown in the figure. The wall is smooth but the surfaces of A and B in contact are rough. Then,

- a. system may remain in equilibrium
 b. both bodies must move together
 c. the system cannot remain in equilibrium
 d. None of the above
53. The coefficient of static friction between the two blocks is 0.363. What is the acceleration of block 1 so that block 2 does not fall?

- a. 6 ms^{-2} b. 12 ms^{-2}
 c. 18 ms^{-2} d. 27 ms^{-2}
54. Two fixed frictionless inclined plane making angles 30° and 60° with the vertical are shown in the figure. Two blocks A and B are placed on the two planes. What is the relative vertical acceleration of A with respect to B ?

- a. 4.9 ms^{-2} in horizontal direction
 b. 9.8 ms^{-2} in vertical direction
 c. Zero
 d. 4.9 ms^{-2} in vertical direction
55. A body is in equilibrium on a rough inclined plane under its own weight. If the angle of inclination of the inclined plane is α and the angle of friction is λ , then
- a. $\alpha > \lambda$ b. $\alpha > \frac{\lambda}{2}$ c. $\alpha = \lambda$ d. $\alpha \geq \lambda$
56. For the equilibrium of a body on an inclined plane of inclination 45° , the coefficient of static friction will be
- a. greater than one b. less than one
 c. zero d. less than zero

BITSAT Archives

1. A block of mass 0.18 kg is attached to a spring of force constant 2 N/m. The coefficient of friction between the block and the floor is 0.1. Initially, the block is at rest and the spring is unstretched. An impulse is given to the block.

The block slides a distance of 0.06 m and comes to rest for the first time. The initial velocity of the block in m/s is $v = N/10$. Then, N is [2014]

- a. 2 b. 3 c. 4 d. 6

2. The sum of the magnitudes of two forces acting at a point is 16 N. The resultant of these forces is perpendicular to the smaller force which has a magnitude of 8 N. If the magnitude of smaller force is x , then the value of x is [2014]

- a. 2 N b. 4 N
c. 6 N d. 7 N

3. A block of mass $m = 1$ kg is placed over a plank Q of mass $M = 6$ kg, placed over a smooth horizontal surface as shown in figure. Block P is given a velocity $v = 2$ m/s² to the right. If the coefficient of friction between P and Q is $\mu = 0.3$. Find the acceleration of Q relative to P . [2013]

- a. 4 m/s² b. 3.5 m/s²
c. 2 m/s² d. 10.0 m/s²

4. A bomb at rest explodes into three parts of the same mass. The linear momentum of two parts are $-2p \hat{i}$ and $p \hat{j}$. The magnitude of momentum of third part is $p\sqrt{x}$. Find x . [2013]

- a. p b. $\sqrt{5}p$
c. $2p$ d. $10p$

5. A block is placed on an inclined plane. The block is moving towards right horizontally with an acceleration $a_0 = g$. The length of the inclined plane (AC) is equal to 1 m. Whole the situation are shown in the figure. Assume that all the surfaces are frictionless. The time taken by the block to reach from C to A is (Take, $g = 10$ m/s²) [2013]

- a. 0.74 s b. 0.9 s
c. 0.52 s d. 1.24 s

6. Pseudo force is [2013]

- a. electromagnetic in nature
b. a nuclear force
c. a gravitational force
d. None of the above

7. A body is moved in straight line by constant power of machine. What will be the relation between the travelling distance and time? [2012]

- a. $s^2 \propto t^3$ b. $s^4 \propto t^3$
c. $s^3 \propto t^2$ d. $s \propto t^3$

8. A 10 kg stone is suspended with a rope of breaking strength 30 kg-wt. The minimum time in which the stone can be raised through a height 10 m starting from rest is (Take, $g = 10$ N kg⁻¹) [2012]

- a. 0.5 s b. 1.0 s
c. $\sqrt{\frac{2}{3}}$ s d. 2.0 s

9. The minimum force required to move a body up an inclined plane is three times the minimum force required to prevent it from sliding down the plane. If the coefficient of friction between the body and the inclined plane is $\frac{1}{2\sqrt{3}}$, the angle of the inclined plane is [2012]

- a. 60° b. 45°
c. 30° d. 15°

10. Natural length of a spring is 60 cm and its spring constant is 4000 N/m. A mass of 20 kg is hung from it. The extension produced in the spring is (Take, $g = 9.8$ m/s²) [2011]

- a. 4.9 cm b. 0.49 cm
c. 9.4 cm d. 0.94 cm

11. The linear momentum p of a body moving in one dimension varies with time t according to the equation $p = a + bt^2$, where a and b are positive constant. The net force acting on the body is [2011]

- a. a constant
b. proportional to t^2
c. inversely proportional to t
d. proportional to t

12. A block of mass 5 kg is placed on a rough inclined plane. The inclination of the plane is gradually increased till the block just begins to slide down. The inclination of the plane is then 3 in 5. The coefficient of friction between the block and the plane is (Take, $g = 10$ m/s²) [2010]

- a. $\frac{3}{5}$ b. $\frac{3}{4}$
c. $\frac{4}{5}$ d. $\frac{2}{3}$

13. A block weighing w is held against a vertical wall by pressing horizontally with a force F . Then, F needed to hold the block is [2010]

- a. equal to w b. equal to $\frac{w}{\mu}$ only
c. greater than $\frac{w}{\mu}$ only d. greater than or equal to $\frac{w}{\mu}$
14. A body of mass 2 kg is placed on a horizontal surface having coefficient of kinetic friction 0.4 and limiting coefficient of static friction 0.5. If a horizontal force 2.5 N is applied on the body, the frictional force acting on the body will be (Take, $g = 10 \text{ ms}^{-2}$) [2010]
a. 8 N b. 10 N c. 20 N d. 2.5 N
15. In figure, block A is released from rest, when spring is at its natural unstretched length. For block B of mass M to leave contact with the ground at some stage, the minimum mass of A must be [2009]

- a. $3M$ b. $\frac{M}{2}$ c. M d. cannot say
16. A 600 kg rocket is set for a vertical firing. If the exhaust speed is 1000 m/s, the mass of the gas ejected per second to supply the thrust needed to overcome the weight of rocket is [2009]
a. 117.6 kgs^{-1} b. 58.6 kgs^{-1} c. 6 kgs^{-1} d. 46.4 kgs^{-1}
17. A system consists of two cubes of masses m_1 and m_2 respectively connected by a spring of force constant k . force (F) that should be applied to the upper cube for which the lower one just lifts after the force is removed, is [2009]

- a. $m_1 g$ b. $m_2 g$
c. $(m_1 + m_2)g$ d. $\frac{m_1 m_2}{m_1 + m_2} g$

18. Starting from rest, the time taken by a body sliding down on a rough inclined plane at 45° with the horizontal is twice the time taken to travel on a smooth plane of same inclination and same distance. Then, the coefficient of kinetic friction is [2008]
a. 0.25 b. 0.33 c. 0.50 d. 0.75
19. Three weights w , $2w$ and $3w$ are connected to identical spring suspended from a rigid horizontal rod. The assembly of the rod and the weights fall freely. The positions of the weight from the rod are such that [2007]
a. $3w$ will be farthest
b. w will be farthest
c. all will be at the same distance
d. $2w$ will be farthest
20. Consider the following statement. When jumping from some height, you should bend your knees as you come to rest instead of keeping your legs stiff. Which of the following relations can be useful in explaining the statement? [2007]
a. $\Delta p_1 = -\Delta p_2$
b. $\Delta E = -\Delta(\text{PE} + \text{KE}) = 0$
c. $F\Delta t = m\Delta v$
d. $\Delta x \propto \Delta F$

where symbols have their usual meaning.

21. A body of mass 5 kg is suspended by a spring balance on an inclined plane as shown in figure. The spring balance measure [2006]

- a. 50 N b. 25 N
c. 500 N d. 10 N
22. Under the action of a force $F = Cx$, the position of a body changes from 0 to x . The work done is [2006]
a. $\frac{1}{2} Cx^2$ b. Cx^2
c. Cx d. $\frac{1}{2} Cx$
23. A student unable to answer a question on Newton's laws of motion attempts to pull himself up by tugging on his hair. He will not succeed [2005]
a. as the force exerted small
b. the frictional force while gripping is small
c. Newton's law of inertia is not applicable to living beings
d. as the force applied is internal to the system

Answer with Solutions

Practice Exercise

- (d) (a) The magnitudes of momentum are same to each other.
(b) Momentum is a vector quantity and vector does not obey division law. So, the ratio of momentum is not determined.
- (d) Contact force is an electromagnetic force.
- (b) Cord D will break due to inertia offered by the block of mass m .
- (a) $\therefore \mathbf{r} = 3t\hat{i} - 4\cos t\hat{j}$
 $\therefore \mathbf{v} = \frac{d\mathbf{r}}{dt} = 3\hat{i} + 4\sin t\hat{j}$
 $\therefore \mathbf{a} = \frac{d^2\mathbf{r}}{dt^2} = 4\cos t\hat{j}$
 $\therefore \mathbf{F} = m\mathbf{a} = 12\cos t\hat{j}$
 $\therefore \text{Impulse} = \int_0^{\pi/2} F dt$
 $= 12 \int_0^{\pi/2} \cos t dt$
 $= 12[\sin t]_0^{\pi/2} = 12 \text{ N-s}$
The direction of impulse will be in the direction of force.
 $\therefore \text{Impulse} = 12 \hat{j} \text{ N-s}$
- (b) The acceleration of the system is
$$a = \frac{\text{Net force}}{\text{Total mass}} = \frac{12}{1+2+3} = \frac{12}{6} = 2 \text{ m/s}^2$$
- (d) A force of constant magnitude which is always perpendicular to the velocity of the particle does not do work. Hence, KE of the particle is constant. As force is perpendicular to the velocity, the particle moves in a circular path.
- (d) Since, at $t = 0$ and $t = 1\text{s}$, particle is in rest. This is possible only when the particle accelerates for sometime and then decelerates to come in rest.
- (e) $a = \frac{v-u}{t} = \frac{-4-10}{2} = -7 \text{ m/s}^2$
The magnitude of change in momentum
 $= |m(v-u)| = 14 \text{ kg-m/s} = \text{Impulse}$
Now, $F = ma = 0.7 \text{ N}$
- (c) $\therefore F = \frac{\Delta p}{\Delta t} = v \frac{\Delta m}{\Delta t} = \rho A v \frac{\Delta x}{\Delta t}$
 $= \rho A v \left(\frac{v \Delta t}{\Delta t} \right) = 1 \times 2 \times (30)^2 = 1800 \text{ dyne}$
- (b) The action and reaction forces must act upon different bodies.
- (c) The tension in the rope will be same at all points if it is massless or if the string has mass, the tension will be the same in the string when it is not accelerating.

$$12. (a) \therefore F = -\frac{k}{x^2}$$

$$\therefore \text{Acceleration, } f = -\frac{k}{mx^2}$$

When x decreases, v increases.

$$\therefore f = -v \frac{dv}{dx}$$

$$\therefore -v \frac{dv}{dx} = -\frac{k}{mx^2}$$

$$\text{or } \int_0^v v dv = \frac{k}{m} \int_a^x \frac{1}{x^2} dx$$

$$\therefore v = \sqrt{\frac{2k}{m} \left(\frac{x-a}{ax} \right)^{1/2}}$$

- (e) At t_2 , force is constant.

So, acceleration is constant.

At $t = 0$, force is zero. Hence, acceleration is zero.

- (b) The equation of parabola is

$$x^2 = 4ay$$

$$\text{Here, } t^2 = 4aF$$

When $t = 5 \text{ s}$, $F = 50 \text{ N}$

(see graph)

$$\therefore 5^2 = 4a \times 50$$

$$\therefore a = \frac{25}{200} = \frac{1}{8}$$

$$\therefore t^2 = 4 \times \frac{1}{8} F = \frac{F}{2} \Rightarrow F = 2t^2$$

$$\text{Acceleration} = \frac{F}{m} = \frac{2t^2}{m} = \frac{2t^2}{10} = \frac{t^2}{5}$$

$$\therefore \frac{dv}{dt} = \frac{t^2}{5} \quad \text{or} \quad \int_0^v dv = \int_0^{5t^2} \frac{t^2}{5} dt$$

$$\therefore v = \frac{1}{5} \left[\frac{t^3}{3} \right]_0^{5t^2} = \frac{125}{15} = 8.33 \text{ m/s}$$

- (d) Since, no force of friction is present. So, no horizontal force is present on body of mass m . In vertical direction normal force balances weight of the body. Hence, net force of top body must be zero. Lesser contact force corresponds more comfortableness.

- (b,c,d) The acceleration of system in rightward direction is

$$a = \frac{F}{m_A + m_B + m_C} = \frac{F}{3M}$$

For A,

From force diagram of A,

Net force on A = $F - F_1$

$$= m_A a = \frac{MF}{3M} = \frac{F}{3}$$

The force interaction between A and B is

$$F_1 = F - \frac{F}{3} = \frac{2F}{3}$$

17. (a) From force diagram shown in figure,

$$\Rightarrow T_1 \sin 30^\circ = 40$$

$$\therefore T_1 = 80 \text{ N}$$

18. (d) For equilibrium of body,

$$mg = 2T \cos \theta$$

$$\therefore T = \frac{mg}{2 \cos \theta}$$

For the string to be horizontal,
 $\theta \rightarrow 90^\circ$

$$\therefore T = \frac{mg}{2 \cos 90^\circ}$$

$$T \rightarrow \infty$$

19. (b) For ring,

From force diagram of ring,

$$T \cos \theta = m_1 g \quad \dots(i)$$

For block B,

$$mg = T$$

$$T \cos \theta = m_1 g$$

$$mg \cos \theta = m_1 g$$

$$\therefore \cos \theta = \frac{m_1}{m} = \frac{5}{10} = \frac{1}{2}$$

$$\Rightarrow \theta = 60^\circ$$

20. (a) $a_{\max} = \frac{T - mg}{m} = \frac{(20 - 10)}{10} = g$

During half time, body is accelerated from rest and during next half time decelerates with same magnitude to come to rest.

$$\therefore \frac{h}{2} = \frac{1}{2} a_{\max} t_1^2$$

$$\therefore t_1 = \sqrt{\frac{h}{a_{\max}}} = 1 \text{ s}$$

21. (c) The force diagram of system (A + B) is shown in figure.

$$\text{Here, } T_1 - (M_A + M_B)g = (M_A + M_B)a$$

$$\therefore T_1 = (M_A + M_B)g + (M_A + M_B)a$$

$$= (M_A + M_B)(g + a)$$

The force diagram of body B,

$$T_2 - M_B g = M_B a$$

$$\therefore T_2 = M_B(g + a)$$

22. (b) $\therefore$

$$F = 5mg = 5ma$$

$$F = 5mg + 5ma$$

$$= 5m(g + a) \quad \dots(i)$$

If the force of interaction between top (first) link and second is T. Then,

$$ma = F - mg - T$$

$$T = F - mg - ma$$

$$= 5mg + 5ma - mg - ma$$

$$= 4mg + 4ma = 4m(g + a)$$

$$T = 4 \times 0.1(9.8 + 2.5) = 4.92 \text{ N}$$

23. (b) $x_1 + x_2 = l$ (length of string)

$$\frac{dx_1}{dt} + \frac{dx_2}{dt} = 0$$

$$v_1 + v_2 = 0$$

$$\Rightarrow \text{and } v_1 = -v_2$$

$$a_1 = -a_2$$

$$a_{m_1 m_2} = a_{m_1} - a_{m_2}$$

$$= a - (-a) = 2a$$

24. (c) $a_{BA} = a_B - a_A$

$$= a_B + (-a_A)$$

25. (d) Since, the mass of the pulleys and the string are negligible, so tension is same everywhere.

Considering free body diagrams of m_1 , m_2 and the pulley A, we have

$$m_1 g - T = m_1 a_1$$

$$2T - m_2 g = m_2 a_2$$

$$2T - T = 0$$

$$2T = T$$

But this is possible only when $T = 0$

$$\therefore a_1 = a_2 = g$$

Thus, weights fall freely and pulleys B and C rotate anti-clockwise but pulley A clockwise.

26. (b)

27. (c) From force diagram in Fig. (a),

$$mg \sin \theta - T = ma \quad \dots(i)$$

In force diagram (b), $T = ma$

...(ii)

From Eqs. (i) and (ii), we get

$$a = \frac{g}{2} \sin \theta$$

$\therefore$

$$T = \frac{mg \sin \theta}{2}$$

28. (c) After sometime, right load moves on straight line ($mg - T$), but left load will oscillate in addition to the motion in straight line ($mg - T \cos \alpha$).

But, $mg - T \cos \alpha > mg - T$

$\therefore a_1 > a_2$ [in downward direction]

So, at any instant, the left load is lower than the right one.

29. (c) The value measured by O_1 is $N_1 = mg$ because acceleration of body with respect to O_1 is zero.

The value measured by O_2 is

$$N_2 - mg = ma_0$$

$\therefore N_2 = m(g + a_0)$

So,

$$N_1 \neq N_2$$

30. (d) Let the velocities of S_1 ,

S_2 and the particle in the frame of ground are v_1 , v_2 and v_3 , respectively.

The velocity of the particle in the frame of S_1 is

$$\mathbf{v}_{31} = \mathbf{v}_3 - \mathbf{v}_1 = 0 \quad \dots(i)$$

From this expression, it is obvious that at every instant, velocity of S_1 and the particle are same with respect to ground. The velocity of the particle in the frame of S_2 is

$$\mathbf{v}_{32} = \mathbf{v}_3 - \mathbf{v}_2 = \text{constant} \quad \dots(ii)$$

If S_1 and S_2 are inertial, then accelerations of S_1 and S_2 in the frame of ground are zero. If the velocity of the particle is constant in the frame of ground, then the statements of Eqs. (i) and (ii) are easily satisfied. If S_1 and S_2 are non-inertial frames of acceleration, then the statements of Eqs. (i) and (ii) are also satisfied.

31. (a) 32. (a)

33. (b)

34. (b)

From force diagram,

$$mg \sin \theta - ma_0 \cos \theta = ma$$

$\therefore$

$$a = g \sin \theta - a_0 \cos \theta$$

35. (c)

36. (a) Let the mass of hanging part of chain in left is m .

Since, $b = 2a$, so the mass of hanging part of chain in right will be $2m$.

$$\therefore 2mg - mg = 3mf$$

$$\therefore f = \frac{g}{3}$$

37. (c) The force diagram of the body at lowest position is shown in the figure force diagram of body.

$$kx - mg = ma$$

$\therefore$

$$a = \frac{kx}{m} - g$$

38. (c) For minimum mass of m , mass M breaks off contact when elongation in spring is maximum. At the time of break off, block A is at lowest position and its speed is zero. At an instant t_1

$$mg - kx = ma$$

$$v \frac{dv}{dx} = \frac{mg - kx}{m}$$

$$\int_0^0 v dv = \int_0^{x_0} \left(g - \frac{k}{m} x \right) dx$$

where, x_0 is maximum elongation in spring.

$$0 = gx_0 - \frac{kx_0^2}{2m}$$

$$x_0 = \frac{2mg}{k}$$

At the time of break off of block B,

$$Mg = kx_0$$

$$Mg = 2mg$$

$$\therefore m = \frac{M}{2}$$

39. (c) When the bicycle is being pedaled then during pedaling, the force is acting in the backward direction on the rear wheel and thus frictional force will act in the forward direction. The choice (c) is correct, when the bicycle is not pedaled.

40. (a) The net electromagnetic force = $\sqrt{N^2 + f^2}$

$$\text{But, } N = mg, f = \mu mg$$

$$\Rightarrow \text{Force} = mg\sqrt{1 + \mu^2}$$

41. (d)

42. (a) When body remains in rest. For equilibrium, static friction f is equal to applied force F .

$$\therefore F = f$$

The corresponding graph is shown in figure.

From graph, slope = $\tan 45^\circ = 1$

43. (d) Since, motion of body is in forward direction. So, friction acts in backward direction. Due to this, velocity of body starts to decrease.

44. (d)

45. (d) $F_{\max} = \mu mg$

Maximum acceleration to the car is provided by the limiting frictional force.

$$\Rightarrow a = \frac{F}{m} = \mu g$$

$$\text{Using, } s = ut + \frac{1}{2}at^2 \Rightarrow s = 0 + \frac{1}{2}a_{\max}t_{\min}^2$$

$$\Rightarrow \sqrt{\frac{2s}{\mu g}} = t \Rightarrow t \propto \frac{1}{\sqrt{\mu}}$$

46. (c) For minimum value of μ , we can write

$$mg \sin(45^\circ) = (f_s)_{\max}$$

$$mg \sin 45^\circ = (\mu)_{\min} mg \cos 45^\circ$$

$$(\mu)_{\min} = 1$$

47. (d) For moving the body, applied force should be greater or equal to limiting friction (i.e. μN).

$$\text{The limiting friction is } f_2 = \mu N = \mu mg$$

$$= 0.2 \times 2 \times 9.8 = 3.92 \text{ N}$$

- (a) Since, applied force $F = 5 \text{ N}$, so body starts to move in forward direction.

- (b) Here, applied force is lesser than limiting friction. So, body does not move.

- (c) The reason is same as option (b).

48. (b) If both blocks move together

$$F - f = (m + M)a$$

$$\therefore a = \frac{F - f}{m + M}$$

$$= \frac{5 - 2}{5} = \frac{3}{5} = 0.6 \text{ m/s}^2$$

49. (d) The maximum deceleration is

$$a = \mu g = 3 \text{ m/s}^2$$

$$\therefore v^2 = u^2 - 2as$$

$$0 = v_0^2 - 2\mu g s_{\min}$$

$$\therefore s_{\min} = \frac{v_0^2}{2\mu g} = \frac{(70 \times \frac{5}{18})^2}{6} = 63 \text{ m}$$

50. (b) From force diagram shown in Fig. (b) and (c), the direction of force of friction on B is rightward.

51. (c)

52. (c) From the diagram shown in figure, the resultant force of B in vertical direction is not zero. Hence, the system never be in equilibrium.

53. (d) In the frame of block M, m is in rest.

$$\therefore N = ma$$

For not falling, $mg < f_L$

$$\text{or } mg < \mu N$$

$$\text{or } mg < \mu ma$$

$$\text{or } a > \frac{g}{\mu}$$

$$\therefore a_{\min} = \frac{g}{\mu} = \frac{9.8}{0.368} = 27 \text{ m/s}^2$$

54. (d) We can write, $mg \sin \theta = ma$

$$\therefore a = g \sin \theta$$

where, a is along the inclined plane.

$\therefore$ Vertical component of acceleration is $g \sin^2 \theta$.

$\therefore$ Relative vertical acceleration of A with respect to B is

$$g(\sin^2 60^\circ - \sin^2 30^\circ) = \frac{g}{2} = 4.9 \text{ ms}^{-2} \text{ [in vertical direction]}$$

55. (c) For equilibrium,

$$mg \sin \alpha = \mu mg \cos \alpha$$

$$\tan \alpha = \mu = \tan \lambda \Rightarrow \alpha = \lambda$$

56. (a)

BITSAT Archives

1. (d) Here, $m = 0.18 \text{ kg}$, $k = 2 \text{ N/m}$, $\mu = 0.1$, $x = 0.06 \text{ m}$.

According to conservation of mechanical energy principle, we know

Decrease in mechanical energy

= Work done against friction

$$\frac{1}{2}mv^2 - \frac{1}{2}kx^2 = \mu mgx$$

$\Rightarrow$

$$v = \sqrt{\frac{2\mu mgx + kx^2}{m}}$$

Substituting the values of m, μ, g, x and k , we get

$$v = \sqrt{\frac{2 \times 0.1 \times 0.18 \times 9.8 \times 0.06 + 2 \times 0.06^2}{0.18}}$$

$$v = (4/10) \text{ m/s}$$

So, $N = 4$

2. (c) $x + y = 16$,

$$\text{Also, } y^2 = 8^2 + x^2$$

$$\text{or } y^2 = 64 + (16 - y)^2 \quad [\because x = 16 - y]$$

$$\text{or } y^2 = 64 + 256 + y^2 - 32y$$

$$\text{or } 32y = 320$$

$$y = 10 \text{ N}$$

$$\therefore x + 10 = 16 \Rightarrow x = 6 \text{ N}$$

3. (b) Frictional force between P and Q is $f = \mu mg$ which will retard P and accelerate Q .

$$\text{Retardation of } P \text{ is } a_P = -\frac{f}{m} = -\frac{\mu mg}{m} = -\mu g$$

$$\text{Acceleration of } Q \text{ is } a_Q = \frac{f}{M} = \frac{\mu mg}{M}$$

Acceleration of Q relative to P is

$$a_{QP} = a_Q - a_P = \frac{\mu mg}{M} - (-\mu g)$$

$$= \mu g \left[1 + \frac{m}{M} \right] = 0.3 \times 10 \left[1 + \frac{1}{6} \right] = 3.5 \text{ m/s}^2$$

4. (b) Given, $p_1 = -2p \hat{i} = 2p$ along negative x -axis.

$$p_2 = p \hat{i} = p \text{ along } y\text{-axis.}$$

The resultant momentum of two parts

$$p' = \sqrt{p_1^2 + p_2^2} = \sqrt{(2p)^2 + p^2} = p\sqrt{5}$$

As the bomb was initially at rest final momentum of all the three parts must be zero

$$p_3 + p' = 0$$

$$p_3 = -p' = -p\sqrt{5} = \sqrt{5} p$$

$$p_3 = \sqrt{5} p$$

5. (a) The forces on smaller block is given as

For the motion of the block along the incline plane in upward direction.

Net force on the block = mass $\times$ acceleration of the block

$$\Rightarrow mg \cos 30^\circ - mg \sin 30^\circ = ma \quad [\because a_0 = g]$$

$$\Rightarrow a = \left(\frac{\sqrt{3} - 1}{2} \right) g = 3.66 \text{ m/s}^2$$

$$\text{Now, from equation of motion } s = \frac{1}{2}at^2$$

$$\Rightarrow t = \sqrt{\frac{2s}{a}} = \sqrt{\frac{2 \times 1}{3.66}} = 0.74 \text{ s}$$

6. (d) Pseudo force is not a real force.

7. (a) Power = $[ML^2T^{-3}]$ = constant

$$\therefore \left[\frac{ML^2}{T^3} \right] = \text{constant}$$

$$\therefore [L^2] \propto [T^3] \quad \text{or } s^2 \propto t^3$$

8. (b) Tension in the string $T = mg$

$$= 30 \times 10 = 300 \text{ N}$$

$$T - Mg = Ma$$

$$\text{From the figure, } 300 - 10 \times 10 = 10a$$

$$\therefore a = 20 \text{ ms}^{-2}$$

Thus, the maximum acceleration with which the stone can be raised is 20 ms^{-2} .

$$\text{Given, } s = 10 \text{ m} \quad \text{and } u = 0$$

$$\therefore 10 = \frac{1}{2}(20)t^2$$

$$\Rightarrow t = 1 \text{ s}$$

9. (c) Minimum force required to move a body up a rough inclined plane is

$$F_1 = mg(\sin \theta + \mu \cos \theta)$$

Minimum force required to prevent the body from sliding down the rough inclined plane, is

$$F_2 = \mu mg \cos \theta$$

According to the question,

$$F_1 = 3F_2$$

$$\therefore mg(\sin \theta + \mu \cos \theta) = 3(\mu mg \cos \theta)$$

$$\Rightarrow \sin \theta + \mu \cos \theta = 3\mu \cos \theta$$

$$\Rightarrow \sin \theta = 2\mu \cos \theta$$

$$\Rightarrow \tan \theta = 2\mu = 2 \times \frac{1}{2\sqrt{3}} = \frac{1}{\sqrt{3}} = \tan 30^\circ$$

$$\theta = 30^\circ$$

10. (a) Given, $l = 60 \text{ cm} = 60 \times 10^{-2} \text{ m}$

$$m = 20 \text{ kg}, k = 400 \text{ N/m}$$

The weight hung from the spring

$$= mg = 20 \times 9.8 = 196 \text{ N}$$

Suppose x is the extension produced in spring

Now, force applied by the spring

= downward force on the spring

$$\therefore kx = mg \Rightarrow x = \frac{mg}{k}$$

$$\Rightarrow x = \frac{20 \times 9.8}{4000} = 0.049 \text{ m} = 4.9 \text{ cm}$$

11. (d) Given, $p = a + bt^2$

$$\frac{dp}{dt} = 2bt$$

$$\therefore F = \frac{dp}{dt}$$

$$\therefore F = 2bt \quad \text{or} \quad F \propto t$$

12. (b) $\sin \theta = \frac{3}{5}$

$$\mu = \tan \theta \Rightarrow \mu = \frac{3}{4}$$

13. (b) $F - N + 0$

$$\Rightarrow F = N$$

$$\text{Further, } f = \mu N = w$$

$$\Rightarrow \mu F = w \Rightarrow F = \frac{w}{\mu}$$

14. (d) $f_{\text{static}} = (\mu_{\text{static}}) mg$

$$\Rightarrow f_{\text{static}} = (0.5)(2)(10) \Rightarrow f_{\text{static}} = 10 \text{ N}$$

$\therefore$ Applied force is just $2.5 \text{ N} < 10 \text{ N}$. So, the block will not move. As, we know that in static region, friction is a self adjusting force and has a value equal to that of applied force.

$$\text{So, } f = F_{\text{applied}} = 2.5 \text{ N}$$

15. (b) The spring will exert maximum force when A is at lowest position, say at distance x from the present position.

$$\therefore mgx = \frac{1}{2} kx^2$$

where, k is force constant of the spring, for the block B to leave contact, $kx = Mg$

$$\therefore mgx = \frac{1}{2} Mg$$

$$\therefore m = \frac{M}{2}$$

16. (c) Thrust $= u \frac{dm}{dt} = Mg$

$$\text{or } \frac{dm}{dt} = \frac{Mg}{u} = \frac{600 \times 9.8}{1000} = 6 \text{ kgs}^{-1}$$

17. (c) Let x_0 be the maximum compression, then

$$m_1 g + F = kx_0 \quad \dots(i)$$

$$\text{and } \frac{1}{2} kx_0^2 = m_1 g x_0 \quad \dots(ii)$$

If x is the maximum elongation, then

$$kx = m_2 g \quad \dots(iii)$$

$$\text{and } -\frac{1}{2} kx^2 = m_1 g(x + x_0) \quad \dots(iv)$$

$$\text{or } k(x_0 - x) = 2m_1 g$$

From Eqs. (i) and (iii), we get

$$m_1 g + F - m_2 g = k(x_0 - x) = 2m_1 g$$

$$\text{or } F = 2m_1 g + m_2 g - m_1 g = (m_1 + m_2)g$$

18. (d) $\mu = \tan \theta \left[1 - \frac{1}{n^2} \right]$

Here, $\theta = 45^\circ$ and $n = 2$

$$\therefore \mu = \tan 45^\circ \left[1 - \frac{1}{2^2} \right] = 1 - \frac{1}{4} = \frac{3}{4} = 0.75$$

19. (c) For $w, 2w, 3w$, apparent weight will be zero because the system is falling freely. So, the distances of the weights from the rod will be same.

20. (c) $F \Delta t = m \Delta v$

$$\Rightarrow F = \frac{m \Delta v}{t}$$

By doing so time of change in momentum increases and impulsive force on knees decreases.

21. (b) Acceleration of the body down the rough inclined plane. $= g \sin \theta$

Force applied on spring balance $= mg \sin \theta$

$$= 5 \times 10 \times \sin 30^\circ = 5 \times 10 \times \frac{1}{2} = 25 \text{ N}$$

22. (a) Work done, $W = \int_0^x F \cdot dx = \int_0^x Cx \, dx = C \left(\frac{x^2}{2} \right)_0^x = \frac{1}{2} Cx^2$

23. (d) In this case, the internal force is applied on the system, so he will not succeed. According to Newton's law, the state of a body can only be changed if some external force is applied on it.

5

Circular Motion

Concept of Circular Motion

The circular motion differs from the linear motion in one very important aspect that in a circular motion particles move along circular track such that direction of motion changes continuously unlike in a linear motion. Therefore, circular motion is described in terms of angular displacement i.e. angle turned by the rotating body in an unit time.

Terms Related to Circular Motion

Some important terms used in circular motion are given as

1. Angular Displacement

It is defined as the angle turned by the particle from some reference line. Angular displacement $\Delta\theta$ is usually measured in radian.

Finite angular displacement $\Delta\theta$ is a scalar but an infinitesimally small displacement is a vector.

2. Angular Velocity

It is defined as the rate of change of the angular displacement of the body.

$$\therefore \text{Angular velocity, } \omega = \lim_{\Delta t \rightarrow 0} \left(\frac{\Delta\theta}{\Delta t} \right) = \frac{d\theta}{dt}$$
$$\omega = \frac{2\pi}{T}$$

It is an axial vector whose direction is given by the right hand rule. Its unit is rad/s.

3. Angular Acceleration

It is the rate of change of angular velocity.

Thus, $\alpha = \frac{d\omega}{dt} = \frac{d^2\theta}{dt^2}$

Its unit is rad/s^2 .

4. Velocity

A particle in a circular motion has two types of velocities and corresponding two speeds.

(i) **Linear velocity** (v) or **speed** (v)

$$\mathbf{v} = \frac{ds}{dt} \text{ and } v = |\mathbf{v}| = \left| \frac{ds}{dt} \right|$$

(ii) **Angular velocity** (ω) or **speed** (ω)

$$\omega = \frac{d\theta}{dt} \text{ and } \omega = |\omega| = \left| \frac{d\theta}{dt} \right| = \frac{d\theta}{dt}$$

Relation between linear speed (v) and angular speed (ω) is

$$v = r\omega$$

In vector form, $\mathbf{v} = \omega \times \mathbf{r}$, which is a relation between linear velocity ($\mathbf{v}$) and angular velocity (ω).

Here, $\mathbf{r}$ is the position vector of particle with respect to the centre of the circle.

5. Acceleration

Acceleration of a particle in circular motion has two components

(i) **Tangential acceleration** (a_t), which is the component of $\mathbf{a}$ in the direction of velocity.

a_t = component of $\mathbf{a}$ along $\mathbf{v}$

$$= \frac{dv}{dt} = \frac{d|\mathbf{v}|}{dt}$$

(ii) **Radial acceleration** (a_r), which is the component of $\mathbf{a}$ towards the centre of the circular motion. This is responsible for a change in the direction of velocity.

$$a_r = \frac{v^2}{r} = r\omega^2$$

(iii) **Tangential acceleration** If we differentiate above equation, we get,

$$\frac{d\mathbf{v}}{dt} = \frac{d\omega}{dt} \times \mathbf{r}$$

i.e.

$$\mathbf{a}_t = \alpha \times \mathbf{r}$$

where, $\mathbf{a}_t$ is the tangential component of acceleration which is responsible for changing the magnitude of velocity.

when speed of the particle increases a_t is positive or in the direction of the velocity.

Thus, net acceleration in this case will be

$$a = \sqrt{a_t^2 + a_r^2}$$

$$\text{where, } a_t = \frac{dv}{dt} \text{ or } = \frac{d|\mathbf{v}|}{dt}$$

Dynamics of Uniform Circular Motion

If a particle in circular motion moves with a uniform speed, then motion of the particle is called **uniform circular motion**. In such a case,

$$\frac{dv}{dt} = 0 \text{ and } a = \omega^2 r$$

or

$$a = \frac{v^2}{r^2} r$$

$$a = \frac{v^2}{r}$$

Thus, if a particle moves in a circle of radius r with a uniform speed v , then its acceleration is $\frac{v^2}{r}$ towards the centre. This acceleration is termed as **centripetal acceleration**.

Forces in Circular Motion

In circular motion of an object, two kinds of forces occur which are described below

(i) Centripetal Force

A particle performing circular motion is acted upon by a force directed along the radius towards the centre of the circle. This force is called the centripetal force.

If m is the mass of the particle, then the magnitude of centripetal force is given by
Centripetal force = Mass $\times$ Centripetal acceleration

$$\Rightarrow F = m \left(\frac{v^2}{r} \right)$$

or

$$F = mr\omega^2$$

In vector form, centripetal force is given by

$$\mathbf{F} = -\frac{mv^2}{r} \hat{\mathbf{r}}$$

or

$$\mathbf{F} = -(m\omega^2 r) \hat{\mathbf{r}}$$

where, $\hat{\mathbf{r}}$ is a unit vector directed away from the centre along the radius.

A particle performing uniform circular motion

(ii) Centrifugal Force

It can be defined as the radially directed outward force acting on a body in circular motion, as observed by a person moving with the body.

Centrifugal force = Mass $\times$ Centrifugal acceleration

$$\Rightarrow F = \frac{mv^2}{r} = mr\omega^2 \quad \text{or} \quad F = mv\omega \quad [\because v = \omega r]$$

This can be written in vector form as $\mathbf{F} = \frac{mv^2}{r} \hat{\mathbf{r}}$

Some Important Points

If a tube filled an incompressible fluid of mass m and closed at both ends is rotated with constant angular velocity ω about an axis passing through one end. Then, the force exerted by liquid at the other end is $\frac{1}{2}mL\omega^2$.

Applications of Centripetal and Centrifugal Forces

1. Motion of a Vehicle on a Level Circular Road

When a vehicle negotiates a circular path, it requires a centripetal force. In such cases the lateral force of friction may provide the required centripetal force. Thus, for maintaining its circular path required centripetal force

$$\left(\frac{mv^2}{r} \right) \leq \text{frictional force } (\mu mg)$$

$$\Rightarrow v_{\max} = \sqrt{\mu rg}$$

where, μ = coefficient of friction between road and vehicle tyres and r = radius of circular path.

2. Banking of a Curved Road

For the safe journey of a vehicle on a curved (circular) road, without any risk of skidding, the road is slightly raised towards its outer end. Let the road be banked at an angle θ from the horizontal, as shown in the figure.

$$v_{\max} = \sqrt{rg \cdot \tan \theta}$$

If b = width of the road and h = height of the outer edge of the road as compared to the inner edge, then $\tan \theta = \frac{v^2}{rg} = \frac{h}{b}$

In case of friction is present between road and tyre

$$\text{then} \quad v_{\max} = \sqrt{\frac{rg(\mu_s + \tan \theta)}{1 - \mu_s \tan \theta}}$$

where, μ_s = coefficient of static friction.

3. Bending of a Cyclist

If a curved road is not banked, then a cyclist/scooterist bends away from the vertical, while negotiating a turn on a curved road. The angle θ at which the cyclist bends from the vertical, is given by $\tan \theta = \frac{v^2}{rg}$

4. Motion of a Cyclist in a Death Well

For equilibrium of cyclist in a death well, as shown in the figure, the normal reaction N provides the centripetal force needed and the force of friction balances his weight mg .

$$\text{Thus, } N = \frac{mv^2}{r}$$

$$\text{and } f = \mu N = mg \Rightarrow v_{\max} = \sqrt{\frac{rg}{\mu}}$$

Vertical Circular Motion

It is an example of non-uniform circular motion in which speed of object decreases due to effect of gravity as the object goes from its lowest position A to highest position B.

- (i) At the lowest point A, the tension T_L and the weight mg are in mutually opposite directions and their resultant provides the necessary centripetal force,

$$\text{i.e.} \quad T_L - mg = \frac{mv_L^2}{r}$$

$$\text{or} \quad T_L = mg + \frac{mv_L^2}{r}$$

- (ii) At the highest point B, tension T_H and the weight mg are in the same direction and hence,

$$T_H + mg = \frac{mv_H^2}{r} \quad \text{or} \quad T_H = \frac{mv_H^2}{r} - mg$$

Moreover, v_L and v_H are correlated as $v_H^2 = v_L^2 - 2gr$

- (iii) In general, if the revolving particle, at any instant of time, is at position C, inclined at an angle θ from the vertical, then

$$v^2 = v_L^2 - 2gr(1 - \cos \theta)$$

$$\text{and} \quad T = mg \cos \theta + \frac{mv^2}{r}$$

- (iv) In the critical condition of just looping the vertical loop, (i.e. when the tension just becomes zero at the highest point B), we obtain the following results

$$T_H = 0, T_L = 6mg, v_L = \sqrt{5rg} \text{ and } v_H = \sqrt{rg}$$

In general, $T_L - T_H = 6mg$

Some Important Points

- When a vehicle is moving over a convex bridge, the maximum velocity $v = \sqrt{rg}$, where r is the radius of the road.
- When the vehicle is at the maximum height, the reaction of the road, is $N_1 = mg - \frac{mv^2}{r}$
- When the vehicle is moving in a dip B, then $N_2 = mg + \frac{mv^2}{r}$
- The weight that we feel is the normal force and not the actual weight.
- When body loses the contact, normal force reduces to zero.
- The normal on tangent at a point on the curve gives the direction of radius.

i.e.
$$\rho = \frac{\left[1 + \left(\frac{dy}{dx}\right)^2\right]^{3/2}}{d^2y/dx^2}$$

- where, ρ is radius of curvature.

Expression for the Radius of Curvature for a Particle at the Highest Point in the Case of Projectile Motion

$$mg = \frac{mv^2}{r} \quad (\text{But, } v = u \cos \alpha)$$

$$r = \frac{v^2}{g}$$

$$= \frac{u^2 \cos^2 \alpha}{g}$$

or

where, r is the radius of curvature.

Practice Exercise

- In circular motion
 - radial acceleration is non-zero
 - radial velocity is zero
 - body is in equilibrium
 - All of the above
- A particle is acted upon by a force of constant magnitude which is always perpendicular to the velocity of the particle. The motion of the particle takes place in a plane. It follows that
 - its velocity is constant
 - its acceleration is constant
 - its kinetic energy is constant
 - it does not move on a circular path
- A stone of mass m tied to a string of length l is rotated in a circle with the other end of the string as the centre. The speed of the stone is v . If the string breaks, the stone will
 - move towards the centre
 - move away from the centre
 - move along a tangent
 - stop

- Particles are released from rest at A and slide down the smooth surface of height h to a conveyor B. The correct angular velocity ω of the conveyor pulley of radius r to prevent any sliding on the belt as the particles transfer to the conveyor is

- a. $\sqrt{2gh}$ b. $\frac{2gh}{r}$ c. $\frac{\sqrt{2gh}}{r}$ d. $\frac{2gh^2}{r^2}$

- Two moving particles P and Q are 10 m apart at a certain instant. The velocity of P is 8 m/s making an angle of 30° with the line joining P and Q and that of Q is 6 m/s making an angle 30° with PQ as shown in figure.

Then, angular velocity of P with respect to Q is

- a. zero b. 0.1 rad/s c. 0.4 rad/s d. 0.7 rad/s

- A solid body rotates about a stationary axis, so that its angular velocity depends on the rotational angle ϕ as $\omega = \omega_0 - k\phi$, where ω_0 and k are positive constants. At the moment $t = 0$, $\phi = 0$. Find the time dependence of rotation angle.

- a. $k\omega_0 e^{-kt}$ b. $\frac{\omega_0}{k} e^{-kt}$
 c. $\frac{\omega_0}{k} (1 - e^{-kt})$ d. $\frac{k}{\omega_0} (e^{-kt} - 1)$

- The position of a point P is $\mathbf{r} = a \cos \theta \hat{i} + b \sin \theta \hat{j}$, where a and b are constants and θ is angle between $\mathbf{r}$ and x -axis. If the rate of increasing of θ is ω . Find the equation of path of particle.

- a. Circle b. Parabola
 c. Ellipse d. Straight line

8. The angular displacement of the rod is defined as $\theta = \frac{3}{20}t^2$, where θ is in radian and t is in second. The collar B slides along the rod in such a way that its distance from O is $r = 0.9 - 0.12t^2$, where r is in metre and t is in second. The velocity of collar at $\theta = 30^\circ$ is
 a. 0.45 m/s b. 0.48 m/s c. 0.52 m/s d. 0.27 m/s
9. Two buses A and B are moving around concentric circular paths of radii r_A and r_B . If the two buses complete the circular paths in the same time. The ratio of their linear speeds is
 a. 1 b. r_A / r_B
 c. r_B / r_A d. None of these
10. A stone of mass 0.3 kg attached to a 1.5 m long string is whirled around in a horizontal circle at a speed of 6 m/s. The tension in the string is
 a. 10 N b. 20 N c. 7.2 N d. None
11. A cyclist goes round a circular path of length 400 m in 20 second. Calculate the angle through which he bends from vertical in order to maintain the balance
 a. $\sin^{-1}(0.64)$ b. $\tan^{-1}(0.64)$
 c. $\cos^{-1}(0.64)$ d. None of these
12. Find the maximum speed with which an automobile can round a curve of radius 8 m without slipping if the road is unbanked and the coefficient of friction between the road and the tyres is 0.8. ($g = 10 \text{ m/s}^2$)
 a. 8 m/s b. 10 m/s
 c. 20 m/s d. None of these
13. A tube of length L is filled completely with an incompressible liquid of mass M and closed at both ends. The tube is then rotated in a horizontal plane about one of its ends with a uniform angular velocity ω . The force exerted by the liquid at the other end is
 a. $\frac{ML\omega^2}{2}$ b. $ML\omega^2$ c. $\frac{ML\omega^2}{4}$ d. $\frac{ML^2\omega^2}{2}$
14. A point on the periphery of a rotating disc has its acceleration vector making an angle of 30° with the velocity vector. The ratio a_c / a_t (a_c is centripetal acceleration and a_t is tangential acceleration) equals
 a. $\sin 30^\circ$ b. $\cos 30^\circ$ c. $\tan 30^\circ$ d. None
15. A car of 1400 kg is moving on a circular path of radius 30 m with a speed of 40 km/h. When the driver applies the brakes and the car continues to move along the circular path, what is the maximum deceleration possible if the tyres are limited to a total horizontal friction of 10.6 kN?
 a. 10 m/s^2 b. 6.36 m/s^2 c. 4 m/s^2 d. None

16. A cyclist is travelling on a circular section of highway of radius 2500 ft at the speed of 60 mile/h. The cyclist suddenly applies the brakes causing the bicycle to slow down at constant rate. Knowing that after 8 second, the speed has been reduced to 45 mile/h. The acceleration of the bicycle immediately after the brakes have been applied is
 a. 2 ft/s^2 b. 4.14 ft/s^2 c. 3.10 ft/s^2 d. 2.75 ft/s^2
17. A road of width 20 m forms an arc of radius 15 m, its outer edge is 2 m higher than its inner edge. Calculate for what velocity the road is banked?
 a. $\sqrt{10} \text{ m/s}$ b. $\sqrt{14.7} \text{ m/s}$
 c. $\sqrt{9.8} \text{ m/s}$ d. None of these
18. Three identical cars A, B and C are moving at the same speed on three bridges. The car A goes on a plane bridge, B on a bridge convex upwards and C goes on a bridge concave upwards. Let F_A, F_B and F_C be the normal forces exerted by the cars on the bridges when they are at the middle of the bridges. Then,
 a. F_A is maximum of the three forces
 b. F_B is maximum of the three forces
 c. F_C is maximum of the three forces
 d. $F_A = F_B = F_C$
19. A car runs from east to west and another car B of the same mass runs from west to east at the same path along the equator. A presses the track with a force N_1 and B presses the track with a force N_2 . Then,
 a. $N_1 > N_2$ b. $N_1 < N_2$
 c. $N_1 = N_2$ d. None of these
20. A small body of mass m slides down from the top of a hemisphere of radius R . The surface of block and hemisphere are frictionless. The height at which the body loss contact with the surface of the sphere is
 a. $\frac{3}{2}R$ b. $\frac{2}{3}R$ c. $\frac{1}{2}R$ d. $\frac{1}{3}R$
21. A person wants to drive on the vertical surface of a large cylindrical wooden well commonly known as death well in a circus. The radius of well is R and the coefficient of friction between the tyres of the motorcycle and the wall of the well is μ_s . The minimum speed, the motorcyclist must have in order to prevent slipping should be
 a. $\sqrt{\left(\frac{Rg}{\mu_s}\right)}$ b. $\sqrt{\left(\frac{\mu_s}{Rg}\right)}$
 c. $\sqrt{\left(\frac{\mu_s g}{R}\right)}$ d. $\sqrt{\left(\frac{R}{\mu_s g}\right)}$
22. A car is moving in a circular horizontal track of radius 10 m with a constant speed of 10 m/s. A plumb bob is suspended from the roof of the car by a light rigid rod of length 1 m. The angle made by the rod with the track is
 a. zero b. 30° c. 45° d. 60°

23. A heavy sphere of mass m is suspended by a string of length l . The sphere is made to revolve about a vertical line passing through the point of suspension, in a horizontal circle such that the string always remains inclined to the vertical making an angle θ . What is the period of revolution?

- a. $T = 2\pi\sqrt{\frac{l}{g}}$ b. $T = 2\pi\sqrt{\frac{l\cos\theta}{g}}$
 c. $T = 2\pi\sqrt{\frac{l\sin\theta}{g}}$ d. $T = 2\pi\sqrt{\frac{l\tan\theta}{g}}$

24. A rod of length L is hinged from one end. It is brought to a horizontal position and released. The angular velocity of the rod when it is in vertical position is

- a. $\sqrt{\frac{2g}{L}}$ b. $\sqrt{\frac{3g}{L}}$ c. $\sqrt{\frac{g}{2L}}$ d. $\sqrt{\frac{g}{L}}$

25. Two wires AC and BC are tied at C of small sphere of mass 5 kg , which revolves at a constant speed v in the horizontal circle of radius 1.6 m . The minimum value of v is

- a. 3.01 m/s
 b. 4.01 m/s
 c. 8.2 m/s
 d. 3.96 m/s

26. The small spherical balls are free to move on the inner surface of the rotating spherical chamber of radius $R = 0.2\text{ m}$. If the balls reach a steady state at angular position $\theta = 45^\circ$, the angular speed ω of device is

- a. 8 rad/s b. 2 rad/s c. 3.64 rad/s d. 9.34 rad/s

27. A frictionless track $ABCD$ ends in a semicircular loop of radius R . A body slides down the track from point A which is at a height $h = 5\text{ cm}$. Maximum value of R for the body to successfully complete the loop is

- a. 5 cm b. $\frac{15}{4}\text{ cm}$ c. $\frac{10}{3}\text{ cm}$ d. 2 cm

28. A rod OA rotates about a horizontal axis through O with a constant anti-clockwise velocity $\omega = 3\text{ rad/s}$. As it passes the position $\theta = 0^\circ$ a small block of mass m is placed on it at a radial distance $r = 450\text{ mm}$. If the

block is observed to slip at $\theta = 50^\circ$, the coefficient of static friction between the block and the rod is (Given that, $\sin 50^\circ = 0.766$, $\cos 50^\circ = 0.64$)

- a. 0.2 b. 0.55 c. 0.8 d. 1

29. A particle of mass m is moving in a horizontal circle of radius r under a centripetal force given by $\left(\frac{-k}{r^2}\right)$,

where k is a constant, then

- a. the total energy of the particle is $\left(\frac{-k}{2r}\right)$
 b. the kinetic energy of the particle is $\left(\frac{k}{r}\right)$
 c. the potential energy of the particle is $\left(\frac{k}{2r}\right)$
 d. the kinetic energy of the particle is $\left(-\frac{k}{r}\right)$

30. Kinetic energy of a particle moving along a circle of radius R depends on the distance covered as $K = as^2$, where a is a constant. Find the force acting on the particle as a function of s .

- a. $\frac{2a}{s}\sqrt{1+\left(\frac{s}{R}\right)^2}$ b. $2as\sqrt{1+\left(\frac{R}{s}\right)^2}$
 c. $2as\sqrt{1+\left(\frac{s}{R}\right)^2}$ d. $\frac{2s}{a}\sqrt{1+\left(\frac{R}{s}\right)^2}$

31. A projectile is projected at a angle 60° with horizontal with speed 10 m/s . The minimum radius of curvature of the trajectory described by the projectile is

- a. 2.55 m b. 2 m
 c. 10 m d. None of these

32. The skate board negotiates the circular surface of radius 4.5 m . At $\theta = 45^\circ$, its speed of centre of mass is 6 m/s . The combined mass of skate board and the person is 70 kg and his centre of mass is 0.75 m from the surface. The normal reaction between the surface and the skate board wheel is

- a. 500 N b. 2040 N c. 1045 N d. zero

BITSAT Archives

- A body of mass $m = 20$ g is attached to an elastic spring of length $L = 50$ cm and spring constant $k = 2 \text{ Nm}^{-1}$. The system is revolved in a horizontal plane with a frequency $\nu = 30$ rev/min. Find the radius of the circular motion and the tension in the spring.
 a. 0.25 m, 0.1 N [2014]
 b. 0.5 m, 0.52 N
 c. 0.55 m, 0.1 N
 d. 0.9 m, 0.2 N
- A car is moving on a circular road of diameter 50 m with a speed of 5 m/s. It is suddenly accelerated at a rate of 1 m/s^2 . If the mass of the car is 500 kg, then the net force acting on the car is [2011]
 a. 5 N
 b. 1000 N
 c. $500\sqrt{2}$ N
 d. $\frac{500}{\sqrt{2}}$ N
- An inclined track ends in a circular loop of radius r . From what height on the track a particle should be released so that it completes the loop, assuming there is no friction? [2010]
 a. $\frac{r}{2}$
 b. $\frac{3r}{2}$
 c. $2r$
 d. $\frac{5r}{2}$
- A small ball describes a horizontal circle on the smooth inner surface of a conical funnel. If the height of the plane of the circle above the vertex be 10 cm, what is the speed of the particle? [2009]
 a. 2 m/s
 b. 4 m/s
 c. 16 m/s
 d. 1 m/s
- The angle turned by a body undergoing circular motion depends on time as $\theta = \theta_0 + \theta_1 t + \theta_2 t^2$. Then, the angular acceleration of the body is [2006]
 a. θ_1
 b. θ_2
 c. $2\theta_1$
 d. $2\theta_2$

Answer with Solutions

Practice Exercise

- (d) In circular motion radial acceleration $a_r = \frac{v^2}{r}$ and the particle does not move along the radius of the circular path hence radial velocity is zero, radial acceleration only changes the direction of motion of the particle.
- (c) Perpendicular force does not change the magnitude of velocity hence the kinetic energy remain constant.
- (c) When the string break, there is no tension in the string, hence there is no radial acceleration to change the direction of the stone the required (tension provide centripetal force), hence the stone will move along the tangent.
- (c) First of all, we have to calculate the velocity of particles at the point B.

$$\therefore \text{Loss in PE} = \text{gain in KE} \quad \text{or} \quad mgh = \frac{1}{2}mv^2$$

$$\therefore v = \sqrt{2gh}$$

To prevent sliding, $v = r\omega$

$$\therefore \omega = \frac{v}{r} = \frac{\sqrt{2gh}}{r}$$

- (d)

$$\therefore \omega_{\text{rel}} = \frac{8 \sin 30^\circ + 6 \sin 30^\circ}{10} = 0.7 \text{ rad/s}$$

- (c) $\therefore \omega = \omega_0 - k\phi$

$$\text{or} \quad \frac{d\phi}{dt} = \omega_0 - k\phi$$

$$\text{or} \quad \int_0^\phi \frac{d\phi}{\omega_0 - k\phi} = \int_0^t dt$$

$$\text{or} \quad -\frac{1}{k} [\ln(\omega_0 - k\phi)]_0^\phi = t$$

$$\text{or} \quad \ln\left(\frac{\omega_0 - k\phi}{\omega_0}\right) = -kt$$

$$\therefore \phi = \frac{\omega_0}{k} (1 - e^{-kt})$$

- (c) $\therefore \mathbf{r} = x\hat{i} + y\hat{j}$

$$\text{But, } \mathbf{r} = a \cos \theta \hat{i} + b \sin \theta \hat{j}$$

$$\therefore x = a \cos \theta$$

$$y = b \sin \theta$$

$$\therefore \frac{x^2}{a^2} + \frac{y^2}{b^2} = \cos^2 \theta + \sin^2 \theta = 1$$

$$\therefore \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

This is an equation of ellipse.

- (c) $\therefore v_r = \frac{dr}{dt} = -0.24t$

$$v_t = r\omega = r \frac{d\theta}{dt} = r \left(\frac{6}{20} t \right) = (0.9 - 0.12 t^2) \left(\frac{6t}{20} \right)$$

$$\therefore v = \sqrt{v_r^2 + v_t^2}$$

$$\therefore \theta = \frac{3}{20} t^2 \quad \text{or} \quad \frac{\pi}{6} = \frac{3}{20} t^2$$

$$\therefore t = \sqrt{\left(\frac{20\pi}{18} \right)}$$

Putting the value of θ , $v = 0.52 \text{ m/s}$

9. (b)

10. (c) The force of tension in the string provides required centripetal force to keep the stone in circular motion.

$$\therefore T = \frac{mv^2}{R} = \frac{0.3 \times (6)^2}{1.5} = 7.2 \text{ N}$$

11. (b) $400 = 2\pi r$

$$\therefore \tan \theta = \frac{v^2}{rg} = \frac{\left(\frac{400}{20} \right)^2}{\left(\frac{400}{2\pi} \right)g}$$

$$\tan \theta = \frac{400 \times 2\pi}{400g} = \frac{6.28}{9.8} = 0.64$$

$$\therefore \theta = \tan^{-1}(0.64)$$

12. (a) Here centripetal force is provided by force of friction.

$$\therefore f = \mu_s N$$

$$\therefore f = \frac{mv^2}{r}$$

$$\text{or} \quad \mu_s N = \frac{mv^2}{r}$$

$$\text{or} \quad \mu_s mg = \frac{mv^2}{r}$$

$$\therefore v = \sqrt{\mu_s gr} = \sqrt{0.8 \times 10 \times 8} = 8 \text{ m/s}$$

13. (a)

$$dm = \frac{M}{L} dx$$

$$dF = dm x \omega^2$$

$$\int_0^L dF = \frac{M}{L} \omega^2 \int_0^L x dx$$

$$F = \frac{M}{L} \omega^2 \frac{L^2}{2} = \frac{ML\omega^2}{2}$$

14.(c) The tangential acceleration is along the tangent and a_c acts radially inwards. The resultant acceleration

$$a = \sqrt{a_c^2 + a_t^2} \quad (\text{from figure})$$

15. (b) The net acceleration to car is provided by force of friction.

$$\therefore a = \sqrt{a_n^2 + a_t^2}$$

$$\therefore F = ma = m \sqrt{\left(\frac{v^2}{r} \right)^2 + a_t^2}$$

$$\text{or} \quad 10.6 \times 10^3 = m \sqrt{\frac{v^4}{r^2} + a_t^2}$$

After solving, $a_t = 6.36 \text{ m/s}^2$

16. (b) Tangential acceleration

$$= a_t = \frac{v_f - v_i}{t} = \left(\frac{45 - 60}{8} \right) \left(\frac{22}{15} \right) = -\frac{11}{4} \text{ ft/s}^2$$

The radial acceleration is

$$a_n = \frac{v^2}{r} = \frac{\left(60 \times \frac{22}{15} \right)^2}{2500}$$

$$\therefore a = \sqrt{a_n^2 + a_t^2} = 4.14 \text{ ft/s}^2$$

17. (b)

18. (c)

For car A, $F_A = mg$... (i)

For car B, $mg - F_B = \frac{mv^2}{r}$... (ii)

For car C, $F_C - mg = \frac{mv^2}{r}$... (iii)

$\therefore F_C > F_A > F_B$

19. (a) Earth rotates from west to east about its axis

$\Rightarrow \omega_A > \omega_B$... (i)

Using, $N - mg = m\omega^2 R$... (ii)

From Eqs. (i) and (ii), we get $N_A > N_B$

or $N_1 > N_2$

20. (b) Suppose body slips at point B

$$mg \cos \theta = \frac{mv^2}{R} \quad [v = \sqrt{2g(R-h)}]$$

$$g \cos \theta = \frac{2g(R-h)}{R}$$

$$\cos \theta = \frac{2(R-h)}{R}$$

$$\frac{h}{R} = \frac{2(R-h)}{R}$$

$$\left[\cos \theta = \frac{h}{R} \right]$$

$\therefore$

$$h = \frac{2}{3}R$$

21. (a) $N = \frac{mv^2}{R}$

$$\mu_s N > mg$$

$$\frac{\mu_s mv^2}{R} < mg \quad \text{or} \quad v < \sqrt{\left(\frac{Rg}{\mu_s}\right)}$$

$\therefore$

$$v_{\min} = \sqrt{\left(\frac{Rg}{\mu_s}\right)}$$

22. (c)

23. (b)

24. (b)

25. (d) From the figure

$$T_1 \cos 30^\circ + T_2 \cos 45^\circ = mg$$

$$\text{and } T_1 \sin 30^\circ + T_2 \sin 45^\circ = \frac{mv^2}{r}$$

...(i)

...(ii)

$$\text{From Eq. (i) and Eq. (ii), we get } T_1 = \frac{mg - \frac{mv^2}{r}}{\left(\frac{\sqrt{3}-1}{2}\right)}$$

But,

$$T_1 \geq 0$$

$$\Rightarrow T_1 = \frac{mg - \frac{mv^2}{r}}{\left(\frac{\sqrt{3}-1}{2}\right)} \geq 0$$

$$mg \geq \frac{mv^2}{r} \Rightarrow v \leq \sqrt{rg}$$

$$v_{\max} = \sqrt{rg} = \sqrt{1.6 \times 9.8} = 3.96 \text{ m/s}$$

26. (c) Here, $R = 0.2 \text{ m}$

From figure, $r = 3R + R \sin 45^\circ$

In the frame of rotating spherical chamber (non-inertial)

$$N \cos 45^\circ = mr \omega^2 \quad \dots (i)$$

$$N \sin 45^\circ = mg \quad \dots (ii)$$

Dividing Eq. (ii) by Eq. (i), we get

$$\therefore \tan 45^\circ = \frac{mg}{mr \omega^2} = \frac{g}{r \omega^2}$$

$$\therefore \omega = \sqrt{\frac{g}{r}} = \sqrt{\frac{g}{3R + \frac{R}{\sqrt{2}}}} = 3.64 \text{ rad/s}$$

27. (d) Velocity at the bottom is $\sqrt{2gh}$

For completing the loop,

$$\sqrt{2gh} = \sqrt{5gR}$$

Hence, $R = 2h/5 = (2 \times 5)/5 = 2 \text{ cm}$

28. (b) At the time of slipping, maximum friction acts on the body.

In the frame of rod,

$$mg \sin \theta = \mu N + mr \omega^2$$

Also,

$$N = mg \cos \theta$$

$$\therefore mg \sin \theta = \mu mg \cos \theta + mr \omega^2$$

Here,

$$r = 0.45 \text{ m}, \theta = 50^\circ,$$

$$\sin 50^\circ = 0.766 \text{ and } \cos 50^\circ = 0.64$$

$$\therefore \mu = \frac{mg \sin \theta - mr \omega^2}{mg \cos \theta} = \frac{g \sin \theta - r \omega^2}{g \cos \theta} = 0.55$$

29. (a)

30. (c) According to given problem,

$$\frac{1}{2} Mv^2 = as^2 \quad [\text{Here, } M = \text{mass}]$$

$$\Rightarrow v = s \sqrt{\frac{2a}{M}} \quad \dots (i)$$

So,

$$a_g = \frac{v^2}{R} = \frac{2as^2}{MR}$$

Further more as $a_t = \frac{dv}{dt} = \frac{dv}{ds} \cdot \frac{ds}{dt} = v \frac{dv}{ds}$ (By chain rule)

from Eq. (i), we get

$$\text{i.e. } v = s \sqrt{\frac{2a}{M}} \text{ yields}$$

$$\therefore a_t = \left[s \sqrt{\frac{2a}{M}} \right] \left[\frac{2a}{M} \right] = \frac{2as}{M} \quad \left(\because \frac{v}{s} = \sqrt{\frac{2a}{M}} \right)$$

So that,

$$a_{\text{net}} = \sqrt{a_R^2 + a_t^2} = \sqrt{\left(\frac{2as^2}{MR}\right)^2 + \left(\frac{2as}{M}\right)^2} = \frac{2as}{M} \left(\sqrt{1 + \left(\frac{s}{R}\right)^2} \right)$$

$$\therefore F = Ma_{\text{net}} = 2as \sqrt{1 + (s/R)^2}$$

31. (a) The radius of curvature is given by

$$\rho = \frac{mv^3}{|\mathbf{F} \times \mathbf{v}|} = \frac{mv^3}{Fv \sin \theta} = \frac{mv^3}{mgv \sin \theta} \quad [\because F = mg]$$

or
$$\rho = \frac{v^2}{g \sin \theta}$$

$$\therefore \rho_{\min} = \frac{v^2}{g(\sin \theta)_{\max}}$$

$$\therefore \rho_{\min} = \frac{v^2}{g} \quad [\because \theta_{\max} = 90^\circ]$$

$\theta = 90^\circ$ is only possible when the projectile is at the maximum height. At the maximum height,

$$v = u \cos \alpha = 10 \cos 60^\circ = 5 \text{ m/s}$$

$$\therefore \rho_{\min} = \frac{5 \times 5}{9.8} = 2.55 \text{ m}$$

32. (c) From the diagram,

$$N - mg \cos \theta = \frac{mv^2}{r}$$

where, $r = CO = 4.5 - 0.75 = 3.75 \text{ m}$

$$\therefore N = \frac{mv^2}{r} + mg \cos \theta$$

From the figure, $\theta = 45^\circ$, $m = 70 \text{ kg}$, $g = 9.8 \text{ m/s}^2$,

$$v' = 6 \text{ m/s}, r = 4.5 \text{ m}$$

Putting these values in above equation, we get

$$N = 1045 \text{ N}$$

BITSAT Archives

1. (c) Angular velocity $\omega = 2\pi r = 2\pi \times \frac{30}{60} = \pi \text{ rad/s}$

For an elastic spring force $F = kx$, where x is the extension

Radius of circular motion $r = L + x$

Centripetal force $= m\omega^2 r = F$

$$\Rightarrow m(L + x)\omega^2 = kx$$

$$\Rightarrow x = \frac{mL\omega^2}{k - m\omega^2} = \frac{0.02 \times 0.5 \times (3.14)^2}{2 - 0.02 \times (3.14)^2}$$

Radius of the circular motion (r)

$$= L + x = 0.5 + 0.05 = 0.55 \text{ m}$$

Tension in the spring $T = kx$

$$= 2 \times 0.05 = 0.1 \text{ N}$$

2. (c) Given, $r = 25 \text{ m}$, $v = 5 \text{ m/s}$, $m = 500 \text{ kg}$

$$a_t = 1 \text{ m/s}^2, a_r = \frac{v^2}{r} = \frac{5 \times 5}{25} = 1 \text{ m/s}^2$$

$$a_{\text{net}} = \sqrt{a_t^2 + a_r^2}$$

$$= \sqrt{1^2 + 1^2} = \sqrt{2} \text{ m/s}^2$$

$$F = ma_{\text{net}} = 500\sqrt{2} \text{ N}$$

3. (d) For looping the loop, $v = \sqrt{5gr}$

By law of conservation of energy.

Loss in potential energy = Gain in kinetic energy

$$\Rightarrow mgh = \frac{1}{2}mv^2$$

$$\Rightarrow h = \frac{5r}{2}$$

4. (d) As it is clear from figure

$$R \sin \theta = mg \quad \dots(i)$$

$$R \cos \theta = \frac{mv^2}{r} \quad \dots(ii)$$

Dividing Eq. (i) by Eq. (ii), we get

$$\therefore \tan \theta = \frac{rg}{v^2}$$

$$\text{or } \frac{r}{h} = \frac{rg}{v^2} \text{ or } v = \sqrt{gh}$$

$$v = \sqrt{10 \times \frac{1}{10}} = 1 \text{ m/s}$$

5. (d) Angle turned by the body $\theta = \theta_0 + \theta_1 t + \theta_2 t^2$

$$\text{Angular velocity, } \omega = \frac{d\theta}{dt} = \frac{d}{dt}(\theta_0 + \theta_1 t + \theta_2 t^2)$$

$$\omega = \theta_1 + 2\theta_2 t$$

$$\text{Angular acceleration, } \alpha = \frac{d\omega}{dt}$$

$$\alpha = \frac{d}{dt}(\theta_1 + 2\theta_2 t)$$

$$\alpha = 2\theta_2$$

6

Work, Energy and Power

Work

Work is said to be done when a force applied on a body displaces the body through a certain distance, in the direction of force.

The work done by the force F in displacing the body through a distance s is given by

$$W = (F \cos \theta)s = Fs \cos \theta = F \cdot s$$

where, $F \cos \theta$ is the component of the force acting along the direction of the displacement produced.

The SI unit of work is joule (J).

$$1 \text{ J} = 1 \text{ N-m}$$

Work is a scalar quantity. Work can be of three types

- (i) **Positive work** Work is said to be positive, if value of the angle θ between the directions of F and s is either zero or an acute angle.
- (ii) **Negative work** Work is said to be negative, if value of angle θ between the directions of F and s is either 180° or an obtuse angle.
- (iii) **Zero work** As work done $W = F \cdot s = Fs \cos \theta$, hence work done can be zero if both F and s are finite but the angle θ between the directions of force and displacement is 90° . In such a case,

$$\begin{aligned} W &= F \cdot s \\ &= Fs \cos \theta \\ &= Fs \cos 90^\circ = 0 \end{aligned}$$

Work Done in Different Conditions

- Work done by a variable force is given by

$$W = \int F \cdot ds$$

It is equal to the area under the force-displacement graph, along with proper sign.

Work done = Area ABCDA

- The force (or field) is said to be **conservative**, if the work done by the force, also referred to as the line integral of the force, i.e. $\int \mathbf{F} \cdot d\mathbf{l}$ is independent of the path followed between any two points. In such cases, the work done simply depends upon the initial and the final positions. Moreover, work done by a conservative force for a closed path is always zero. Gravitational force, force of gravity, electrostatic force, elastic force are some examples of conservative forces (fields).
- The force is said to be **non-conservative**, if the work done by the force depends on the actual path followed by the body for a displacement between any two points. Friction, viscous force, damping force, etc., are some examples of non-conservative forces.

Energy

Energy is defined as the capacity or ability of a body to do work. Energy is scalar quantity and its units and dimensions are the same as that of work. Thus, SI unit of energy is joule. There are so many types of energy e.g. kinetic, potential, electrostatic, magnetic, geothermal, elastic, solar etc. Some of them are described below.

Some other commonly used units of energy are

$$1 \text{ erg} = 10^{-7} \text{ J}$$

$$1 \text{ cal} = 4.186 \text{ J} \cong 4.2 \text{ J}$$

$$1 \text{ kcal} = 4186 \text{ J}, 1 \text{ kWh} = 3.6 \times 10^6 \text{ J}$$

and 1 electron volt = 1 eV = $1.60 \times 10^{-19} \text{ J}$

Kinetic Energy

Kinetic Energy (KE) is the capacity of a body to do work by virtue of its motion. Motion may be either translational or rotational.

A body of mass m , moving with a velocity v , has a kinetic energy

$$K = \frac{1}{2}mv^2$$

Thus,

$$K \propto m$$

$$K \propto v^2$$

Kinetic energy of a body is always positive irrespective of the sign of velocity v . Negative kinetic energy is impossible.

Kinetic energy is correlated with momentum as

$$K = \frac{p^2}{2m} \text{ or } p = \sqrt{2mK}$$

Kinetic energy for a system of particle will be

$$K = \frac{1}{2} \sum_i m_i v_i^2$$

Kinetic energy depends on the frame of reference. Kinetic energy of a passenger sitting in a running train is zero in the frame of reference of the train but is finite in the frame of reference of the earth.

Potential Energy

Potential Energy (PE) is energy of the body by virtue of its position, configuration or state of strain. The relation between potential energy and work done is

$$W = -\Delta U$$

where, ΔU is change in potential energy.

Change in potential energy of a body between any two points is equal to the negative of work done by the conservative force in displacing the body between these two points, without there being any change in kinetic energy. Thus,

$$dU = -dW = -\mathbf{F} \cdot d\mathbf{r}$$

and

$$\begin{aligned} U_2 - U_1 &= -W \\ &= -\int_{r_1}^{r_2} \mathbf{F} \cdot d\mathbf{r} \end{aligned}$$

Value of the potential energy in a given position can be defined only by assigning some arbitrary value to the reference point. Generally, reference point is taken at infinity and potential energy at infinity is taken as zero. In that case,

$$U = -W = -\int_{\infty}^r \mathbf{F} \cdot d\mathbf{r}$$

Potential energy is a scalar quantity but has a sign. It may be positive as well as negative.

Generally potential energy is of two types

Gravitational Potential Energy

It is the energy associated with the state of separation between two bodies which interact *via* the gravitational force. The gravitational potential energy of two particles of masses m_1 and m_2 separated by a distance r is

$$U = \frac{-Gm_1m_2}{r}$$

Generally, one of the two bodies is our earth of mass M and radius R . If m is the mass of the other body, situated at a distance r ($r \geq R$) from the centre of earth, the potential energy of the body

$$U(r) = -\frac{GMm}{r}$$

Some Important Points

- If a body of mass m is raised to a height h from the surface of earth, the change in potential energy of the system (earth+body) comes out to be

$$\Delta U = \frac{mgh}{\left(1 + \frac{h}{R}\right)} \text{ or } \Delta U \approx mgh, \text{ if } h \ll R$$

Thus, the potential energy of a body at height h , i.e. mgh is really the change in potential energy of the system for $h \ll R$.

- For the gravitational potential energy, the zero of the potential energy is chosen to be the ground.

Elastic Potential Energy

Whenever an elastic body (say a spring) is either stretched or compressed, work is being done against the elastic spring force. The work done is $W = \frac{1}{2}kx^2$

where, k is spring constant and x is the displacement and elastic potential energy

$$U = \frac{1}{2}kx^2$$

Elastic potential energy is always positive.

Potential Energy of a Spring

Elastic potential energy is equal to work done to stretch the spring, which depends upon the spring constant k as well as the distance stretched. From Hooke's law, the force required to stretch the spring will be directly proportional to the amount of stretch.

$$F = -kx \quad [\text{force by spring}]$$

Then, the work done to stretch the spring by a distance x is

$$W = PE = \frac{1}{2}kx^2 \quad [\text{work done by stretcher}]$$

Since, the change in potential energy of an object between two positions is equal to the work that must be done to move the object from one point to the other, the calculation of potential energy is equivalent to calculating work. Since, the force required to stretch a spring changes with distance, the calculation of the work involves an integral.

$$W = \int_0^x kx \, dx = k \frac{x^2}{2}$$

Work can also be visualized as the area under the force curve. Here, object is displaced slowly.

If the potential energy function U is known, the force at any point can be obtained by taking the derivative of the potential.

$$F_y = -\frac{dU}{dy} = -\frac{d}{dy}(mgy)$$

$$F_x = -\frac{dU}{dx} = -\frac{d}{dx}\left(\frac{1}{2}kx^2\right)$$

$$F_y = -mg, F_x = -kx$$

Electric Potential Energy

The electric potential energy of two point charges q_1 and q_2 separated by a distance r in vacuum is given by

$$U = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r}$$

where, $\frac{1}{4\pi\epsilon_0} = 9.1 \times 10^9 \frac{\text{N}\cdot\text{m}^2}{\text{C}^2} = \text{Constant}$

Work-Energy Theorem

According to this theorem, work done by all the forces (conservative or non-conservative, external or internal) acting on a particle or an object is equal to the change in kinetic energy of it.

$$\text{i.e. } W_{\text{net}} = W_c + W_{nc} + W_{\text{ext}} = \Delta KE = K_f - K_i$$

If work is being done by the force on the body, then its kinetic energy increases, i.e. $\Delta K = +ve$. On the other hand, if work is being done by the body on the force, then its kinetic energy decreases i.e. $\Delta K = -ve$.

This theorem is true for all type of forces

(i) The work-energy theorem is not independent of the Newton's second law. It may be viewed as scalar form of second law.

(ii) When a body moves along a circular path with uniform speed, there is no change in its kinetic energy. By the work-energy theorem, the work done by the centripetal force is zero.

Law of Conservation of Energy

Total mechanical energy of a system remains constant if the internal forces are conservative and external forces do not work. We define the change in potential energy of a system corresponding to a conservative internal force as

$$U_f - U_i = -W = -\int_i^f \mathbf{F} \cdot d\mathbf{r}$$

where, W is work done by internal force on the system as system passes from the position i to f .

$$U_f - U_i = -W = -(K_f - K_i) \Rightarrow U_i + K_i = U_f + K_f$$

If non-conservative internal forces operate within the system or external forces do work on the system, then apply work-energy theorem.

$$\Rightarrow W_c + W_{nc} + W_{ext} = K_f - K_i \quad [\because W_c = -(U_f - U_i)]$$

$$\Rightarrow W_{nc} + W_{ext} = E_f - E_i$$

Power

Power is defined as the rate of doing work. If an agent does work W in time t , then its average power is given by

$$P_{av} = \frac{W}{t}$$

Power is a scalar quantity and its SI unit is watt, where

$$1W = 1J/s$$

$$\text{Instantaneous power, } P_{inst} = \frac{dW}{dt} = \frac{\mathbf{F} \cdot d\mathbf{s}}{dt} = \mathbf{F} \cdot \mathbf{v}$$

The power of a system is defined as the rate of change of kinetic energy per unit time. Mathematically,

$$\text{Power, } P = \frac{d}{dt}(\text{KE}) = \frac{dK}{dt}$$

Practice Exercise

- A body of mass 10 kg is moving on a horizontal surface by applying a force of 10 N in forward direction. Find the work done by force of friction.
 - 20 J
 - 10 J
 - 20 J
 - 5 J
- In Q. (1), the work done by normal reaction is
 - 20 J
 - 196 J
 - zero
 - None of these
- A body of mass 10 kg is moving on an inclined plane of inclination 30° with an acceleration 2 m/s^2 . The body starts from rest. Find the work done by force of gravity in 2 s.
 - 10 J
 - zero
 - 98 J
 - 196 J
- In Q. (3), find the work done by force of friction.
 - 58 J
 - 58 J
 - 98 J
 - 116 J
- A body of mass 1 kg moves from point A(2m, 3m, 4m) B(3 m, 2 m, 5 m). During motion of body, a force $\mathbf{F} = (2\text{N})\hat{i} - (4\text{N})\hat{j}$ acts on it. The work done by the force on the particle during displacement is
 - $2\hat{i} - 4\hat{j}$
 - 2 J
 - 2 J
 - None of these
- During swinging of simple pendulum,
 - the work done by gravitational force is zero
 - the work done by tension force is always zero
 - the mechanical energy of bob does not remain constant in the absence of air
 - the mechanical energy remains constant in the presence of air resistance
- A force of 0.5 N is applied on upper block as shown in figure. Find the work done by lower block on upper block for a displacement 3 m of the upper block. (Take, $g = 10 \text{ m/s}^2$)
 - 1 J
 - 1 J
 - 2 J
 - 2 J
- A force $\mathbf{F} = -k(y\hat{i} + x\hat{j})$, acts on a particle moving in the xy -plane. Starting from the origin, the particle is taken along the positive x -axis to the point $(a, 0)$ and is then taken parallel to the y -axis to the point (a, a) . The total work done by the force is
 - $-2ka^2$
 - $2ka^2$
 - $-ka^2$
 - ka^2
- A particle moves along a curve of unknown shape but magnitude of force F is constant and always acts along tangent to the curve. Then,
 - $\mathbf{F}$ may be conservative
 - $\mathbf{F}$ must be conservative
 - $\mathbf{F}$ may be non-conservative
 - $\mathbf{F}$ must be non-conservative
- If a man of mass M jumps to the ground from a height h and his centre of mass moves a distance x in the time taken by him to hit the ground, the average force acting on him is
 - $\frac{Mgh}{x}$
 - $\frac{Mgx}{h}$
 - $Mg\left(\frac{h}{x}\right)^2$
 - $Mg\left(\frac{x}{h}\right)^2$

11. A particle is moving in a region where the potential U is given by $U = k(x^2 + y^2 + z^2)$. The force acting on the particle is

a. $k(\hat{i}x + \hat{j}y + \hat{k}z)$ b. $-k(\hat{i}x + \hat{j}y + \hat{k}z)$
 c. $-2k(\hat{i}x + \hat{j}y + \hat{k}z)$ d. zero

12. The potential energy is a function for the force between two atoms in a diatomic molecule is given by

$$U(x) = \frac{a}{x^{12}} - \frac{b}{x^6}, \text{ where } a \text{ and } b \text{ are positive constants}$$

and x is the distance between the atoms. The position of stable equilibrium for the system of the two atoms is given by

a. $x = \frac{a}{b}$ b. $x = \frac{\sqrt{a}}{b}$ c. $x = \frac{\sqrt{3a}}{b}$ d. $x = \sqrt[6]{\left(\frac{2a}{b}\right)}$

13. The potential energy of a particle of mass 5 kg moving in the xy -plane is given by $U = (-7x + 24y)$ J. x and y being in metre. If the particle starts from rest from origin then speed of particle at $t = 2$ s is

a. 5 m/s b. 14 m/s c. 17.5 m/s d. 10 m/s

14. The potential energy of a particle of mass 5 kg moving in the xy -plane is given by $U = -7x + 24y$ J, x and y being in metre. Initially at $t = 0$, the particle is at the origin $(0, 0)$ moving with a velocity of $6[2.4\hat{i} + 0.7\hat{j}]$ m/s. The magnitude of force on the particle is

a. 25 units b. 24 units
 c. 7 units d. None of these

15. If a compressed spring is dissolved in acid, then

a. the energy of the spring increases
 b. the energy of acid decreases
 c. the potential energy and kinetic energy of molecules of acid increases
 d. the temperature of acid decreases

16. A long spring, when stretched by x cm has a potential energy U . On increasing the length of spring by stretching to nx cm, the potential energy stored in the spring will be

a. $\frac{U}{n^2}$ b. nU c. n^2U d. $\frac{U}{n^2}$

17. Mark the correct option.

a. The negative change in potential energy is equal to work done
 b. Mechanical energy of a system remains constant
 c. If internal forces are non-conservative, then the net work done by internal forces must be zero
 d. None of the above

18. A ball of mass m is dropped from a height h on a massless platform fixed at the top of a vertical spring as shown below. The platform is depressed by a distance x . What will be the value of the spring constant?

a. $2mg/x$ b. $2mg h/x$
 c. $2mg(h+x)/x^2$ d. $2mg(h) + 2mg hx/x^2$

19. The kinetic energy of a particle moving on a curved path continuously increases with time. Then,

a. resultant force on the particle must be parallel to the velocity at all instants
 b. the resultant force on the particle must be at an angle less than 90° all the time
 c. its height above the ground level must continuously decrease
 d. the magnitude of its linear momentum is increasing continuously
 e. both b and d are correct

20. Force F acts on a body by mass 1 kg moving with an initial velocity v_0 for 1 s. Then,

a. distance covered by the body is $v_0 + \frac{F}{2}$
 b. final velocity of body is $(v_0 + F)$
 c. momentum of body increased by F
 d. All of the above

21. When a bullet of mass 10 g and speed 100 m/s penetrates upto distance 1 cm in a human body in rest. The resistance offered by human body is

a. 2000 N b. 1500 N c. 5000 N d. 1000 N

22. A 60 g bullet is fired through a stack of fibre board sheet, 200 mm thick. If the bullet approaches the stack with a velocity of 600 m/s. The average retarding force offered to the bullet is

a. 54 kN b. 2 kN c. 20.25 kN d. 10 kN

23. A bucket tied to a string is lowered at a constant acceleration of $\frac{g}{4}$. If the mass of the bucket is m and is

lowered by a distance d , the work done by the string will be

a. $\frac{mgd}{4}$ b. $-\frac{3}{4}mgd$
 c. $-\frac{4}{3}mgd$ d. $\frac{4}{3}mgd$

24. A uniform chain of length l and weight w is hanging from its ends A and B which are close together. At a given instant end B is released. The tension at A when B has fallen a distance $x < \frac{l}{2}$ is

a. $\frac{w}{2} \left[\frac{3x}{l} - 2 \right]$ b. $\frac{w}{2} \left[3 - \frac{3x}{4} \right]$
 c. $\frac{w}{2} \left[1 + \frac{3x}{l} \right]$ d. $\frac{w}{2} \left[\frac{3x}{l} + 4 \right]$

25. A small sphere of mass m is suspended by a thread of length l . It is raised upto the height of suspension with thread fully stretched and released. Then, the maximum tension in thread will be

a. mg b. $2mg$ c. $3mg$ d. $6mg$

26. An object of mass m is tied to a string of length L and a variable horizontal force is applied on it which starts at zero and gradually increases until the string makes an angle θ with the vertical. Work done by the force F is
- a. $mgL(1 - \sin \theta)$ b. mgL
c. $mgL(1 - \cos \theta)$ d. $mgL(1 + \cos \theta)$

27. An elastic string of unstretched length L and force constant k is stretched by a small length x . It is further stretched by another small length y . The work done in the second stretching is
- a. $\frac{1}{2}ky^2$ b. $\frac{1}{2}k(x^2 + y^2)$
c. $\frac{1}{2}k(x + y)^2$ d. $\frac{1}{2}ky(2x + y)$

28. A body of mass m is accelerated uniformly from rest to a speed v in a time interval T . The instantaneous power delivered to the body as a function of time, is given by
- a. $\frac{mv^2}{T^2}t$ b. $\frac{mv^2}{T^2}t^2$ c. $\frac{1}{2}\frac{mv^2}{T^2}t$ d. $\frac{1}{2}\frac{mv^2}{T^2}t^2$

29. Two small balls of equal masses are joined by a light rigid rod. If they are released from rest in the position shown and slide on the smooth track in the vertical plane. The speed of balls when A reaches B 's position and B is at B' is

- a. 4 m/s
b. 4.21 m/s
c. 2.21 m/s
d. None of the above

30. A man weighing 60 kg climbs a staircase carrying a 20 kg load on his hand. The staircase has 20 steps and each step has a height of 20 cm. If he takes 20 s to climb, his power is

a. 160 W b. 230 W c. 320 W d. 80 W

31. The average human heart forces 4 L of blood per minute through arteries a pressure of 125 mm. If the density of blood is $1.03 \times 10^3 \text{ kg/m}^3$, then the power of heart is

a. $112.76 \times 10^{-6} \text{ HP}$ b. 112.76 HP
c. $1.03 \times 10^3 \text{ HP}$ d. $1.03 \times 10^{-6} \text{ HP}$

32. A bullet fired into a fixed target loses half of its velocity after penetrating distance of 3 cm. How much further it will penetrate before coming to rest, assuming that it faces constant resistance to its motion?

a. 3.0 cm b. 2.0 cm c. 1.5 cm d. 1.0 cm

33. The power supplied by a force acting on a particle moving in a straight line is constant. The velocity of the particle varies with the displacement x as

a. $\sqrt{x}$ b. x c. x^2 d. $x^{1/3}$

34. A particle of mass m is moving in a circular path of constant radius r such that its centripetal acceleration a_c is varying with time t as $a_c = k^2 r t^2$. The power is

a. $2\pi m k^2 r^2 t$ b. $m k^2 r^2 t$ c. $\frac{m k^4 r^2 t^5}{3}$ d. zero

35. A uniform chain of length 2 m is kept on a table such that a length of 60 cm hangs freely from the edge of the table. The total mass of the chain is 4 kg. What is the work done in pulling the entire chain on the table?

a. 7.2 J b. 3.6 J c. 120 J d. 1200 J

36. A particle move with a velocity $(5\hat{i} - 3\hat{j} + 6\hat{k}) \text{ m/s}$ under the influence of a constant force $\mathbf{F} = 10\hat{i} + 10\hat{j} + 20\hat{k}$. The instantaneous power applied to the particle is

a. 200 J/s b. 40 J/s c. 140 J/s d. 170 J/s

BITSAT Archives

1. A light inextensible string that goes over a smooth fixed pulley as shown in the figure, connect two blocks of masses 0.36 kg and 0.72 kg. Taking $g = 10 \text{ m/s}^2$. Find the work done by string on the block of mass 0.36 kg during the first second after the system is released from rest. [2013]

- a. 4 J
b. 2 J
c. 8 J
d. 10 J

2. How much work must be done by a force on 50 kg body in order to accelerate it from rest to 20 m/s in 10 s? [2012]

a. 10^3 J b. 10^4 J c. $2 \times 10^3 \text{ J}$ d. $4 \times 10^4 \text{ J}$

3. An object placed on a ground is in stable equilibrium. If the object is given a slight push, then initially the position of centre of gravity [2012]

a. moves nearer to ground
b. rises higher above the ground
c. remains as such
d. may remain at same level

4. A shell of mass 20 kg at rest explodes into two fragments whose masses are in the ratio 2 : 3. The smaller fragment moves with a velocity of 6 ms^{-1} . The kinetic energy of the larger fragment is [2012]
 a. 96 J b. 216 J c. 144 J d. 360 J
5. The force constant of a spring gun is 50 N/m. If a ball of 20 g be shoot by the gun, so that its spring is compressed by 10 cm, the velocity of the ball is [2011]
 a. 5 m/s b. 15 m/s
 c. 25 m/s d. 20 m/s
6. A stone of mass m is pushed down a frictionless hemispherical bowl of radius r from a point O . The stone just rises up to the half of other side of the bowl as shown in the figure, what is the initial speed of stone with which it was pushed? [2009]

- a. $\sqrt{g(r-H)}$ b. $\sqrt{2gH}$
 c. $\sqrt{g(r-2H)}$ d. Zero

7. A river of salty water is flowing with a velocity 2 m/s. If the density of the water is 1.2 g/cc, then the kinetic energy of each cubic metre of water is [2008]
 a. 2.4 J b. 24 J c. 2.4 kJ d. 4.8 kJ
8. A ball is released from the top of a tower. The ratio of work done by force of gravity in first, second and third seconds of the motion of the ball is [2007]
 a. 1 : 2 : 3 b. 1 : 4 : 9 c. 1 : 3 : 5 d. 1 : 5 : 3
9. Two springs have their force constant as k_1 , and k_2 ($k_1 > k_2$). When they are stretched by the same force [2007]
 a. no work is done in case of both the springs
 b. equal work is done in case of both the springs
 c. more work is done in case of second spring
 d. more work is done in case of first spring

Answer with Solutions

Practice Exercise

1. (a) Since, body moves with constant velocity. So, net force on the body is zero.

Here, $N = mg$
 $F = f$
 $\therefore W = \mathbf{f} \cdot \mathbf{s} = fs \cos 180^\circ$
 $= -fs = -10 \times 2 = -20 \text{ J}$

2. (c) $\therefore W = \mathbf{F} \cdot \mathbf{s} = N \cdot \mathbf{s}$
 $= Ns \cos 90^\circ = 0$

3. (d) $s = \frac{1}{2} at^2 = \frac{1}{2} \times 2 \times 4 = 4 \text{ m}$

$\therefore$ Work done by force of gravity

$$= W = m\mathbf{g} \cdot \mathbf{s}$$

$$= mgs \cos 60^\circ$$

$$= 10 \times 9.8 \times 4 \times \frac{1}{2} = 196 \text{ J}$$

4. (d) From force diagram,

$$mg \sin 30^\circ - f = ma$$

$$\therefore f = mg \sin 30^\circ - ma$$

$$= 10 \times 9.8 \times \frac{1}{2} - 10 \times 2$$

$$= 49 - 20 = 29 \text{ N}$$

$$\therefore W = \mathbf{f} \cdot \mathbf{s} = fs \cos 180^\circ$$

$$= -fs = -29 \times 4$$

$$= -116 \text{ J}$$

5. (c) The displacement of body is

$$\mathbf{AB} = \mathbf{r}_B - \mathbf{r}_A$$

$$= (3\hat{i} + 2\hat{j} + 5\hat{k}) - (2\hat{i} + 3\hat{j} + 4\hat{k})$$

$$= \hat{i} - \hat{j} + \hat{k}$$

$$\therefore W = \mathbf{F} \cdot \mathbf{AB}$$

$$= (2\hat{i} - 4\hat{j}) \cdot (\hat{i} - \hat{j} + \hat{k})$$

$$= 2 - 4 = -2 \text{ J}$$

6. (b) Since, the tension force is in perpendicular direction of instantaneous displacement of bob. Hence, work done is zero. [$\therefore W = \int F ds \cos 90^\circ = 0$]

7. (b) From force diagram shown in figure.

$$\therefore f_{\max} = \mu N = \mu mg = 0.1 \times 1 \times 10 = 1 \text{ N}$$

Since, $F < f$

So, both blocks move together. The acceleration of system is

$$a = \frac{F}{1+2} = \frac{0.5}{3} = \frac{5}{30} = \frac{1}{6} \text{ m/s}^2$$

For lower block,

$$f = 2a = 2 \times \frac{1}{6} = \frac{1}{3} \text{ N}$$

So, the force of friction due to lower block on upper block is $\frac{1}{3}$ N in the opposite direction of displacement of the block.

$\therefore$ Work done by lower block on upper block is

$$W = -fs = -\frac{1}{3} \times 3 = -1 \text{ J}$$

$$8. (c) W_1 = \int_0^a \mathbf{F} \cdot d\mathbf{x} = \int_0^a -k(y\hat{i} + x\hat{j}) \cdot \hat{i} dx$$

$$= \int_0^a -k(0\hat{i} + x\hat{j}) \cdot \hat{i} dx = \text{zero}$$

$$W_2 = \int_0^a \mathbf{F} \cdot d\mathbf{y} = \int_0^a -k(y\hat{i} + x\hat{j}) \cdot \hat{j} dy$$

$$= \int_0^a -k(a\hat{i} + a\hat{j}) \cdot \hat{j} dy = -ka \int_0^a dy = -ka^2$$

Total work done,

$$W = W_1 + W_2 = 0 - ka^2 = -ka^2$$

9. (d) Since, work done by this force depends upon path followed by the particle between two points. Hence, the force must be non-conservative.

$$10. (a) \text{ Here, } F = -\frac{\Delta U}{\Delta x} = -\frac{(-Mgh)}{x} = \frac{Mgh}{x}$$

$$11. (c) U = k(x^2 + y^2 + z^2) = kr^2$$

$$F = -\frac{dU}{dr} = -\frac{d}{dr}(kr^2)$$

$$-2kr = -kr = -2k(\hat{i}x + \hat{j}y + \hat{k}z)$$

$$12. (d) \therefore U(x) = \frac{a}{x^{12}} - \frac{b}{x^6}$$

At the stable equilibrium,

$$\frac{dU}{dx} = 0 \Rightarrow -\frac{12a}{x^{13}} + \frac{6b}{x^7} = 0 \Rightarrow x = \left(\frac{2a}{b}\right)^{1/6}$$

$$13. (d) \mathbf{F} = -\frac{\partial U}{\partial x} \hat{i} - \frac{\partial U}{\partial y} \hat{j} = 7\hat{i} - 24\hat{j}$$

$$\therefore a_x = \frac{F_x}{m} = \frac{7}{5} = 1.4 \text{ m/s}^2$$

$$a_y = \frac{F_y}{m} = -\frac{24}{5}$$

$$= 4.8 \text{ m/s}^2 \text{ along negative } y\text{-axis}$$

$$\therefore v_x = a_x t = 1.4 \times 2$$

$$= 2.8 \text{ m/s along negative } y\text{-axis}$$

$$\text{and } v_y = 4.8 \times 2 = 9.6 \text{ m/s}$$

$$\therefore v = \sqrt{v_x^2 + v_y^2} = 10 \text{ m/s}$$

$$14. (a) \mathbf{F} = -\frac{\partial U}{\partial x} \hat{i} - \frac{\partial U}{\partial y} \hat{j} = 7\hat{i} - 24\hat{j}$$

$$\therefore |\mathbf{F}| = \sqrt{(7)^2 + (-24)^2} = 25 \text{ units}$$

15. (c) The spring loses elastic potential energy which appears as energy of molecules of acid.

$$16. (c) \text{ Initially potential energy} = \frac{1}{2} kx^2$$

$$\Rightarrow U = \frac{1}{2} kx^2 \text{ or } 2U = kx^2 \Rightarrow k = \frac{2U}{x^2}$$

When it is stretched to nx cm.

$$\therefore \text{PE} = \frac{1}{2} kx_1^2 = \frac{1}{2} \times \frac{2U}{x^2} \times n^2 x^2 = n^2 U$$

$\therefore$ Potential energy stored in the spring $= n^2 U$

17. (d) (a) This statement is correct only when forces are of conservative nature.

(b) In the absence of non-conservative force, mechanical energy and non-mechanical energy are separately constant.

(c) The work done by internal forces may not be zero.

$$18. (c) \text{ Here, } mg(h+x) = \frac{1}{2} kx^2$$

$$\Rightarrow kx^2 = 2mg(h+x) \Rightarrow k = \frac{2mg(h+x)}{x^2}$$

19. (e) If particle moves on a curved path, then there are two components of force

(i) **Tangential Component** This component provides tangential acceleration. Due to this, speed increases.

(ii) **Radial Force** This component provides centripetal acceleration.

The resultant force is

$$F = \sqrt{F_r^2 + F_t^2}$$

$$\tan \theta = \frac{F_r}{F_t}$$

But F_t is not zero.

$$\therefore \tan \theta < \infty \Rightarrow \theta < 90^\circ$$

When speed increases, $p = mv$ increases.

$$20. (d) a = \frac{F}{m} = \frac{F}{1} = F \text{ m/s}^2$$

$$v = u + at$$

$$v = v_0 + (F \times 1) \Rightarrow v = v_0 + F$$

where, v = final velocity

$$s = ut + \frac{1}{2} at^2$$

$$s = v_0 + \frac{F}{2}$$

$$p_i \text{ (initial momentum)} = mv_0 - v_0$$

$$p_f \text{ (final momentum)} = mv = v_0 + F$$

$$\text{Change in momentum, } \Delta p = p_f - p_i = F$$

21. (c) Here, $u = 100 \text{ m/s}$, $v = 0$, $s = 1 \text{ cm} = 10^{-2} \text{ m}$

$$\therefore v^2 = u^2 - 2as$$

$$\therefore a = \frac{u^2}{2s} = \frac{100 \times 100}{2 \times 1 \times 10^{-2}} = 5 \times 10^5 \text{ m/s}^2$$

$$\therefore F = ma = 10 \times 10^{-3} \times 5 \times 10^5 = 5000 \text{ N}$$

Alternate method

$$W = \Delta K \quad \text{or} \quad -Fs = \frac{1}{2}mv^2 - \frac{1}{2}mu^2$$

$$= 0 - \frac{1}{2} \times 10 \times 10^{-3} \times 10000$$

$$\text{or} \quad -F \times 10^{-2} = -\frac{1}{2} \times 10 \times 10^{-3} \times 10^4$$

$$\therefore F = 5000 \text{ N}$$

22. (a) $m = 60 \text{ g} = \frac{60}{1000} = 0.06 \text{ kg}$

$$s = 200 \text{ mm} = 0.2 \text{ m}$$

$$u = 600 \text{ m/s}$$

$$v = 0$$

$$\text{Using} \quad v^2 = u^2 + 2as$$

$$(0)^2 = (600)^2 + 2 \times a \times 0.2$$

$$a = \frac{-600 \times 600 \times 10}{0.4}$$

Average retarding force

$$F = ma = \frac{0.06 \times 600 \times 600 \times 10}{4}$$

$$F = 54 \text{ kN}$$

23. (b) From force diagram as shown in figure, $mg - T = ma$

$$\therefore T = mg - ma = mg - \frac{mg}{4} = \frac{3mg}{4}$$

$$\therefore W_T = \text{work done by tension}$$

$$= \mathbf{T} \cdot \mathbf{s} = Ts \cos 180^\circ = -\frac{3mgd}{4}$$

24. (c) Mass per unit length, $\lambda = \frac{m}{l} = \frac{w}{lg}$

$$\text{Velocity, } v^2 = 2g\left(\frac{x}{2}\right) \text{ or } v = \sqrt{gx}$$

Change in momentum when an element dx falls is

$$\frac{w}{lg} \sqrt{gx} \, dx$$

$$F = \frac{dp}{dt} = \frac{w}{lg} \sqrt{gx} \frac{dx}{dt} = \frac{w}{l} x \quad \left[\because \frac{dx}{dt} = \sqrt{gx} \right]$$

Tension at A = Weight of half the chain

$$+ \text{Weight of } \frac{x}{2} \text{ length} + F$$

$$= \frac{w}{2} + \frac{wx}{2l} + \frac{wx}{l} = \frac{w}{2} \left[1 + \frac{3x}{l} \right]$$

- 25 (c) The tension in string is maximum at the lowest position of the ball.

$$\therefore T_{\max} - mg = \frac{mv^2}{l}$$

$$\therefore T_{\max} = mg + \frac{mv^2}{l} \dots (i)$$

The loss in potential energy = gain in kinetic energy

$$\text{or} \quad mgl = \frac{1}{2}mv^2$$

$$\therefore v = \sqrt{2gl} \dots (ii)$$

$$\therefore \frac{mv^2}{l} = \frac{m}{l} 2gl = 2mg \dots (iii)$$

From Eqs. (i), (ii) and (iii),

$$T_{\max} = mg + 2mg = 3mg$$

26. (c)

$$W = \Delta K \quad \text{or} \quad W_T + W_g + W_F = 0$$

[Since, change in kinetic energy is zero]

Here, $W_T = \text{work done by tension} = 0$

$W_g = \text{work done by force of gravity}$

$$= -mgh = -mgL(1 - \cos \theta)$$

$$\therefore W_F = -W_g = mgL(1 - \cos \theta)$$

27. (d) Elastic force in string is conservative in nature.

$$\therefore W = -\Delta U$$

where, $W = \text{work done by elastic force of string}$

$\Delta U = \text{change in elastic potential energy}$

$$\therefore W = -(U_f - U_i) = U_i - U_f$$

$$\text{or} \quad W = \frac{1}{2}kx^2 - \frac{1}{2}k(x+y)^2$$

$$\text{or} \quad W = \frac{1}{2}kx^2 - \frac{1}{2}k(x^2 + y^2 + 2xy)$$

$$= \frac{1}{2}kx^2 - \frac{1}{2}kx^2 - \frac{1}{2}ky^2 - \frac{1}{2}k(2xy)$$

$$= -kxy - \frac{1}{2}ky^2 = \frac{1}{2}ky(-2x - y)$$

The work done against elastic force is

$$W_{\text{external}} = -W = \frac{ky}{2}(2x + y)$$

28. (a) $F = ma = \frac{mv}{T}$ $\left[\because a = \frac{v-0}{T} \right]$

Instantaneous power $= Fv = mav = \frac{mv}{T} at$
 $= \frac{mv}{T} \frac{v}{T} t = \frac{mv^2}{T^2} t$

29. (c) The final speeds of each ball are same.
 $\therefore$ Loss in PE by ball A = gain in KE by the system

or $mgr = \frac{1}{2}mv^2 + \frac{1}{2}mv^2$

or $mgr = mv^2$

$\therefore v = \sqrt{gr} = \sqrt{9.8 \times 0.5} = \sqrt{4.9}$
 $= \sqrt{\left(\frac{49}{10}\right)} = 2.21 \text{ m/s}$

30. (a) Power $= \frac{(60 + 20) \times (10) \times (20 \times 0.2)}{20} = 160 \text{ W}$

31. (a) Height of liquid column, $h = 125 \text{ mm} = 0.125 \text{ m}$

Density of blood, $\rho = 1.03 \times 10^3 \text{ kg/m}^3$.

Acceleration due to gravity, $g = 9.8 \text{ m/s}^2$

Volume of blood, $V = 4 \text{ litre} = 4 \times 10^{-3} \text{ m}^3$

Time, $t = 1 \text{ minute} = 60 \text{ second}$.

Work done, $W = \text{force} \times \text{distance}$
 $= \text{pressure} \times \text{area} \times \text{distance}$
 $= \text{pressure} \times \text{volume}$
 $= h\rho gV$

Power, $P = \frac{W}{t} = \frac{h\rho gV}{t}$
 $= \frac{0.125 \times 1.03 \times 10^3 \times 9.8 \times 4 \times 10^{-3}}{60}$
 $= 112.76 \times 10^{-6} \text{ HP}$

32. (d) According to the work-energy theorem,

$$W = \Delta K$$

Case I $-F \times 3 = \frac{1}{2}m\left(\frac{v_0}{2}\right)^2 - \frac{1}{2}mv_0^2$

where, F is the resistive force and v_0 is the initial speed.

Case II Let the further distance travelled by the bullet before coming to rest is s .

$\therefore -F(3+s) = K_f - K_i = -\frac{1}{2}mv_0^2$
 $\Rightarrow -\frac{1}{8}mv_0^2(3+s) = -\frac{1}{2}mv_0^2$

or $\frac{1}{4}(3+s) = 1$

or $\frac{3}{4} + \frac{s}{4} = 1$

or $s = 1 \text{ cm}$

33. (d) $\because P = Fv = (ma)v = m\left(\frac{d^2x}{dt^2}\right)\left(\frac{dx}{dt}\right)$

Since, power is constant.

$\therefore \left(\frac{d^2x}{dt^2}\right)\left(\frac{dx}{dt}\right) = k$

or $\frac{d}{dt}\left(\frac{dx}{dt}\right)^2 = k$ or $\left(\frac{dx}{dt}\right)^2 = k_1t$

or $\frac{dx}{dt} = \sqrt{k_1t} = k_2t^{1/2}$ or $x = k_3t^{3/2}$

Hence, $\frac{dx}{dt} \propto t^{1/2} \propto x^{1/3}$

34. (b) $a_c = \frac{v^2}{r} = k^2rt^2$

$\therefore v = krt$

The tangential acceleration is

$$a_t = \frac{dv}{dt} = \frac{d(krt)}{dt} = kr$$

The work done by centripetal force will be zero.

So, power is delivered to the particle by only tangential force which acts in the same direction of instantaneous velocity.

$\therefore \text{Power} = F_t v$
 $= ma_t krt$
 $= m(kr)(krt) = mk^2r^2t$

35. (b) Mass per unit length $= \frac{M}{L} = \frac{4}{2} = 2 \text{ kg m}^{-1}$

The mass of 0.6 m of chain $= 0.6 \times 2 = 1.2 \text{ kg}$

The height of the centre of mass of the hanging part

$$h = \frac{0.6 + 0}{2} = 0.3 \text{ m}$$

Hence, work done in pulling the chain on the table =

work done against gravity the force of gravity

i.e.

$$W = mgh$$

$$= 1.2 \times 10 \times 0.3 = 3.6 \text{ J}$$

36. (c) $P_{\text{inst}} = \mathbf{F} \cdot \mathbf{v}$

$$= (10\hat{i} + 10\hat{j} + 20\hat{k}) \cdot (5\hat{i} - 3\hat{j} + 6\hat{k})$$

$$= 50 - 30 + 120$$

$$= 140 \text{ J/s}$$

BITSAT Archives

1. (c) According to figure

$$\text{So, acceleration} = \frac{\text{Net pulling force}}{\text{Total mass}} = \frac{0.72g - 0.36g}{0.72 + 0.36} = \frac{g}{3}$$

$$\text{Distance, } s = ut + \frac{1}{2}at^2 = 0 + \frac{1}{2} \times \frac{g}{3} \times (1)^2 = \frac{g}{6}$$

$$\begin{aligned} \text{So, } T - mg &= ma \\ T - 0.36g &= 0.36a \\ T &= 0.48g \end{aligned}$$

Now, work done by string on the block

$$\begin{aligned} W_T &= Ts \cos 0^\circ \text{ (on 0.36 kg of mass)} \\ &= (0.48g) \left(\frac{g}{6} \right) (1) = 0.08g^2 \\ &= 0.08 \times (10)^2 = 8 \text{ J} \end{aligned}$$

2. (b) Now,
- $s = ut + \frac{1}{2}at^2$

$$s = 0 + \frac{1}{2} \times 2 \times 10 \times 10$$

$$s = 100 \text{ m}$$

Hence, work done

$$W = F \times s$$

$$W = ma \times s$$

$$\therefore W = 50 \times 2 \times 100$$

$$W = 10000 = 10^4 \text{ J}$$

3. (b) In stable equilibrium, the centre of gravity of object, lies at minimum height from ground. As the object is given a slight push, its centre of gravity rises because it comes in unstable equilibrium.

4. (a) Total mass of the shell = 20 kg

Ratio of the masses of the fragments = 2 : 3

 $\therefore$ Masses of the fragments are 8 kg and 12 kg. Now, according to the conservation of momentum

$$m_1 v_1 = m_2 v_2$$

$$\therefore 8 \times 6 = 12 \times v$$

 v (velocity of the larger fragment) = 4 m/s

$$\begin{aligned} \text{Kinetic energy} &= \frac{1}{2}mv^2 \\ &= \frac{1}{2} \times 12 \times (4)^2 = 96 \text{ J} \end{aligned}$$

5. (a)
- $\frac{1}{2}mv^2 = \frac{1}{2}kx^2$

$$\begin{aligned} v &= \sqrt{\frac{R}{m}x} \\ &= \sqrt{\frac{50}{20 \times 10^{-3}}} (10 \times 10^{-2}) \\ &= 50 \times 10^{-1} \\ &= 5 \text{ m/s} \end{aligned}$$

6. (c) Let the velocity with which stone is pushed =
- u
- .

We have,

$$\begin{aligned} \frac{1}{2}mu^2 + mgH &= mg \frac{r}{2} \\ u &= \sqrt{2g \left(\frac{r}{2} - H \right)} \end{aligned}$$

or

$$u = \sqrt{g(r - 2H)}$$

7. (c) Given, velocity of river,
- $(v) = 2 \text{ m/s}$

Density of water $\rho = 1.2 \text{ g/cc}$

Mass of each cubic metre

$$\begin{aligned} m &= \frac{1.2 \times 10^{-3}}{(10^{-2})^3} \\ &= 1.2 \times 10^3 \text{ kg} \end{aligned}$$

$$\begin{aligned} \therefore \text{Kinetic energy} &= \frac{1}{2}mv^2 \\ &= \frac{1}{2} \times 1.2 \times 10^3 \times (2)^2 = 2.4 \text{ kJ} \end{aligned}$$

8. (c) When the ball is released from the top of tower, then ratio of distance covered by the ball in first, second and third seconds is

$$h_I : h_{II} : h_{III} = 1 : 3 : 5 \quad [\text{because } h_n \propto (2n - 1)]$$

 $\therefore$ Ratio of work done

$$mgh_I : mgh_{II} : mgh_{III} = 1 : 3 : 5$$

9. (c)
- $W = \frac{F^2}{2k}$

If both springs are stretched by same force, then $W \propto \frac{1}{K}$

As

$$K_1 > K_2$$

Therefore, $W_1 > W_2$

i.e. more work is done in case of second spring.

7

Centre of Mass, Momentum and Collision

Centre of Mass

The **centre of mass** of a body is a point where the whole mass of the body is supposed to be concentrated for describing its translatory motion. In a uniform gravitational field, the centre of mass and the centre of gravity of a system are coincident.

Centre of Mass of Two Particles System

Consider the two particles system in which two masses m_1 and m_2 are separated by a distance d .

The Centre of Mass (CM) divides internally the line joining two particles (or masses) in inverse ratio of their masses.

$$PR = \frac{m_2 d}{m_1 + m_2} \text{ and } QR = \frac{m_1 d}{m_1 + m_2}$$

Centre of Mass of N-Particles System

If there are N -particles distributed in space whose masses are $m_1, m_2, m_3, \dots, m_N$ and position vectors $r_1, r_2, r_3, \dots, r_N$ respectively, then the coordinates of the centre of mass are given as below :

$$X_{\text{CM}} = \frac{m_1 x_1 + m_2 x_2 + m_3 x_3 + \dots + m_N x_N}{m_1 + m_2 + m_3 + \dots + m_N}, \quad Y_{\text{CM}} = \frac{m_1 y_1 + m_2 y_2 + m_3 y_3 + \dots + m_N y_N}{m_1 + m_2 + m_3 + \dots + m_N}$$

$$Z_{\text{CM}} = \frac{m_1 z_1 + m_2 z_2 + m_3 z_3 + \dots + m_N z_N}{m_1 + m_2 + m_3 + \dots + m_N}$$

We can also write as,

$$X_{CM} = \frac{1}{M} \sum m_i x_i; \quad Y_{CM} = \frac{1}{M} \sum m_i y_i; \quad Z_{CM} = \frac{1}{M} \sum m_i z_i$$

where, $M = m_1 + m_2 + m_3 + \dots + m_N$

The position vector of centre of mass of N -particles system is given by

$$\mathbf{r}_{CM} = \frac{m_1 \mathbf{r}_1 + m_2 \mathbf{r}_2 + m_3 \mathbf{r}_3 + \dots + m_N \mathbf{r}_N}{m_1 + m_2 + m_3 + \dots + m_N}$$

Important Formulae of Centre of Mass

- Velocity of centre of mass of N -particles system is given by

$$\mathbf{v}_{CM} = \frac{\sum_{i=1}^n m_i \mathbf{v}_i}{M}$$

- Similarly, acceleration of centre of mass is given by

$$\mathbf{a}_{CM} = \frac{\sum_{i=1}^n m_i \mathbf{a}_i}{M}$$

- In accordance with Newton's second law of motion

$$\mathbf{F}_{CM} = \mathbf{F}_1 + \mathbf{F}_2 + \dots + \mathbf{F}_n$$

or

$$\mathbf{F}_{CM} = \sum_{i=1}^n \mathbf{F}_i$$

- This is called as equation of motion of centre of mass. In pure translation, every particle of the body moves with the same velocity at any instant of time.

Rigid Body

It is a continuous solid body of finite size in which deformation is not possible, i.e. the relative distance between the two given points within the rigid body is always constant whatever the force is applied on it. Practically, there is no existence of it. In order to assume a body to be completely rigid, deformation would be neglected.

For a rigid body which is not under any external force, centre of mass is always a fixed point while in case of body which is not rigid, the centre of mass can vary.

Coordinates of centre of mass of a rigid body are

$$X_{CM} = \frac{1}{M} \int x \, dm, \quad Y_{CM} = \frac{1}{M} \int y \, dm$$

and

$$Z_{CM} = \frac{1}{M} \int z \, dm$$

where, M is total mass of the rigid body and x, y and z are the coordinates of elementary mass dm .

Centre of Mass of Some Rigid Bodies

- Centre of mass of a uniform rectangular, square or circular plate lies at its centre.

- Centre of mass of a uniform semi-circular ring lies at a distance of $h = \frac{2R}{\pi}$ from its centre on the axis of symmetry where R is the radius of the ring.

- Centre of mass of a uniform semi-circular disc of radius R lies at a distance of $h = \frac{4R}{3\pi}$ from the centre on the axis of symmetry as shown in figure.

- Centre of mass of a hemispherical shell of radius R lies at a distance of $h = \frac{R}{2}$ from its centre on the axis of symmetry as shown in figure.

- Centre of mass of a solid hemisphere of radius R lies at a distance of $h = \frac{3R}{8}$ from its centre on the axis of symmetry. If some mass or area is removed from a rigid body, then the position of centre of mass of the remaining portion is obtained from the following formula

$$\mathbf{r}_{CM} = \frac{m_1 \mathbf{r}_1 - m_2 \mathbf{r}_2}{m_1 - m_2} \quad \text{or} \quad \mathbf{r}_{CM} = \frac{A_1 \mathbf{r}_1 - A_2 \mathbf{r}_2}{A_1 - A_2}$$

In rotation about a fixed axis, every particle of the rigid body moves in a circle which is in a plane perpendicular to the axis and has its centre on the axis.

Collision

It is defined as an isolated event in which two or more colliding bodies exert relatively strong forces on each other for a relatively short time, as a result of which the kinetic energy and momentum of the colliding particles change.

Types of Collision

There are two basic types of collision in one dimension as given below :

- (i) **Elastic collision** The collision is said to be elastic, if both the bodies regain their original shape and size completely, after they are separated. Also, the total linear momentum as well as kinetic energy of bodies remain conserved.

Let the two balls of mass m_1 and m_2 collide each other elastically with their respective velocities v_1 and v_2 in the same direction as shown in figure. Their velocities become v_1' and v_2' after the collision along the same line. Applying conservation of linear momentum, we get

$$m_1 v_1 + m_2 v_2 = m_1 v_1' + m_2 v_2' \quad \dots(i)$$

In an elastic collision, kinetic energy before and after collision is also conserved. Hence,

$$\frac{1}{2} m_1 v_1^2 + \frac{1}{2} m_2 v_2^2 = \frac{1}{2} m_1 v_1'^2 + \frac{1}{2} m_2 v_2'^2 \quad \dots(ii)$$

Solving Eqs. (i) and (ii) for v_1' and v_2' , we get

$$v_1' = \left(\frac{m_1 - m_2}{m_1 + m_2} \right) v_1 + \left(\frac{2m_2}{m_1 + m_2} \right) v_2 \quad \dots(iii)$$

$$\text{and } v_2' = \left(\frac{m_2 - m_1}{m_1 + m_2} \right) v_2 + \left(\frac{2m_1}{m_1 + m_2} \right) v_1 \quad \dots(iv)$$

- (ii) **Inelastic collision** The collision is said to be inelastic, if the bodies do not return to their original form after the collision. In this type of collision, the total linear momentum of the system of bodies will remain conserved but kinetic energy of the system is not conserved.

$$\text{i.e. } \mathbf{p}_{\text{initial}} = \mathbf{p}_{\text{final}}$$

$$\Rightarrow \Delta \mathbf{p} = 0$$

$$\text{But, } K_{\text{initial}} \neq K_{\text{final}}$$

$$\Rightarrow \Delta K \neq 0$$

Perfectly Elastic Collision in a Plane

In a two-dimensional (or oblique) collision between two bodies, momentum remains conserved.

$\therefore$ Along the x -axis

$$m_1 u_1 + m_2 u_2 = m_1 v_1 \cos \theta + m_2 v_2 \cos \phi \quad \dots(i)$$

and along the y -axis

$$0 = m_1 v_1 \sin \theta - m_2 v_2 \sin \phi \quad \dots(ii)$$

As the total kinetic energy remains unchanged.

$$\text{Hence, } \frac{1}{2} m_1 u_1^2 + \frac{1}{2} m_2 u_2^2 = \frac{1}{2} m_1 v_1^2 + \frac{1}{2} m_2 v_2^2 \quad \dots(iii)$$

We can solve these equations provided that either the value of θ or ϕ is known to us.

Rebounding of a Ball on Collision with the Floor

1. Speed of the ball after the n th rebound

$$v_n = e^n v_0 = e^n \sqrt{2gh_0}$$

2. Height covered by the ball after the n th rebound

$$h_n = e^{2n} h_0$$

3. Total distance (vertical) covered by the ball before it stops bouncing

$$H = h_0 + 2h_1 + 2h_2 + 2h_3 + \dots = h_0 \left(\frac{1+e^2}{1-e^2} \right)$$

4. Total time taken by the ball before it stops bouncing

$$T = t_0 + t_1 + t_2 + t_3 + \dots$$

$$= \sqrt{\frac{2h_0}{g}} + 2\sqrt{\frac{2h_1}{g}} + 2\sqrt{\frac{2h_2}{g}} + \dots = \sqrt{\frac{2h_0}{g}} \left(\frac{1+e}{1-e} \right)$$

Coefficient of Restitution (e)

For a collision, it is defined as the ratio of relative velocity of separation to the relative velocity of approach.

$$\text{Thus, coefficient of restitution, } e = \frac{v_2 - v_1}{u_1 - u_2}$$

For a perfectly elastic collision, $e = 1$.

If $0 < e < 1$, the collision is said to be partially elastic. But if, $e = 0$, the collision is said to be perfectly inelastic.

- In a perfectly inelastic collision, $e = 0$ which means that $v_2 - v_1 = 0$ or $v_2 = v_1$
- It can be shown that for an inelastic collision, the final velocities of the colliding bodies are given by

$$v_1 = \left(\frac{m_1 - em_2}{m_1 + m_2} \right) u_1 + \frac{(1+e)m_2}{(m_1 + m_2)} u_2$$

$$\text{and } v_2 = \frac{(1+e)m_1}{(m_1 + m_2)} u_1 + \left(\frac{m_2 - em_1}{m_1 + m_2} \right) u_2$$

- If a particle of mass m , moving with velocity u , hits an identical stationary target inelastically, then final velocities of projectile and target are correlated as

$$\text{i.e. } m_1 = m_2 = m$$

$$\text{and } u_2 = 0; \frac{v_1}{v_2} = \frac{1-e}{1+e}$$

Important Concepts Regarding the Collision

- Two bodies of mass m_1 (heavy) and mass m_2 (light) are moving with same kinetic energy. If they are stopped by the same retarding force, then
 - The bodies cover the same distance before coming to rest.
 - The time taken to come to rest is lesser for m_2 as it has less momentum, i.e. $t = \frac{p}{F}$.
 - The time taken to come to rest is more for m_1 as it has greater momentum.

- Two bodies A and B having masses m_1 and m_2 have equal kinetic energies. If they have velocities v_1 and v_2 , then

$$\frac{v_1}{v_2} = \sqrt{\frac{m_2}{m_1}} \text{ and } \frac{p_1}{p_2} = \sqrt{\left(\frac{m_1}{m_2} \right)}$$

where, p_1 and p_2 are their momenta.

- If a bullet of mass m_1 moving with a velocity u , strikes a mass m_2 which is free to move in the direction of the bullet and is embedded in it, then the loss of kinetic energy is $\frac{1}{2} \left(\frac{m_1 m_2 u^2}{m_1 + m_2} \right)$.
- A shell of mass m_1 is ejected from a gun of mass m_2 by an explosion which generates kinetic energy equals to E . Then, the initial velocity of the shell is

$$\sqrt{\left[\frac{2m_2 E}{m_1 (m_1 + m_2)} \right]}$$

- A gun of mass m_2 fires a shell of mass m_1 horizontally and the energy of explosion is such as would be sufficient to project the shell vertically to a height h . Then, the velocity or recoil of the gun is

$$\sqrt{\left[\frac{2m_1^2 gh}{m_2 (m_1 + m_2)} \right]}$$

- A bullet of mass m_1 penetrates a thickness of a fixed plate of mass m_2 . If m_2 is free to move and the resistance is supposed to be uniform, then the thickness penetrated is $\frac{m_2 s}{m_1 + m_2}$.

Practice Exercise

- Two homogeneous spheres A and B of masses m and $2m$ having radii $2a$ and a respectively, are placed in touch. The distance of centre of mass from first sphere is
 - a
 - $2a$
 - $3a$
 - None of these
- A circular hole of radius 1 cm is cut-off from a disc of radius 6 cm. The centre of hole is 3 m from the centre of the disc. Find the position of centre of mass of the remaining disc from the centre of disc.
 - $-\frac{3}{35}$ cm
 - $\frac{1}{35}$ cm
 - $\frac{3}{10}$ cm
 - None of these
- A non-uniform thin rod of length L is placed along X-axis as such its one end is at the origin. The linear mass density of rod is $\lambda = \lambda_0 x$. Find the distance of centre of mass of rod from the origin.
 - $L/2$
 - $2L/3$
 - $L/4$
 - $L/5$
- Which of the following has centre of mass not situated in the material of body?
 - A rod bent in the form of a circle
 - Football
 - Hand ring
 - All of the above

5. A ball kept in a closed box moves in the box making collisions with the walls. The box is kept on a smooth surface. The centre of mass
- of the box remains constant
 - of the box plus the ball system remains constant
 - of the ball remains constant
 - of the ball relative to the box remains constant
6. A man of mass M stands at one end of a plank of length L which lies at rest on a frictionless surface. The man walks to the other end of the plank. If the mass of plank is $M/3$, then the distance that the mass moves relative to the ground is
- $3L/4$
 - $L/4$
 - $4L/5$
 - $L/3$
7. The centre of mass of a system cannot change its state of motion, unless there is an external force acting on it. Yet the internal force of the brakes can bring a car to rest. Then
- the brakes stop the wheels
 - the friction between the brake pads and the wheel stops the car
 - the car is stopped by the road
 - the car is stopped by the driver pressing the pedal
8. Two blocks A and B are connected by a massless string (shown in figure) A force of 30 N is applied on block B . Find the distance travelled by centre of mass in 2 s starting from rest.
- 
- 1 m
 - 2 m
 - 3 m
 - None of these
9. A loaded spring gun of mass M fires a shot of mass m with a velocity v at an angle of elevation θ . The gun is initially at rest on a horizontal frictionless surface. After firing, the centre of mass of the gun-shot system
- moves with a velocity $v \frac{m}{M}$
 - moves with a velocity $\frac{vm}{M} \cos \theta$ in the horizontal direction
 - remains at rest
 - moves with a velocity $\frac{v(M-m)}{(M+m)}$ in the horizontal direction
10. Two bodies A and B of masses m_1 and m_2 respectively are connected by a massless spring of force constant k . A constant force F starts acting on the body A at $t = 0$. Then,
- 
- at every instant, the acceleration of centre of mass is $\frac{F}{m_1 + m_2}$
 - at $t = 0$, acceleration of B is zero but that of A is maximum
 - the acceleration of A decreases continuously and finally becomes equal
 - All of the above

11. In the given figure, the mass m_2 starts with velocity v_0 and moves with constant velocity on the surface. During motion, the normal reaction between the horizontal surface and fixed triangular block m_1 is N . Then, during motion

- $N = (m_1 + m_2)g$
 - $N = m_1g$
 - $N < (m_1 + m_2)g$
 - $N > (m_1 + m_2)g$
12. Four particles of masses 1 kg , 2 kg , 3 kg and 4 kg are placed at the corners A, B, C and D respectively of a square $ABCD$ of edge 1 m . If point A is taken as origin, edge AB is taken along X -axis and edge AD is taken along Y -axis. Find the coordinates of centre of mass in SI
- $(1, 1)$
 - $(5, 7)$
 - $(0.5, 0.7)$
 - None of these
13. Three bodies having masses 5 kg , 4 kg and 2 kg are moving at the speed of 5 m/s , 4 m/s and 2 m/s , respectively along X -axis. The magnitude of velocity of CM is
- 1.0 m/s
 - 4 m/s
 - 0.9 m/s
 - 1.3 m/s
14. Figure shows the situation involving two blocks of masses m_1 and m_2 . The heavier block of mass m_1 is pulled by a force F . The acceleration of CM is (all the surfaces are smooth)
- 
- $\frac{F}{m_2}$
 - $\frac{F}{m_1}$
 - $\frac{F}{m_1 + m_2}$
 - $\frac{2F}{m_1 m_2}$
15. A particle is projected such that its horizontal range would be R . At the highest point, the particle breaks into two identical parts P and Q . If P comes to rest, the horizontal distance of point from the point of projection (i.e. origin) where the particle Q lands on the ground is
- $1.5 R$
 - R
 - $2.5 R$
 - $2 R$
16. A string of negligible thickness is wrapped several times around a cylinder kept on a rough horizontal surface. A boy standing at a distance l from the cylinder holds one end of the string and pulls the cylinder towards him. Assuming no slipping, the length of the thread passed through the hands of the man is
- 
- $\frac{l}{2}$
 - l
 - $2l$
 - $\frac{3l}{2}$
17. If momentum of a body remains constant. Then mass-speed graph of body is
- circle
 - straight line
 - rectangular hyperbola
 - parabola

18. Two bodies of masses m and $4m$ are moving with equal linear momentum. The ratio of their kinetic energies is
 a. 1 : 4 b. 4 : 1
 c. 1 : 1 d. 1 : 2
19. A man is sitting in a moving train, then
 a. his momentum must not be zero
 b. his kinetic energy is zero
 c. his kinetic energy is not zero
 d. his kinetic energy may be zero
20. When a meteorite burns in the atmosphere. Then,
 a. the momentum conservation principle is applicable to the meteorite system
 b. the energy of meteorite remains constant
 c. the conservation principle of momentum is applicable to a system consists of meteorites, earth and air molecules
 d. the meteorite momentum remains constant
21. If a bullet is fired from a gun, then
 a. the mechanical energy of bullet-gun system remains constant
 b. the mechanical energy is converted into non-mechanical energy
 c. the mechanical energy may be conserved
 d. the non-mechanical energy is converted into mechanical energy
22. A nucleus moving with a velocity $\mathbf{n}$ emits an α -particle. Let the velocities of the α -particle and the remaining nucleus be $\mathbf{n}_1$ and $\mathbf{n}_2$ and their masses be m_1 and m_2 , then
 a. $\mathbf{n}$, $\mathbf{n}_1$ and $\mathbf{n}_2$ must be parallel to each other
 b. none of the two of $\mathbf{n}$, $\mathbf{n}_1$, $\mathbf{n}_2$ should be parallel to each other.
 c. $\mathbf{n}_1 + \mathbf{n}_2$ must be parallel to $\mathbf{n}$
 d. $m_1 \mathbf{n}_1 + m_2 \mathbf{n}_2$ must be parallel to $\mathbf{n}$
23. Two blocks of mass m_1 and m_2 are connected by a massless spring and placed at smooth surface. The spring initially stretched and released. Then,
 a. the momentum of each particle remains constant separately
 b. the momentum of both bodies are same to each other
 c. the magnitude of momentum of both bodies are same to each other
 d. the mechanical energy of system remains constant
 e. Both (c) and (d) are correct
24. When two blocks A and B coupled by a spring on a frictionless table are stretched and then released, then
 a. kinetic energy of body at any instant after releasing is inversely proportional to their masses
 b. kinetic energy of body at any instant may or may not be inversely proportional to their masses
 c. $\frac{\text{KE of } A}{\text{KE of } B} = \frac{\text{mass of } B}{\text{mass of } A}$, when spring is massless
 d. Both (b) and (c) are correct
25. Two bodies are projected from roof with same speed in different directions. If air resistance is not taken into account. Then,
 a. they reach at ground with same magnitude of momenta if bodies have same masses
 b. they reach at ground with same kinetic energy
 c. they reach at ground with same speed
 d. both (a) and (c) are correct
26. If a ball is dropped from rest. It bounces from the floor respectively. The coefficient of restitution is 0.5 and the speed just before the first bounce is 5 m/s. The total time taken by the ball to come to the rest is
 a. 2 s b. 1 s c. 0.5 s d. 0.25 s
27. Three identical blocks A , B and C are placed on horizontal frictionless surface. The blocks B and C are in rest. But A is approaching towards B with a speed of 10 m/s. The coefficient of restitution for all collision is 0.5. The speed of the block C just after collision is
 a. 5.6 m/s b. 6 m/s c. 8 m/s d. 10 m/s
- 
28. A thin uniform bar lies on a frictionless horizontal surface and is free to move in any way on the surface. Its mass is 0.16 kg and length is 1.7 m. Two particles each of mass 0.08 kg are moving on the same surface and towards the bar in the direction perpendicular to the bar, one with a velocity of 10 m/s and other with velocity of 6 m/s. If collision between particles and bar is completely inelastic. Both particles strike with the bar simultaneously. The velocity of centre of mass after collision is
 a. 2 m/s b. 4 m/s c. 10 m/s d. 16 m/s
29. When two bodies collide elastically. The force of interaction between them is
 a. conservative
 b. non-conservative
 c. either conservative or non-conservative
 d. zero
30. A body of mass M moving with a speed u has a head-on collision with a body of mass m originally at rest. If $M \gg m$, then the speed of the body of mass m after collision will be nearly
 a. $\frac{um}{M}$ b. $\frac{uM}{m}$ c. $\frac{u}{2}$ d. $2u$
31. A ball moving with a certain velocity hits another identical ball at rest. If the plane is frictionless and collision is elastic, then the angle between the directions in which the balls move after collision, will be
 a. 30° b. 60° c. 90° d. 120°
32. A shell is fired from a cannon with a velocity v at an angle θ with the horizontal direction. At the highest point in its path, it explodes into two pieces, one retraces its path to the cannon and the speed of the other pieces immediately after the explosion is
 a. $3v \cos \theta$ b. $2v \cos \theta$
 c. $\left(\frac{3}{2}\right)v \cos \theta$ d. $\frac{\sqrt{3}}{2}v \cos \theta$

7. If gas molecules undergo inelastic collision with the walls of the container, [2009]
 a. temperature of gas will increase
 b. temperature of gas will fall
 c. pressure of the gas will increase
 d. neither the temperature nor the pressure will change
8. A ball is dropped from a height h on a floor of coefficient of restitution e . The total distance covered by the ball just before second hit is [2008]
 a. $h(1 - 2e^2)$ b. $h(1 + 2e^2)$ c. $h(1 + e^2)$ d. he^2
9. Two particles A and B initially at rest, move towards each other, under mutual force of attraction. At an

instance when the speed of A is v and speed of B is $2v$, the speed of centre of mass (CM) is [2008]

- a. zero b. v c. $2.5v$ d. $4v$

10. Consider the following statement. When jumping from some height, you should bend your knees as you come to rest instead of keeping your legs stiff. Which of the following relations can be useful in explaining the statement? [2007]

- a. $\Delta \mathbf{p}_1 = -\Delta \mathbf{p}_2$ b. $\Delta E = -\Delta(\text{PE} + \text{KE}) = 0$
 c. $\mathbf{F} \Delta t = m \Delta \mathbf{v}$ d. $\Delta \mathbf{x} \propto \Delta \mathbf{F}$

where, symbols have their usual meanings.

Answer with Solutions

Practice Exercise

1. (b) We assume that origin is situated at the O_1 .

$$\therefore x_1 = 0, m_1 = m$$

$$x_2 = 3a, m_2 = 2m$$

$$\begin{aligned} \therefore x_{\text{CM}} &= \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2} \\ &= \frac{m \times 0 + 2m \times 3a}{m + 2m} \\ &= \frac{6ma}{3m} = 2a \end{aligned}$$

2. (a) For the calculation of the position of centre of mass, cut-off mass is taken as negative. The mass of disc is

$$m_1 = \pi r_1^2 \sigma = \pi 6^2 \sigma = 36\pi\sigma$$

where, σ = Surface mass density

The mass of cutting portion is

$$m_2 = \pi (1)^2 \sigma = \pi\sigma$$

$$x_{\text{CM}} = \frac{m_1 x_1 - m_2 x_2}{m_1 + m_2}$$

Taking origin at the centre of disc,

$$x_1 = 0, x_2 = 3 \text{ cm}$$

$$\begin{aligned} x_{\text{CM}} &= \frac{36\pi\sigma \times 0 - \pi\sigma \times 3}{36\pi\sigma - \pi\sigma} \\ &= \frac{-3\pi\sigma}{35\pi\sigma} = -\frac{3}{35} \text{ cm} \end{aligned}$$

3. (b) The mass of considered element is

$$dm = \lambda dx = \lambda_0 x dx$$

$$\therefore x_{\text{CM}} = \frac{\int_0^L x dm}{\int_0^L dm} = \frac{\int_0^L x (\lambda_0 x dx)}{\int_0^L \lambda_0 x dx}$$

$$\begin{aligned} &= \frac{\lambda_0 \left[\frac{x^3}{3} \right]_0^L}{\lambda_0 \left[\frac{x^2}{2} \right]_0^L} = \frac{\lambda_0 \frac{L^3}{3}}{\lambda_0 \frac{L^2}{2}} = \frac{2}{3} L \end{aligned}$$

4. (d) (a) If a rod is bent in the form of a circle. Its centre of mass is at the centre of curvature.

(b) Football is in the shape of hollow sphere. So, its centre of mass is at the centre of sphere.

(c) The reason is same as (a).

In all the above geometrical shapes, no material is present at the centre of mass.

5. (b) Since, no external force is present on the system. So, the centre of mass of system will not be changed.
6. (b) Since, external force on system is zero. So, no change takes place in the centre of mass.

$$x_{\text{CM}} = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2}$$

or

$$\Delta x_{\text{CM}} = \frac{m_1 \Delta x_1 + m_2 \Delta x_2}{m_1 + m_2}$$

Here,

$$\Delta x_{\text{CM}} = 0$$

$$\therefore m_1 \Delta x_1 + m_2 \Delta x_2 = 0 \text{ or } M \Delta x_1 + \frac{M}{3} \Delta x_2 = 0$$

$$\therefore \Delta x_1 = -\frac{M}{3M} \Delta x_2 = -\frac{\Delta x_2}{3} \quad \dots (i)$$

$$\text{But, } x_{\text{rel}} = \Delta x_1 - \Delta x_2 \text{ or } L = \Delta x_1 - \Delta x_2$$

$$\text{or } L = -\frac{\Delta x_2}{3} - \Delta x_2 = -\frac{4}{3} \Delta x_2 \quad [\text{from Eq. (i)}]$$

$$\therefore \Delta x_2 = -\frac{3}{4} L$$

$$\therefore \Delta x_1 = -\frac{\Delta x_2}{3} = -\frac{-3L}{4 \times 3} = -\frac{L}{4}$$

Negative sign indicates that both move in opposite direction.

7. (c) The car is stopped by the contact force exerted due to road.

8. (b) The acceleration of centre of mass is

$$a_{CM} = \frac{F}{m_A + m_B} = \frac{30}{10 + 20} = 1 \text{ m/s}^2$$

$$\therefore s = \frac{1}{2} a_{CM} t^2 = \frac{1}{2} \times 1 \times 2^2 = 2 \text{ m}$$

9. (c) If we consider a system consists of gun plus mass m . Then, no external force is present on the system. So, the acceleration of centre of mass of system will be zero. Since, initially the system is in rest. So, centre of mass will always remains at rest.

10. (d) (a) Since, external force on the system is F .

$$\therefore a_{CM} = \frac{F}{m_1 + m_2}$$

(b) At $t = 0$, elongation in spring is zero. So, force on m_2 is zero but force on m_1 is only in forward direction, i.e. F .

$$\therefore a_1 = \frac{F}{m_1}, \text{ at } t = 0$$

This is maximum acceleration of m_1 .

11. (c) When mass m_2 moves downwards, the centre of mass of system ($m_1 + m_2$) moves downwards. It means the acceleration is found in centre of mass in downward direction during motion of m_2 . This is possible only when net downward force is greater than that of upward force.

Mathematically,

$$m_1g + m_2g > N$$

$$\therefore N < m_1g + m_2g$$

12. (c) $x_{CM} = \frac{m_A x_A + m_B x_B + m_C x_C + m_D x_D}{m_A + m_B + m_C + m_D}$
- $$= \frac{1 \times 0 + 2 \times 1 + 3 \times 1 + 4 \times 0}{1 + 2 + 3 + 4}$$
- $$= \frac{2 + 3}{10} = \frac{1}{2} = 0.5 \text{ m}$$

Similarly,

$$y_{CM} = \frac{m_A y_A + m_B y_B + m_C y_C + m_D y_D}{m_A + m_B + m_C + m_D}$$

$$= \frac{1 \times 0 + 2 \times 0 + 3 \times 1 + 4 \times 1}{1 + 2 + 3 + 4}$$

$$= \frac{7}{10} = 0.7 \text{ m}$$

13. (b) As, $v_{CM} = \frac{m_1 v_1 + m_2 v_2 + m_3 v_3}{m_1 + m_2 + m_3}$
- $$= \frac{5 \times 5 + 4 \times 4 + 2 \times 2}{5 + 4 + 2}$$
- $$= \frac{25 + 16 + 4}{11}$$
- $$\therefore v_{CM} = \frac{45}{11} \approx 4.09 \approx 4 \text{ m/s}$$

14. (c) FBD of two blocks

$$\text{For } m_1, a_1 = \frac{F}{m_1}$$

$$\text{and } N_2 + m_1g = N_1$$

$$\text{For } m_2, a_2 = 0, N_2 = m_2g$$

$$\therefore a_{CM} = \frac{m_1 a_1 + m_2 a_2}{m_1 + m_2}$$

$$= \frac{m_1 \times \frac{F}{m_1} + 0}{m_1 + m_2} = \frac{F}{m_1 + m_2}$$

15. (a) Here, $m_1 = m_2 = m$ (suppose), when P comes to rest, it falls vertically downward.

$$X_1 = \frac{R}{2}$$

Centre of mass,

$$X_{CM} = \frac{m_1 X_1 + m_2 X_2}{m_1 + m_2}$$

$$R = \frac{m \frac{R}{2} + m X_2}{2m}$$

$$[\because X_{CM} = R]$$

$\Rightarrow$

$$X_2 = 1.5 R$$

16. (c) If velocity of centre of mass is v , then velocity of contact is 0 and that of the top is $2v$, hence when centre of mass covers a distance l , thread covers a distance $2l$.

17. (c)

$$p = mv$$

$\therefore$

$$m = \frac{p}{v}$$

Hence, m - v graph will be rectangular hyperbola.

18. (b) $\frac{E_{k1}}{E_{k2}} = \frac{\frac{p_1^2}{2m_1}}{\frac{p_2^2}{2m_2}} = \frac{m_2}{m_1} = \frac{4m}{m} = 4:1$ $[\because p_1 = p_2]$

19. (d) The momentum and kinetic energy depend upon reference frame. In the frame of train, the man is in rest. So, the momentum and kinetic energy of the man in the frame of train are zero. But in the frame of ground, velocity of the man is non-zero. So, in the frame of ground, momentum and kinetic energy are not zero.

20. (c) Since, gravitational force is present. So, conservation principle is only applicable to a system consists of air molecules + earth + meteorite.

21. (d) (a) During firing of the bullet from gun, the chemical energy of powder of bullet is converted into the kinetic energy of the system. So, final mechanical energy of system is greater than initial kinetic energy of the system.

(b) In this case, chemical energy (non-mechanical) is converted into mechanical energy of the system.

(c) The same reason as the above.

(d) The same reason as (a) and (b).

22. (d) Since, no external force is present. So, momentum conservation principle is completely applicable.

$$\therefore m \mathbf{n} = m_1 \mathbf{n}_1 + m_2 \mathbf{n}_2$$

$$\text{or } (m_1 + m_2) \mathbf{n} = m_1 \mathbf{n}_1 + m_2 \mathbf{n}_2$$

23. (e) Since, no external force is present on the system. So, conservation principle of momentum is applicable.

$$\therefore \mathbf{p}_i = \mathbf{p}_f = \mathbf{p}_1 + \mathbf{p}_2$$

$$\therefore \mathbf{p}_1 = -\mathbf{p}_2 \quad [\because \mathbf{p}_i = 0]$$

$$\therefore |\mathbf{p}_1| = |\mathbf{p}_2|$$

$$\therefore \mathbf{p}_1 = \mathbf{p}_2$$

From this point of view, it is clear that momenta of both particles are equal in magnitude but opposite in direction.

Also, friction is absent. So, total mechanical energy of system remains conserved.

24. (d) When spring is massless. Then according to momentum conservation principle,

$$\mathbf{p}_i = \mathbf{p}_f \text{ or } 0 = m_1 \mathbf{v}_1 + m_2 \mathbf{v}_2$$

$$\therefore m_1 \mathbf{v}_1 = -m_2 \mathbf{v}_2$$

$$\therefore m_1 v_1 = m_2 v_2 \text{ or } p_1 = p_2$$

$$\therefore K_1 = \frac{p_1^2}{2m_1} \Rightarrow K_2 = \frac{p_2^2}{2m_2}$$

$$\therefore \frac{K_1}{K_2} = \frac{m_2}{m_1} \quad [\because p_1 = p_2]$$

25. (d) In the case of projectile motion, if bodies are projected with same speed, they reach at ground with same speeds. So, if bodies have same masses, then momentum of body will be different for different directions of projection but magnitude of momenta must be same.

26. (c) $\therefore$ Acceleration, $a = \frac{v - u}{t}$ or $a = \frac{v - v_0}{t}$

$$\text{or } g = \frac{v - v_0}{t} \quad [\text{considered average force}]$$

$$\therefore v = 0$$

Speed before first bounce

$$v_0 = 5 \text{ m/s } (\uparrow)$$

$$\therefore t = \frac{v - v_0}{g} = \frac{0 - (-5)}{10} = \frac{5}{10} = 0.5 \text{ s}$$

27. (a) For collision between blocks A and B,

$$e = \frac{v_B - v_A}{u_A - u_B} = \frac{v_B - v_A}{10 - 0} = \frac{v_B - v_A}{10}$$

$$\therefore v_B - v_A = 10e = 10 \times 0.5 = 5 \quad \dots (i)$$

From momentum conservation principle,

$$m_A u_A + m_B u_B = m_A v_A + m_B v_B$$

$$\text{or } m \times 10 + 0 = m v_A + m v_B$$

$$\therefore v_A + v_B = 10 \quad \dots (ii)$$

Adding Eqs. (i) and (ii), we get

$$v_B = 7.5 \text{ m/s}$$

Similarly for collision between B and C,

$$v_C - v_B = 7.5e = 7.5 \times 0.5 = 3.75$$

$$\therefore v_C - v_B = 3.75 \text{ m/s} \quad \dots (iii)$$

$$\text{and } v_C + v_B = 7.5 \quad \dots (iv)$$

Adding Eqs. (iii) and (iv), we get

$$2v_C = 11.25$$

$$\therefore v_C = \frac{11.25}{2} = 5.6 \text{ m/s}$$

28. (b) Here, $m = 0.08 \text{ kg}$

$$m_0 = 0.16 \text{ kg}$$

According to conservation principle of momentum

$$mv_1 + mv_2 = (2m + m_0) v_{CM}$$

$$\begin{aligned} \therefore v_{CM} &= \frac{mv_1 + mv_2}{2m + m_0} \\ &= \frac{0.08 \times 16}{0.16 + 0.16} \\ &= \frac{1.28}{0.32} = \frac{128}{32} = 4 \text{ m/s} \end{aligned}$$

29. (a)

30. (d)

31. (c)

32. (a) As we know that at the highest point, the shell has only the horizontal component of velocity which is $v \cos \theta$. If u be the velocity of second exploded piece, then applying conservation of linear momentum along X-axis.

$$\therefore 2mv \cos \theta = -mv \cos \theta + m$$

$$\text{or } u = 3v \cos \theta$$

33. (b) Since, no force is present along the surface of plate. So, momentum conservation principle for ball is applicable along the surface of plate.

$$mv \sin \theta_1 = mv_1 \sin \theta_2$$

$$\text{or } v \sin \theta_1 = v_1 \sin \theta_2 \quad \dots (i)$$

$$e = \frac{v_1 \cos \theta_2}{v \cos \theta_1} = \frac{v_1 \cos \theta_2}{v \cos \theta} \quad [\text{Let } \theta_1 = \theta]$$

$$\therefore v_1 \cos \theta_2 = ev \cos \theta \quad \dots (ii)$$

$$\therefore \frac{v_1 \sin \theta_2}{v_1 \cos \theta_2} = \frac{v \sin \theta}{ev \cos \theta} = \frac{\tan \theta}{e}$$

$$\therefore \tan \theta_2 = \frac{\tan \theta}{e}$$

$$\therefore \theta_2 = \tan^{-1} \left(\frac{\tan \theta}{e} \right)$$

34. (c) $F = v \frac{\Delta m}{\Delta t}$

$$\text{Here, } \frac{\Delta m}{\Delta t} = \frac{nm}{t} = \frac{120 \times 10 \times 10^{-3}}{60}$$

$$= 20 \times 10^{-3} \text{ kg/s}$$

$$\therefore = 800 \times 20 \times 10^{-3} \text{ N} = 16 \text{ N}$$

35. (c) $F = \frac{\Delta p}{\Delta t} = v \frac{\Delta m}{\Delta t} = v \frac{nm}{t}$

$$F = vm \frac{n}{60} = \frac{mvn}{60}$$

36. (a) Since, m_2 moves with constant velocity.

$$\therefore \quad \begin{aligned} f_2 &= m_2 g \\ f_2 &= 8 \times 10 = 80 \text{ N} \end{aligned}$$

Since, block m_1 moves with acceleration $a = 2 \text{ m/s}^2$ in upward direction

$$\begin{aligned} \therefore \quad f_1 - m_1 g &= m_1 a \\ \therefore \quad f_1 &= m_1 g + m_1 a = 10 \times 10 + 10 \times 2 = 120 \text{ N} \end{aligned}$$

For equilibrium of rope,

$$T = f_1 + f_2 = (120 + 80) \text{ N} = 200 \text{ N}$$

37. (a) 38. (a)

39. (b) Initially from conservation of momentum theorem, for bullet and block system

$$mv' = (m + M)v \Rightarrow v' = \frac{mv}{(m + M)}$$

Let the bullet-block system rises to height h , so from conservation of mechanical energy,

$$\frac{1}{2}(m + M)v'^2 = (m + M)gh$$

$$h = \frac{v'^2}{2g}$$

$$\Rightarrow \quad h = \frac{m^2 v^2}{(m + M)^2} \times \frac{1}{2g}$$

40. (a) From definition, we can write coefficient of restitutions,

$$e = \frac{v' - 2v}{v + 2v}$$

$$\Rightarrow \quad \frac{1}{3} = \frac{v' - 2v}{3v}$$

$$\Rightarrow \quad 3v' = 9v$$

$$\Rightarrow \quad v' = 3v$$

As wood sheet is heavier than ball, so its speed will not change.

BITSAT Archives

1. (b) In any type of collision, the linear momentum of the system remain conserved even during collision.

2. (a) Total mass of the shell = 20 kg

Ratio of the masses of the fragments = 2 : 3

$\therefore$ Masses of the fragments are 8 kg and 12 kg. Now, according to the conservation of momentum

$$m_1 v_1 = m_2 v_2 \quad \therefore 8 \times 6 = 12 \times v$$

v (velocity of the larger fragment) = 4 m/s

$$\text{Kinetic energy} = \frac{1}{2} m v^2 = \frac{1}{2} \times 12 \times (4)^2 = 96 \text{ J}$$

3. (a) Momentum is conserved in non-elastic collision but kinetic energy is not conserved.

4. (d) A ball bearing striking another ball bearing is not an example of perfectly inelastic collision.

5. (b) Since, if momentum is conserved, then

$$mu = mv_1 + mv_2$$

$$\Rightarrow \quad u = v_1 + v_2 \dots (i)$$

As we know that coefficient of restitution can be given as

$$e = \frac{v_1 - v_2}{u} \dots (ii)$$

From Eqs. (i) and (ii), we get

$$e = \frac{v_1 - v_2}{v_1 + v_2} \dots (iii)$$

On solving Eq. (iii), we get $\frac{v_1}{v_2} = \frac{1+e}{1-e}$

6. (c) Thrust = $u \frac{dm}{dt} = Mg$ or $\frac{dm}{dt} = \frac{Mg}{u} = \frac{600 \times 9.8}{1000} = 6 \text{ kgs}^{-1}$

7. (d) Usually, temperature of the gas in a container is same as the temperature of the walls of the container. Therefore, during collision, there is no exchange of energy. Hence, whether collision is elastic or inelastic, molecules rebound with same average speed. Therefore, neither the temperature nor the pressure will change.

8. (b) Total distance travelled by the ball before its second hit is

$$H = h + 2h_1 = h[1 + 2e^2] \quad [\because h_1 = he^2]$$

9. (a) As initially both the particles were at rest, therefore velocity of centre of mass was zero and there is no external force on the system. So, speed of centre of mass remains constant, i.e. it should be equal to zero.

10. (c) $F \Delta t = m \Delta v \Rightarrow F = \frac{m \Delta v}{\Delta t}$

By doing so, time of change in momentum increases and impulsive force on knees decreases.

8

Rotational Motion

Concept of Rotational Motion

If a force is exerted on some body that does not pass through its centre of mass, then it can produce a turning effect in the body about its centre of mass. If the body is fixed, then there will not be its linear motion. Thus, it will go under pure rotation. But if the body is not fixed, then there will be a linear motion along with the rotational motion.

Terms Related to Rotational Motion of the Body

(R and r are two radii)

(i) Linear speed

$$v = \omega R$$

[Its SI unit is m/s]

(ii) Angular speed

$$\omega = \frac{2\pi}{T}$$

[Its SI unit is rad/s]

Also,

$$\omega = \lim_{\Delta t \rightarrow 0} \frac{\Delta \theta}{\Delta t} = \frac{d\theta}{dt}$$

[where, $\Delta \theta$ = angular displacement]

(iii) Angular acceleration

$$\alpha = \lim_{\Delta t \rightarrow 0} \frac{\Delta \omega}{\Delta t} = \frac{d\omega}{dt} = \frac{\text{Change in angular speed}}{\text{Time taken}}$$

α is same for all the points of the rotational body. Its SI unit is rad/s^2 .

(iv) Linear acceleration

$$a = R\alpha$$

[Its SI unit is m/s^2]

Equations of Rotational Motion

If angular acceleration α is uniform, then equations of rotational motion may be written as

$$\begin{aligned} \text{(i)} \quad \omega &= \omega_0 + \alpha t & \text{(ii)} \quad \theta &= \omega_0 t + \frac{1}{2} \alpha t^2 \\ \text{(iii)} \quad \omega^2 - \omega_0^2 &= 2\alpha\theta & \text{(iv)} \quad \theta_{n\text{th}} &= \omega_0 + \frac{\alpha}{2}(2n-1) \end{aligned}$$

Torque or Moment of a Force

Torque is a quantity which measures the capability of a force to rotate a body. It is a vector quantity which is directly perpendicular to both position vector (r) and force (F). Its SI unit is Nm.

Representation of torque on axes

Torque, $\tau = \mathbf{r} \times \mathbf{F} = rF \sin \theta \hat{n}$

where, θ = angle between $\mathbf{r}$ and $\mathbf{F}$.

and $\hat{n}$ is unit vector which shows the direction of τ .

Torque due to a force is also known as the **moment of a force**. It is defined as the cross product of the position vector of point (P) from the origin (O) on which the force is acting, with the force (see figure).

Angular Momentum

The moment of linear momentum of a given body about an axis of rotation is called as its angular momentum. If $\mathbf{p}$ is the linear momentum of a particle and $\mathbf{r}$ is its position vector from the point of rotation, then

Angular momentum, $\mathbf{L} = \mathbf{r} \times \mathbf{p} = rpsin\theta \hat{n}$

where, $\hat{n}$ is a unit vector in the direction of rotation.

Angular momentum is an axial vector and its SI unit is $\text{kgm}^2\text{s}^{-1}$ or J-s.

- (i) For rotational motion of a rigid body, angular momentum is equal to the product of angular velocity and moment of inertia of the body about the axis of rotation. Mathematically, $\mathbf{L} = I\boldsymbol{\omega}$

- (ii) According to the second law of rotational motion, the rate of change of angular momentum of a body is equal to the external torque applied on it and takes place in the direction of torque. Thus,

$$\tau = \frac{d\mathbf{L}}{dt} = \frac{d}{dt}(I\boldsymbol{\omega}) = I \frac{d\boldsymbol{\omega}}{dt} = I\alpha$$

- (iii) Total effect of a torque applied on a rotating body in a given time is called angular impulse. Angular impulse is equal to total change in angular momentum of the system in given time. Thus, angular impulse

$$J = \int_0^{\Delta t} \tau dt = \Delta L = L_f - L_i$$

- (iv) The angular momentum of a system of particles about the origin is

$$L = \sum r_i \times p_i$$

Law of Conservation of Angular Momentum

According to the law of conservation of angular momentum, if no external torque is acting on a system, then total vector sum of angular momentum of different particles of the system remains constant.

We know that, $\frac{d\mathbf{L}}{dt} = \tau_{\text{ext}}$

Hence, if $\tau_{\text{ext}} = 0$, then $\frac{d\mathbf{L}}{dt} = 0 \Rightarrow L = \text{constant}$

Therefore, in the absence of any external torque, total angular momentum of a system must remain conserved.

Relation between Angular Momentum and Torque

If the external force exerted on a body rotates it, then there is an external torque on the body. This external torque will be equal to the time rate of change of angular momentum.

$$\tau_{\text{ext}} = \frac{d\mathbf{L}}{dt}$$

Moment of Inertia of Different Bodies

Body	Axis	Moment of Inertia
1. Rectangular Lamina	Passing through its CG and perpendicular to its plane of length of breadth.	$\frac{M(l^2 + b^2)}{12}$
2. Uniform thin bar	(i) Through centre of gravity and perpendicular to length.	$\frac{Ml^2}{12}$
	(ii) Through one end and perpendicular to length.	$\frac{Ml^2}{3}$
3. Disc	(i) Passing through its centre and perpendicular to its plane.	$\frac{MR^2}{2}$
	(ii) About a diameter.	$\frac{MR^2}{4}$
4. Ring or Hoop	(i) Passing through its centre and perpendicular to its plane.	MR^2
	(ii) About a diameter.	$\frac{MR^2}{2}$

Body	Axis	Moment of Inertia
5. Solid cylinder	(i) About its own geometric axis.	$\frac{MR^2}{2}$
	(ii) Passing through CG and perpendicular to its geometric axis.	$M\left(\frac{l^2}{12} + \frac{R^2}{4}\right)$
6. Hollow disc of radii R_1 and R_2	Passing through its centre and perpendicular to its plane.	$\frac{M(R_1^2 + R_2^2)}{2}$
7. Hollow cylinder	(i) About its own geometric axis.	MR^2
	(ii) Passing through CG and perpendicular to length.	$M\left(\frac{l^2}{12} + \frac{R^2}{2}\right)$
8. Thin spherical shell	(i) About a diameter.	$\frac{2}{3}MR^2$
	(ii) About a tangent.	$\frac{5}{3}MR^2$
9. Diatomic molecule	Passing through centre of gravity and perpendicular to bond length.	$\frac{m_1 m_2}{m_1 + m_2} r^2$
10. Solid sphere	(i) About a diameter.	$\frac{2}{5}MR^2$
	(ii) About a tangent.	$\frac{7}{5}MR^2$

Moment of Inertia

The property by virtue of which a body opposes its change in its state of motion is called its inertia.

In similar manner, a body have the tendency to oppose its rotational motion or change in rotational motion about its axis is known as moment of inertia.

Mathematically, it is given as the product of mass and square of the perpendicular distance of a particle from the axis of rotation.

$$I = mR^2$$

where, m = mass of the particle

and R = perpendicular distance from axis of rotation.

A particle is rotating about z-axis in a circle of radius R .

Radius of Gyration

Radius of gyration of a given body about a given axis of rotation is the normal distance of a point from the axis, where if whole mass of the body is placed, then its moment of inertia will be exactly same as it has with its actual distribution of mass.

Thus, radius of gyration

$$K = \sqrt{\frac{I}{M}} \quad \text{or} \quad K = \left[\frac{r_1^2 + r_2^2 + r_3^2 + \dots + r_n^2}{n} \right]^{-1/2}$$

SI unit of radius of gyration is metre.

NOTE Radius of gyration depends upon shape and size of the body, position and configuration of the axis of rotation and also on distribution of mass of body w.r.t. axis of rotation.

Theorems on Moment of Inertia

There are two theorems of moment of inertia, i.e. theorem of parallel axes and theorem of perpendicular axes. Both the theorems are described below

1. Theorem of Parallel Axes

Moment of inertia of a body about a given axis I is equal to the sum of moment of inertia of the body about a parallel axis passing through its centre of mass I_{CM} and the product of mass of body (M) and square of normal distance d between the two axes.

Mathematically, $I = I_{CM} + Md^2$

2. Theorem of Perpendicular Axes

The sum of moment of inertia of a plane lamina body about two mutually perpendicular axes lying in its plane is equal to its moment of inertia about an axis passing through the point of intersection of these two axes and perpendicular to the plane of lamina body. If I_x and I_y be moment of inertia of the body about two perpendicular axes in its own plane and I_z be the moment of inertia about an axis passing through point O and perpendicular to the plane of lamina, then

$$I_z = I_x + I_y$$

Rigid Body Rotation

If a rigid body of moment of inertia I about a given axis is rotating with an angular speed ω , then its rotational kinetic energy is given by, $K_R = \frac{1}{2} I \omega^2$. Rotational kinetic energy is a scalar having SI unit joule (J). Rotational kinetic energy is related to angular momentum as per relation,

$$K_R = \frac{L^2}{2I} \quad \text{or} \quad L = \sqrt{2IK_R}$$

Rolling on an Inclined Plane

For a body of mass M , rolling on an inclined plane having inclination θ , slant height s and height h .

(i) Height of an inclined plane, $h = \frac{v^2}{2g} \left(1 + \frac{K^2}{R^2} \right)$

(ii) Acceleration in motion $a = g \sin \theta / \left(1 + \frac{K^2}{R^2} \right)$

(iii) Time of descent,

$$t = \frac{1}{\sin \theta} \sqrt{\frac{2h \left(1 + \frac{K^2}{R^2} \right)}{g}}$$

(iv) The velocity of CM at the bottom of the incline,

$$v = \sqrt{\frac{2gh}{1 + K^2/R^2}}$$

Here, K = Radius of gyration.

Practice Exercise

- The angular displacement at any time t is given by $\theta(t) = 2t^3 - 6t^2$. The torque on the wheel will be zero at
 a. 1 s b. 0.1 s c. 2 s d. 0.2 s
- Four 2 kg masses are connected by 1/4 m spokes to an axle. A force of 24 N acts on a lever 1/2 m long to produce angular acceleration α . The magnitude of α (in rad s^{-2}) is (the angle between $\mathbf{r}$ and $\mathbf{F}$ is 30°)
 a. 24 b. 12 c. 6 d. 3
- A flywheel of moment of inertia 0.4 kg m^2 and radius 0.2 m is free to rotate about a central axis. If a string is wrapped around it and it is pulled with a force of 10 N, then its angular velocity after 4 s will be
 a. 10 rad s^{-1} b. 5 rad s^{-1} c. 20 rad s^{-1} d. None
- The centre of a wheel rolling on a plane surface moves with a speed v_0 . A particle on the rim of the wheel at the same level as the centre will be moving at speed
 a. zero b. v_0 c. $\sqrt{2}v_0$ d. $2v_0$
- A meter stick is held vertically with one end on the floor and then is allowed to fall. Assuming that the end on the floor of the sticks does not move. The velocity of the other end when it hits the floor, will be
 a. 9.8 m/s b. 6.2 m/s c. 8.9 m/s d. 5.4 m/s
- The instantaneous velocity of point B of the given rod of length 0.5 is 3 m/s in the represented direction.
 The angular velocity of the rod for minimum velocity of end A is
 a. 1.5 rad/s b. 5.2 rad/s c. 2.5 rad/s d. 3.6 rad/s
- A car is moving in a circular horizontal track of radius 10 m with a constant speed of 10 m/s. A plumb bob is suspended from the roof of the car by a light rigid rod of length 1 m. The angle made by the rod with the track is (Take $g = 10 \text{ m/s}^2$)
 a. zero b. 30°
 c. 45° d. 60°
- If a raw egg and a boiled egg are spinned on the table by applying same torque. Then
 a. boiled egg will spin faster
 b. raw egg will spin faster
 c. moment of inertia of boiled egg will be lesser than that of the raw egg
 d. Both a and c are correct
- The torque τ on a body about a given point is found to be equal to $\mathbf{A} \times \mathbf{L}$, where $\mathbf{A}$ is constant vector and $\mathbf{L}$ is the angular momentum of the body about that point. From this, it follows that
 a. $\frac{d\mathbf{L}}{dt}$ is perpendicular to $\mathbf{L}$ at all instant of time
 b. the component of $\mathbf{L}$ in the direction of $\mathbf{A}$ does not change with time
 c. the magnitude of $\mathbf{L}$ does not change with time
 d. All of the above
- The tricycle weighing 20 kg has a small wheel symmetrically placed 1 m behind the two large wheels, which are also 1 m apart. If the centre of gravity of machine is at a horizontal distance of 25 cm behind the front wheels and the rider whose weight is 40 kg is 10 cm behind the front wheels. Then, the thrust on each front wheel is
 a. 255 N b. 90 N
 c. 200 N d. 400 N

11. A rectangular plate of mass 20 kg is suspended from points A and B as shown. If the pin B is suddenly removed, then determine the angular acceleration (in rad/sec^2) of the plate.

a. 48 b. 19.6 c. 29.4 d. 23.6

12. A uniform rod of length l and mass m is suspended by two vertical inextensible strings as shown in figure. Then, tension in the left string when right string snaps, is

a. $\frac{3mg}{4}$ b. $\frac{mg}{4}$
c. $\frac{mg}{2}$ d. $\frac{mg}{8}$

13. A rod of length L is hinged from one end. It is brought to a horizontal position and released. The angular velocity of the rod, when it is in vertical position, is

a. $\sqrt{\frac{2g}{L}}$ b. $\sqrt{\frac{3g}{L}}$ c. $\sqrt{\frac{g}{2L}}$ d. $\sqrt{\frac{g}{L}}$

14. A light rod carries three equal masses A, B and C as shown in figure. Find the velocity of B in vertical position of rod, if it is released from horizontal position as shown in figure.

a. $\sqrt{2gl}$ b. $\sqrt{\frac{18gl}{7}}$ c. $\sqrt{\frac{4gl}{3}}$ d. $\sqrt{\frac{8gl}{7}}$

15. The kinetic energy of a lamina moving in its plane is

a. $M(v_{CM}^2 + K^2\omega^2)$ b. $\frac{1}{2}M(v_{CM}^2 + K^2\omega^2)$
c. $\frac{1}{2}I\omega^2$ d. None of these

16. A wheel has mass of the rim 1 kg, having 50 spokes each of mass 5 g. The radius of the wheel is 40 cm. The moment of inertia is

a. 0.273 kg m^2 b. 1.73 kg m^2
c. 0.173 kg m^2 d. 2.73 kg m^2

17. The moment of inertia of a system of four rods each of length l and mass m about the axis shown is

a. $\frac{2}{3}ml^2$ b. $2ml^2$ c. $3ml^2$ d. $\frac{8}{3}ml^2$

18. The surface density of a circular disc of radius a depends on the distance as $\rho(r) = A + Br$. The moment of inertia about the line perpendicular to the plane of the disc is

a. $\pi a^4 \left(\frac{A}{2} + \frac{2a}{5} B \right)$ b. $\pi a^4 \left(\frac{A}{2} + \frac{2B}{5} \right)$
c. $2\pi a^3 \left(\frac{A}{2} + \frac{Ba}{5} \right)$ d. None of these

19. A hoop of radius 2 m, weight 100 kg. It rolls along horizontal floor so that its centre of mass has a speed of 20 cm/s. How much work has to be done to stop it?

a. 4.8 J b. 4.0 J c. 6.2 J d. 7.2 J

20. Mass of bigger disc having radius $2R$ is M . A disc of radius R is cut from bigger disc. Moment of inertia of disc about an axis passing through periphery and perpendicular to plane is

a. $\frac{27}{8}MR^2$ b. $\frac{29}{8}MR^2$ c. $3.5MR$ d. $2MR^2$

21. Three thin rods each of length L and mass M are placed along x, y and z-axes such that one of each rod is at origin. The moment of inertia of this system about z-axis is

a. $\frac{2}{3}ML^2$ b. $\frac{4ML^2}{3}$ c. $\frac{5}{3}ML^2$ d. $\frac{ML^2}{3}$

22. If r is the distance between the Earth and the Sun. Then, angular momentum of the Earth around the Sun is proportional to

a. $r^{-1/2}$ b. $r^{1/2}$ c. r^2 d. r^{-2}

23. Two wheels A and B are mounted on 6 kg m^2 the same shaft. One of them having their moment of inertia 8 kg m^2 with angular speed 600 rpm and other is at rest. The value of moment of inertia of another wheel in order to achieve the combined angular speed 300 rpm is

a. 4 kg m^2 b. 3 kg m^2 c. 6 kg m^2 d. 9 kg m^2

24. Choose the correct option.

a. Friction is necessary for rolling motion
b. Friction is necessary for pure accelerated rolling motion
c. Friction is necessary for pure accelerated rolling on an inclined plane
d. None of the above

25. An arm making an angle of 120° at the centre of ring of mass m and radius r is cut from the ring. The arc is made to rotate about z-axis perpendicular to its plane and passing through the centre of the ring. The moment of inertia of the arc about the z-axis is

- a. mr^2 b. $\frac{mr^2}{3}$ c. $\frac{mr^2}{2}$ d. $\frac{mr^2}{4}$
26. A particle of mass m rotates in a circle of radius a with a uniform angular speed ω_0 . It is viewed from a frame rotating about the z-axis with a uniform angular speed ω . The centrifugal force on the particles is
- a. $m\omega^2 a$ b. $m\omega_0^2 a$
 c. $m\left(\frac{\omega + \omega_0}{2}\right)^2 a$ d. $m\omega\omega_0$

27. At any instant, a rolling body may be considered to be in pure rotation about an axis through the point of contact. This axis is translating forward with speed
- a. equal to centre of mass b. zero
 c. twice of centre of mass d. No sufficient data

28. In the given figure, the sphere rolls without slipping on the plank which is moving with constant velocity v_0 . The radius and angular velocity of the sphere is r and ω , respectively. The velocity of centre of mass of the sphere is

- a. $v_0 + r\omega$ b. $v_0 - r\omega$ c. $r\omega$ d. v_0
29. A uniform cube of mass m and edge a moves on a horizontal surface along the positive x-axis, with initial velocity v_0 . Then,
- a. during motion, $N > mg$
 b. during motion, normal reaction acts on the centre of mass
 c. during motion, the normal reaction shifts towards positive x-axis from the centre of mass
 d. during motion, normal reaction shifts in the direction of the forces of friction

30. In the case of toppling of the body about the point A (shown in the figure),

- a. $v_C > v_2 > v_1 > v_A$
 b. $v_1 > v_2 > v_C > v_A$
 c. $v_A \geq 0$
 d. $v_C < v_1 < v_2 < v_A$
31. In Q. 30, acceleration of the point A is
- a. ≥ 0 b. > 0
 c. < 0 d. $= 0$

32. Two cubes A and B of same shape, size and mass are placed on a rough surface in the same manner. Equal forces are applied on the both cubes. But at the cube A, the force is applied at the top in horizontal direction. But at the cube B just above the centre of mass of the cube in the same manner. Then,
- a. A will topple first
 b. B will topple first
 c. Both will topple at the same time
 d. None of the above

33. A regular polygon of n sides is placed on a rough surface vertically as such one of the side of regular polygon touches the surface. A force is applied horizontally at the top. The chosen value of n are 3, 5 and 8. For which value of n , the polygon first is likely to topple?

- a. 3 b. 5
 c. 8 d. All of these

34. A particle performs uniform circular motion with an angular momentum L . If the frequency of particles motion is doubled and its KE is halved, then the angular momentum becomes

- a. $2L$ b. $4L$ c. $\frac{L}{2}$ d. $\frac{L}{4}$

35. A mass m is moving with a constant velocity along a line parallel to the x-axis, away from the origin. Its angular momentum with respect to the origin
- a. is zero
 b. remains constant
 c. goes on increasing
 d. goes on decreasing

36. A particle of mass m is projected with velocity v moving at an angle of 45° with horizontal. The magnitude of angular momentum of projectile about point of projection when particle is at maximum height, is

- a. zero b. $\frac{mv^3}{4\sqrt{2}g}$
 c. $\frac{mv^3}{\sqrt{2}g}$ d. $m\sqrt{2}gh^3$

37. A uniform rod of length $2a$ is held with one end resulting on a smooth horizontal table making an angle α with the vertical. When the rod is released,
- a. its centre of mass moves vertically downwards on a straight line
 b. its centre of mass remains in rest
 c. the rod rotates about a vertical axis
 d. Both a and c are correct

38. A 70 kg man standing on ice throws a 3 kg body horizontally at 8 m/s. The friction coefficient between the ice and his feet is 0.02. The distance, the man slips is

- a. 0.3 m b. 2 m
 c. 1 m d. ∞

39. A weightless rod of length l carries two equal masses m one fixed at the end and other in the middle of the rod. The rod can revolve in a vertical plane about A . Then, horizontal velocity which must be imparted to end C of rod to deflect it to horizontal position is

a. $\sqrt{\frac{12}{5}gl}$ b. $\sqrt{3gl}$ c. $\sqrt{\frac{16}{5}gl}$ d. $\sqrt{2gl}$

40. Two balls A and B of angular velocities ω_A and ω_B collide with each other. Then, after collision
- both have same angular velocities
 - $\omega_A > \omega_B$
 - $\omega_A = \omega_B$, when balls are smooth
 - $\omega_A > \omega_B$, when balls are smooth

41. A uniform rod OA of mass M and length $2a$ rests on a smooth table and is free to turn about a smooth pivot at its end O , in contact with it at a distance b from O is an inelastic particle of mass m , a horizontal blow of impulse p is given to rod at a distance x from O in a direction perpendicular to the rod. The resultant instantaneous angular velocity of the rod is

a. $\frac{px}{\frac{4Ma^2}{3} + mb^2}$ b. $\frac{px}{M}$
c. $\frac{px}{ma^2 + mb^2}$ d. None of these

42. A uniform rod AB of mass m and length l is at rest on a smooth horizontal surface. An impulse p is applied to the end B . The time taken by the rod to turn through a right angle is

a. $2\pi \frac{ml}{p}$ b. $2\pi \frac{p}{ml}$ c. $\frac{\pi ml}{12p}$ d. $\frac{\pi p}{ml}$

43. A sphere of radius R is rolling on a rough horizontal surface. The magnitude of velocity of A with respect to ground will be

a. $\sqrt{2}v_{CM}$
b. $2v_{CM} \sin \theta$
c. $\sqrt{2}v_{CM}\sqrt{1 + \sin \theta}$
d. No sufficient information

44. When a wheel moves a distance shorter than $2\pi R$ while making one rotation. Then,

a. $v_{CM} < R\omega$ b. $v_{CM} \leq R\omega$
c. $v_{CM} > R\omega$ d. $v_{CM} \geq R\omega$

45. If a body moves through a distance greater than $2\pi R$ in one full rotation. Then,

a. $v_{CM} > R\omega$
b. $v_{CM} < R\omega$
c. $v_{CM} \geq R\omega$
d. $v_{CM} \leq R\omega$

46. A uniform sphere of radius a rotating with an angular velocity ω about an axis perpendicular to the plane of motion and its centre impinges on a horizontal plane, let u and v are horizontal and vertical component of velocity before impact. Then

a. if $u = a\omega$, then u and ω are unaltered
b. if $u = a\omega$, then surface is frictionless
c. if $u > a\omega$, then angular velocity increases
d. All of the above

47. In the given figure, a solid sphere is placed on a plank having acceleration a_0 (shown in the figure). Then,

a. if $a_p = a_0$, then pure rolling takes place
b. if $v_p = v_0$, then pure rolling takes place
c. if $a_p = a_0$, $v_p \neq v_0$, then pure rolling takes place
d. if $a_p = a_0$, $v_p = v_0$, then pure rolling takes place

48. The cylinder of mass M is suspended through two strings as shown in figure. The speed of cylinder after descending through a depth h , is

a. $\sqrt{\frac{3gh}{2}}$ b. $\sqrt{\frac{4gh}{3}}$
c. $\sqrt{\frac{2gh}{3}}$ d. $\sqrt{\frac{8gh}{3}}$

BITSAT Archives

- Two rings of radius R and nR made of same material have the ratio of moment of inertia about an axis passing through centre is 1:8. The value of n is [2013, 07]
 a. 2 b. $2\sqrt{2}$ c. 4 d. $1/2$
- A mass m is moving with a constant velocity along a line parallel to x -axis. Its angular momentum with respect to origin on z -axis is [2013, 07]
 a. zero b. remain constant
 c. goes on increasing d. goes on decreasing
- The moment of inertia of the body about an axis is 1.2 kg m^2 . Initially, the body is at rest. In order to produce a rotational kinetic energy of 1500J , an angular acceleration of 25 rad/s^2 must be applied about the axis for the duration of [2011]
 a. 2 s b. 4 s c. 8 s d. 10 s
- When the mass is rotated in a plane about a fixed point, then angular momentum is directed along the [2010]
 a. radius
 b. tangent to orbit
 c. axis of rotation
 d. line at an angle of 45° to plane of rotation
- A solid cylinder of mass 2 kg rolls down (pure rolling) an inclined plane from a height of 4 m. Its rotational kinetic energy, when it reaches the foot of the plane is (Take $g = 10 \text{ ms}^{-2}$) [2010]
 a. 20 J b. 40 J c. $\frac{80}{3} \text{ J}$ d. 80 J
- The radius of a wheel is R and its radius of gyration about its axis passing through its centre and perpendicular to its plane is K . If the wheel is rolling without slipping, then the ratio of its rotational kinetic energy to its translational kinetic energy is [2010]
 a. $\frac{K^2}{R^2}$ b. $\frac{R^2}{K^2}$
 c. $\frac{R^2}{R^2 + K^2}$ d. $\frac{K^2}{R^2 + K^2}$
- The moment of inertia of a thin circular disc about an axis passing through its centre and perpendicular to its plane, is I . Then, the moment of inertia of the disc about an axis parallel to its diameter and touching the edge of the rim is [2008]
 a. I b. $2I$ c. $\frac{3}{2}I$ d. $\frac{5}{2}I$
- The moment of inertia of a circular disc about an axis passing through the circumference perpendicular to the plane of the disc is [2006]
 a. MR^2 b. $\frac{3}{2}MR^2$
 c. $\frac{MR^2}{2}$ d. $\frac{5}{4}MR^2$
- Angular momentum is conserved [2006]
 a. always
 b. never
 c. when external force is absent
 d. when external torque is absent

Answer with Solutions

Practice Exercise

1. (a) Given, $\theta(t) = 2t^3 - 6t^2 \Rightarrow \frac{d\theta}{dt} = 6t^2 - 12t$

$$\frac{d^2\theta}{dt^2} = 12t - 12$$

For torque, $\tau = I\alpha = 0$

$$\frac{d^2\theta}{dt^2} = 0 \Rightarrow 12t^2 - 12 = 0$$

$$\therefore t = 1 \text{ s}$$

2. (b) As, force $\times$ distance $= \tau = I\alpha$

$$\Rightarrow F \sin 30^\circ \times \frac{1}{2} = 4 \left[2 \times \left(\frac{1}{4} \right)^2 \right] \alpha$$

$$\text{or } 24 \times \frac{1}{2} \times \frac{1}{2} = \frac{\alpha}{2}$$

$$\therefore \alpha = 12 \text{ rad s}^{-2}$$

3. (c) As, $\tau = F \times r = I\alpha$

$$= I \frac{(\omega_2 - \omega_1)}{t}$$

$$\therefore \omega_2 - \omega_1 = \frac{F \times r \times t}{I} = \frac{10 \times 0.2 \times 4}{0.4} = 20 \text{ rad s}^{-1}$$

4. (c) $v_p = r\omega = (\sqrt{2}R)\omega = \sqrt{2}v_0$

5. (d) From energy conservation,

$$\frac{M}{2}gl = \frac{1}{2}I\omega^2 \quad \dots(i)$$

Moment of inertia of the rod,

$$I = \frac{1}{3}Ml^2 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{M}{2}gl = \frac{1}{2} \frac{Ml^2}{3} \omega^2 \Rightarrow \omega = \sqrt{\frac{3g}{l}}$$

Given, $l = 1\text{m}$, $\omega = \sqrt{3g}$

Also, $v = r\omega = 1 \times \sqrt{3 \times 9.8} = 5.4\text{m/s}$

6. (b) If rod is rotated about end A, then vertical component of velocity, $v_{\perp}$ of end A will be zero.

$$\therefore \omega = \frac{v \sin 60^\circ}{l} = \frac{\sqrt{3}v}{2l} = \frac{\sqrt{3} \times 3}{2 \times 0.5} = 5.2 \text{ rad/s}$$

7. (c) From figure,

$$T \cos \theta = mg \quad \dots(i)$$

$$\text{or } T \sin \theta = \frac{mv^2}{r} \quad \dots(ii)$$

Dividing Eq. (ii) by Eq. (i)

$$\therefore \tan \theta = \frac{v^2}{rg} = \frac{10^2}{10 \times 10} = 1$$

$$\Rightarrow \theta = 45^\circ$$

8. (d) $\tau = I\alpha$, $\alpha = \frac{\tau}{I}$, $\alpha \propto \frac{1}{I}$

It means, greater moment of inertia, lesser the spin. The MI of boiled egg is less than that of the raw egg. So, options (a) and (c) are correct.

9. (c) $\therefore \tau = \mathbf{A} \times \mathbf{L}$ or $\frac{d\mathbf{L}}{dt} = \mathbf{A} \times \mathbf{L}$... (i)

i.e. $\left(\frac{d\mathbf{L}}{dt}\right)$ is always perpendicular to $\mathbf{L}$

(and also $\mathbf{A}$)

$$\text{From Eq. (i), } \left(\frac{dL}{dt}\right) = AL \sin \theta \quad \dots(ii)$$

The component of $\mathbf{L}$ in the direction of $\mathbf{A}$ ($L \cos \theta$) will not change with time. And also torque is perpendicular to $\mathbf{L}$, the magnitude of $\mathbf{L}$ will not change with time.

10. (a)

In the given figure, the tricycle with two front wheels A and B with one rear wheel C with centre of gravity of machine G_1 and that of rider G_2 .

Now, force at $G_1 = 20 \times 10 = 200\text{N}$

Force at $G_2 = 400\text{N}$

Let F_C = Force on ground under rear wheel C

Force at $D = F_D = 2F_A$ acts at mid-point of AB.

Taking torque about D, for equilibrium,

$$F_C \times 100 = 200 \times 25 + 400 \times 10 = 9000$$

$$\therefore F_C = 90\text{N}$$

$\therefore$ Thrust on each front wheel is N.

$\therefore 2N + F_C = \text{Total weight} = 600\text{N}$

$$\therefore N = \frac{600 - F_C}{2} = \frac{600 - 90}{2} = 255\text{N}$$

11. (a) When plate starts to rotate about point A, then

$$\tau = mg \frac{l}{2} \quad \left(\because \tau = mg \frac{l}{2} \right)$$

$$\text{or } I\alpha = mg \frac{l}{2}$$

Here, $l = 0.2\text{m}$, $b = 0.15\text{m}$

$$\therefore d^2 = \frac{l^2}{4} + \frac{b^2}{4} = \frac{(0.2)^2}{4} + \frac{(0.15)^2}{4} = \frac{0.0625}{4}$$

$\therefore$ The moment of inertia about vertical axis passing through point A is

$$I = I_C + md^2 = \frac{m}{12}(l^2 + b^2) + md^2$$

$$= \frac{20}{12}\{(0.2)^2 + (0.15)^2\} + 20 \times \frac{0.0625}{4}$$

On putting the values,

$$\alpha = 48 \text{ rad/s}^2$$

12. (b) The torque on rod about point O is

$$\tau = mg \frac{l}{2} \text{ or } I\alpha = mg \frac{l}{2}$$

$$\text{or } \frac{ml^2}{3} \alpha = mg \frac{l}{2} \text{ or } \alpha = \frac{3}{2}g$$

For centre of rod,

$$mg - T = ma_{CM}$$

$$\therefore T = mg - ma_{CM} = mg - m \frac{l}{2} \alpha$$

$$= mg - \frac{3}{4}mg = \frac{mg}{4}$$

13. (b) The loss in potential energy = Gain in angular kinetic energy

$$\therefore mg \frac{L}{2} = \frac{1}{2}I\omega^2$$

$$\text{or } mg \frac{L}{2} = \frac{1}{2} \frac{mL^2}{3} \omega^2$$

$$\text{or } g = \frac{L\omega^2}{3}$$

$$\therefore \omega = \sqrt{\left(\frac{3g}{L}\right)}$$

14. (d) Loss in PE = Gain in angular kinetic energy

$$\text{or } mg \frac{l}{3} + mg \left(\frac{2l}{3} \right) + mgl = \frac{1}{2} I \omega^2 \quad \dots(i)$$

Here, I = Moment of inertia about fixed point

$$= m \left(\frac{l}{3} \right)^2 + m \left(\frac{2l}{3} \right)^2 + ml^2 = \frac{14}{9} ml^2$$

From Eq. (i),

$$2mgl = \frac{1}{2} \left(\frac{14}{9} ml^2 \right) \omega^2 \therefore \omega = \sqrt{\left(\frac{36g}{14l} \right)}$$

$$\therefore v_B = r\omega = \frac{2l}{3} \sqrt{\left(\frac{36g}{14l} \right)} = \sqrt{\left(\frac{8gl}{7} \right)}$$

15. (b) If a lamina is moving with
- v_{CM}
- having angular velocity
- ω
- .

Then,

KE = Angular kinetic energy + Translatory kinetic energy

$$= \frac{1}{2} I_{CM} \omega^2 + \frac{1}{2} m v_{CM}^2$$

$$= \frac{1}{2} M K^2 \omega^2 + \frac{1}{2} M v_{CM}^2 = \frac{1}{2} M (K^2 \omega^2 + v_{CM}^2)$$

16. (c)
- $I = mr^2 + 50 \frac{ml^2}{3}$

$$= 1 \times (0.4)^2 + \frac{50 (5 \times 10^{-3}) (0.4)^2}{3}$$

$$= 0.16 (1.083) = 0.173 \text{ kg m}^2$$

17. (d) Consider a square lamina, then

$$4m \left(\frac{l^2}{12} + \frac{l^2}{12} \right) \text{ about}$$

$$\text{Centre of mass} = \frac{2ml^2}{3}$$

Apply perpendicular axes theorem

$$= \frac{2ml^2}{3} + 4m \left(\frac{l}{\sqrt{2}} \right)^2 = \frac{8}{3} ml^2$$

18. (a)
- $dm = 2\pi r dr$
- (
- $\rho = (A + Br) (2\pi r dr)$
-)

$$I = \int_0^a dm r^2 = \frac{\pi A a^4}{2} + \frac{2\pi B a^5}{5} = \pi a^4 \left(\frac{A}{2} + \frac{2a}{5} B \right)$$

19. (b) Given,
- $R = 2 \text{ m}$
- ,
- $M = 100 \text{ kg}$

Speed of centre of mass,

$$v = 20 \text{ cm/s} = 0.20 \text{ m/s}$$

Work done to stop the hoop = Total kinetic energy of the hoop

$$W = \frac{1}{2} M v^2 + \frac{1}{2} I \omega^2$$

But moment of inertia, $I = Mr^2$ and angular velocity, $\omega = \frac{v}{R}$

$$W = \frac{1}{2} M v^2 + \frac{1}{2} (Mr^2) \times \left(\frac{v^2}{R^2} \right)$$

$$= \frac{1}{2} M v^2 + \frac{1}{2} M v^2 = M v^2$$

$$= 100 \times (0.20)^2 = (100 \times 0.04) \text{ J} = 4.0 \text{ J}$$

20. (b) Surface density of motional disc is

$$\sigma = \frac{M}{\pi(2R)^2} = \frac{M}{4\pi R^2}$$

Mass of cutting portion is

$$m_1 = \sigma \times \pi R^2 = \frac{M}{4}$$

$$I = I_1 - I_2$$

where,

 I_1 = Moment of inertia of disc about given axis without cutting portion I_2 = Moment of inertia due to cutting portion

$$I = \frac{M(2R)^2}{2} + M(2R)^2 - \left[\frac{m_1 R^2}{2} + m_1 (3R)^2 \right]$$

$$= 6MR^2 - \frac{19MR^2}{8} = \frac{29MR^2}{8}$$

21. (a) Moment of inertia of the rod lying along z-axis will be

zero. MI of the rods along x and y-axes will be $\frac{ML^2}{3}$ each.Hence, total moment of inertia is $\frac{2}{3} ML^2$.

22. (b) By the Kepler's rule,

$$L = mvr = m \sqrt{\frac{GM}{r}} r$$

 $\Rightarrow$

$$L \propto \sqrt{r}$$

23. (c) From the conservation of angular momentum,

$$(I_1 + I_2) \omega = I_1 \omega_1 + I_2 \omega_2$$

$$\Rightarrow (6 + I_2) \times \frac{300}{60} \times 2\pi = 6 \times \frac{600}{60} \times 2\pi + I_2 \times 0$$

$$\Rightarrow I_2 = 6 \text{ kg m}^2$$

24. (c) For pure rolling, friction is not necessary.

For pure accelerated rolling on a horizontal floor, friction is not necessary in every case.

For pure accelerated rolling on an inclined plane, friction is necessary.

25. (b) The mass of ring per unit angle is
- $\lambda = \frac{m}{2\pi}$

$$\therefore dm = \frac{m}{2\pi} d\theta$$

 $\therefore$ The moment of inertia of considered element about z-axis passing through point O is

$$dl = r^2 dm$$

 $\therefore$ The moment of inertia of the arc is

$$I = r^2 = \frac{mr^2}{3} \int_{\theta=0}^{\theta=2\pi/3} d\theta = \frac{mr^2}{3}$$

26. (b) Centrifugal force does not depend upon angular velocity of particle. It depends upon angular velocity of frame of reference.

 $\therefore$ Centrifugal force is $F = m\omega_0^2 a$

27. (a) Since, in this case, instantaneous axis of rotation is always below the centre of mass. This is possible only when point of contact moves with a velocity equal to centre of mass.

28. (a) For pure rolling motion of sphere, relative motion of point of contact of sphere and plank should be zero. For this, the point of contact has a velocity equal to the velocity of plank.

$$\therefore v_0 = v_{CM} - r\omega$$

$$\therefore v_{CM} = v_0 + r\omega$$

29. (c) According to figure,

In this case, the force of friction has a tendency to rotate the cube in clockwise direction. So, normal reaction will shift in forward direction to balance the torque due to force of friction.

30. (b)

31. (d)

32. (a) The greater height of the point of applying force from ground, more chance of toppling.

33. (c) The body has smaller base, greater chance of toppling. When the value of n increases, base size decreases.

34. (d)

35. (b) From figure, the angular momentum is

$$\mathbf{L} = \mathbf{r} \times m\mathbf{v}$$

$$\therefore L = rmv \sin \theta = mv(r \sin \theta) = mvd = \text{constant}$$

36. (b) The angular momentum is

$$\mathbf{L} = \mathbf{r} \times \mathbf{p}$$

$$L = rmv \cos \theta \sin \theta$$

$$\text{But, } H = r \sin \theta$$

$$L = mvH \cos \theta$$

$$= mv \times \frac{v^2 \sin^2 \theta}{2\sqrt{2}g}$$

$$\text{But, } \theta = 45^\circ$$

$$\therefore L = \frac{mv^3}{4\sqrt{2}g}$$

37. (d) Since, no force is present in horizontal direction.

So, acceleration of centre of mass in horizontal direction is zero. Hence, the centre of mass of rod moves in vertically downward direction.

If perpendiculars are drawn at the velocities of centre of mass and lower end. They are passing through point O. So, rod is rotating about instantaneous axis passing through point O.

38. (a)

39. (a) Loss in kinetic energy = Gain in potential energy

$$\therefore \frac{1}{2} I \omega^2 = mg \frac{l}{2} + mgl \quad \dots (i)$$

$$\text{Here, } I = \frac{ml^2}{4} + ml^2 = \frac{5}{4} ml^2$$

$$v_C = l\omega$$

From Eq. (i),

$$\frac{1}{2} \left(\frac{5}{4} ml^2 \right) \omega^2 = \frac{mgl}{2} + mgl = \frac{3}{2} mgl$$

$$ml^2 \omega^2 = \frac{12}{5} mgl \therefore v_C = \sqrt{\left(\frac{12gl}{5} \right)}$$

40. (c) (a) This is possible, when balls are smooth.

- (b) $\omega_A = \omega_B$ is not always possible. It depends upon conditions. But no conditions are mentioned.

41. (a) Angular impulse,

$$J = \Delta L = I \Delta \omega = I(\omega - 0) = I\omega$$

$$\text{Here, } px = l\omega$$

$$\therefore \omega = \frac{px}{I} + \frac{px}{mb^2 + \frac{M(2a)^2}{3}} = \frac{px}{\frac{4Ma^2}{3} + mb^2}$$

42. (c) The angular impulse about centre of mass is

$$J = L_f - L_i = I\omega - 0$$

$$\therefore J = l\omega$$

$$\text{or } p \frac{l}{2} = \frac{ml^2}{12} \omega \text{ or } p = \frac{ml}{6} \omega$$

$$\therefore \omega = \frac{6p}{ml}$$

$$\therefore \theta = \omega t$$

$$\therefore t = \frac{\theta}{\omega} = \frac{\pi}{2\omega} = \frac{\pi}{2 \times \frac{6p}{ml}} = \frac{\pi ml}{12p}$$

43. (c) Here, $v_{CM} = R\omega$

The resultant velocity of point A is

$$v_A = \sqrt{v_{CM}^2 + (R\omega)^2 + 2v_{CM}(R\omega) \cos(90^\circ - \theta)}$$

$$= \sqrt{v_{CM}^2 + v_{CM}^2 + 2v_{CM}^2 \sin \theta}$$

$$= \sqrt{2} v_{CM} \sqrt{1 + \sin \theta}$$

44. (a) $\because v_{CM} T < 2\pi R$ or $v_{CM} < \frac{2\pi R}{T}$

$\therefore v_{CM} < R\omega$

45. (a) $\because v_{CM} T > 2\pi R$

or $v_{CM} > \frac{2\pi R}{T} \therefore v_{CM} > R\omega$

46. (d)

47. (d) For pure rolling motion, the relative motion between point of contact and surface should be zero.

This is possible only when,

$$a_p = a_0, v_p = v_0$$

48. (b) From the equation of centre of mass of the cylinder,
 $Mg - 2T = Ma \quad \dots(i)$

For rotational motion about CM

$$2Tr = \frac{1}{2} Mr^2 \alpha$$

$$4T = Mr\alpha$$

where, r = radius of cylinder

$$\Rightarrow 2T = \frac{1}{2} Ma \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$a = \frac{2}{3} g \text{ and } T = \frac{mg}{6}$$

Now, from equation of motion, $v^2 = u^2 + 2gh$, we get

$$v^2 = 2 \left(\frac{2}{3} g \right) h \Rightarrow v = \sqrt{\frac{4gh}{3}}$$

BITSAT Archives

1. (a)

Ratio of moment of inertia of the rings

$$\frac{I_1}{I_2} = \left(\frac{M_1}{M_2} \right) \left(\frac{R_1}{R_2} \right)^2 = \left(\frac{\lambda L_1}{\lambda L_2} \right) \left(\frac{R_1}{R_2} \right)^2$$

$$= \left(\frac{2\pi R}{2\pi nR} \right) \left(\frac{R}{nR} \right)^2 \quad [\lambda = \text{linear density of wire} = \text{constant}]$$

$$\Rightarrow \frac{I_1}{I_2} = \frac{1}{n^3} = \frac{1}{8} \quad [\text{given}]$$

$$\therefore n^3 = 8$$

$$\Rightarrow n = 2$$

2. (b) Angular momentum of particle w.r.t. origin = linear momentum $\times$ perpendicular distance on line of action of linear momentum from origin
 $[= mv \times a = mva = \text{constant}]$

3. (a) Rotational kinetic energy = $\frac{1}{2} I\omega^2$

According to question, $\frac{1}{2} I\omega^2 = 1500$

$$\frac{1}{2} I(\alpha t)^2 = 1500$$

$$(1.2) \times (25)^2 \times t^2 = 3000$$

$$1.2 \times 625 \times t^2 = 3000$$

$$t^2 = \frac{3000}{1.2 \times 625} = 4$$

$$t = 2 \text{ s}$$

4. (c) The angular momentum will be directed along the axis of rotation.

5. (c) At foot of the plane,

$$mgh = \frac{1}{2} I\omega^2 + \frac{1}{2} mu^2$$

$$2 \times 10 \times 4 = \frac{1}{2} \times \left(\frac{1}{2} mR^2 \right) \times \left(\frac{u^2}{R^2} \right) + \frac{1}{2} mu^2$$

$$80 = \frac{3}{4} mu^2 \quad \dots(i)$$

$$\therefore \text{Rotational KE} = \frac{1}{2} I\omega^2$$

$$= \frac{1}{4} mu^2 = \frac{1}{4} \times \frac{80 \times 4}{3} = \frac{80}{3} \text{ J}$$

6. (a) $\frac{\text{Rotational KE}}{\text{Translational KE}} = \frac{\frac{1}{2} I\omega^2}{\frac{1}{2} Mv^2} = \frac{K^2}{R^2} \quad [\because I = MK^2, v = R\omega]$

7. (d) Moment of inertia of a circular disc about an axis passing through centre of gravity and perpendicular to its plane

$$I = \frac{1}{2} MR^2 \quad \dots(i)$$

From Eq. (i),

$$MR^2 = 2I$$

Then, moment of inertia of disc about tangent in a plane

$$= \frac{5}{4} MR^2 = \frac{5}{4} (2I) = \frac{5}{2} I$$

8. (b) $I_{CM} = \frac{1}{2} MR^2$

Now, moment of inertia about an axis is given as

$$I = I_{CM} + Mh^2 = \frac{1}{2} MR^2 + MR^2$$

$$[as h = R]$$

$$I = \frac{3}{2} MR^2$$

9. (d) According to law of conservation of angular momentum, if there is no torque on the system, then the angular momentum remains constant.

9

Gravitation

Introduction

Gravitation is the name given to the force of attraction between any two massive bodies of the universe.

Universal Law of Gravitation

Every body in the universe attracts every other body. Force of gravitational attraction between two bodies of mass m_1 and m_2 is given as

$$F = G \frac{m_1 m_2}{r^2}$$

The proportionality constant G is called universal gravitational constant. In SI system, the value of gravitational constant G is $6.67 \times 10^{-11} \text{ Nm}^2\text{kg}^{-2}$. Dimensional formula of G is $[\text{M}^{-1}\text{L}^3\text{T}^{-2}]$.

Gravity

In Newton's law of gravitation, we consider the gravitation as the force. But in case of two gravitationally interacting masses (or bodies), if one is the earth, then the gravitational force is called as the **gravity**.

Acceleration due to Gravity (g)

At the earth's surface, the value of g is found to be 9.8 ms^{-2} or 32 ft s^{-2} .

Mathematically,
$$g = \frac{F}{m} = \frac{GMm}{R^2m}$$

where, F = force exerted by the earth on a mass m .

$$\Rightarrow g = \frac{GM}{R^2}$$

Here, M = mass of earth, R = radius of earth.

Variation in Acceleration due to Gravity (g)

The value of g is variable and can vary in some cases as mentioned below (R is treated to be radius of the earth, i.e. 6400 km)

- (i) **Variation in g with the Height from the Earth's Surface** The new value of g at height h from the earth's surface, is

$$g' = \frac{g}{\left(1 + \frac{h}{R}\right)^2}$$

and if $h \ll R$, then

$$g' = g\left(1 - \frac{2h}{R}\right)$$

- (ii) **Variation in g with Depth Inside the Earth** The new value of g at a place inside the earth with depth h from the earth's surface, is

$$g' = g\left(1 - \frac{h}{R}\right)$$

- (iii) **Variation in g Due to Daily Rotation of the Earth** The new value of g at point P with latitude θ , is

$$g' = g - \omega^2 R \cos^2 \theta$$

- (a) At the pole,

$$\cos \theta = 0 \quad [\because \theta = 90^\circ]$$

$$g' = g$$

- (b) At the equator,

$$\cos \theta = 1 \quad [\because \theta = 0^\circ]$$

$$g' = g - \omega^2 R$$

Kepler's Laws of Planetary Motion

Kepler discovered three empirical laws which accurately describe the motion of planets.

These laws are

1. Law of Orbits

Every planet moves in an elliptical orbit around the sun, with sun situated at one of the foci of the ellipse.

2. Law of Areas

The line joining a planet to the sun sweeps equal areas in equal intervals of time, howsoever small these time intervals may be. Mathematically,

$$\frac{dA}{dt} = \frac{1}{2} r v = \text{constant} = \frac{L}{2m}$$

where, L = angular momentum of planet and
 m = mass of planet.

3. Law of Periods

The square of the time period of revolution of a planet is proportional to the cube of the semi-major axis of the ellipse traced out by the planet. Thus,

$$T^2 \propto r^3 \quad \text{or} \quad \left(\frac{T_1}{T_2}\right)^2 = \left(\frac{r_1}{r_2}\right)^3$$

Gravitational Field

Gravitational field of a given body is the space around it, within which gravitational effect due to that body may be experienced.

Gravitational Field Intensity

Gravitational field intensity at any point in the field of given body is defined as the force experienced by a unit mass placed at that point. Mathematically,

$$\text{Gravitational field intensity, } \mathbf{I} = \lim_{m_0 \rightarrow 0} \frac{\mathbf{F}}{m_0}$$

where, m_0 is a small test mass. The SI unit of gravitational intensity is N kg^{-1} .

Gravitational intensity at a point situated at a distance r from a point mass M is given by

$$I = \frac{GM}{r^2}$$

Gravitational Field in Different Cases

The calculation of gravitational field in some situations are mentioned below

- **Field due to point mass** The field at point P , at a distance r from the point mass (M) is

$$E_P = \frac{-GM}{r^2} \mathbf{e}_r$$

where, $\mathbf{e}_r$ is the unit vector along r .

- **Field at an axial point of a circular ring**

The field at an axial point P is

$$E_P = \frac{GMr}{(a^2 + r^2)^{3/2}}$$

- **Field at an axial point of a disc**

The field at an axial point P is

$$E_P = \frac{2GM}{a^2} (1 - \cos\theta)$$

- **Field due to a uniform spherical shell**

There may be two conditions as

- When point P is an internal point of the shell (i.e. $r < a$), then

$$E_P = 0$$

Field at any point inside the shell is zero, which implies that the potential inside the shell is constant everywhere.

- When point P is an external point of the shell (i.e. $r \geq a$), then

$$E_P = \frac{GM}{r^2}$$

- **Field due to a uniform solid sphere** There may be two conditions as

- When point P is an internal point, then

$$E_P = \frac{GM}{a^3} r$$

At the centre, $r = 0$, $E_P = 0$

- When point P is an external point, then

$$E_P = \frac{GM}{r^2}$$

In the case of uniform solid sphere, the graph of E versus r is shown below

Gravitational Potential

The amount of work done by the applied force required to bring a body of unit mass from reference position (i.e. infinity) to a given position within the field is known as gravitational potential of the field (created by mass).

Gravitational Potential in Different Cases

- Potential due to a point mass

Gravitational potential at P ,

$$V_P = -\frac{GM}{r}$$

2. Potential at an axial point of a uniform ring

Gravitational potential at point P ,

$$V_P = \frac{-GM}{\sqrt{a^2 + r^2}}$$

where, a = radius of the ring
 M = mass of the ring

3. Potential due to a uniform thin spherical shell

There may be two conditions as

(i) When point P is an internal point (i.e. $r < a$)

$$V_P = \frac{-GM}{a}$$

(ii) When point P is an external point (i.e. $r \geq a$)

$$V_P = \frac{-GM}{r}$$

4. Potential due to solid sphere

There may be two conditions

(i) Potential at an internal point P

$$V_P = \frac{-GM}{2a^3} (3a^2 - r^2), \quad (r \leq a)$$

When point is at the centre of sphere, then

$$V = \frac{-3GM}{2a}$$

(ii) Potential at an external point P

$$V_P = \frac{-GM}{r}, \quad (r \geq a)$$

Gravitational Potential Energy

Gravitational potential energy of a body or system is negative of work done by the conservative gravitational forces, F in bringing it from infinity to the present position. Mathematically, gravitational potential energy

$$U = -W = -\int_{\infty}^r \mathbf{F} \cdot d\mathbf{r}$$

The gravitational potential energy of two particles of masses m_1 and m_2 separated by a distance r is given by

$$U = -\frac{Gm_1m_2}{r}$$

The gravitational potential energy of mass m at the surface of the earth is

$$U = -\frac{GMm}{R}$$

Difference in potential energy of mass m at a height h from the earth's surface and at the earth's surface is

$$U_{(R+h)} - U_R = \frac{mgh}{1 + \frac{h}{R}} \approx mgh, \text{ if } h \ll R$$

• For three particles system,

$$U = -\left[\frac{Gm_1m_2}{r_{12}} + \frac{Gm_1m_3}{r_{13}} + \frac{Gm_2m_3}{r_{23}} \right]$$

• For n -particles system, $\frac{n(n-1)}{2}$ pairs form and total potential energy of the system is sum of potential energies of all such pairs.

The Orbital Speed, Time Period and Energy of the Satellite

Let the mass of the satellite be m and that of the planet under study be M and a is radius of the orbit.

(i) Orbital Speed

The speed with which a satellite revolves in its orbit is known as its orbital speed (v). The gravitational force between earth-satellite provides required centripetal force. i.e.

$$\frac{GMm}{a^2} = m\left(\frac{v^2}{a}\right) \Rightarrow v = \sqrt{GM/a}$$

(ii) Time Period

The time taken by satellite to just complete a revolution around the earth is known as its time period (T).

$$T = \frac{2\pi a}{v} = \sqrt{\frac{4\pi^2}{GM} a^3}$$

(iii) Height of Satellite in Terms of Period

The height of the satellite (from the earth's planet) can be determined by its time period and *vice-versa*.

As the height of the satellite in terms of time period,

$$h = a - R = \left[\frac{gR^2 T^2}{4\pi^2} \right]^{1/3} - R$$

(iv) Angular Momentum of Satellite

Angular momentum of a satellite, $L = mv_0 a = \sqrt{m^2 G M a}$.

During the motion of planet and satellite, the angular momentum will remain conserved.

Energy

The total mechanical energy (E) associated with sun-planet (earth-satellite) system (i.e. sum of kinetic energy and potential energy) is treated to be energy of the system.

E = Potential energy + Kinetic energy

$$= U + K = \frac{GMm}{2a} - \frac{GMm}{a}$$

$$\Rightarrow E = -\frac{GMm}{2a}$$

Binding Energy of Satellite

It is the energy required to remove the satellite from its orbit and take it to infinity.

$$\text{Binding energy} = -E = +\frac{GMm}{2a}$$

Escape Velocity

The minimum velocity with which a particle or body should be launched from the earth's surface to just cross the earth's gravitational field (i.e. it never comes back to the earth), is known as escape velocity.

It is given by the equation,

$$v_e \geq \sqrt{\frac{2GM}{R}}$$

where, R = radius of the earth and M = Mass of the earth.

At the earth's surface, the value of escape velocity is 11.6 kms^{-1} .

Practice Exercise

- Calculate the gravitational force of attraction between two spherical bodies, each of mass 1 kg placed at 10 m apart ($G = 6.67 \times 10^{-11} \text{ Nm}^2/\text{kg}^2$).
 a. $6.67 \times 10^{-13} \text{ N}$ b. $6.67 \times 10^{-11} \text{ N}$
 c. $6.67 \times 10^{-7} \text{ N}$ d. None of these
- If the distance between the two particles is increased by 2%, then the force of attraction between them will
 a. decrease 6% b. decrease 4%
 c. increase 4% d. increase 6%
- How the gravitational constant will change if a brass plate is introduced between two bodies?
 a. No change b. Decreases
 c. Increases d. Insufficient data
- Six particles each of mass m are placed at the corners of a regular hexagon of edge length a . If a point mass m_0 is placed at the centre of the hexagon. Then, the net gravitational force on the point mass m_0 is

- a. $\frac{6Gm^2}{a^2}$ b. $\frac{6Gmm_0}{a^2}$ c. zero d. None

5. Two particles each of mass m are placed at A and C as such $AB = BC = L$. Calculate the gravitational force on the third particle placed at D at a distance L metre on the perpendicular bisector of the line AC .

- a. $\frac{Gm^2}{\sqrt{2}L^2}$ along BD b. $\frac{Gm^2}{\sqrt{2}L^2}$ along DB
 c. $\frac{Gm^2}{L^2}$ along AC d. None of these

6. In a hypothetical concept, electron of mass m_e revolves around nucleus due to gravitational force of attraction between electron and proton of mass m_p . If the radius of circular path of electron is r , then the speed of electron is
- a. $\sqrt{\left(\frac{Gm_p m_e}{4r}\right)}$ b. $\sqrt{\left(\frac{Gm_p m_e}{r}\right)}$
 c. $\sqrt{\left(\frac{Gm_p}{r}\right)}$ d. None of these
7. Three point masses each of mass m rotate in a circle of radius r with constant angular velocity ω due to their mutual gravitational attraction. If at any instant, the masses are on the vertex of an equilateral triangle of side a , then the value of ω is
- a. $\sqrt{\left(\frac{Gm}{a^3}\right)}$ b. $\sqrt{\left(\frac{3Gm}{a^3}\right)}$ c. $\sqrt{\left(\frac{Gm}{3a^3}\right)}$ d. None
8. A gravitational field is present in a region. Point A mass is shifted from A to B, from different paths shown in the figure. If W_1 , W_2 and W_3 represent work done by gravitational force for respective paths. Then,
- a. $W_1 = W_2 = W_3$
 b. $W_1 > W_2 > W_3$
 c. $W_1 > W_3 > W_2$
 d. None of the above
- 
9. A point mass m_0 is placed at distance $R/3$ from the centre of a spherical shell of mass m and radius R . The gravitational force on the point mass m_0 is
- a. $\frac{4Gmm_0}{R^2}$ b. zero
 c. $\frac{9Gmm_0}{R^2}$ d. None of these
10. A uniform ring of mass M and radius R is placed directly above a uniform sphere of mass $8M$ and of same radius R . The centre of the ring is at a distance of $d = \sqrt{3}R$ from the centre of the sphere. The gravitational attraction between the sphere and the ring is
- a. $\frac{GM^2}{R^2}$ b. $\frac{3GM^2}{2R^3}$ c. $\frac{2GM^2}{\sqrt{2}R^2}$ d. $\frac{\sqrt{3}GM^2}{R^2}$
11. A mass m is placed at P at a distance h along the normal through the centre O of a thin circular ring of mass M and radius r as shown in figure.
- 
- If the mass is removed further away such that OP becomes $2h$, by what factor the force of gravitation will decrease, if $h = r$?
- a. $\frac{3\sqrt{2}}{4\sqrt{3}}$ b. $\frac{5\sqrt{2}}{\sqrt{3}}$ c. $\frac{4\sqrt{3}}{5}$ d. $\frac{4\sqrt{2}}{5\sqrt{5}}$
12. A point mass of 10 kg is placed at the centre of earth. The weight of the point mass is
- a. zero b. 98 N c. 49 N d. 38 N
13. How will you weight the sun, i.e. estimate its mass? You will need to know the period of one of its planets and the radius of the planetary orbit. The mean orbital radius of the earth around the sun is 1.5×10^8 km, then the mass of the sun would be calculated as
- a. 2×10^{15} kg
 b. 2×10^{20} kg
 c. 2×10^{27} kg
 d. 2×10^{30} kg
14. A particle hanging from a massless spring stretches it by 2 cm at earth's surface. How much will the same particle stretch the spring at height 2624 km from the surface of earth? (radius of earth = 6400 km)
- a. 1 cm b. 2 cm
 c. 3 cm d. 4 cm
15. There is a mine of depth 2 km. The conditions as compared to those at the surface of the earth are
- a. lower value of g b. higher value of g
 c. Both (a) and (b) d. None of these
16. In order to make the weight of a 5 kg body to zero at the equator. The angular speed of the earth would must be (take, $g = 10 \text{ m/s}^2$ and radius of the earth, $R = 6400$ km)
- a. $0.00125 \text{ rad s}^{-1}$ b. $0.0125 \text{ rad s}^{-1}$
 c. 0.125 rad s^{-1} d. $0.0325 \text{ rad s}^{-1}$
17. At what height, the weight of the body is same as that at same depth from the earth's surface? (take, earth's radius = R)
- a. $R/2$ b. $\frac{(\sqrt{5}-1)R}{2}$
 c. $\frac{(\sqrt{3}R-1)}{2}$ d. $\frac{\sqrt{5}}{3}R$
18. At the surface of a certain planet acceleration due to gravity is one-quarter of that on the earth. If a brass ball is transported on this planet, then which one of the following statements is not correct?
- a. The brass ball has the same mass on the other planet as on the earth
 b. The mass of the brass ball on this planet is a quarter of its mass as measured on the earth
 c. The weight of the brass ball on this planet is a quarter of the weight as measured on the earth
 d. The brass ball has the same volume on the other planet as on the earth
19. If both the mass and radius of the earth, each decreases by 50%, the acceleration due to gravity would
- a. remain same
 b. decrease by 50%
 c. decrease by 100%
 d. increase by 100%

20. A body is suspended on a spring balance in a ship sailing along the equator with a speed v' . If ω is the angular speed of the earth and ω_0 is the scale reading when the ship is at rest, the scale reading when the ship is sailing, is
- ω_0
 - zero
 - $\omega_0 \left(1 \pm \frac{2\omega v'}{g}\right)$
 - $\omega_0 \left(1 - \frac{g}{2\omega}\right)$
21. The maximum vertical distance through which a full dressed astronaut can jump on the earth is 0.5 m. Estimate the maximum vertical distance through which he can jump on the moon, which has a mean density $2/3$ rd that of the earth and radius one-quarter that of the earth.
- 1.5 m
 - 3 m
 - 6 m
 - 7.5 m
22. Two satellites A and B revolve round the same planet in coplanar circular orbits lying in the same plane. Their periods of revolutions are 1 h and 8 h, respectively. The radius of the orbit of A is 10^4 km. The speed of B relative to A when they are closed, in kmh^{-1} is
- $3\pi \times 10^4$
 - zero
 - $2\pi \times 10^4$
 - $\pi \times 10^4$
23. A satellite is moving on a circular path of radius r around earth has a time period T . If its radius slightly increases by Δr , determine the change in its time period.
- $\frac{3}{2} \left(\frac{T}{r}\right) \Delta r$
 - $\left(\frac{T}{r}\right) \Delta r$
 - $\frac{3}{2} \left(\frac{T^2}{r^2}\right) \Delta r$
 - None of these
24. The gravitational field in a region is $10 \text{ N/kg } (\hat{i} - \hat{j})$. Find the work done by gravitational force to shift slowly a particle of mass 1 kg from point (1m, 1m) to a point (2 m, - 2 m).
- 10 J
 - 10 J
 - 40 J
 - + 40 J
25. In previous problem, find the work done by external agent.
- 40 J
 - 40 J
 - zero
 - + 10 J
26. The gravitational force in a region is given by
- $$\mathbf{E} = ay \hat{i} + ax \hat{j}$$
- Find the work done by gravitational force to shift a point mass m from $(0, 0, 0)$ to (x_0, y_0, z_0) .
- $ma x_0 y_0 z_0$
 - $ma x_0 y_0$
 - $-ma x_0 y_0$
 - Zero
27. The work done by an external agent to shift a point mass from infinity to the centre of earth is
- = 0
 - > 0
 - < 0
 - ≤ 0
28. The work done in shifting a particle of mass m from centre of earth to the surface of earth is
- $-mgR$
 - $\frac{mgR}{2}$
 - zero
 - None of these
29. The change in potential energy of a body of mass m when it elevated upto height of nR from the earth's surface, is
- $nmgR$
 - $mgR = \left(\frac{n^2 + 1}{n^2}\right)$
 - $mgR \left(\frac{n-1}{n}\right)$
 - $mgR \left(\frac{n+1}{n}\right)$
30. Suppose the gravitational force varies inversely as the n th power of the distance. Then, the time period of a planet in circular orbit of radius R around the sun will be proportional to
- R^n
 - $R^{(n+1)/2}$
 - $R^{(n-1)/2}$
 - R^{-n}
31. The time period of a simple pendulum at the centre of earth is
- zero
 - infinity
 - less than zero
 - None of these
32. If a rocket is fired with a speed $v = 2\sqrt{gR}$ near the earth's surface and coasts upwards, its speed in the inter-stellar space is
- $4\sqrt{gR}$
 - $\sqrt{2gR}$
 - $\sqrt{gR}$
 - $4\sqrt{gR}$
33. In Q. 32. if the satellite is stopped suddenly in its orbit and allowed to fall freely onto the earth, the speed with which it hits the surface of the earth is (Take, $g = 9.8 \text{ m/s}^2$ and $R = 6400 \text{ km}$)
- 4 km/s
 - 8 km/s
 - 2 km/s
 - 6 km/s
34. A projectile is fired vertically upward from the surface of the earth with a velocity kv_e , where v_e is the escape velocity and $k < 1$. If R is the radius of the earth, the maximum height to which it will rise measured from the centre of earth will be (neglect air resistance)
- $\frac{1-k^2}{R}$
 - $\frac{R}{1-k^2}$
 - $R(1-k^2)$
 - $\frac{R}{1+k^2}$
35. A satellite of mass M revolving in a circular orbit of radius r_s around the earth of mass M has a total energy E . Then, its angular momentum will be
- $\sqrt{\frac{E}{m_s r_s^2}}$
 - $\frac{E}{2m_s r_s^2}$
 - $(2Em_s r_s^2)^{1/2}$
 - $\sqrt{2Em_s r_s^2}$
36. A planet revolves in elliptical orbit around the sun. (see figure). The linear speed of the planet will be maximum at
- 
- A
 - B
 - C
 - D
37. Two bodies each of mass 1 kg are at a distance of 1 m. The escape velocity of a body of mass 1 kg which is midway between them is
- $8 \times 10^{-5} \text{ m/s}$
 - $2.31 \times 10^{-5} \text{ m/s}$
 - $4.2 \times 10^{-5} \text{ m/s}$
 - zero

38. If an artificial satellite is moving in a circular orbit around the earth with a speed equal to half the magnitude of the escape velocity from the earth, the height of the satellite above the surface of the earth is
 a. $2R$ b. $R/2$
 c. R d. $R/4$
39. A particle of mass m is projected from the surface of earth with a speed v_0 ($v_0 < \text{escape velocity}$). Find the speed of particle at height $h=R$ (radius of earth). (Take, $R=6400\text{km}$ and $g=9.8\text{ m/s}^2$)
 a. $\sqrt{gR}$
 b. $\sqrt{v_0^2 - 2gR}$
 c. $\sqrt{v_0^2 - gR}$
 d. None of these
40. The binding energy of earth-sun system is (neglecting the other planets)
 a. $2.60 \times 10^{33}\text{ J}$ b. $6.33 \times 10^{16}\text{ J}$
 c. $3.40 \times 10^{33}\text{ J}$ d. $8.60 \times 10^{24}\text{ J}$
41. If one of the satellites of jupiter has an orbital period of 1.769 days and the radius of the orbit is $4.22 \times 10^8\text{ m}$. The mass of jupiter is about
 a. one thousandth that of the sun
 b. one hundredth that of the sun
 c. one tenth that of the sun
 d. half of that of the sun
42. A satellite is orbiting closely to earth and having kinetic energy K . The kinetic energy required by it to just overcome the gravitational pull of the earth, is
 a. $2K$ b. $\sqrt{2}K$ c. $\sqrt{3}K$ d. $2\sqrt{2}K$

BITSAT Archives

1. The total energy of a revolving satellite around the earth is $-K\text{ J}$. The minimum energy required to throw it out of earth's gravitational fields is [2013]
 a. $K\text{ J}$ b. $\frac{K}{2}\text{ J}$
 c. $2K\text{ J}$ d. None of these
2. There is a shell of mass M and density of shell is uniform. The work done to take a point mass from point A to B is ($AB=r$) [2013]
- 
- a. $\frac{GmM}{r}$ b. $\frac{GmM}{R}$ c. $-\frac{GmM}{r}$ d. zero
3. A satellite is in a circular orbit round the earth at an altitude R above the earth's surface, where R is the radius of the earth. If g is the acceleration due to gravity on the surface of the earth, the speed of the satellite is [2012]
 a. $\sqrt{2Rg}$ b. $\sqrt{Rg}$
 c. $\sqrt{\frac{Rg}{2}}$ d. $\frac{\sqrt{Rg}}{4}$
4. Which is constant, the earth revolving around the sun? [2012]
 a. Angular momentum b. Linear momentum
 c. Rotational kinetic energy d. Kinetic energy
5. Suppose the gravitational force varies inversely as the n th power of distance. Then, the time period of a planet in circular orbit of radius R around the sun will be proportional to [2011]
 a. $R^{(n+1)/2}$ b. $R^{(n-1)/2}$
 c. R^n d. $R^{(n-2)/2}$
6. The satellite of mass m revolving in a circular orbit of radius r around the earth has kinetic energy E . Then, its angular momentum will be [2011]
 a. $\sqrt{\frac{E}{mr^2}}$ b. $\frac{E}{2mr^2}$
 c. $\sqrt{2Emr^2}$ d. $\sqrt{2Emr}$
7. If a new planet is discovered rotating around sun with the orbital radius double that of the earth, then what will be its time period? (in earth's days) [2011]
 a. 1032 b. 1023
 c. 1024 d. 1043
8. If the radius of the earth were to shrink by one percent, its mass remaining the same, the value of g on the earth's surface would [2010]
 a. increase by 0.5% b. increase by 2%
 c. decrease by 0.5% d. decrease by 2%
9. The mean radius of the earth's orbit around the sun is $15 \times 10^{11}\text{ m}$ and that of the orbit of mercury is $6 \times 10^{10}\text{ m}$. The mercury will revolve around the sun is nearly [2010]
 a. $\sqrt{\frac{2}{5}}\text{ yr}$ b. $\frac{2}{5}\text{ yr}$ c. $\left(\frac{2}{5}\right)^2\text{ yr}$ d. $\left(\frac{2}{5}\right)^{3/2}\text{ yr}$
10. A satellite of mass m is orbiting around the earth at a height equal to twice the radius of the earth (R). Its potential energy is given by [2009]
 a. $-2mgR$ b. $-mg\frac{R}{2}$ c. $-\frac{2}{3}mgR$ d. $-mg\frac{R}{2}$
11. A small mass m is moved slowly from the surface of earth to a height h above the earth. The work done in doing this is [2009]
 a. $-mgR$ for $h \ll R$ b. mgh for all values of h
 c. $-\frac{1}{2}mgR$ for $h=R$ d. $\frac{1}{2}mgR$ for $h=R$

14. A satellite of mass m is placed at a distance r from the centre of earth (mass M). The mechanical energy of the satellite is [2006]
- a. $-\frac{GMm}{r}$ b. $\frac{GMm}{r}$ c. $\frac{GMm}{2r}$ d. $-\frac{GMm}{2r}$
15. If M is the mass of the earth and R its radius, the ratio of the gravitational acceleration and the gravitational constants is [2005]
- a. $\frac{R^2}{M}$ b. $\frac{M}{R^2}$ c. MR^2 d. $\frac{M}{R}$

Practice Exercise

1. (a) 2. (b) 3. (a)
4. (c) If equal masses are placed at respective corners of a regular polygon. Then, the gravitational force on a point mass placed at centre of the regular hexagon is zero.

5. (b) Here, $F_0 = \frac{Gm^2}{(\sqrt{2}L)^2} = \frac{Gm^2}{2L^2}$

$\therefore$ Resultant force,

$$F = 2F_0 \cos 45^\circ \quad (\text{along } DB)$$

$$= 2F_0 \times \frac{1}{\sqrt{2}} = 2 \frac{Gm^2}{2l^2} \times \frac{1}{\sqrt{2}} = \frac{Gm^2}{\sqrt{2}l^2} \quad (\text{along } DB)$$

- 6. (c)**

7. (b) Here, $F_0 = \frac{Gm^2}{a^2}$

$$\therefore F = 2F_0 \cos 30^\circ = \frac{2Gm^2}{a^2} \frac{\sqrt{3}}{2}$$

$$= \frac{\sqrt{3} Gm^2}{a^2} \text{ or } mr\omega^2 = \frac{\sqrt{3} Gm^2}{a^2}$$

$$\text{or } m \frac{a}{\sqrt{3}} \omega^2 = \frac{\sqrt{3} Gm^2}{a^2} \therefore \omega = \sqrt{\left(\frac{3Gm}{a^3}\right)}$$

8. (a)
9. (b)
10. (d) Gravitational intensity due to the ring at a distance $d = \sqrt{3} R$ on its axis is

$$I = \frac{GMd}{(d^2 + R^2)^{3/2}} = \frac{GM \times \sqrt{3} R}{(3R^2 + R^2)^{3/2}} = \frac{\sqrt{3} GM}{8R^2}$$

$$\text{Force on sphere} = (8M)I = (8M) \times \frac{\sqrt{3} GM}{8R^2} = \frac{\sqrt{3} GM^2}{R^2}$$

11. (d) Gravitational force acting on an object of mass m , placed at point P at a distance h along the normal through the centre of a circular ring of mass M and radius r is given by

$$F = \frac{GMmh}{(r^2 + h^2)^{3/2}}$$

When mass is displaced upto distance $2h$, then

$$F' = \frac{GMm \times 2h}{(r^2 + (2h)^2)^{3/2}} = \frac{2GMmh}{(r^2 + 4h^2)^{3/2}}$$

When $h = r$, then

$$F = \frac{GMm \times r}{(r^2 \times r^2)^{3/2}} = \frac{GMm}{2\sqrt{2}r^2}$$

and

$$F' = \frac{2GMmr}{(r^2 + 4r^2)^{3/2}} = \frac{2GMm}{5\sqrt{5}r^2}$$

$$\therefore \frac{F'}{F} = \frac{4\sqrt{2}}{5\sqrt{5}} \text{ or } F' = \frac{4\sqrt{2}}{5\sqrt{5}} F$$

12. (a)
13. (d) Mean orbital radius of the earth around the sun,

$$r = 1.5 \times 10^8 \text{ km} = 1.5 \times 10^{11} \text{ m}$$

Time period of the earth around the sun

$$= 1 \text{ yr} = 365 \text{ days}$$
$$= 365 \times 24 \times 60 \times 60 \text{ s}$$

As, required centripetal force is obtained from the gravitational force, therefore

Centripetal force = Gravitational force

$$\frac{mv^2}{r} = \frac{GM_s m}{r^2}, v^2 = \frac{GM_s}{r}$$

$$(r\omega)^2 = \frac{GM_s}{r} \text{ or } \omega^2 = \frac{GM_s}{r^3} \quad [\because v = r\omega]$$

But, $\omega = \frac{2\pi}{T}$

$$\therefore \left(\frac{2\pi}{T}\right)^2 = \frac{GM_s}{r^3} \text{ or } M_s = \frac{4\pi^2 r^3}{GT^2}$$

$$= \frac{4 \times (3.14)^2 \times (1.5 \times 10^{11})^3}{6.67 \times 10^{-11} (365 \times 24 \times 60 \times 60)^2}$$

$$\approx 2 \times 10^{30} \text{ kg}$$

14. (a) $g_1 = \frac{GM}{(R+h)^2}$

$$\therefore \frac{g_1}{g} = \left(\frac{R}{R+h}\right)^2 \therefore g_1 = \left(\frac{R}{R+h}\right)^2 g$$

$$g_1 = \left(\frac{6400}{6400 + 2624}\right)^2 \times g = \frac{g}{2}$$

 $\therefore$ At surface of earth, $mg = kx_0$ At the height $h = 2624$ km, $mg_1 = kx$

$$\therefore \frac{x}{x_0} = \frac{g_1}{g}$$

$$\therefore x = \frac{g_1}{g} \times x_0 = \frac{1}{2} \times 2 = 1 \text{ cm}$$

15. (a)

16. (a) As $g' = g - \omega^2 R \cos^2 \phi$ At the equator, $\phi = 0$, i.e. $\cos \phi = 1$ For weight to be zero $g' = 0$

$$\therefore \omega = \sqrt{\frac{g}{R}} = 0.00125 \text{ rad s}^{-1}$$

17. (b) The value of g at two places will must be same

$$\Rightarrow \frac{gR^2}{(R+h)^2} = g \left(1 - \frac{h}{R}\right)$$

$$\Rightarrow \left(1 - \frac{h}{R}\right) \left(1 + \frac{h^2}{R^2} + \frac{2h}{R}\right) = 1$$

$$\Rightarrow \frac{h^3}{R^3} + \frac{h^2}{R^2} - \frac{h}{R} = 0$$

$$\Rightarrow \frac{h}{R} \left(\frac{h^2}{R^2} + \frac{h}{R} - 1\right) = 0$$

$$\Rightarrow h = \frac{\sqrt{5}R - R}{2} = \frac{R(\sqrt{5} - 1)}{2}$$

18. (a)

19. (d) Here, $g = GM/R^2$ and

$$g' = \frac{G(M/2)}{(R/2)^2} = \frac{2GM}{R^2} = 2g$$

$$\therefore \% \text{ increase in } g = \left(\frac{g' - g}{g}\right) \times 100$$

$$= \left(\frac{2g - g}{g}\right) \times 100 = 100\%$$

20. (c)

21. (b) On the moon, $g_m = \frac{4}{3} \pi G (R/4) (2\rho/3)$

$$= \frac{1}{6} \left(\frac{4}{3} \pi G R \rho\right) = \frac{1}{6} g$$

Work done in jumping $= m \times g \times 0.5 = m \times (g/6) h_1$

$$h_1 = 0.5 \times 6 = 3.0 \text{ m}$$

22. (d) From the Kepler's law,

$$\frac{T_1^2}{T_2^2} = \frac{r_1^3}{r_2^3}$$

$$\Rightarrow \frac{1}{64} = \frac{r_1^3}{r_2^3} \Rightarrow r_2 = 4 \times 10^4 \text{ km}$$

$$\therefore v_1 = \frac{2\pi r_1}{T_1} \text{ and } v_2 = \frac{2\pi r_2}{T_2}$$

$$\Rightarrow v_1 = 2 \times 10^4 \pi \text{ kmh}^{-1}$$

and $v_2 = \pi \times 10^4 \text{ kmh}^{-1}$

Thus, speed of B relative to A is v_{21} .

i.e. $v_{21} = \pi \times 10^4 \text{ kmh}^{-1}$

23. (a) 24. (d)

25. (b) Since, particle is shifted slowly. So, change in kinetic energy is zero.

According to work-energy theorem

$$W + W_{\text{ext}} = 0$$

$$W_{\text{ext}} = -W = -40 \text{ J}$$

26. (b) Here, $\mathbf{F} = m \mathbf{E} = m a (\mathbf{y}\hat{\mathbf{i}} + \mathbf{x}\hat{\mathbf{j}})$

$$\therefore \mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}}$$

$$\therefore d\mathbf{r} = dx\hat{\mathbf{i}} + dy\hat{\mathbf{j}}$$

$$\therefore W = \int \mathbf{F} \cdot d\mathbf{r} = ma \int_{0,0,0}^{x_0,y_0,z_0} (y\hat{\mathbf{i}} + x\hat{\mathbf{j}}) \cdot (dx\hat{\mathbf{i}} + dy\hat{\mathbf{j}})$$

$$= ma \int d(xy) = ma [xy]_{0,0,0}^{x_0,y_0,z_0} = ma x_0 y_0$$

27. (c)

28. (b)

29. (c) Change in PE $= \Delta U = U_f - U_i = GmM \left(\frac{1}{R} - \frac{1}{nR}\right)$

$$= \frac{GMm}{R} \left(\frac{n-1}{n}\right) = mgR \left(\frac{n-1}{n}\right) \quad \left(\because g = \frac{GM}{R^2}\right)$$

30. (b) $T = \frac{2\pi R}{v}$

$$E = \frac{1}{2} mv^2 = \frac{GMm}{R^{n-1}} \text{ or } v = \left[\frac{2GM}{R^{n-1}}\right]^{1/2}$$

$$\therefore T = \frac{2\pi R}{\sqrt{\frac{2GM}{R^{n-1}}}} = \frac{2\pi}{\sqrt{2GM}} \times R^{(n+1)/2}$$

$$\therefore T \propto R^{(n+1)/2}$$

31. (b)

32. (b) Applying law of conservation of energy,

$$\frac{1}{2}mv^2 - \frac{GMm}{R} = \frac{1}{2}mv_1^2 + 0$$

$$\text{or} \quad \frac{1}{2}mv_1^2 = \frac{1}{2}mv^2 - \frac{GMm}{R}$$

$$\text{or} \quad v_1^2 = v^2 - \frac{2GM}{R} = v^2 - v_e^2$$

$$\therefore v_1 = \sqrt{v^2 - v_e^2} = \sqrt{4gR - 2gR} = \sqrt{2gR}$$

33. (b)

 34. (b) If a body is projected from the surface of the earth with a velocity v and reaches a height h , then according to the law of conservation of energy,

$$\frac{1}{2}mv^2 = \frac{mgh}{1 + \frac{h}{R}}$$

$$\text{Here, } v = kv_e = k\sqrt{2gR}$$

$$\therefore \frac{1}{2}mk^2 \cdot 2gR = \frac{mgh}{1 + \frac{h}{R}}$$

$$k^2R \left[1 + \frac{r-R}{R} \right] = r - R$$

$$\text{or} \quad k^2r = r - R$$

$$\text{or} \quad r = \frac{R}{1 - k^2}$$

$$35. (c) \therefore \frac{GMm_s}{r_s^2} = \frac{m_s v_s^2}{r_s}$$

$$v_s = \left(\frac{GM}{r_s} \right)^{1/2}$$

$$\text{Angular momentum} = m_s v_s r_s = J$$

$$\therefore J = \left(\frac{GM}{r_s} \right)^{1/2} m_s r_s = (GMm_s^2 r_s)^{1/2}$$

$$\therefore \text{KE} = \frac{1}{2}m_s v_s^2 = \frac{1}{2}m_s \frac{GM}{r_s}$$

$$\text{PE} = -\frac{GMm_s}{r_s}$$

$$\text{Total energy, } E = -\frac{GMm_s}{2r_s}$$

$$\therefore J = (2Em_s r_s^2)^{1/2}$$

36. (a)

$$37. (b) U_i = -\frac{6.67 \times 10^{-11} \times 1^2}{\left(\frac{1}{2}\right)} - \frac{6.67 \times 10^{-11} \times 1^2}{\left(\frac{1}{2}\right)}$$

$$= -6.67 \times 10^{-11} (2 + 2)$$

$$= -4 \times 6.67 \times 10^{-11}$$

$$U_f = 0 \text{ at infinity}$$

$$\therefore \frac{1}{2}mv_e^2 = \Delta U_f - U_i = 4 \times 6.67 \times 10^{-11}$$

$$\therefore v_e = \sqrt{2 \times 4 \times 6.67 \times 10^{-11}} = 2.31 \times 10^{-5} \text{ m/s}$$

$$38. (c) v_e = \text{escape velocity} = \sqrt{\frac{2GM}{R+h}}$$

$$v_o = \text{orbital velocity} = \sqrt{\frac{GM}{R+h}}$$

$$\text{Given, } v_o = \frac{v_e}{2}$$

$$\therefore \sqrt{\frac{GM}{R+h}} = \frac{1}{2} \sqrt{\frac{2GM}{R}}$$

$$\text{or} \quad \frac{GM}{R+h} = \frac{1}{4} \times \frac{2GM}{R}$$

 On solving, we get $h = R$

39. (c) During motion of the particle, total mechanical energy remains constant.

At the surface of earth, total mechanical energy is

$$\begin{aligned} E_i &= -\frac{GmM}{R} + \frac{1}{2}mv_0^2 \\ &= -\frac{GM}{R^2}mR + \frac{1}{2}mv_0^2 \\ &= -gmR + \frac{1}{2}mv_0^2 \end{aligned}$$

 Total mechanical energy at height $h = R$ is

$$\begin{aligned} E_f &= -\frac{GmM}{2R} + \frac{1}{2}mv^2 \\ &= -\frac{gmR}{2} + \frac{1}{2}mv^2 \end{aligned}$$

According to conservation principle of energy,

$$\begin{aligned} E_i &= E_f \\ \therefore -gmR + \frac{1}{2}mv_0^2 &= -\frac{gmR}{2} + \frac{1}{2}mv^2 \end{aligned}$$

$$\text{or} \quad -2gR + v_0^2 = -gR + v^2$$

$$\therefore v = \sqrt{v_0^2 - gR}$$

40. (a) 41. (a)

 42. (a) Orbital speed closer to the earth is $\sqrt{gR}$.

$$K = \text{KE} = \frac{1}{2}m(\sqrt{gR})^2 = \frac{mgR}{2}$$

 Now, if the velocity is changed to $\sqrt{2gR}$ (escape speed), then the kinetic energy K' will be

$$K' = \frac{1}{2}m(\sqrt{2gR})^2 = mgR$$

$$\Rightarrow K' = 2K$$

BITSAT Archives

1. (a) If the satellite could be through outside the earth's gravitational field, its minimum total energy = 0.

So, $-K + K' = 0$
 $K' = K \text{ J}$

2. (d)

The gravitational field at A and B are zero. So, no work required to make change between the points A and B.

3. (c) Orbital velocity (v_o) at a height h above the earth's surface is given by

$$v_o = R_e \sqrt{\frac{g}{R_e + h}}$$

Given,

$$h = R_e$$

$\therefore$

$$v_o = R \sqrt{\frac{g}{2R}}$$

$\Rightarrow$

$$v_o = \sqrt{\frac{Rg}{2}}$$

4. (a) Kepler's second law

$$\frac{dA}{dt} = \frac{L}{2m}$$

$$\frac{dA}{dt} = \text{constant}$$

$$L = \text{constant}$$

5. (a) The necessary centripetal force required for a planet to move round the sun

= gravitational force exerted on it

$$\frac{mv^2}{R} = \frac{GM_e m}{R^n} \text{ or } v = \left(\frac{GM}{R^{n-1}} \right)^{1/2}$$

As,

$$T = \frac{2\pi R}{v} = 2\pi R \times \left(\frac{R^{n-1}}{GM} \right)^{1/2}$$

$$T = 2\pi \left[\frac{R^{\frac{(n+1)}{2}}}{(GM_e)^{1/2}} \right]$$

$$T \propto R^{(n+1)/2}$$

6. (c) KE of a satellite

$$E = \frac{1}{2} mv^2$$

or

$$mv = \sqrt{2Em}$$

Angular momentum,

$$L = mvr = (\sqrt{2Em}) \times r = \sqrt{2mEr^2}$$

7. (a) By Kepler's third law, $T^2 \propto R^3$

$$\therefore \left(\frac{T_2}{365 \text{ days}} \right)^2 = \left(\frac{2r}{r} \right)^3$$

$$T_2 = 365 \times 2\sqrt{2} = 1032 \text{ days}$$

8. (b) $g = \frac{GM}{R^2}$

$$\frac{\Delta g}{g} \times 100 = 2 \left(\frac{\Delta R}{R} \times 100 \right) = 2 \times 1\% = 2\%$$

Therefore, the value of g will increase by 2%.

9. (d) According to Kepler's law,

$$\frac{T_1^2}{T_2^2} = \frac{r_1^3}{r_2^3}$$

$$\frac{1}{T_2^2} = \left(\frac{15 \times 10^{11}}{6 \times 10^{10}} \right)^3 = \left(\frac{5}{2} \right)^3$$

$$T_2 = \left(\frac{2}{5} \right)^{3/2} \text{ yr}$$

10. (c) $PE = \int_R^{3R} -\frac{GMm}{r^2} dr$

$$= -GMm \left[\frac{r^{-1}}{-1} \right]_R^{3R} = GMm \left[\frac{1}{3R} - \frac{1}{R} \right]$$

$$= -\frac{2}{3} \frac{GMm}{R} = -\frac{2}{3} \frac{gR^2 m}{R} = -\frac{2}{3} mgR$$

11. (d) When $h = R$

$$\text{Work done} = -\frac{GMm}{(R+R)} - \left(-\frac{GMm}{R} \right) = \frac{GMm}{2R} = \frac{1}{2} mgR$$

12. (a) Time period of satellite,

$$T \propto \frac{1}{M^{1/2}}, \text{ where } M \text{ is mass of earth.}$$

$T \propto (R+h)^{3/2}$, where R is radius of the orbit, h is the height of satellite from the earth's surface.

13. (a) $v = \sqrt{2gR}$

$$\therefore \frac{v_1}{v_2} = \sqrt{\frac{g_1}{g_2} \times \frac{R_1}{R_2}} = \sqrt{g \times K} = (Kg)^{1/2}$$

14. (d) If a satellite of mass m is placed at a distance r from the centre of the earth (of mass M), the mechanical energy of the satellite is given by $\frac{-GMm}{2r}$.

15. (b) Gravitational acceleration is given by $g = \frac{GM}{R^2}$

where, G = gravitational constant

$$\therefore \frac{g}{G} = \frac{M}{R^2}$$

10

Simple Harmonic Motion

Periodic Motion

A motion which repeats itself over and over again after a regular interval of time is called a **periodic motion**. A periodic motion in which a body moves back and forth repeatedly about a fixed point (called mean position) is called **oscillatory** or **vibratory motion**.

Period The regular interval of time after which periodic motion repeats itself is called period of the motion.

Frequency The number of times of motion repeated in one second is called frequency of the periodic motion. Every oscillatory motion is periodic but every periodic motion is not an oscillatory motion.

Displacement as a Function of Time

In a periodic motion each displacement value is repeated after a regular interval of time, displacement can be represented as a function of time $y = f(t)$.

Periodic Function

A function which repeats its value after a fix interval of time is called a **periodic function**.

$$y(t) = y(t + T)$$

where, T is the period of the function.

Trigonometric functions $\sin\theta$ and $\cos\theta$ are simplest periodic functions having period of 2π .

Simple Harmonic Motion (SHM)

It is a special kind of oscillatory motion in which particle moves to and fro about a mean position (on a straight line) under a restoring force which is directed towards mean position and its magnitude (of restoring force) is directly proportional to the displacement of particle (at all instants). For simple harmonic motion, displacement should be very small.

Simple harmonic motion is a special form of oscillatory or vibratory motion.

It is of two types

1. Linear simple harmonic motion
2. Angular simple harmonic motion

Linear SHM

In linear SHM, a particle moves to and fro (on a straight line) about fixed point under a restoring force (always directed towards mean position) whose magnitude is directly proportional to displacement of the particle (at all instants).

e.g. Motion of a block connected to a spring on a smooth surface.

Restoring force $\propto$ Displacement

$$F \propto -x \quad (\text{if displacement is along } X\text{-axis})$$

$\therefore$ Acceleration, $a \propto -x$

$$\text{or} \quad \frac{d^2x}{dt^2} \propto -x$$

$$\Rightarrow \quad a = -\omega^2 x$$

where, a is acceleration and ω is angular frequency.

Negative sign indicates direction of restoring force and acceleration is towards equilibrium position, but in opposite direction of displacement.

Angular SHM

In angular SHM, the restoring torque (or angular acceleration) acting on the particle is proportional to the angular displacement of the particle and directed towards equilibrium position.

Restoring torque $\propto$ Angular displacement

$$\tau \propto -\theta$$

$$\Rightarrow \quad \alpha \propto -\theta$$

$$\text{or} \quad \frac{d^2\theta}{dt^2} \propto -\theta$$

Some Terms Related to SHM

- Mean position** It is a point at which restoring force on the particle is zero.
- Restoring force** The force which is acting on the particle tends to bring the particle towards its mean position is known as restoring force.

Restoring force, $F = -kx$, where x is displacement, k is spring constant.

(iii) Force constant (Spring constant)

We know that, defining equation of SHM is

$$a = -\omega^2 x, \text{ also } a = \frac{F}{m}$$

$$\therefore \quad \frac{F}{m} = -\omega^2 x$$

$$F = -m\omega^2 x \Rightarrow F = -kx$$

k is called spring constant or force constant.

$$\text{Also, } k = m\omega^2.$$

- Amplitude** Maximum displacement of particle from mean position on either side is defined as amplitude. It is a scalar quantity.

$$\text{Amplitude} = \frac{1}{2} \times (\text{Distance between extreme points})$$

or position)

- Instantaneous displacement** Displacement of particle from mean position in a particular direction (at any instant of time) is defined as instantaneous displacement.

$$\text{It is given by } x = A \sin(\omega t + \phi)$$

where, A = amplitude

ϕ = initial phase or phase constant

Velocity

The velocity of a particle executing SHM at an instant is defined as the time rate of change of its displacement at that instant.

$$\text{Velocity, } v = \omega \sqrt{A^2 - y^2}$$

At the mean position ($y=0$), during its motion $v = A\omega = v_{\max}$ and at the extreme positions ($y = \pm A$) $v = 0$.

$$\text{Velocity amplitude} = v_{\max} = A\omega$$

Acceleration

The acceleration of a particle executing SHM at an instant is defined as the time rate of change of velocity at that instant.

Acceleration, $a = -\omega^2 y$

The acceleration is also a variable. At the mean position ($y = 0$), acceleration $a = 0$ and at the extreme position ($y = \pm A$), the acceleration is $a_{\max} = -A\omega^2$.

$\therefore$ Acceleration amplitude, $a_{\max} = A\omega^2$

Phase and Phase Relationship

Phase is that physical quantity which tells about the position and direction of motion of any particle at any moment. It is denoted by ϕ . In SHM, the velocity is ahead of the displacement by a phase $\frac{\pi}{2}$ and the acceleration is further ahead of the velocity by a phase of $\frac{\pi}{2}$.

Phase Difference

The difference of total phase angles of two particles executing SHM with respect to their mean positions is known as **phase difference**. If phase angles of two particles executing SHM are $(\omega t + \phi_1)$ and $(\omega t + \phi_2)$ respectively, then

$$\Delta\phi = (\omega t + \phi_2) - (\omega t + \phi_1)$$

$$\Delta\phi = \phi_2 - \phi_1$$

Time Period

The time taken by a particle to complete one oscillation is called **time period**. It is denoted by T .

Acceleration in SHM, $a = -\omega^2 y$

Hence, $|a| = \omega^2 |y| \Rightarrow \omega = \sqrt{\frac{|a|}{|y|}}$

$\therefore$ Time period of SHM,

$$T = \frac{2\pi}{\omega} = 2\pi \sqrt{\frac{|y|}{|a|}} = 2\pi \sqrt{\frac{\text{Displacement}}{\text{Acceleration}}}$$

Equation of Simple Harmonic Motion

A simple harmonic motion may be mathematically expressed by a single sinusoidal (sine or cosine) function of time. The equation of simple harmonic motion is given by

$$y = A \sin \omega t$$

$$\text{and } x = A \cos \omega t$$

- Differential equations of SHM for linear SHM, $\frac{d^2 y}{dt^2} + \omega^2 y = 0$, for angular SHM, $\frac{d^2 \theta}{dt^2} + \omega^2 \theta = 0$
- All sine and cosine functions of t are simple harmonic in nature, i.e. for the function
- $y = A \sin(\omega t \pm \phi)$ or $y = A \cos(\omega t \pm \phi)$
- $\frac{d^2 y}{dt^2}$ is directly proportional to $-y$. Hence, they are simple harmonic in nature.

Oscillations of a Spring Block System

A spring pendulum consists of a point (small sized) mass m either suspended from a massless (or light) spring or placed on a smooth horizontal plane attached with a spring.

Here, $x_1 = x_2 = l$

If the mass is once pulled so as to stretch the spring and is then released, then a restoring force acts on it which continuously tries to restore its mean position, restoring force $F = -kl$, where k is force constant and l is the change in length of the spring under the restoring force the spring pendulum oscillates simple harmonically having time period and frequency given by

$$T = 2\pi \sqrt{\frac{m}{k}} \text{ and } \nu = \frac{1}{2\pi} \sqrt{\frac{k}{m}}$$

where, k is the force constant of the spring and it is numerically equal to the force required to increase the length of the spring by unity.

If the spring is not light but has a mass m_s , then

$$T = 2\pi \sqrt{\frac{m + 1/3 m_s}{k}}$$

NOTE If two masses m_1 and m_2 , connected by a spring are made to oscillate on a horizontal surface, then its period will be

$$T = 2\pi \sqrt{\frac{\mu}{k}}$$

where, $\mu = \frac{m_1 m_2}{m_1 + m_2}$ = reduced mass of the system.

Series Combination of Springs

If two springs of spring constants k_1 and k_2 are joined in series (horizontally and vertically), then their equivalent spring constant k_s is given by

$$\frac{1}{k_s} = \frac{1}{k_1} + \frac{1}{k_2}$$

$$\Rightarrow k_s = \frac{k_1 k_2}{k_1 + k_2}$$

$$\therefore T = 2\pi \sqrt{\frac{m}{k_s}} = 2\pi \sqrt{\frac{m(k_1 + k_2)}{k_1 k_2}}$$

Parallel Combination of Springs

If the two springs of spring constants k_1 and k_2 are joined in parallel as shown in the figure then their equivalent spring constant $k_p = k_1 + k_2$, hence

$$T = 2\pi \sqrt{\frac{m}{k_p}}$$

$$= 2\pi \sqrt{\frac{m}{(k_1 + k_2)}}$$

Spring Pendulum

A point mass suspended from a massless (or light) spring constitutes a spring pendulum. If the mass is once pulled downwards so as to stretch the spring and then released, the system oscillates up and down about its mean position simple harmonically. Time period (T) and frequency (ν) of oscillations are given by

$$T = 2\pi \sqrt{\frac{m}{k}} \quad \text{or} \quad \nu = \frac{1}{2\pi} \sqrt{\frac{k}{m}}$$

If the spring is not light but has a definite mass m_s , then it can be easily shown that period of oscillation will be

$$T = 2\pi \sqrt{\frac{m + \frac{m_s}{3}}{k}}$$

Energy in Simple Harmonic Motion

If a particle executes SHM, its kinetic energy changes into potential energy and *vice-versa* keeping total energy constant (if friction of air is neglected).

A particle executing SHM possesses two types of energy

1. **Kinetic energy** This is an account of the velocity of the particle.

$$K = \frac{1}{2}mv^2 = \frac{1}{2}mA^2\omega^2 \cos^2(\omega t + \phi) = \frac{1}{2}m\omega^2(A^2 - x^2)$$

From this expression, we conclude that kinetic energy is maximum at the centre ($x = 0$) and zero at the extremes of oscillation ($x = \pm A$).

2. **Potential energy** This is an account of the displacement of the particle from its mean position.

$$U = \frac{1}{2}m\omega^2 x^2$$

$$= \frac{1}{2}mA^2\omega^2 \sin^2(\omega t + \phi)$$

Thus, potential energy has its minimum at the centre ($x = 0$) and increases as the particle approaches either extreme of oscillation ($x = \pm A$).

3. **Mechanical energy** This is an account of kinetic and potential energy.

Thus, total mechanical energy = kinetic energy + potential energy

$$\text{or} \quad E = \frac{1}{2}m\omega^2 A^2$$

Obviously, the total energy is constant and is proportional to the square of amplitude (A) of motion.

Figures show the variations of total energy (E), potential energy (U) and kinetic energy (K) with displacement (x).

Some Important Points

- KE and PE also varies periodically.
- Frequency of PE or KE is double than that of SHM.
- The frequency of total energy in SHM is zero.
- The average values of KE and PE in one complete revolution is $\frac{1}{4}m\omega^2 A^2$.
- The average value of total energy in one complete revolution is $\frac{1}{2}m\omega^2 A^2$.

Simple Pendulum

A simple pendulum, in practice, consists of a heavy but small sized metallic bob suspended by a light, inextensible and flexible string. The motion of a simple pendulum is simple harmonic for very small angular displacement (α) whose time period and frequency are given by

$$T = 2\pi\sqrt{\frac{l}{g}} \text{ and } \nu = \frac{1}{2\pi}\sqrt{\frac{g}{l}}$$

where, l is the effective length of the string and g is acceleration due to gravity.

- (i) If a pendulum of length l at temperature $\theta^\circ\text{C}$ has a time period T , then on increasing the temperature by $\Delta\theta^\circ\text{C}$ its time period changes to $T \times \Delta T$,

$$\text{where, } \frac{\Delta T}{T} = \frac{1}{2}\alpha\Delta\theta$$

where, α is the temperature coefficient of expansion of the string.

- (ii) A second's pendulum is a pendulum whose time period is 2s. At a place where $g = 9.8\text{m/s}^2$, the length of a second's pendulum is 0.9929 m (or 1 m approx).

- (iii) If the bob of a pendulum (having density ρ) is made to oscillate in a non-viscous fluid of density σ , then it can be shown that the new period is

$$T = 2\pi\sqrt{\frac{l}{g\left(1 - \frac{\sigma}{\rho}\right)}}$$

- (iv) If a pendulum is in a lift or in some other carriage moving vertically with an acceleration a , then the effective value of the acceleration due to gravity becomes $(g \pm a)$ and hence,

$$T = 2\pi\sqrt{\frac{l}{(g \pm a)}}$$

Here, positive sign is taken for an upward accelerated motion and negative sign for a downward accelerated motion.

- (v) If a pendulum is made to oscillate in a freely falling lift or an orbiting satellite then the effective value of g is zero and hence, the time period of the pendulum will be infinity and therefore pendulum will not oscillate at all.

Free, Forced, Damped and Resonant Vibrations

Free Vibrations

If a given body is once set into vibrations and then let free to vibrate with its own natural frequency, the vibrations are

said to be free vibrations. The natural frequency of free vibrations depends on the nature and structure of the body and in ideal situation, the amplitude, frequency and the energy of the vibrating body remain constant.

Forced Vibrations

The vibrations in which a body oscillates under the effect of an external periodic force, whose frequency is different from the natural frequency of oscillating body are called forced vibrations. In forced vibrations, the oscillating body vibrates with the frequency of external force and amplitude of oscillations is generally small.

If an external driving force is represented by

$$F(t) = F_0 \cos \omega_d t$$

The motion of particle is under combined action of restoring force ($-kx$), damping force ($-bv$) and driving force $F(t)$.

Now,

$$ma = -kx - bv + F_0 \cos \omega_d t$$

or

$$\frac{d^2x}{dt^2} = -\frac{kx}{m} - \frac{b}{m} \frac{dx}{dt} + \frac{F_0 \cos \omega_d t}{m}$$

The solution of this equation gives $x = x_0 \sin(\omega_d t + \phi)$ with amplitude

$$x_0 = \frac{F_0/m}{\sqrt{(\omega_0^2 - \omega_d^2)^2 + \left(\frac{b\omega_d}{m}\right)^2}}, \tan \theta = \frac{\omega_0^2 - \omega_d^2}{b\omega_d/m}$$

and $\omega_0 = \sqrt{\frac{k}{m}}$ = natural frequency

Damped Vibrations

When a body is set in free vibrations, generally there is a dissipation of energy due to dissipative causes like viscous drag of a fluid, frictional force, hysteresis, electromagnetic damping force, etc., and as a result amplitude of vibration regularly decreases with time. Such vibrations of continuously falling amplitudes are called damped vibrations. In these oscillations, the amplitude of oscillation decreases exponentially and hence, energy also decreases exponentially. If the velocity of an oscillator is v , the damping force

$$F_d = -bv$$

where, b = damping constant.

Resultant force on a damped oscillator is given by

$$F = F_R + F_D = -kx - bv \text{ or } \frac{md^2x}{dt^2} + \frac{bdx}{dt} + kx = 0$$

Displacement of a damped oscillator is given by

$$x = x_m e^{-bt/2m} \sin(\omega' t + \phi)$$

$$\omega' = \sqrt{\omega_0^2 - (b/2m)^2}$$

where, ω' = angular frequency of the damped oscillator

For a damped oscillator, if the damping is small then the mechanical energy decreases exponentially with time

as $E = \frac{1}{2} kx_m^2 e^{-bt/m}$

Resonant Vibrations

It is a special case of forced vibrations in which frequency of external force is exactly same as the natural frequency of oscillator. As a result the oscillating body begins to vibrate with a large amplitude leading to the resonance phenomenon to occur. Resonant vibrations play a very important role in music and tuning of station/channel in a radio/TV.

Some Important Points

(i) Physical or compound pendulum, $T = 2\pi \sqrt{\left(\frac{l + \frac{K^2}{l}}{g} \right)}$

where, l = distance of centre of gravity from point of suspension and

K = radius of gyration about an axis passing through centre of gravity.

(ii) In the case of water oscillating in a U-tube,

$$T = 2\pi \sqrt{\left(\frac{h}{g} \right)}$$

where, h is the height of liquid column in each limb.

(iii) When a ball of mass m is made to oscillate in the neck of an air chamber having volume V and neck area A , then

$$T = 2\pi \sqrt{\left(\frac{mV}{pA^2} \right)}$$

(iv) If a person sitting on an oscillating swings stands up, the time period of the swing decreases.

(v) When a pendulum is kept in a car which is sliding down, then

$$T = 2\pi \sqrt{\left(\frac{1}{g \cos \theta} \right)}$$

where, θ is an angle of inclination.

(vi) If time period of one spring is T_1 and that of second spring is T_2 and if they are connected in series, then $T_{\text{series}} = \sqrt{T_1^2 + T_2^2}$. If they are connected in parallel, then

$$T_{\text{parallel}} = \frac{T_1 T_2}{\sqrt{T_1^2 + T_2^2}}$$

(vii) The time period of a simple pendulum having long

length is $T = 2\pi \sqrt{\left(\frac{IR}{(l+R)g} \right)}$

where, R = radius of earth

If length is infinite, then $T = 2\pi \sqrt{\left(\frac{R}{g} \right)}$

Practice Exercise

- A particle executing simple harmonic motion has amplitude of 1 m and time period 2 s. At $t = 0$, net force on the particle is zero. The equation of displacement of particle is
a. $x = \sin \pi t$ b. $x = \cos \pi t$ c. $x = \sin 2\pi t$ d. $x = \cos 2\pi t$
- In Q. 1, find maximum velocity and maximum acceleration.
a. 1 m/s, π m/s² b. π m/s and π^2 m/s²
c. π m/s and π m/s² d. None of these
- A particle executes simple harmonic motion. The amplitude of vibration of particle is 2 cm. The displacement of particle in one time period is
a. 1 cm b. 2 cm c. 4 cm d. zero
- In Q. 3, the distance travelled by the particle is
a. 8 cm b. 2 cm
c. 4 cm d. zero
- A particle moves along Y-axis according to equation $y = 3 + 4 \cos \omega t$. The motion of particle is
a. not SHM b. oscillatory but not SHM
c. SHM d. None of these
- In Q. 5, the amplitude of vibration is
a. 3 units b. 4 units
c. 5 units d. None of these
- If $\mathbf{s} = a \sin \omega t \hat{i} + b \cos \omega t \hat{j}$, the equation of path of particle is
a. $x^2 + y^2 = \sqrt{a^2 + b^2}$ b. $\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1$
c. $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ d. None of these
- In previous question, the amplitude of vibration is
a. 4 units b. 8 units
c. 10.58 units d. None of these

9. The motion of a particle varies with time according to the relation
 $y = a \sin \omega t + a \cos \omega t$. Then,
 a. the motion is oscillatory but not SHM
 b. the motion is SHM with amplitude a
 c. the motion is SHM with amplitude $\sqrt{2}a$
 d. None of the above
10. A particle executes SHM along a straight line so that its period is 12 s. The time it takes in traversing a distance equal to half its amplitude from its equilibrium position is
 a. 6 s
 b. 4 s
 c. 2 s
 d. 1 s
11. A particle executes SHM with an amplitude of 10 cm and frequency 2 Hz. At $t = 0$, the particle is at a point where, potential energy and kinetic energy are same. The equation of displacement of particle is
 a. $0.1 \sin \left(4\pi t + \frac{\pi}{4} \right)$
 b. $0.1 \sin 4\pi t$
 c. $0.1 \cos \left(4\pi t + \frac{\pi}{4} \right)$
 d. None of the above
12. A particle executes simple harmonic motion with a frequency f . The frequency with which the potential energy oscillates is
 a. f
 b. $f/2$
 c. $2f$
 d. zero
13. A particle of mass m is executing oscillation about the origin on the X -axis. Its potential energy is $u(x) = k|x|^3$, where k is a positive constant. If the amplitude of oscillation is a , then its time period T is
 a. proportional to $\frac{1}{\sqrt{a}}$
 b. independent of a
 c. proportional to $\sqrt{a}$
 d. proportional to $a^{3/2}$
14. A particle of mass m is free to move along the x -axis and has potential energy given by $u(x) = k[1 - e^{-x^2}]$ for $-\infty \leq x \leq \infty$, where k is positive constant of appropriate dimensions. Then,
 a. at points away from the origin, the particle is in unstable equilibrium
 b. for any finite non-zero value of x , there is a force directed away from the origin
 c. its total mechanical energy is $\frac{k}{2}$, it has its minimum kinetic energy at origin
 d. for small displacement from $x = 0$, motion is SHM
15. A simple harmonic oscillator has amplitude A , angular velocity ω , and mass m . Then, average energy in one time period will be
 a. $\frac{1}{4} m \omega^2 A^2$
 b. $\frac{1}{2} m \omega^2 A^2$
 c. $m \omega^2 A^2$
 d. zero
16. A point mass $m = 20$ kg, is suspended by a massless spring of constant 2000 N/m. The point mass is released when elongation in the spring is 15 cm. The equation of displacement of particle as function of time is (take, $g = 10 \text{ m/s}^2$)
 a. $y = 10 \sin 10t$
 b. $Y = 10 \cos 10t$
 c. $y = 10 \sin \left(10t + \frac{\pi}{6} \right)$
 d. None of these
- 
17. A spring of spring constant 200 N/m has a block of mass 1 kg hanging at its one end and from other end spring is attached to a ceiling of an elevator. The elevator rising upwards with an acceleration of $g/3$. When acceleration is suddenly cease, then what should be the angular frequency and elongation during the time when the elevator is accelerating?
 a. 14.14 rad/s, 0.07 m
 b. 14 rad/s, 0.1 m
 c. 14.14 rad/s, 0.05 m
 d. 10 rad/s, 0.07 m
- 
18. A spring of force constant k is cut into two pieces such that one piece is double the length of the other. Then, the long piece will have a force constant of
 a. $\frac{2}{3}k$
 b. $\frac{3}{2}k$
 c. $3k$
 d. $6k$
19. A solid copper sphere is suspended from a massless spring. The time period of oscillation of the system is 4 s. The sphere is now completely immersed in a liquid whose density is $1/8$ th that of brass. The sphere remains in liquid during oscillation. Now, the time period is
 a. 4 s
 b. 2 s
 c. 3 s
 d. None of these
20. A load of mass m falls from a height h on to the scale pan hung from a spring as shown in the adjoining figure. If the spring constant is k and mass of the scale pan is zero and the mass m does not bounce relative to the pan, then the amplitude of vibration is
 a. $\frac{mg}{k}$
 b. $\frac{mg}{k} \sqrt{\left(\frac{1+2hk}{mg} \right)}$
 c. $\frac{mg}{k} + \frac{mg}{k} \sqrt{\left(\frac{1+2hk}{mg} \right)}$
 d. $\frac{mg}{k} \sqrt{\left(\frac{1+2hk}{mg} - \frac{mg}{k} \right)}$
- 
21. In Q. 20, find the amplitude of vibration.
 a. $\sqrt{\left(\frac{mv^2}{k} \right)}$
 b. $\sqrt{\left(\frac{mv^2}{2k} \right)}$
 c. $\sqrt{\left(\frac{mv^2}{4k} \right)}$
 d. None of these

22. Two point masses of 3 kg and 1 kg are attached to opposite ends of a horizontal springs whose spring constant is 300 N/m as shown in figure. The natural vibration frequency of the system is of order

a. 4 Hz b. 3 Hz c. 2 Hz d. 1 Hz

23. Two blocks connected by a spring rest on a smooth horizontal plane as shown in figure. If a constant force F starts acting on the block m_2

- a. length of spring increases continuously, if $m_1 > m_2$
 b. blocks start performing SHM about centre of mass of the system with increasing amplitude
 c. blocks start performing SHM about centre of mass of the system which moves rectilinearly with constant acceleration
 d. acceleration of m_2 is maximum at initial moment of time only

24. There is a spring with nature length L_0 . Two masses m_1 and m_2 are connected to both of its ends as shown in figure. The whole system is held at rest. At any time $t = 0$, m_2 is released and system starts free fall. Initial stretched length of spring before fall is L_0 . What is the displacement of centre of mass as a function of time?

- a. gt^2 b. $\frac{1}{2}gt^2$ c. $\frac{g}{k}t^2$ d. $\frac{m_1 + m_2}{m_1 m_2} \times t$

25. A second's pendulum has time period 2s. The spherical bob which is empty has mass of 50 g. This is replaced by another solid bob of same radius but having mass of 100 g. The new time period will be

- a. 4 s b. 1 s
 c. 2 s d. 8 s

26. A clock pendulum is adjusted for giving correct time in Patna. This clock pendulum also gives correct time in

- a. Delhi b. Kota
 c. Hyderabad d. None of these

27. A simple pendulum of length L and mass M is oscillating in a plane about a vertical line between angular limits $-\phi$ and $+\phi$. For an angular displacement, the tension in the string and the velocity of the bob are T and v respectively. The following relation holds good under the above conditions

- a. $T = Mg \cos \theta$ b. $T \cos \theta = Mg$
 c. $T - Mg \cos \theta = \frac{Mv^2}{L}$ d. None of these

28. From the ceiling of a train, a pendulum of length ' l ' is suspended. The train is moving with an acceleration a_0 on horizontal surface. What must be the period of oscillation of pendulum?

a. $T = 2\pi \sqrt{\left(\frac{l}{g}\right)}$ b. $T = 2\pi \sqrt{\left(\frac{l}{a_0^2 + g^2}\right)}$
 c. $T = \pi \sqrt{\left(\frac{l}{\sqrt{a_0^2 + g^2}}\right)}$ d. $T = 2\pi \sqrt{\left(\frac{l}{\sqrt{a_0^2 - g^2}}\right)}$

29. There is a clock which give correct time at 20°C is subjected to 40°C . The coefficient of linear expansion of the pendulum is 12×10^{-6} per $^\circ\text{C}$, how much is gain or loss in time?

- a. 10.3 s/day b. 19 s/day c. 5.5 s/day d. 6.8 s/day

30. There are two pendulums of length l_1 and l_2 start vibrating. At some instant, the two are in mean position in the same phase. Calculate after how many vibrations of shorter pendulum, the two will be in phase in the mean position?

$[(l_1 > l_2), l_1 = 121\text{cm}, l_2 = 100\text{cm}]$

- a. 11 b. 10 c. 9 d. 8

31. A clock is performing SHM along a vertical line with amplitude of 40 cm on a horizontal plank. The block just lose the contact with plank when plank is momentarily at rest. Then, (Take, $g = 10\text{ m/s}^2$)

- a. the period of its oscillation is $\frac{2\pi}{5}\text{ s}$
 b. the period of its oscillation is $\frac{2\pi}{6}\text{ s}$
 c. the period of its oscillation is $\frac{\pi}{5}\text{ s}$
 d. None of the above

32. There is a ring or mass m and radius R is pivoted at a point O on its periphery. It is free to rotate about an axis perpendicular to its plane. What is the period of ring?

a. $T = 2\pi \sqrt{\left(\frac{R}{g}\right)}$ b. $T = 2\pi \sqrt{\left(\frac{2R}{g}\right)}$
 c. $T = \pi \sqrt{\left(\frac{2R}{g}\right)}$ d. $T = 2\pi \sqrt{\left(\frac{3R}{g}\right)}$

33. There is a rod of length l and mass m . It is hinged at one end to the ceiling. Find the period of small oscillation.

a. $T = 2\pi \sqrt{\left(\frac{2l}{3g}\right)}$ b. $T = \pi \sqrt{\left(\frac{l}{3g}\right)}$
 c. $T = 2\pi \sqrt{\left(\frac{l}{3g}\right)}$ d. $T = 2\pi \sqrt{\left(\frac{l}{g}\right)}$

34. A particle of mass m is allowed to oscillate near the minimum of a vertical parabolic path having the equation $x^2 = 4ay$. The angular frequency of small oscillations is given by

a. $\sqrt{gh}$ b. $\sqrt{2gh}$ c. $\sqrt{\left(\frac{g}{2a}\right)}$ d. $\sqrt{\left(\frac{g}{a}\right)}$

35. A highly rigid cubical block of mass m and side L is fixed rigidly on to another cubical block B of the same dimensions and of low modulus of rigidity η such that the lower face of A completely covers the upper face of B . The lower face of B is rigidly held on a horizontal surface. A small force F is applied perpendicular to one of the side faces of A . After the force is withdrawn, block A executes small oscillation, the period is

a. $2\pi\sqrt{\eta mL}$ b. $2\pi\sqrt{\left(m\frac{\eta}{L}\right)}$ c. $2\pi\sqrt{\left(\frac{mL}{\eta}\right)}$ d. $2\pi\sqrt{\left(\frac{m}{\eta L}\right)}$

36. A cylindrical piston of mass M slide smoothly inside a long cylinder closed at one end, enclosing a certain mass of gas.

The cylinder is kept with its axis horizontal. If the piston is disturbed from its equilibrium position, it oscillates simple harmonically. Find its period.

a. $T = 2\pi\sqrt{\left(\frac{Mh}{pA}\right)}$ b. $T = 2\pi\sqrt{\left(\frac{MA}{ph}\right)}$
 c. $T = 2\pi\sqrt{\left(\frac{M}{pah}\right)}$ d. $T = 2\pi\sqrt{MphA}$

BITSAT Archives

1. A particle of mass $m = 5\text{ g}$ is executing simple harmonic motion with an amplitude 0.3 m and time period $\pi/5$ second. The maximum value of force acting on the particle is [2013]
 a. 5 N b. 4 N c. 0.5 N d. 0.15 N
2. Pulse rate of a normal person is 75 per minute. The time period of heart is [2013]
 a. 0.8 s b. 0.75 s c. 1.25 s d. 1.75 s
3. A simple wave motion represented by $y = 5(\sin 4\pi t + \sqrt{3}\cos 4\pi t)$. Its amplitude is [2012]
 a. 5 b. $5\sqrt{3}$ c. $10\sqrt{3}$ d. 10
4. If the displacement of simple pendulum at any time is 0.02 m and acceleration is 2 m/s^2 , then in this time angular velocity will be [2012]
 a. 100 rad/s b. 10 rad/s c. 1 rad/s d. 0.1 rad/s
5. If k_s and k_p respectively are effective spring constant in series and parallel combination of springs as shown in figure, find $\frac{k_s}{k_p}$. [2012]

- a. $\frac{9}{2}$ b. $\frac{3}{7}$ c. $\frac{2}{9}$ d. $\frac{7}{3}$
6. What is the maximum acceleration of the particle doing the SHM?

$y = 2\sin\left[\frac{\pi t}{2} + \phi\right]$, where 2 is in cm [2011]

a. $\frac{\pi}{2}\text{ cm/s}^2$ b. $\frac{\pi^2}{2}\text{ cm/s}^2$ c. $\frac{\pi}{4}\text{ cm/s}^2$ d. $\frac{\pi}{4}\text{ cm/s}^2$

7. The equation $\frac{d^2y}{dt^2} + \frac{b}{m}\frac{dy}{dt} + \omega^2y = 0$ represents the equation of motion for a [2010]
 a. free vibration b. damped vibration
 c. forced vibration d. resonant vibration

8. A pole is floating in a liquid with 80 cm of its length immersed. It is pushed down a certain distance and then released. Time period of vertical oscillation is [2010]

a. $\frac{4\pi}{7}\text{ s}$ b. $\frac{3\pi}{7}\text{ s}$ c. $\frac{2\pi}{7}\text{ s}$ d. $\frac{\pi}{7}\text{ s}$

9. A pendulum has a ball of mass m attached to the string and is suspended from the roof of a trolley. If the trolley rolls upwards with acceleration a , then what is the angle made by the string with the inclined plane? (Given that, $a = 5\text{ m/s}^2$, $g = 10\text{ m/s}^2$ and the angle of inclination of the plane is 30°) [2009]

a. $\cos^{-1}\left(\frac{2}{\sqrt{3}}\right)$ b. $\cot^{-1}\left(\frac{2}{\sqrt{3}}\right)$ c. $\sin^{-1}\left(\frac{2}{\sqrt{3}}\right)$ d. $\tan^{-1}\left(\frac{2}{\sqrt{3}}\right)$

10. A particle is executing simple harmonic motion with an amplitude A and time period T . The displacement of the particles after $2T$ period from its initial position is [2008]

a. A b. $4A$
 c. $8A$ d. zero

11. In a second's pendulum, mass of bob is 30 g . If it is replaced by 90 g mass, then its time period will be [2007]

a. 1 s b. 2 s
 c. 4 s d. 3 s

12. A simple pendulum hanging from the ceiling of a stationary lift has time period t_1 . When the lift moves downward with constant velocity, the time period is t_2 , then [2006]

a. t_2 is infinity b. $t_2 > t_1$
 c. $t_2 < t_1$ d. $t_2 = t_1$

Answer with Solutions

Practice Exercise

1. (a) $\therefore$ In the case of SHM,

$$x = a \sin(\omega t + \phi)$$

Here, $a = 1\text{m}, \omega = \frac{2\pi}{T} = \frac{2\pi}{2} = \pi \text{ rad/s}$

At $t = 0$, net force on the particle is zero.

Hence, particle is at mean position at $t = 0$

$$\therefore x = 0 \text{ at } t = 0$$

$$\therefore 0 = a \sin(\omega \times 0 + \phi) \Rightarrow \phi = 0$$

$$\therefore x = a \sin \omega t$$

$$\therefore x = 1 \times \sin \pi t$$

$$\therefore x = \sin \pi t$$

2. (b) $v_{\max} = a\omega = 1 \times \pi = \pi \text{ m/s}^2$

$$a_{\max} = -\omega^2 a = -\pi^2 \text{ m/s}^2$$

$$\therefore |a_{\max}| = \pi^2 \text{ m/s}^2$$

3. (d) $\therefore x = A \sin \omega t$

$$\therefore x = A \sin\left(\frac{2\pi}{T} \times T\right)$$

$$\therefore x = A \sin 2\pi = 0$$

4. (a) Since, the distance travelled in $T/4$ time is $S_1 = A$

$\therefore$ The distance travelled in one time.

$$s = 4S_1 = 4A$$

$$\therefore s = 8 \text{ cm} \quad (\because A = 2 \text{ cm})$$

5. (c) $y = 3 + 4 \cos \omega t$

The y - t graph is shown in the figure. Since, graph is sinusoidal, hence motion is SHM.

6. (b) $y - 3 = 4 \cos \omega t$

Comparing with $x = A \cos \omega t$

$\Rightarrow$ Amplitude of SHM, $A = 4$ units

7. (c) Here, $x = a \sin \omega t$

$$\therefore \sin \omega t = \frac{x}{a}$$

Similarly, $y = b \cos \omega t$

$$\therefore \cos \omega t = \frac{y}{b}$$

$$\therefore \sin^2 \omega t + \cos^2 \omega t = \frac{x^2}{a^2} + \frac{y^2}{b^2}$$

$$\therefore \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad (\text{Ellipse})$$

8. (c)

9. (c) $y = a \sin \omega t + a \cos \omega t = a \sin \omega t + a \sin\left(\omega t + \frac{\pi}{2}\right)$

The resultant motion is SHM but resultant amplitude is

$$A = \sqrt{a^2 + a^2 + 2a^2 \cos \frac{\pi}{2}} = \sqrt{2}a$$

10. (d) Since, particle starts from mean position.

$$\therefore x = A \sin \omega t$$

$$\therefore \frac{A}{2} = A \sin \omega t_0 \text{ or } \frac{1}{2} = \sin \omega t_0$$

$$\text{or } \sin \frac{2\pi}{T} t_0 = \sin \frac{\pi}{6}$$

$$\text{or } \frac{2\pi}{T} t_0 = \frac{\pi}{6}$$

$$\therefore t_0 = \frac{T}{12} = \frac{12}{12} = 1\text{s}$$

11. (a) Let $x = A \sin(\omega t + \phi)$

$$\therefore v = \frac{dx}{dt} = A \omega \cos(\omega t + \phi)$$

$$\therefore \text{KE} = \frac{1}{2} m v^2 = \frac{1}{2} m A^2 \omega^2 \cos^2(\omega t + \phi)$$

$$\therefore (\text{KE})_{\max} = \frac{1}{2} m A^2 \omega^2$$

$$\therefore \text{PE} = \frac{1}{2} m A^2 \omega^2 - \text{KE}$$

$$= \frac{1}{2} m A^2 \omega^2 - \frac{1}{2} m A^2 \omega^2 \cos^2(\omega t + \phi)$$

$$= \frac{1}{2} m A^2 \omega^2 \sin^2(\omega t + \phi)$$

According to problem, $\text{KE} = \text{PE}$ (at $t = 0$)

$$\therefore \frac{1}{2} m A^2 \omega^2 \sin^2(\omega t + \phi)$$

$$= \frac{1}{2} m A^2 \omega^2 \cos^2(\omega t + \phi)$$

$$\therefore \tan^2(\omega t + \phi) = 1$$

$$\Rightarrow \tan^2(\omega t + \phi) = \tan^2 \frac{\pi}{4}$$

$$\Rightarrow \omega t + \phi = \frac{\pi}{4}$$

$$\Rightarrow \phi = \frac{\pi}{4}$$

($\because t = 0$)

$$\therefore x = A \sin(\omega t + \phi)$$

Here, $A = 10 \text{ cm} = 0.1 \text{ m}$

$$\omega = 2\pi f = 2\pi \times 2 = 4\pi \text{ rad/s}$$

$$\phi = \frac{\pi}{4}$$

$$\therefore x = 0.1 \sin\left(4\pi t + \frac{\pi}{4}\right)$$

12. (c) If
- $x = A \sin \omega t$

Then, $PE = \frac{1}{2} mA^2 \omega^2 \sin^2 \omega t$

$$\therefore PE = \frac{1}{2} mA^2 \omega^2 \left(\frac{1 - \cos 2\omega t}{2} \right)$$

$$\therefore \omega' = 2\omega$$

$$\text{or } 2\pi f' = 2 \times 2\pi f$$

$$\therefore f' = 2f$$

13. (a)
- $u = k|x|^3$

$$u_{\max} = ka^3$$

The oscillation energy is given by $\frac{1}{2} ma^2 \omega^2$.

$$\therefore \frac{1}{2} ma^2 \omega^2 = ka^2 a$$

$$\text{or } \omega^2 = \frac{2k}{m} a$$

$$\text{or } \omega = \sqrt{\left[\left(\frac{2k}{m} \right) a \right]}$$

$$\therefore T = \frac{2\pi}{\omega} = 2\pi \sqrt{\frac{m}{2ka}}$$

$$\therefore T \propto \frac{1}{\sqrt{a}}$$

14. (d)

$$15. (a) \text{ Average energy} = \frac{\int_0^T u dt}{\int_0^T dt} = \frac{1}{T} \int_0^T u dt$$

$$= \frac{1}{2T} \int_0^T m\omega^2 A^2 \cos^2(\omega t + \phi) dt = \frac{1}{4} m\omega^2 A^2$$

16. (c)

17. (a) The angular frequency under all circumstances is

$$\omega = \sqrt{\left(\frac{k}{m} \right)} = \sqrt{\left(\frac{200}{1} \right)} = 14.14 \text{ rad/s}$$

When elevator is moving up, the equation of motion is

$$T - mg = \frac{mg}{3} \Rightarrow T = \frac{4mg}{3}$$

This tension elongates the spring by x

$$T = kx$$

$$\Rightarrow x = \frac{4mg}{3k} = 0.07 \text{ m}$$

$$18. (b) \frac{1}{k} = \frac{1}{k_1} + \frac{1}{k_2} \text{ or } \frac{1}{k} = \frac{2}{k_2} + \frac{1}{k_2} = \frac{3}{k_2}$$

$$\therefore k_2 = 3k$$

$$\therefore k_1 = \frac{k_2}{2} = \frac{3}{2} k$$

$$19. (a) \text{ Since, } T = 2\pi \sqrt{\frac{m}{k}}$$

Here, m and k remain constant.

Hence, T remains constant.

20. (b) According to conservation principle

$$mgh = \frac{1}{2} kx_0^2 - mgx_0$$

where, x_0 is maximum elongation in spring (when particle is in its lowest extreme position).

$$\text{or } \frac{1}{2} kx_0^2 - mgx_0 - mgh = 0$$

$$\text{or } x_0^2 - \frac{2mg}{k} x_0 - \frac{2mg}{k} h = 0$$

$$\therefore x_0 = \frac{\frac{2mg}{k} \pm \sqrt{\left[\left(\frac{2mg}{k} \right)^2 + 4 \times \frac{2mg}{k} h \right]}}{2}$$

$\therefore$ Amplitude = elongation in spring for lowest extreme position – elongation in spring for equilibrium position

$$= x_0 - x_1 = \frac{mg}{k} \sqrt{\left(1 + \frac{2hk}{mg} \right)}$$

$$21. (b) \text{ Here, } \omega = \sqrt{\left(\frac{k}{2m} \right)}$$

$$\therefore E_0 = \frac{1}{2} (2m) A^2 \omega^2$$

$$\text{or } \frac{mv^2}{4} = mA^2 \omega^2 \text{ or } \frac{mv^2}{4} = mA^2 \frac{k}{2m}$$

$$\therefore A = \sqrt{\left(\frac{mv^2}{2k} \right)}$$

22. (b) The reduced mass of the system is
- $\mu = \frac{m_1 m_2}{m_1 + m_2}$

$$T = 2\pi \sqrt{\left(\frac{\mu}{k} \right)} = 2\pi \sqrt{\left[\frac{m_1 m_2}{(m_1 + m_2) k} \right]}$$

$$\therefore f = \frac{1}{T} = 3 \text{ Hz}$$

23. (c) In this case, a constant force
- F
- acts on the system. So, the centre of mass of system moves with constant acceleration.

$$a_{\text{CM}} = \frac{F}{m_1 + m_2}$$

In the frame of centre of mass, particles execute SHM because force on each particles varies linearly.

24. (b)

25. (c) Time period of second's pendulum does not depend on the mass of bob.

26. (d) The time period of clock pendulum at different places are different due to variation of
- g
- .

27. (c) The bob moves on a circular path

$$\therefore T - Mg \cos \theta = \frac{Mv^2}{L}$$

28. (b) Let train is moving towards right. The pseudo force is acting in left direction $= ma_0$

Effective acceleration, $a_{\text{eff}} = \sqrt{a_0^2 + g^2}$

$$\therefore \text{Time period} = 2\pi \sqrt{\left(\frac{l}{a_{\text{eff}}}\right)}$$

$$T = 2\pi \sqrt{\left(\frac{l}{\sqrt{a_0^2 + g^2}}\right)}$$

29. (a) $\frac{\Delta t}{t} = \frac{1}{2} \frac{\Delta L}{L} = \frac{1}{2} \alpha \Delta \theta$
 $= \frac{1}{2} \times 12 \times 10^{-6} \times (40^\circ - 20^\circ) = 12 \times 10^{-5}$
 $\Delta t = t \times 12 \times 10^{-5} = 86400 \times 12 \times 10^{-5} = 10.3 \text{ s/day}$

30. (a) $T_1 = 2\pi \sqrt{\left(\frac{l_1}{g}\right)}, T_2 = 2\pi \sqrt{\left(\frac{l_2}{g}\right)} (l_1 > l_2)$

Let shorter pendulum makes n vibrations, then the longer will make one less than n to come in phase again.

$$\frac{nT_2}{2\pi} = (n-1) \frac{T_1}{2\pi}$$

$$2\pi \sqrt{\left(\frac{l_2}{g}\right)} n = (n-1) 2\pi \sqrt{\left(\frac{l_1}{g}\right)}$$

$$\therefore n = 11$$

31. (a) The block just loose the contact from the plank if acceleration of plank is just equal to g . (Vertically downward)

Since, block just loses contact, when the plank is momentarily at rest. Therefore, at that instant the plank is at its upper extreme position.

But at extreme position acceleration $= a\omega^2$

where, $a = 40 \text{ cm} = 0.4 \text{ m}$

Hence, $0.4\omega^2 = g = 10 \text{ m/s}^2$

$$\omega = 5 \text{ rad/s} \Rightarrow T = \frac{2\pi}{5} \text{ s}$$

32. (b) $d = R$ and $I = 2mR^2$

$$\therefore T = 2\pi \sqrt{\left(\frac{I}{mgd}\right)} = 2\pi \sqrt{\left(\frac{2mR^2}{mgR}\right)}$$

$$\Rightarrow T = 2\pi \sqrt{\left(\frac{2R}{g}\right)}$$

33. (a)

34. (c) At the vertex, tangential acceleration is zero. When particle is at mean position, it is at vertex. When it is displaced for small angle θ ,

$$-mf = mg \sin \theta$$

$$\text{or } f = -g \sin \theta = -g \theta \tan \theta$$

$$\text{or } f = -g \left(\frac{dy}{dx}\right)$$

$$\therefore x^2 = 4ay \text{ or } 2x = 4a \frac{dy}{dx}$$

$$\text{or } \frac{dy}{dx} = \frac{x}{2a} \therefore \tan \theta = \frac{x}{2a}$$

$$\therefore f = -g \left(\frac{x}{2a}\right)$$

$$\text{or } -\omega^2 x = -g \left(\frac{x}{2a}\right)$$

$$\therefore \omega = \sqrt{\left(\frac{g}{2a}\right)}$$

35. (d) Stress $= \frac{F}{L^2}, \eta = \frac{F}{L^2 \phi}$

$$F = L^2 \eta \phi$$

$$F = L^2 \eta \left(\frac{-x}{L}\right) \quad \left[\because \text{Strain} = \phi = -\frac{x}{L} \right]$$

$$F = (L\eta)(-x)$$

$$\Rightarrow ma = (L\eta)(-x)$$

$$a = \left(\frac{L\eta}{m}\right)(-x)$$

$$\therefore a \propto -\omega^2 x$$

$$\frac{L\eta}{m}(-x) = -\omega^2 x$$

$$\text{or } \omega = \sqrt{\left(\frac{L\eta}{m}\right)} \therefore T = 2\pi \sqrt{\left(\frac{m}{\eta L}\right)}$$

36. (a) $f = \frac{1}{2\pi} \sqrt{\left(\frac{BA^2}{MV_0}\right)}$

where, B = Bulk modulus of elasticity

$$T = 2\pi \sqrt{\left(\frac{MV_0}{BA^2}\right)}$$

$$= 2\pi \sqrt{\left(\frac{M(hA)}{pA^2}\right)}$$

$$T = 2\pi \sqrt{\left(\frac{Mh}{pA}\right)}$$

BITSAT Archives

1. (d) We know maximum acceleration, $a_{\max} = \omega^2 A = \frac{4\pi^2}{T^2} A$

$$= \frac{4\pi^2}{\left(\frac{\pi}{5}\right)^2} \times 0.3 = 30 \text{ m/s}^2$$

Maximum force, $F_{\max} = ma_{\max} = \frac{5}{1000} \times 30 = 0.15 \text{ N}$

2. (a) The beat frequency of heart is

$$v = \frac{75}{(1 \text{ min})} = \frac{75}{60 \text{ s}} = 1.25 = 1.25 \text{ Hz}$$

The time period of heart is

$$T = \frac{1}{v} = \frac{1}{1.25 \text{ s}^{-1}} = 0.8 \text{ s}$$

3. (d) $y = 5 (\sin 4\pi t + \sqrt{3} \cos 4\pi t)$

$$y = 5 (\sin 4\pi t + 5\sqrt{3} \cos 4\pi t)$$

$$A = \sqrt{A_1^2 + A_2^2}$$

$$A = \sqrt{(5)^2 + (5\sqrt{3})^2}$$

$$= \sqrt{25 + 75} = \sqrt{100} = 10$$

4. (b) Acceleration $|\alpha| = \omega^2 x$

or

$$\omega = \sqrt{\frac{\alpha}{x}}$$

$$= \sqrt{\frac{2}{0.002}} = 10 \text{ rad/s}$$

5. (c) The effective spring constant k_s of this arrangement is

$$\frac{1}{k_s} = \frac{1}{k} + \frac{1}{2k} \Rightarrow \frac{1}{k_s} = \frac{2+1}{2k} = \frac{3}{2k}$$

$$k_s = \frac{2k}{3}$$

The effective spring constant k_p of this arrangement is

$$k_p = k_1 + k_2 = k + 2k = 3k$$

$$\therefore \frac{k_s}{k_p} = \frac{2k/3}{3k} = \frac{2}{9}$$

6. (b) $y = 2 \sin\left(\frac{\pi t}{2} + \phi\right)$

Comparing the equation with the standard equation

$$y = A \sin(\omega t + \phi)$$

So $A = 2 \text{ cm}, \omega = \frac{\pi}{2}$

Acceleration of particle is

$$a = \omega^2 x$$

[numerically]

At $x = +A, a = a_{\max}$

$$\therefore a_{\max} = \omega^2 A = \left(\frac{\pi}{2}\right)^2 \times 2$$

$$= 2 \times \frac{\pi^2}{4} = \frac{\pi^2}{2} \text{ cm/s}^2$$

7. (b) This equation represented damped vibration.

8. (a) $T = 2\pi \sqrt{\frac{l_{\text{immersed}}}{g}}$

$$\Rightarrow T = 2\pi \sqrt{\frac{0.80}{9.8}} = \frac{4\pi}{7}$$

9. (b) In equilibrium,

$$T \cos \theta = ma + mg \sin \alpha$$

and

$$T \sin \theta = mg \cos \alpha$$

This gives, $\cot \theta = \frac{a + g \sin \alpha}{g \cos \alpha}$

$$= \frac{5 + 10 \times \left(\frac{1}{2}\right)}{10 \times \frac{\sqrt{3}}{2}} = \frac{2}{\sqrt{3}}$$

$$\therefore \theta = \cot^{-1}\left(\frac{2}{\sqrt{3}}\right)$$

10. (d) It is the least interval of time after which the periodic motion of a body repeats itself.

Therefore, displacement will be zero.

11. (a) Time period is independent of mass of bob of pendulum.

12. (d) The lift is moving with constant velocity, so there will be no change in the acceleration. Hence, time period will remain same.

11

Fluid Mechanics

Fluid Statics

The substances which flow are called fluids. Fluids include both liquids and gases. The science of fluids at rest is called **fluid statics**.

Pressure in a Fluid

Consider a point A inside the fluid (see figure alongside). Imagine a small area ΔS containing the point A . We define pressure of fluid at point A as

$$p = \lim_{\Delta S \rightarrow 0} \frac{F}{\Delta S}$$

where, p = pressure of fluid, F = force exerted by fluid

The SI unit of pressure is Nm^{-2} called pascal which is abbreviated as Pa. Common unit of pressure is 1 atmosphere (atm), i.e. the pressure exerted by the atmosphere at sea level.

$$1 \text{ atm} = 1.013 \times 10^5 \text{ Pa}$$

Other unit of pressure is torricelli's, 1 torr = 133 Pa

Another important property of fluid is its **density**, which is defined as the mass of fluid per unit volume occupied by it, i.e.

$$\text{Density of fluid} = \frac{\text{Mass of fluid}}{\text{Volume occupied by the fluid}}$$

It is denoted by ρ and its SI unit is kg/m^3 .

Relative density is defined as the ratio of the density of a substance to the density of water at 4°C , i.e.

$$\text{Relative density} = \frac{\text{Density of substance}}{\text{Density of water at } 4^\circ\text{C}}$$

Relative density has no unit and no dimension.

Pressure due to Fluid Column

Hydrostatic pressure at a point A depth h below the fluid surface is given by

$$p = h\rho g$$

where, ρ = density of fluid.

Gauge Pressure

The pressure difference between the real hydrostatic pressure and the atmospheric pressure is known as the gauge pressure.

∴ Gauge pressure

$$= \text{real pressure } (p) - \text{atmospheric pressure } (p_0)$$

Pascal's Law

This law can be defined as “if the pressure in a liquid is changed at a particular point, then this change is transmitted to the entire liquid without being diminished in magnitude”. Assuming liquid to be incompressible and non-viscous. This law has various interesting applications in the form of hydraulic machines such as hydraulic lift, hydraulic brakes etc.

Archimedes' Principle

Whenever a body is partly or wholly immersed in a fluid at rest, there is a decrease in its weight and this decrease in weight is equal to the weight of the fluid displaced by the immersed part of the body. In fact, when a body is immersed in a fluid, it experiences an upthrust due to the fluid and as a result the apparent weight of the body is reduced.

∴ Apparent weight of the body

= weight of the body – upthrust due to fluid

= weight of the body – weight of the fluid displaced

e.g. for a floating body, the volume of a body ($V - V_s$) remaining outside the liquid will be given by

$$V_0 = V - V_s = V - V \frac{\rho}{\sigma} = V \left(1 - \frac{\rho}{\sigma} \right)$$

Laws of Floatation

When a body of density ρ_B and volume V is immersed in a liquid of density σ , the forces acting on the body are

(i) The weight of body $w = mg = V\rho_B g$ acting vertically downwards through the centre of gravity of the body.

(ii) The upthrust $F = V\sigma g$ acting vertically upwards through the centre of gravity of the displaced liquid i.e. centre of buoyancy.

So, the following three cases are possible.

Case I The density of body is greater than that of liquid (i.e. $\rho_B > \sigma$). In this case, as weight will be more than upthrust, the body will sink.

Case II The density of body is equal to the density of liquid (i.e. $\rho_B = \sigma$). In this case, $w = F$, so the body will float fully submerged in neutral equilibrium anywhere in the liquid.

Case III The density of body is lesser than that of liquid (i.e. $\rho_B < \sigma$). In this case, $w < F$, so the body will move upwards and in equilibrium will float partially immersed in the liquid, such that

$$w = V_{in}\sigma g \quad [V_{in} \text{ is the volume of body in the liquid}]$$

$$\text{or} \quad V\rho_B g = V_{in}\sigma g \quad [\text{as } w = mg = \rho_B V g]$$

$$\text{or} \quad V\rho_B = V_{in}\sigma \quad \dots(i)$$

Equation of Continuity

Consider a streamline flow of a fluid through a tube of varying cross-section (see figure alongside).

Now, according to equation of continuity,

$$A_1 v_1 = A_2 v_2 \quad (\text{or } Av = \text{constant})$$

where, A_1 and A_2 are the cross-section areas and v_1 and v_2 are the velocities of the fluids at two section respectively.

Energy of a Flowing Fluid

There are three types of energies in a flowing liquid, which are defined below

Pressure Energy

If p is the pressure at the cross-section area A of a fluid and the fluid moves through a distance l against this pressure. Then, the pressure energy stored in fluid = $(pA) \times l = pAl$
Volume of liquid moved = Al

∴ Pressure energy (stored in fluid) per unit volume = p

Kinetic Energy

If any fluid element of mass m and volume V is flowing with velocity v , then

$$\therefore \text{KE per unit volume} = \frac{1}{2} \left(\frac{m}{V} \right) v^2 = \frac{1}{2} \rho v^2 \quad \left\{ \because \rho = \frac{m}{V} \right\}$$

Here, ρ is the density of the fluid.

Potential Energy

If a fluid element of mass m and volume V is at a height of h above the ground level (reference level), then the potential energy stored in fluid is mgh . So, potential energy per unit

$$\text{volume is given by} = \frac{mgh}{V} = \rho gh$$

Bernoulli's Theorem

Bernoulli's theorem is an outcome of the principle of conservation of energy, when applied to the flowing fluid. It states that “for a streamline flow of an ideal fluid (incompressible, non-viscous), the sum of

pressure energy per unit volume, kinetic energy per unit volume and potential energy per unit volume remains constant at every cross-section of the flow".

$$\text{i.e. } p + \rho gh + \frac{1}{2}\rho v^2 = \text{constant}$$

Applications of Bernoulli's Theorem

- The action of carburetor, paintgun, scent sprayer, atomiser is based on Bernoulli's equation.
- Action of Bunsen's burner, gas burner, oil stove is also based on it.
- Motion of spinning ball (Magnus effect) is based on Bernoulli's equation.
- Aerofoil or lift of aircraft wing is also based on it. When aerofoil moves against the wind, the flow of speed of air on top is more as compared to the speed of air below it, which results into an upward force providing lift to the aircraft.
- Torricelli's law and venturimeter are also based on this equation.

Limitations of Bernoulli's Theorem

- When a fluid is at rest, i.e. its velocity is zero everywhere, Bernoulli's equation becomes $p_1 + \rho gh_1 = p_2 + \rho gh_2 \Rightarrow (p_1 - p_2) = \rho g(h_2 - h_1)$
- Bernoulli's equation ideally applies to fluids with zero viscosity or non-viscous fluids.
- Bernoulli's equation applies to fluids which must be incompressible, as the elastic energy of the fluid is also not taken into consideration.
- Bernoulli's equation does not hold for steady or turbulent flows, because in that situation velocity and pressure are constantly fluctuating in time.

Torricelli's Law

This law states that "speed of liquid coming out through a hole at a depth h below the free surface of a tank is same as that of a particle fallen freely through height h under gravity". The speed of the liquid coming out is called the **speed of efflux**.

In the above figure, p_1, v_1, A_1 are the pressure, velocity and area of orifice at 1 and p_2, v_2, A_2 be pressure, velocity and area at 2 respectively.

Now, speed of efflux, $v_1 = \sqrt{2gh}$

$$\therefore \text{Volume of liquid coming out of orifice per second} \\ = A_1 v_1 = A_1 \sqrt{2gh}$$

The time of making empty a hemispherical tank through an orifice at its bottom. Initially, tank is full of water and finally tank is completely made empty.

$$T = 14\pi \frac{R^{5/2}}{15a\sqrt{2g}}$$

where, R = the radius of the hemispherical tank
 a = cross-sectional area of the orifice

Surface Tension

Each molecule (or atom) of liquid attracts the neighbouring molecule with the same force (called cohesive force). However, as every molecule is gathered by a number of molecules in every direction, the net effect on the molecule is zero (figure).

Now, if we consider a molecule on the surface of the liquid, as clear from the figure, the molecule would feel a net downward force due to which the free surface behaves like a stretched membrane under tension.

If we draw an imaginary line of a length l on the surface of the liquid, the net value of force acting on this line per unit length is called surface tension.

$$\text{Surface tension, } S = \frac{\text{Force}}{\text{Length}} \Rightarrow S = \frac{F}{L}$$

SI unit of surface tension (S or T) is Nm^{-1} and its dimensional formula is $[\text{MT}^{-2}]$. It is the characteristic of the two media in contact.

Applications of Surface Tension (Drop, Bubble)

As every system tends to have minimum potential energy, the surface of a liquid too tends to have minimum surface area. As, sphere has the minimum surface area for a given volume, drops and bubbles tend to have spherical shape.

If any other force such as gravitation, air resistance is absent, then the drops and bubbles would be perfect spheres.

Another interesting consequence of surface tension is that pressure inside a spherical drop or bubble is more than the pressure outside.

$$\text{Excess pressure for liquid drop } (\Delta p)_d = \frac{2S}{r}$$

$$\text{Excess pressure for soap bubble } (\Delta p)_b = \frac{4S}{r}$$

where, S is the surface tension of the liquid and r is the radius of drop and bubble.

Surface Energy

Surface energy of a liquid is the potential energy of the molecules of a surface film of the liquid by virtue of its position.

When the surface area of a liquid is increased, work is done against the cohesive force of molecules and this work is stored in the form of additional surface energy.

Increase in surface potential energy

$$\Delta U = \text{Work done } (\Delta W) = S \Delta A$$

where, ΔA is the increase in surface area of the liquid.

Angle of Contact

The angle of contact between a liquid and a solid is defined as the angle enclosed between the tangent to the liquid surface and the solid surface which is in contact with the liquid as shown in the figure given below.

(A) Acute angle

(B) Obtuse angle

The angle of contact varies between 0° to 180° .

For the liquids which wet the surface of solid (such as water and glass), the angle of contact is acute, while those for liquids which do not wet the surface of solid (such as mercury and glass), the angle of contact is obtuse.

Angle of contact decreases with the addition of impurities whereas it increases if temperature is increased.

Capillary Rise or Capillarity

Capillarity is the phenomenon of rise or fall of a liquid in a capillary tube as compared to that in a surrounding liquid.

The height h upto which a liquid will rise in a capillary tube

$$\text{is given by } h = \frac{2S \cos \theta}{r \rho g} = \frac{2S}{r \rho g}$$

where, r = radius of the capillary tube and

$$R = \frac{r}{\cos \theta} = \text{radius of liquid meniscus.}$$

(i) The rise in capillary tube $h \propto \frac{1}{r}$.

(ii) If a capillary tube, dipped in a liquid is tilted at an angle α from the vertical, the vertical height h of the liquid column remains the same. However, the length of the liquid column (l) in the capillary tube increases to

$$l = \frac{h}{\cos \alpha}$$

(iii) If the capillary tube is of insufficient length, the liquid rises upto the upper end of the tube and then the radius of its meniscus changes from R to R' such that $hR = h'R'$, where h' = insufficient length of the tube.

(iv) After connection due to the weight of liquid contained in the meniscus, the formula for the height is given by $h = \frac{2S}{\rho r g} - \frac{r}{3}$

Viscosity

Viscosity is the property of a fluid in motion, by virtue of which a force of resistance exists between the different layers of the fluid whenever there is relative motion between them.

When a fluid is flowing in a pipe or a tube, then the velocity of the liquid layer along the axis of the tube is maximum and decreases gradually as we move towards the walls, where it becomes zero.

The relative speed of the liquid layer (closest to boundary) is assumed to be zero.

Hence, due to viscosity, liquid flows in layers. This type of flow is called **laminar flow**.

Poiseuille's Formula

In case of steady flow of liquid of viscosity η in a capillary tube of length L and radius R under a pressure difference p across it, the volume of liquid flowing per second is given by

$$\frac{dQ}{dt} = \frac{\pi p R^4}{8 \eta L}$$

This is called poiseuille's formula.

Stokes' Law

Stokes proved that for a small spherical body of radius r moving with a constant speed v called terminal velocity through a fluid having coefficient of viscosity η , the viscous force F is given by $F = 6\pi\eta r v$. It is known as the **Stokes' law**.

Terminal Velocity

If a small spherical body is dropped in a fluid, then initially it is accelerated under the action of gravity. However, with an increase in speed, the viscous force increases and soon it balances the weight of the body. Now, the body moves with

a constant velocity, called the **terminal velocity**. Terminal velocity v_t is given by

$$v_t = \frac{2}{9} \frac{r^2(\rho - \sigma)g}{\eta}$$

where, r = radius of the falling body,
 ρ = density of the falling body and
 σ = density of the fluid.

Reynold's Number

Reynold defined a dimensionless number called Reynold's number (R_e), whose value gives an approximate idea whether the flow would be laminar or turbulent.

Flow is streamline, if $R_e < 2000$

Flow is turbulent, if $R_e > 3000$

Between 2000 to 3000, the flow is transient.

Practice Exercise

- The pressure at the bottom of a tank of liquid is not proportional to
 - the density of the liquid
 - the area of the liquid surface
 - the height of the liquid
 - the acceleration

- If a vessel containing a fluid of density ρ upto height h is accelerated vertically downwards with acceleration a_0 . Then, the pressure by fluid at the bottom of vessel is
 - $p = p_0 + \rho gh + \rho ha_0$
 - $p = p_0 + \rho gh$
 - $p = p_0 + \rho h(g - a_0)$
 - $p = p_0 - \rho gh$

- In each heart beat, a heart pumps 80 ml of blood at an average pressure of 100 mm of Hg. What will be the power output of the heart? (Assume 60 heart beat per minute)
 - 1 W
 - 2.75 W
 - 1.06 W
 - 0.5 W

- One end of a U-tube of uniform bore (area A) containing mercury is connected to a suction pump. Because of it the level of liquid of density ρ falls in one limb. When the pump is removed, the restoring force in the other limb is

- $2\rho Ag$
 - $x\rho g$
 - $A\rho g$
 - $x\rho Ag$
- A cylindrical vessel of radius r containing a liquid is rotating about a vertical axis through the centre of circular base. If the vessel is rotating with angular velocity ω , then what is the difference of the heights of liquid at centre of vessel and edge?
 - $\frac{r\omega}{2g}$
 - $\frac{r^2\omega^2}{2g}$
 - $\sqrt{2g r\omega}$
 - $\frac{\omega^2}{2gr^2}$

- If the weight of a body in vacuum is w and w_1 and w_2 are weights when it is immersed in a liquid of specific gravity ρ_1 and ρ_2 respectively, then find the relation among w , w_1 and w_2 .

$$\begin{aligned} \text{a. } w &= \frac{w_1\rho_2 + w_2\rho_1}{w_1 + w_2} & \text{b. } w &= \frac{w_1\rho_2 - w_2\rho_1}{\rho_2 - \rho_1} \\ \text{c. } w &= \frac{w_1\rho_1 + w_2\rho_2}{\rho_1 + \rho_2} & \text{d. } w &= \frac{w_1\rho_2 + w_2\rho_1}{\rho_1 + \rho_2} \end{aligned}$$

- A closed rectangular tank 10 m long, 5 m wide and 3 m deep is completely filled with an oil of specific gravity 0.92. Find the pressure difference between the rear and front corners of the tank, if its moving with an acceleration of 3 m/s^2 in the horizontal direction
 - 27.6 kPa
 - 50 kPa
 - 60 kPa
 - 70 kPa

- A U-tube having a liquid of density ρ is accelerated at $a \text{ m/s}^2$, so as to create be the height difference between two columns of $l/2$ (as shown in figure). If l is the length of the base of U-tube, the value of acceleration given to the system is

- 4.9 m/s^2
 - 9.8 m/s^2
 - 5.6 m/s^2
 - 6.4 m/s^2
- A body weighs 5 N in air and 2 N when immersed in a liquid. The buoyant force is
 - 2 N
 - 3 N
 - 5 N
 - 7 N
 - A neckless weighing 50 g in air, but it weight 46 g in water. Assume copper is mixed with gold to prepare the neckless. Find how much copper is present in it. (Specific gravity of gold is 20 and that of copper is 10)
 - $m = 25 \text{ g}$
 - $m = 30 \text{ g}$
 - $m = 35 \text{ g}$
 - $m = 20 \text{ g}$

11. If air of weight w is filled in a empty balloon which weights w_1 the weight of balloon will become w_2 . Suppose the density of air inside and out side the balloon is same, then
 - a. $w_2 = w_1 + w$
 - b. $w_2 = \sqrt{w_1 w}$
 - c. $w_2 = w_1$
 - d. $w_2 = w_1 - w$
12. A soft plastic bag of weight w_0 is filled with air at STP. Now, weight of the bag is w in air. Then,
 - a. $w > w_0$
 - b. $w = w_0$
 - c. $w \geq w_0$
 - d. $w < w_0$
13. A block of ice of area A and thickness 0.5 m is floating in the fresh water. In order to just support a man of 100 kg, the area A should be (specific gravity of ice 0.917 and density of water = 1000 kg/m³)
 - a. 124 m²
 - b. 4.21 m²
 - c. 2.41 m²
 - d. 7.23 m²
14. A piece of ice is floating in water. Find the fraction of volume of the piece of ice outside the water
(Given, density of ice = 900 kg/m³ and density of water = 1000 kg/m³)
 - a. 0.21
 - b. 0.01
 - c. 0.1
 - d. 0.9
15. A block of wood floats with 1/4 of its volume under water. What is the density of the wood? (Density of water = 1000 kg/m³)
 - a. 750 kg/m³
 - b. 250 kg/m³
 - c. 300 kg/m³
 - d. 260 kg/m³
16. A block weighs 15 N and 12 N in air and water respectively. When it is immersed in another liquid, it weights 13 N, then find the relative density of the block.
 - a. 5
 - b. 6
 - c. 10
 - d. 2
17. In English, the phrase 'tip of the iceberg' is used to mean a small visible fraction of something that is mostly hidden. For a real iceberg, what is this fraction, if the density of sea water is 1.03 g/cc and that of ice is 0.92 g/cc?
 - a. 0.106
 - b. 10.6
 - c. 0.901
 - d. 0.801
18. A vessel contains oil (density 0.8 g/cc) over mercury (density 13.6 g/cc). A homogeneous sphere floats with half its volume immersed in mercury and the other half in oil. The density of the material of the sphere in g/cc is
 - a. 3.3
 - b. 6.4
 - c. 7.2
 - d. 12.8
19. In a steady incompressible flow of a liquid
 - a. the speed does not change, if the area of cross-section changes
 - b. the speed increases, if the area of cross- section increases
 - c. the speed decreases, if the area of cross- section increases
 - d. bubbles are produced when the area of the cross-section increases

20. Water from a tap emerges vertically downward with an initial speed of 1 m/s. The cross-sectional area of the tap is 10⁻⁴ m². Assume that the pressure is constant throughout the stream of water and that the flow is steady. The cross-sectional area of the steam 0.15 m below the tap is
 - a. 5×10^{-4} m²
 - b. 1×10^{-5} m²
 - c. 5.83×10^{-5} m²
 - d. 2×10^{-5} m²

21. A tube of flow is shown in the figure.

- a. The fluid particles must be accelerated from A to B
 - b. Fluid particles may accelerate from A to B
 - c. The fluid particles must be decelerated from A to B
 - d. The fluid particles may be decelerated from B to A
22. A pipe GB is fitted with two pipes C and D as shown in the figure. The pipe has area $A = 24$ m² at G and velocity of water at G is 10 m/s, and at C is 6 m/s. The velocity of water at D is
 - a. 21 m/s
 - b. 3.3 m/s
 - c. 30 m/s
 - d. None of these

23. Bernoulli's equation is applicable to points
 - a. in a steadily flowing liquid
 - b. in a stream line
 - c. in a straight line perpendicular to stream line
 - d. in any non- viscous liquid
24. The horizontal flow of fluid depends upon
 - a. pressure difference
 - b. amount of fluid
 - c. density of fluid
 - d. All of the above
25. In steady horizontal flow,
 - a. the pressure is greatest where the speed is least
 - b. the pressure is independent of speed
 - c. the pressure is least where the speed is least
 - d. Both a and c are correct

26. From a horizontal tube with area of cross-section A_1 and A_2 as shown in figure, liquid is flowing with velocities v_1 and v_2 respectively. The difference in the level of the liquid in the two vertical tubes is h .

- a. The volume of the liquid flowing through the tube in time is $A_1 v_1$
 b. $v_2 - v_1 = \sqrt{2gh}$
 c. $v_2^2 - v_1^2 = 2gh$
 d. The energy per unit mass of the liquid is the same in both sections of the tube
27. A vessel is filled with water and kerosene oil. The vessel has a small hole in the bottom. Neglecting viscosity if the thickness of water layer is h_1 and kerosene layer is h_2 , then the velocity v of flow of water will be (density of water is ρ_1 g/cc and that of kerosene is ρ_2 g/cc)

a. $v = \sqrt{2g(h_1 + h_2)}$ b. $v = \sqrt{2g\left(h_1 + h_2 \frac{\rho_2}{\rho_1}\right)}$
 c. $v = \sqrt{2g(h_1 \rho_1 + h_2 \rho_2)}$ d. $v = \sqrt{2g\left(h_1 \frac{\rho_1}{\rho_2} + h_2\right)}$

28. Mark the correct option(s).
 a. two stream lines may cross each other
 b. two stream lines must cross each other
 c. two stream lines never cross each other
 d. None of the above
29. Water flows along a horizontal pipe whose cross-section is not constant. The pressure is 1 cm of Hg, where the velocity is 35 cm/s. At a point where the velocity is 65 cm/s, then pressure will be
 a. 0.89 cm of Hg b. 8.9 cm of Hg
 c. 0.5 cm of Hg d. 1 cm of Hg
30. A pilot tube was inserted in a pipe to measure the velocity of water in it. If the water rises in the tube is 200 mm. Find the velocity of water.
 a. 9.8 m/s b. 1.98 m/s c. 19.6 m/s d. 196 m/s

31. A cylindrical vessel filled with water to a height H . A vessel has two small holes in the side, from which water is rushing out horizontally and the two streams strike the ground at the same point. If the lower hole Q

Q is h height above the ground, then the height of hole P above the ground will be

- a. $2h$ b. $\frac{H}{h}$
 c. $H - h$ d. $\frac{H}{2}$
32. A liquid having area of free surface A and has an orifice at a depth of h with an area a , below the liquid surface, then find the velocity v of flow through the orifice.
 a. $v = \sqrt{2gh}$ b. $v = \sqrt{2gh} \sqrt{\frac{A^2}{A^2 - a^2}}$
 c. $v = \sqrt{2gh} \sqrt{\frac{A}{A - a}}$ d. $v = \sqrt{2gh} \sqrt{\frac{A^2 - a^2}{A^2}}$
33. A capillary tube of area of cross-section A is dipped in water vertically. Calculate the amount of heat evolved as the water rises in the capillary tube upto height h . The density of water is ρ
 a. $\frac{A\rho gh^2}{2}$ b. $Agh^2\rho$
 c. $2Agh^2\rho$ d. None of these
34. The radius of the biggest metal coin of thickness t and density ρ , which would be able to float on water surface of surface tension S , is
 a. $\frac{S}{2\rho gt}$ b. $\frac{S}{\rho gt}$
 c. $\frac{2S}{\rho gt}$ d. $\frac{4S}{3\rho gt}$
35. An open glass tube is immersed in mercury in such a way that a length of 8 cm extends above the mercury level. The open end of the tube is then closed and sealed and the tube is raised vertically up by additional 46 cm. What will be length of the air column above mercury in the tube now? (Atmospheric pressure = 76 cm of Hg)
 a. 38 cm b. 6 cm
 c. 16 cm d. 22 cm
36. While measuring surface tension of water using capillary rise method, height of the lower meniscus from free surface of water is 3 cm, while inner radius of capillary tube is found to be 0.5 cm. Then, compute tension of water using this data. [Take, contact angle between glass and water as 0 and $g = 9.81 \text{ m/s}^2$]
 a. 0.72 N/m
 b. 0.77 N/m
 c. 1.67 N/m
 d. None of the above
37. To what depth must a rubber ball be taken in deep sea so that its volume is decreased by 0.1%. (The bulk modulus of rubber is $9.8 \times 10^8 \text{ N/m}^2$, and the density of sea water is 10^3 kg/m^3)
 a. 100 m b. 60 m c. 75 m d. 65 m

38. A wooden block of mass m and density ρ is tied to a string, the other end of the string is fixed to the bottom of a tank. The tank is filled with a liquid of density σ with $\sigma > \rho$. The tension in the string will be
- $\left(\frac{\sigma - \rho}{\sigma}\right) mg$
 - $\left(\frac{\sigma - \rho}{\rho}\right) mg$
 - $\frac{\rho mg}{\sigma}$
 - $\frac{\sigma mg}{\rho}$
39. Assume that a drop of liquid evaporates by decrease in its surface energy, so that its temperature remains unchanged. What should be the minimum radius of the drop for this to be possible? The surface tension is T , density of liquid is ρ and L is its latent heat of vaporisation.
- $\rho L/T$
 - $\sqrt{T/\rho L}$
 - $T/\rho L$
 - $2T/\rho L$
40. Water is flowing continuously from a tap having an internal diameter 8×10^{-3} m. The water velocity as it leaves the tap is 0.4 ms^{-1} . The diameter of the water stream at a distance 2×10^{-1} m below the tap is close to
- 7.5×10^{-3} m
 - 9.6×10^{-3} m
 - 3.6×10^{-3} m
 - 5.0×10^{-3} m
41. In an experiment a capillary tube is kept vertical, then water rises up in the tube upto 3 mm height. When the tube is tilted at an angle of 60° with vertical, what should be the height of water rise
- 6 mm
 - 4 mm
 - 3 mm
 - None of these
42. Calculate for the rise of water in a capillary tube when kept vertical in water whose radii is $1/4$ th of that capillary tube which when kept vertical water rise in it upto a height of 3 mm.
- 12 mm
 - 10 mm
 - 4 mm
 - 3 mm
43. Calculate the heat evolved for the rise of water when one end of the capillary tube of radius r is immersed vertically into water. Assume surface tension = T and density of water to be ρ .
- $\frac{2\pi T}{\rho g}$
 - $\frac{\pi T^2}{\rho g}$
 - $\frac{2\pi T^2}{\rho g}$
 - None of these
44. In a liquid there is air bubble of radius 1 mm at a depth 10 cm below the free space. The surface tension of liquid 0.075 N/m and density is 1000 kg/m^3 . By what amount is the pressure inside the bubble greater than the atmospheric pressure?
- 1130 pascal
 - 1200 pascal
 - 1100 pascal
 - 1000 pascal
45. Calculate the work done by a boy in making a soap bubble of diameter 1.4 cm by blowing, if the surface tension of soap solution is 0.03 N/m .
- $3 \times 10^{-5} \text{ J}$
 - $3.696 \times 10^{-5} \text{ J}$
 - $2 \times 10^{-5} \text{ J}$
 - $4.2 \times 10^{-5} \text{ J}$
46. A drop of radius r is broken into n equal drops. Calculate the work done if surface tension of water is T .
- $4\pi R^2 n T$
 - $4\pi R^2 T (n^{2/3} - 1)$
 - $4\pi R^2 T (n^{1/3} - 1)$
 - None of the above
47. What will happen if n drops of a liquid each has surface energy E , combine to form a single drop.
- No energy will be released in the process
 - Some energy will be absorbed in the process
 - Energy released or absorbed will be $E(n - n^{2/3})$
 - Energy released or absorbed will be $nE(2^{2/3} - 1)$
48. If a bigger drop of liquid at temperature t , breaks up into number of small droplets, then what is temperature of the droplets? (Assume, bigger drop is isolated from its surroundings)
- Equal to t
 - Greater than t
 - Less than t
 - Either (a), (b) and (c) depending on surface tension of liquid
49. The excess pressure inside a soap bubble of radius 4 cm is 30 dyne/cm^2 . The surface tension is
- 30 dyne/cm
 - 20 dyne/cm
 - 40 dyne/cm
 - 80 dyne/cm
50. Calculate the work done against surface tension in formation of a drop of mercury of radius 4 cm (surface tension for mercury = 465 dyne/cm)
- $9.34 \times 10^{-3} \text{ J}$
 - $10 \times 10^{-2} \text{ J}$
 - $4 \times 10^{-3} \text{ J}$
 - 466 J
51. Calculate the energy required to increase the radius of a soap bubble from 1 cm to 2 cm (The surface tension is 30 dyne/cm).
- $240 \pi \text{ erg}$
 - $720 \pi \text{ erg}$
 - $480 \pi \text{ erg}$
 - None of these
52. A film of a liquid is held on a circular ring of radius r , if the surface tension of the liquid is T . The surface tension of the liquid is
- $\pi r^2 T$
 - $2\pi r^2 T$
 - $4\pi r^2 T$
 - None of these
53. A small uniform tube is bent into a circle of radius r whose plane is vertical. The equal volumes of two fluids whose densities are ρ and σ ($\rho > \sigma$), fill half the circle. Find the angle that the radius passing through the interface makes with the vertical.
- $\cot \theta = \frac{\rho - \sigma}{\rho + \sigma}$
 - $\tan \theta = \frac{\rho - \sigma}{\rho + \sigma}$
 - $\sin \theta = \frac{\rho + \sigma}{\rho - \sigma}$
 - $\sin \theta = \frac{\rho}{\sigma}$

54. A liquid drop of radius R breaks into N smaller droplets of radii r . If liquid has density ρ , specific heat s and surface tension T , then the drop in temperature is given by
- $\frac{NT}{\rho s} \left(\frac{1}{R} - \frac{1}{r} \right)$
 - $\frac{NT}{\rho s} \left(\frac{R}{r} - 1 \right)$
 - $\frac{3T}{4\rho s} \left(\frac{1}{R} - \frac{1}{r} \right)$
 - $\frac{3T}{\rho s} \left(\frac{1}{R} - \frac{1}{r} \right)$
55. A body of density ρ is dropped from height h into a liquid having density σ ($\sigma > \rho$). If the body just touches the base of the container, then the distance of fallen would be proportional to (Neglect viscous forces)
- $\frac{h}{\sigma - \rho}$
 - $\frac{h}{\sigma + \rho}$
 - $h \times (\sigma - \rho)$
 - $\frac{h\rho}{\sigma - \rho}$
56. A block of mass m and density ρ is hanging from a string. If it is lowered into a vessel of cross-sectional area A containing a liquid of density σ ($\sigma < \rho$) and gets fully immersed, the increase in pressure at the bottom of vessel would be
- $\frac{m\rho g}{\sigma A}$
 - $\frac{m\sigma g}{\rho A}$
 - $\frac{mg}{A}$
 - zero
57. A solid sphere falls with a terminal velocity of 32 m/s in air. If it is allowed to fall in vacuum, then
- the terminal velocity will be 32 m/s
 - the terminal velocity will be less than 32 m/s
 - the terminal velocity will be greater than 32 m/s
 - there will be no terminal velocity
58. Find the common radius of curvature r when two soap bubbles with radii r_1 and r_2 ($r_1 > r_2$) come in contact
- $r = \frac{r_1 + r_2}{2}$
 - $r = \frac{r_1 r_2}{r_1 - r_2}$
 - $r = \frac{r_1 r_2}{r_1 + r_2}$
 - $r = \sqrt{r_1 r_2}$
59. Water is flowing in a river. If the velocity of a layer at a distance 10 cm from the bottom is 20 cm/s. Find the velocity of layer at a height of 40 cm from the bottom.
- 10 m/s
 - 20 cm/s
 - 30 cm/s
 - 80 cm/s
60. A horizontal plate (10 cm $\times$ 10 cm) moves on a layer of oil of thickness 4 mm with a constant speed of 10 cm/s. The coefficient of viscosity of oil is 4 poise. The tangential force applied on the plate to maintain the constant speed of the plate is
- 10^3 dyne
 - 10^4 dyne
 - 10^5 dyne
 - None of these
61. A liquid is flowing through a narrow tube. The coefficient of viscosity of liquid is 0.1308 poise. The length and inner radius of tube are 50 cm and 1 mm respectively. The rate of flow of liquid is 360 cm³/min. Find the pressure difference between ends of tube.
- 10^6 dyne/cm²
 - 10^4 dyne/cm²
 - 10 dyne/cm²
 - None of the above
62. Find the terminal velocity of solid sphere of radius 0.1 m moving in air in vertically downward direction. ($\eta = 18 \times 10^{-5}$ Ns/m², density of sphere = 1000 kg/m³ and $g = 10$ m/s²)
- 2 m/s
 - 1.2 cm/s
 - 4 cm/s
 - None of these
63. Eight equal drops of water each of radius $r = 2$ mm are falling through air with a terminal velocity of 16 cm/s. The eight drops combine to form a big drop. Calculate the terminal velocity of big drop.
- 16 cm/s
 - 32 cm/s
 - 64 cm/s
 - None of these
64. At 20°C, to attain the terminal velocity how fast will an aluminium sphere of radii 1 mm fall through water. Assume flow to be laminar flow and specific gravity (Al) = 2.7, $\eta_{\text{water}} = 8 \times 10^{-4}$ Pa.
- 5 m/s
 - 4.6 m/s
 - 4 m/s
 - 2 m/s

BITSAT Archives

- The work done in blowing a soap bubble of surface tension 0.06 Nm^{-1} from 2 cm radius to 5 cm radius is
 - 0.004168 J
 - 0.003168 J
 - 0.003158 J
 - 0.004568 J
 [2014]
- A ball whose density is $0.4 \times 10^3 \text{ kg/m}^3$ falls into water from a height of 9 cm. To what depth does the ball sink?
 - 9 cm
 - 6 cm
 - 4.5 cm
 - 2.25 cm
 [2013]
- The relative humidity on a day when partial pressure of water vapour is $0.012 \times 10^6 \text{ Pa}$ at 12°C is (Take, vapour pressure of water at this temperature as $0.016 \times 10^5 \text{ Pa}$)
 - 70%
 - 40%
 - 75%
 - 25%
 [2013]
- In the absence of intermolecular forces of attraction, the observed pressure p will be
 - remain same
 - decrease
 - increase
 - zero
 [2013]

5. 10000 small balls, each weighting 1g, strike one square centimetre of area per second with a velocity 100 m/s in a normal directions and rebound with the same velocity. The value of pressure on the surface will be [2013]
 a. $2 \times 10^{10} \text{ N/m}^2$ b. $2 \times 10^5 \text{ N/m}^2$
 c. 10^7 N/m^2 d. $2 \times 10^7 \text{ N/m}^2$
6. At a given place where acceleration due to gravity is $g \text{ m/s}^2$, a sphere of lead of density $d \text{ kg/m}^3$ is gently released in a column of liquid of density $\rho \text{ kg/m}^3$. If $d > \rho$, the sphere will [2013]
 a. fall vertically with an acceleration $g \text{ m/s}^2$
 b. fall vertically with no acceleration
 c. fall vertically with an acceleration $g \left(\frac{d - \rho}{d} \right)$
 d. fall vertically with an acceleration $g \left(\frac{\rho}{d} \right)$
7. Motion of a fluid in a tube is best described by [2011]
 a. Bernoulli's theorem b. Poiseuille's principle
 c. Archimedes' principle d. Stokes' law
8. The velocity of efflux of a liquid through an orific in the bottom of the tank does not depend upon [2011]
 a. size of orifice
 b. height of liquid
 c. acceleration due to gravity
 d. density of liquid
9. Density of sea water is 1.03 g/cc^{-1} . A ship passes from fresh water into sea water. It will [2010]
 a. rise
 b. sink
 c. remain at the same depth
 d. rise or sink depending on its shape and size
10. Water is flowing through a tube of non-uniform cross-section. If the radii of the tube at the entrance and the exit are in the ratio 3 : 2, then the ratio of the velocities of flow of water at the entrance and the exit is [2010]
 a. 9 : 4 b. 4 : 9
 c. 8 : 27 d. 27 : 8
11. A liquid X of density 3.36 g/cm^3 is poured in a U-tube, which contains Hg. Another liquid Y is poured in left arm with height 8 cm, upper levels of X and Y are same. What is density of Y? [2010]
 a. 0.8 g/cc b. 1.2 g/cc
 c. 1.4 g/cc d. 1.6 g/cc
12. The surface tension of soap solution is 0.03 N/m . The work done in blowing to form a soap bubble of surface area 40 cm^2 , (in J), is [2008]
 a. 12×10^{-4} b. 2.4×10^{-4}
 c. 12×10^{-4} d. 24×10^{-4}
13. Two rain drops reach the earth with different terminal velocities having ratio 9 : 4. Then, the ratio of their volumes is [2008]
 a. 3 : 2 b. 4 : 9
 c. 9 : 4 d. 27 : 8
14. Water falls from a tap down the streamline, [2006]
 a. area decreases
 b. area increases
 c. velocity remains same
 d. area remains same
15. If a liquid does not wet glass, its angle of contact is [2005]
 a. zero b. acute
 c. obtuse d. right angle

Answer with Solutions

Practice Exercise

1. (b)
 2. (c) Here, effected gravitational acceleration is

$$\therefore \begin{aligned} g' &= g - a_0 \\ p &= p_0 + \rho g' h = p_0 + \rho(g - a_0)h \end{aligned}$$

3. (c) Work done by the heart = $p dV$

$$dV = (60) \times (80 \times 10^{-6} \text{ m}^3)$$

$$p = (100 \text{ mm of Hg}) \times \frac{101 \times 10^5 \text{ Pa}}{760 \text{ mm of Hg}}$$

$$= 1.33 \times 10^4 \text{ Pa}$$

$$\text{Power} = \frac{\text{Work done}}{\text{Time}}$$

$$= \frac{1.33 \times 10^4 \text{ Pa} \times 60 \times 80 \times 10^{-6} \text{ m}^3}{60 \text{ s}}$$

$$\text{Power} = 1.06 \text{ W}$$

4. (a) $\therefore$ The force due to excess pressure = restoring force
 or $pghA = \text{restoring force}$
 or $pg(2x)A = \text{restoring force}$
 $\therefore$ Restoring force = $2pg \times A$

27. (b) Net pressure = $h_1 \rho_1 g + h_2 \rho_2 g$

According to Bernoulli's theorem, this pressure energy will be converted into KE, while flowing through the hole is

$$h_1 \rho_1 g + h_2 \rho_2 g = \frac{1}{2} \rho v^2$$

$$v = \sqrt{2g \left(h_1 + h_2 \frac{\rho_2}{\rho_1} \right)}$$

28. (c) If two stream lines cross each other, then at a given point, there are two directions of motion of fluid particles. This is physically not possible.

Hence, (c) is correct,

29. (a) In horizontal pipe,

$$p_1 + \frac{1}{2} \rho v_1^2 = p_2 + \frac{1}{2} \rho v_2^2 \quad \dots(i)$$

Here,

$$p_1 = \rho_m g h_1 = 13600 \times 9.8 \times 10^{-2}$$

$$p_2 = 13600 \times 9.8 \times h$$

$$\rho = 1000 \text{ kg/m}^3$$

$$v_1 = 35 \times 10^{-2} \text{ m/s}$$

$$v_2 = 65 \times 10^{-2} \text{ m/s}$$

$\therefore$ From Eq. (i), we get

$$13600 \times 9.8 \times 10^{-2} + \frac{1}{2} \times 1000 \times (0.35)^2$$

$$= 13600 \times 9.8 \times h + \frac{1}{2} \times 1000 \times (0.65)^2$$

After solving, 0.89 cm of Hg.

30. (b) $\frac{1}{2} \rho v^2 = \rho g h$

$$v = \sqrt{2gh} = \sqrt{2 \times 9.8 \times 200 \times 10^{-3}} = 1.98 \text{ m/s}$$

31. (c)

32. (a) Applying Bernoulli's theorem,

$$\frac{p}{\rho} + \frac{1}{2} (v')^2 + gh = \frac{p}{\rho} + \frac{1}{2} v^2 + 0$$

where, v' is velocity of all surfaces of liquid and v is velocity of efflux.

From equation of continuity

$$Av' = av \Rightarrow v' = \frac{av}{A}$$

$$\frac{1}{2} \left(\frac{av}{A} \right)^2 + gh = \frac{1}{2} v^2$$

$$v = \sqrt{2gh} \sqrt{\left(\frac{A^2 - a^2}{A^2} \right)}$$

33. (a) Heat evolved = Potential energy of water

$$= \frac{mgh}{2} = \frac{\rho Ah gh}{2} = \frac{\rho Ah^2 g}{2}$$

34. (c) For the biggest coin, the force due to surface tension shall be vertical (i.e. $\theta = 0$)
 $\therefore$ Upward force exerted on the coin at the verge of its sinking

$$F = (S) \times (2\pi r) \quad (r = \text{radius of coin})$$

Now,

$$F = \text{weight of coin}$$

$$\therefore S \times 2\pi r = \pi t^2 \tau \times \rho g \Rightarrow r = \frac{2S}{\rho g t}$$

35. (c) Assuming, temperature remains same.

Hence, we can write $p_1 V_1 = p_2 V_2$

$$\Rightarrow p_1 l_1 = p_2 l_2 \Rightarrow (76)(8) = (54 - x)(76 - x)$$

$$\Rightarrow x = 38 \text{ cm}$$

Length of air column = $54 - 38 = 16 \text{ cm}$

$$r \left(h + \frac{r}{3} \right) \rho g$$

36. (b) As, $T = \frac{r \left(h + \frac{r}{3} \right) \rho g}{2 \cos \theta}$

$$= \frac{0.5 \times 10^{-2} \left[3 + \frac{0.5}{3} \right] \times 10^{-2} \times 10^3 \times 9.81}{2} = 0.77 \text{ N/m}$$

37. (a)

38. (b) From free body diagram of the wooden block,

$$V\sigma g = mg + T \quad [V \text{ is the volume of block}]$$

$$T = V\sigma g - mg$$

$$T = \frac{m}{\rho} \sigma g - mg = mg \left(\frac{\sigma - \rho}{\rho} \right)$$

39. (a) When radius is decreased by
- dr
- .

Decrease in surface energy = Heat required for vaporisation $(4\pi r dr) \times T \times 2 = 4\pi r^2 dp$

$$\Rightarrow r = \frac{2T}{\rho L}$$

40. (c) From Bernoulli's theorem,
- $\rho gh = \frac{1}{2} \rho (v_2^2 - v_1^2)$

$$\Rightarrow gh = \frac{1}{2} v_1^2 \left[\left(\frac{v_2}{v_1} \right)^2 - 1 \right] = \frac{1}{2} v_1^2 \left[\left(\frac{A_1}{A_2} \right)^2 - 1 \right]$$

($\because A_1 v_1 = A_2 v_2$)

$$\Rightarrow \left(\frac{A_1}{A_2} \right)^2 = 1 + \frac{2gh}{v_1^2}$$

$$\Rightarrow \left(\frac{D_1^2}{D_2^2} \right)^2 = 1 + \frac{2gh}{v_1^2}$$

$$\Rightarrow D_2 = \frac{D_1}{\left(1 + \frac{2gh}{v_1^2} \right)^{1/4}} = \frac{8 \times 10^{-3}}{\left(1 + \frac{2 \times 10 \times 0.2}{(0.4)^2} \right)^{1/4}} = 3.6 \times 10^{-3} \text{ m}$$

41. (a) Since, the atmospheric pressure and temperature are same.

$$\therefore h_2 = \frac{h_1}{\cos 60^\circ} = \frac{3}{1/2} = 6 \text{ mm}$$

42. (a)
- $h = \frac{2S \cos \theta}{\rho g}$

$$\Rightarrow hr = \frac{2S \cos \theta}{\rho g}$$

For both experiment S, θ, ρ, g are same

$$hr = \frac{2S \cos \theta}{\rho g} = \text{constant}$$

$$h_1 r_1 = h_2 r_2$$

$$h_2 = \left(\frac{r_1}{r_2} \right) 3 = 12 \text{ mm}$$

43. (c) Water rise to height
- $h = \frac{2T}{\rho g r}$

$$\text{Potential energy of water column } U = \frac{mgh}{2} = \frac{2\pi T^2}{\rho g}$$

The work performed by force of surface tension is

$$W = 2\pi r T h = \frac{4\pi T^2}{\rho g}$$

From conservation of energy, the heat evolved

$$Q = W - U = \frac{2\pi T^2}{\rho g}$$

44. (a) Let atmospheric pressure is
- p_0
- .

Pressure of liquid just outside the bubble is

$$p = p_0 + h \rho g$$

Pressure of liquid inside the bubble

$$p' = p + \frac{2T}{r} = p_0 + h \rho g + \frac{2T}{r}$$

$$p' - p_0 = \frac{1}{10} \times 1000 \times 9.8 + \frac{2 \times 0.075}{1 \times 10^{-3}}$$

$$p' - p_0 = 1130 \text{ Pa}$$

45. (b) Initial area of soap bubble = 0

Soap bubble has two surfaces internal and external.

Increase in surface area = $\Delta A = 2 \times 4\pi r^2$

$$= 2 \times 4 \times \frac{22}{7} \times (0.7 \times 10^{-2})^2$$

$$= 12.32 \times 10^{-4} \text{ m}^2$$

Work done = $W = S \Delta A$

$$= 0.03 \times 12.32 \times 10^{-4}$$

$$= 3.696 \times 10^{-5} \text{ J}$$

46. (c) The volume of
- n
- smaller drop = volume of bigger drop

$$\therefore n \frac{4}{3} \pi r^3 = \frac{4}{3} \pi R^3$$

$$\therefore R = n^{1/3} r$$

$$\therefore r = \frac{R}{n^{1/3}}$$

Here, R = radius of bigger drop r = radius of smaller drop

$$\therefore W = 4\pi(nr^2 - R^2)T$$

$$= 4\pi \left[n \left(\frac{R}{n^{1/3}} \right)^2 - R^2 \right] T = 4\pi \left[\frac{nR^2}{n^{2/3}} - R^2 \right] T$$

$$= 4\pi R^2 (n^{1-2/3} - 1) T = 4\pi R^2 T (n^{1/3} - 1)$$

47. (c) Let radius of small drop =
- r

Radius of single drop = R Surface tension S = surface energy per unit area

$$n \times \frac{4}{3} \pi r^3 = \frac{4}{3} \pi R^3$$

$$R = n^{1/3} r$$

Initial surface energy = $E_i = n \times 4\pi r^2 \times S = nE$ Final surface energy = $E_f = 4\pi R^2 S$

$$= 4\pi r^2 n^{2/3} S = n^{2/3} E$$

$$\text{Energy released} = E_i - E_f = E(n - n^{2/3})$$

48. (c) 49. (a) 50. (a) 51. (b)

52. (b)

53. (b) Taking torque about the point
- O
- .

$$\therefore \rho V r \sin(45^\circ - \theta) g = \sigma V r \sin(45^\circ + \theta) g$$

$$\tan \theta = \frac{\rho - \sigma}{\rho + \sigma}$$

54. (d) Volume will remain same, hence we can write

$$\frac{4}{3}\pi R^3 = N \times \frac{4}{3}\pi r^3 \Rightarrow N = \frac{R^3}{r^3}$$

Increase in surface energy due to breaking of drop into N droplets,

$$\Delta U = 4\pi T(R^2 - Nr^2)$$

As this energy is provided at the cost of lowering of temperature by $\Delta\theta$

$$ms\Delta\theta = \Delta U$$

$$\Delta\theta = \frac{\Delta U}{ms} = \frac{4\pi T(R^2 - Nr^2)}{\left(\frac{4}{3}\pi R^3 \rho\right)s}$$

$$\Rightarrow \Delta\theta = \frac{3T}{\rho s} \left(\frac{1}{R} - \frac{r^2}{R^3} N \right) = \frac{3T}{\rho s} \left(\frac{1}{R} - \frac{1}{r} \right) \quad \left(\because N = \frac{R^3}{r^3} \right)$$

55. (a) Buoyant force, $F \propto (\sigma - \rho)$

$$\therefore \text{Deceleration} \propto (\sigma - \rho) \Rightarrow a = -k(\sigma - \rho)$$

Now, as initial velocity, $u = \sqrt{2gh}$

and final velocity, $v = 0$

Distance fallen by the body,

$$s = \frac{2gh}{2 \times k(\sigma - \rho)} \quad \left[\because s = \frac{u^2}{2a} \right]$$

$$\Rightarrow s \propto \frac{h}{\sigma - \rho}$$

56. (b) Volume of block = $\frac{m}{\rho}$

$$\therefore \text{Buoyant force on block} = \text{Volume} \times \text{Density of liquid} \times g$$

$$= \frac{m}{\rho} \times \sigma \times g$$

By Newton's third law of motion, force exerted by block on liquid surface = $\frac{m\sigma g}{\rho A}$

$$\therefore \text{Increase in pressure} = \frac{m\sigma g}{\rho A}$$

57. (d)

58. (b) Let p_0 = atmosphere pressure

p_1 and p_2 are pressure difference across the common surface.

Let r = radius of curvature of the common surface.

$$p_2 - p_1 = \frac{4S}{r}$$

$$\frac{4S}{r} = \frac{4S}{r_2} - \frac{4S}{r_1} \quad (S = \text{surface tension})$$

$$\frac{1}{r} = \frac{1}{r_2} - \frac{1}{r_1} \Rightarrow r = \frac{r_1 r_2}{r_1 - r_2}$$

59. (d) $\therefore F = -\eta A \frac{dv}{dx}$

$$\therefore F \propto \frac{dv}{dx} \text{ or } F \propto \frac{\Delta v}{\Delta x}$$

$$F \propto \frac{v}{x} \text{ or } x \propto \frac{v}{F}$$

But F is constant,

$$\therefore x \propto v$$

$$\frac{v_2}{v_1} = \frac{x_2}{x_1} \text{ or } \frac{v_2}{20} = \frac{40}{10}$$

$$\therefore v_2 = 80 \text{ cm/s}$$

60. (b)

61. (a)

62. (b)

63. (c)

64. (b)

BITSAT Archives

1. (b) As given, $s = 0.06 \text{ Nm}^{-1}$,

$$r_1 = 2 \text{ cm} = 0.02 \text{ m}, r_2 = 5 \text{ cm} = 0.05 \text{ m}$$

Since, bubble has two surface

$$\text{Initial surface area of the bubble} = 2 \times 4\pi r_1^2$$

$$= 2 \times 4\pi \times (0.02)^2$$

$$= 32\pi \times 10^{-4} \text{ m}^2$$

$$\text{Final surface area of the bubble} = 2 \times 4\pi r_2^2$$

$$= 2 \times 4 \times \pi \times (0.05)^2$$

$$= 200 \times \pi \times 10^{-4} \text{ m}^2$$

So, work done = $s \times \text{increase in surface}$

$$= 0.06 \times (200\pi \times 10^{-4} - 32\pi \times 10^{-4})$$

$$= 0.06 \times 168\pi \times 10^{-4}$$

$$= 0.003168 \text{ J}$$

2. (b) The velocity of ball before entering the water surface

$$v = \sqrt{2gh} = \sqrt{2g \times 9}$$

When ball enters into water, due to upthrust of water, the velocity of ball decreases (or retarded)

The retardation,

$$a = \frac{\text{apparent weight}}{\text{mass of ball}}$$

$$= \frac{V(\rho - \sigma)g}{V\rho} = \frac{(\rho - \sigma)g}{\rho}$$

$$= \left(\frac{0.4 - 1}{0.4} \right) g = -\frac{3}{2}g$$

If h be the depth upto which ball sink, then

$$0 - v^2 = 2 \times \left(-\frac{3}{2}g \right) \times h$$

$$\Rightarrow 2g \times 9 = 3gh$$

$$\therefore h = 6 \text{ cm}$$

3. (c) Relative humidity at a given temperature (R)

$$= \frac{\text{partial pressure of water pressure}}{\text{vapour pressure of water}}$$

$$= \frac{0.012 \times 10^5}{0.016 \times 10^5}$$

$$= 0.75 = 75\%$$

4. (c) In the absence of intermolecular forces, there will be no stickiness of molecules. Hence, pressure will increase.

$$5. (d) p = \frac{F}{A} = \frac{n\{mv - (-mv)\}}{A} = \frac{2mnv}{A}$$

$$= \frac{2 \times 10^{-3} \times 10^4 \times 10^2}{10^{-4}} = 2 \times 10^7 \text{ N/m}^2$$

6. (c) Apparent weight = actual weight – upthrust

$$Vdg' = Vdg - V\rho g$$

$$\Rightarrow g' = \left(\frac{d - \rho}{d} \right) g$$

7. (a) Bernoulli's theorem is applicable only for tube flow of non-uniform cross-section.

8. (a) v = velocity of efflux through an orifice

$$= \sqrt{2gH}$$

It is independent of the size of orifice.

9. (a) Fresh water has lesser density as compared to sea water. So, upthrust in sea water will be more as compared to fresh water.

10. (b) From equation of continuity

$$A_1 v_1 = A_2 v_2$$

$$\Rightarrow \pi r_1^2 v_1 = \pi r_2^2 v_2$$

$$\Rightarrow \frac{v_1}{v_2} = \frac{r_2^2}{r_1^2} = \frac{4}{9}$$

11. (a) As shown in figure, in the two arms of a tube pressure remains same on surface PP' . Hence,

$$8 \times \rho_y \times g + 2\rho_{\text{Hg}} \times g = 10 \times \rho_x \times g$$

$$8\rho_y = 2 \times 13.6 = 10 \times 3.36$$

or

$$\rho_y = \frac{39.6 - 27.2}{8}$$

$$= 0.8 \text{ g/cc}$$

12. (b) In case of soap bubble,

$$W = T \times 2 \times \Delta A$$

$$= 0.03 \times 2 \times 40 \times 10^{-4}$$

$$= 2.4 \times 10^{-4} \text{ J}$$

13. (d) Terminal velocity, $v_T \propto r^2$

or

$$\frac{v_{T1}}{v_{T2}} = \frac{r_1^2}{r_2^2}$$

$$\therefore \sqrt{\frac{9}{4}} = \frac{r_1}{r_2} \text{ or } \frac{r_1}{r_2} = \frac{3}{2}$$

$$\therefore V = \frac{4}{3} \pi r^3 \text{ or } \frac{V_1}{V_2} = \frac{r_1^3}{r_2^3} = \frac{27}{8}$$

14. (b) If water falls from a tap down the streamline, then its area increases.

15. (c) For the liquids, which do not wet the glass, the liquid meniscus is convex upward, so angle of contact is obtuse.

12

Elasticity

Introduction

Elasticity is the property of body by virtue of which a body regains or tends to regain its original configuration (shape as well as size), when the external deforming forces acting on it, is removed.

Cause of Elasticity

When a solid is deformed by a force, atoms or molecules get displaced from their equilibrium position causing a change in interatomic/intermolecular distances. When deforming force is removed, the interatomic forces tend to drive back the molecules to their original positions. This gives rise to the property elasticity.

Elastic Behaviour of Solids

If a body completely regains its original configuration on removal of external deforming forces, it is called a **perfectly elastic body**.

If a body has no tendency to regain its original configuration and tends to maintain its deformed state even after the removal of the deforming force, the body is called a **plastic** (or **non-elastic**) **body**.

Stress

The internal restoring force per unit area of cross-section of the deformed body is called **stress**. Thus,

$$\text{Stress, } \sigma = \frac{\text{Restoring force}}{\text{Area}} = \frac{F}{A}$$

Stress is numerically equal to the deforming force per unit area of cross-section.

The SI unit of stress is Nm^{-2} or pascal (Pa).

Types of Stress

Stress are of two types normal stress or longitudinal stress and tangential stress or shearing stress.

Also the longitudinal stress can be of two types

- (i) If a solid in the form of a wire/rod is stretched by applying a force normally, then the stress is called **tensile stress** (first type of longitudinal stress).

- (ii) If the solid wire/rod is compressed, then the stress is called **compressive stress**. (Other type of longitudinal stress)

- (iii) For a bulk solid or liquid or gas if the deforming force is applied normal to the surface such that magnitude of force on any small area is proportional to the area, the stress is called **volumetric stress**.

Fig (b) Volumetric stress

The given Fig. (b). Here, force is applied tangentially to the cross-section of the body. So, the restoring force developed due to applied tangential force is called **tangential or shearing stress**.

Strain

When the size or shape of a body is changed under an external force, the body is said to be strained. The change occurred in the unit size of the body is called **strain**.

$$\text{i.e. Strain} = \frac{\text{Change in dimension}}{\text{Original dimension}} = \frac{\Delta x}{x}$$

where, Δx = Change (may be in length, in volume etc)

x = Original value of quantity in which change has occurred

It is a dimensionless quantity.

Types of Strain

- (i) For a wire or rod, **linear strain** is defined as the ratio of change in length to the original length.

$$\therefore \text{Longitudinal strain} = \frac{\text{Change in length } (\Delta L)}{\text{Original length } (L)}$$

- (ii) When the deforming force causes a change in volume, the strain is called **volumetric strain**.

$$\text{Volumetric strain} = \frac{\text{Change in volume } (\Delta V)}{\text{Original volume } (V)}$$

- (iii) When the deforming force, applied tangentially to a surface, produces a change in shape of the body, the strain developed is called **shearing strain or shear**.

$$\text{Shearing strain} = \phi$$

Hooke's Law

According to the Hooke's law, for any body within the elastic limit, stress developed is directly proportional to the strain produced.

$$\text{Stress} \propto \text{strain}$$

$$\text{Stress} = E \times \text{strain}$$

The ratio of stress to strain, within the elastic limit, is called the coefficient (or modulus) of elasticity for the given material.

Depending on the type of stress applied and resulting strain, we have the following three of elasticity given as

$$E = \frac{\text{Stress}}{\text{Strain}}$$

Stress-Strain Relationship

When a wire is stretched by an applied force, then a typical graph is obtained (especially in case of metals) as shown below

Modulus of Elasticity

Within the proportional region (region OA in stress-strain graph), the ratio of stress and strain remains constant. This ratio is called **modulus of elasticity**.

It has same units and dimensions as that of stress.

As there are three types of stresses and corresponding strains. So, there are three different modulus of elasticity which are given below.

1. Young's Modulus

Young's modulus of elasticity (Y) is defined as the ratio of normal stress (either tensile or compressive) to the longitudinal strain within a elastic limit.

$$Y = \frac{\text{Normal stress}}{\text{Longitudinal strain}} = \frac{F/A}{\Delta L/L} = \frac{FL}{A\Delta L}$$

2. Bulk Modulus

It is defined as the ratio of the normal stress to the volumetric strain.

Coefficient of volume elasticity

$$B = \frac{F/A}{\Delta V/V} = -\frac{pV}{\Delta V}$$

where, $p = \frac{F}{A}$ = the pressure or stress negative sign signifies that for an increase in pressure, the volume will decrease. Reciprocal of bulk modulus is called **compressibility**.

3. Modulus of Rigidity (Shear Modulus)

It is defined as the ratio of tangential stress to shearing stress.

$$\eta = \frac{\text{Tangential stress}}{\text{Shearing strain}} = \frac{F/A}{\phi} = \frac{F}{A\phi} = \frac{FL}{Ax}$$

Poisson's Ratio (σ)

In general, a deforming force in one direction can produce strains in other directions such as when wire is stretched, then force will produce longitudinal strain (obviously) but it will also change its lateral dimensions, (i.e. radius of cross-section) as described in figure given below

The fractional change in transverse length is proportional to the fractional change in longitudinal length and is constant for a given material. This constant of proportionality is called **Poisson's ratio** and is given by

$$\sigma = -\frac{\text{Transverse strain}}{\text{Longitudinal strain}} \Rightarrow \sigma = -\frac{\frac{\Delta d}{d}}{\frac{\Delta L}{L}}$$

Theoretical value of σ varies from -1 to 0.5 .

Elastic Potential Energy of a Strained Body

When force is applied on a wire, it gets under tension and work is done against the internal forces which is stored in the form of potential energy in the body.

$$\therefore \text{Young's modulus, } Y = \frac{\text{Stress}}{\text{Strain}}$$

$$\text{or } F = \frac{AY}{L} \cdot x$$

$\therefore$ Work done is equal to potential energy

$$W = \int_0^l \frac{AY}{L} \cdot x \, dx = \frac{AY}{2L} \cdot l^2 \quad (\because dW = F \cdot dx)$$

$$U = \frac{1}{2} \times \text{Stress} \times \text{Strain} \times \text{Volume}$$

$$\therefore \text{Energy per unit volume} = \frac{1}{2} \times \text{Stress} \times \text{Strain}$$

Inter-relations between Elastic Constants

Y = Young's modulus, η = Rigidity modulus, K = Bulk modulus, σ = Poisson's ratio

$$Y = 2\eta(1 + \sigma)$$

$$Y = 3K(1 - 2\sigma)$$

$$\frac{9}{Y} = \frac{3}{\eta} + \frac{1}{K}$$

or

$$Y = \frac{9K\eta}{\eta + 3K}$$

$$\sigma = \frac{3K - 2\eta}{6K + 2\eta}$$

Volume elasticity of a gas under an isothermal condition is equal to the pressure exerted by the gas $B_{\text{iso}} = p$

Adiabatic elasticity of a gas $B_{\text{adia}} = \gamma p$, where γ is the ratio of the two principal specific heats of the gas

Practice Exercise

- Calculate the stress for one litre of a perfect gas, at a pressure of 72 cm of Hg, when it is compressed isothermally to a volume of 900 cc.
 a. $9.88 \times 10^3 \text{ N/m}^2$ b. $10.88 \times 10^3 \text{ N/m}^2$
 c. $1.088 \times 10^3 \text{ N/m}^2$ d. $2 \times 10^3 \text{ N/m}^2$
- If a metal wire of length L , having area of cross-section A and Young's modulus Y , behaves as a spring of spring constant k . The value of k is
 a. $\frac{YA}{L}$ b. $\frac{YA}{2L}$ c. $\frac{2YA}{L}$ d. $\frac{YL}{A}$
- In the figure three identical springs are shown. From spring A , a mass of 4 kg is hung and spring shows elongation of 1 cm. But when a weight of 6 kg is hung on B , the Hooke's descends

- a. 1 cm b. 2 cm c. 3 cm d. 4 cm
- A system consists of two springs and a mass $m = 1 \text{ kg}$ as shown in figure. If mass m is displaced slightly along vertical and released. The system oscillates with a period of 2 s. Then, the spring constant k is
 a. $\frac{\pi^2}{4}$ b. $\frac{\pi^2}{6}$
 c. $\frac{\pi^2}{8}$ d. $\frac{\pi^2}{2}$
 - A spring of constant k is cut into two parts of length in the ratio 2 : 3. The spring constant of larger spring is
 a. $\frac{5}{3}k$ b. $\frac{2}{3}k$
 c. k d. $\frac{3}{5}k$
 - A light rod of length L is suspended from a support horizontally by means of two vertical wires A and B of equal lengths as shown in the figure. Cross-section area of A is half that of B and Young's modulus of A is double than that of B . A weight W is hung

on the rod as shown. The value of x , so that the stress in A is same as that in B , is

- a. $\frac{L}{3}$ b. $\frac{L}{2}$ c. $\frac{2L}{3}$ d. $\frac{3L}{4}$

- Two wires, one made of copper and other of steel are joined end to end. (as shown in figure). The area of cross-section of copper wire is twice that of steel wire. They are placed under compressive force of magnitudes F . Find the ratio of their lengths such that change in lengths of both wires are same ($Y_s = 2 \times 10^{11} \text{ N/m}^2$ and $Y_c = 11 \times 10^{11} \text{ N/m}^2$).

- a. 2.1 b. 1.1 c. 1.2 d. 2
- Find the total elongation of the bar, if the bar is subjected to axial forces as shown in figure. The cross-sectional area of bar is 10 cm^2 . [Take $E = 8 \times 10^2 \text{ dyne/cm}^2$]

- a. 0.01 cm b. 0.5 cm c. 0.0675 cm d. 0.775 cm
- When tension in a metal wire is T_1 , its length was l_1 , and when tension is T_2 , the length is l_2 . Find its unstretched length.
 a. $\sqrt{l_1 l_2}$ b. $\frac{l_1 + l_2}{2}$ c. $\frac{(l_1 T_2 - l_2 T_1)}{T_2 - T_1}$ d. $\frac{l_1 T_2 + T_1 l_2}{T_1 + T_2}$
 - One end of a steel wire is fixed to ceiling of an elevator moving up with an acceleration 2 m/s^2 and a load of 10 kg hangs from other end. Area of cross-section of the wire is 2 cm^2 . Find the longitudinal strain in the wire (Take $g = 10 \text{ m/s}^2$ and $Y = 2 \times 10^{11} \text{ N/m}^2$)
 a. 4×10^{11} b. 3×10^{-6} c. 8×10^{-6} d. 2×10^{-6}
 - Two wires one of copper and other of steel having same cross-sectional area and lengths 1.0 m and 0.5 m respectively, are fastened end to end and stretched by a load M . If copper wire is stretched by 1 mm, the total extension of the combined wire is (Given, Young's moduli are $Y_{\text{copper}} = 1 \times 10^{11} \text{ N/m}^2$, and $Y_{\text{steel}} = 2 \times 10^{11} \text{ N/m}^2$)
 a. 1.125 cm b. 0.2 cm c. 0.120 cm d. 0.25 cm

12. A body of mass 1 kg is fastened to one end of a steel wire of cross-sectional area $3 \times 10^{-6} \text{ m}^2$ and is rotated in horizontal circle of radius 20 cm with a constant speed 2 m/s. Find the elongation of the wire ($Y = 2 \times 10^{11} \text{ N/m}^2$)

a. $0.33 \times 10^{-5} \text{ m}$ b. $0.67 \times 10^{-5} \text{ m}$
c. $2 \times 10^{-5} \text{ m}$ d. $4 \times 10^{-5} \text{ m}$

13. If a conical wire is stretched by two forces F applied parallel to its length and in opposite direction. Normal to end faces. The length of wire is L and its end radius are r_1 and r_2 . Find out the extension produced. (Given, Y = Young's modulus of wire)

a. $\frac{FL}{\pi r_1^2 Y}$ b. $\frac{FL}{\pi r_1 Y}$ c. $\frac{FL}{\pi r_1 r_2 Y}$ d. $\frac{FLY}{\pi r_1 r_2}$

14. If for a material, Y and B are Young's modulus and Bulk's modulus, then

a. $Y < 3B$ b. $Y = 3B$ c. $Y > 3B$ d. $3Y = B$

15. When a sphere is taken to bottom of sea 1 km deep, it contracts by 0.01%. Find the bulk modulus of elasticity of the material of sphere. (Given, density of water = 1 g/cm^3)

a. $9.8 \times 10^{10} \text{ N/m}^2$ b. $10.2 \times 10^{10} \text{ N/m}^2$
c. $0.98 \times 10^{10} \text{ N/m}^2$ d. $8.4 \times 10^{10} \text{ N/m}^2$

16. The Young's modulus of brass and steel are $1.0 \times 10^{11} \text{ Nm}^{-2}$ and $2.0 \times 10^{11} \text{ Nm}^{-2}$ respectively. A brass wire and a steel wire of the same length extend by 1 mm, each under the same force. If radii of brass and steel wires are R_B and R_S respectively, then

a. $R_S = \sqrt{2} R_B$ b. $R_S = \frac{R_B}{\sqrt{2}}$
c. $R_S = 4R_B$ d. $R_S = \frac{R_B}{2}$

17. The adjacent graph shows the extension Δl of a wire of length 1 m, suspended from the top of a roof at one end and with a load w connected to the other end. If the cross-sectional area of the wire is 10^{-6} m^2 , calculate the Young's modulus of the material of the wire.

a. $2 \times 10^{11} \text{ Nm}^{-2}$ b. $2 \times 10^{-11} \text{ Nm}^{-2}$
c. $3 \times 10^{-12} \text{ Nm}^{-2}$ d. $2 \times 10^{-13} \text{ Nm}^{-2}$

18. A wire of mass m and length l is suspended from a ceiling. Due to its own weight it elongates, consider cross-section area of wire as A and Young's modulus of material of wire as Y . The elongation in the wire is

a. $\frac{2mg}{3YA}$ b. $\frac{mgl}{YA}$
c. $\frac{mgl}{2YA}$ d. Cannot be calculated

19. A body of mass $m = 10 \text{ kg}$ is attached to a wire of length 0.3 m. Calculate the maximum angular velocity with which it can be rotated in a horizontal circle (Breaking stress of wire = $4.8 \times 10^7 \text{ N/m}^2$ and area of cross-section of a wire = 10^{-6} m^2)

a. 4 rad/s b. 8 rad/s c. 1 rad/s d. 2 rad/s

20. Find the velocity of projection of a missile of mass 5 g. When a rubber cord is stretched to 12 cm and then released to project the missile (Given, area of cross-section of cord = 1 mm^2 , total unstretched length = 10 cm, Young's modulus of rubber = $5 \times 10^8 \text{ N/m}^2$)

a. 20 m/s b. 25 m/s
c. 22 m/s d. 18 m/s

21. A rubber cord catapult has a cross-sectional area of 25 mm^2 and the initial length of rubber cord is 10 cm. It is stretched by 5 cm and then released to project a missile of mass 5 g. Taking, $Y_{\text{rubber}} = 5 \times 10^8 \text{ Nm}^{-2}$, velocity of the projected missile is

a. 20 ms^{-1} b. 100 ms^{-1} c. 250 ms^{-1} d. 200 ms^{-1}

22. One end of a wire 2 m long and diameter 2 mm is fixed in a ceiling. A naughty boy of mass 10 kg jumps to catch the free end and stays there. The change in length of wire is (Take $g = 10 \text{ m/s}^2$, $Y = 2 \times 10^{11} \text{ N/m}^2$)

a. $3185 \times 10^{-5} \text{ m}$ b. 2 mm
c. 3 mm d. 4 mm

23. In above problem, if Poisson's ratio is $\sigma = 0.1$ Find the change in diameter.

a. $3.184 \times 10^{-5} \text{ m}$ b. $31.84 \times 10^{-5} \text{ m}$
c. $3.184 \times 10^{-8} \text{ m}$ d. $31.84 \times 10^{-8} \text{ m}$

24. Each of three blocks shown in figure has a mass 3 kg. The wire connecting blocks A and B has area of cross-section 0.005 cm^2 and Young's modulus of elasticity $Y = 2 \times 10^{11} \text{ N/m}^2$. Neglect friction. Find the elastic potential energy stored per unit volume in wire connecting blocks A and B in steady state. (Take $g = 10 \text{ m/s}^2$)

a. 500 J/m^3 b. 1000 J/m^3
c. 2000 J/m^3 d. 3000 J/m^3

25. A steel rod of Young's modulus $2 \times 10^{11} \text{ N/m}^2$ undergoes an elastic strain of 0.05%. The energy per unit volume stored in J/m^3 is

a. 12500 b. 5000
c. 10000 d. 25000

26. If F is the force applied to an elastic bar to produce an extension of Δl . Then, the energy lost in the process is

a. $F \cdot \Delta l$ b. $\frac{F \cdot \Delta l}{2}$
 c. zero d. $\frac{3F \cdot \Delta l}{2}$

27. If the work done in stretching a wire by 1 mm is W . Then, the work required to stretch another wire of same material but with half the radius of cross-section and double the length by 2 mm is

a. $4W$ b. W c. $\frac{1}{4}W$ d. $\frac{1}{2}W$

28. Which of the following correctly gives the elastic energy stored in the metal bar?

(σ = stress, ϵ = strain, Y = Young's modulus, L = length, Δl = extension, F = load, A = cross-sectional area).

a. $\frac{1}{2} \sigma^2 Y$
 b. $\frac{1}{2} \sigma^2 Y$
 c. $\frac{1}{2} \epsilon^2 Y \cdot (AL)$
 d. $\frac{1}{2} \sigma^2 Y \cdot (AL)$

BITSAT Archives

1. The strain-stress curves of three wires of different material are shown in the figure.

P, Q, R are the elastic limits of the wires, the figure shows that [2014]

a. elasticity of wire P is maximum
 b. elasticity of wire R is maximum
 c. tensile strength of R is maximum
 d. None of the above

2. A steel wire of length 4.7 m and cross-section $3.0 \times 10^{-5} \text{ m}^2$ stretches by the same amount as a copper wire of length 3.5 m and cross-section $4.0 \times 10^{-5} \text{ m}^2$ under a given load. What is the ratio of the Young's modulus of steel so that of copper? [2014]

a. 1.5 : 2 b. 1.8 : 2
 c. 1.5 : 1 d. 1.8 : 1

3. The average depth of Indian Ocean is about 3000 m. Bulk modulus of water is $2.2 \times 10^4 \text{ N/m}^2$,

$g = 10 \text{ m/s}^2$, then fractional compression $\frac{\Delta V}{V}$ of water

at the bottom of the Indian Ocean will be [2014]

a. 1.36% b. 20.6%
 c. 13.9% d. 0.52%

4. One end of steel wire is fixed to ceiling of an elevator moving up with an acceleration 2 m/s^2 and a load of 10 kg hangs from other end. Area of cross-section of the wire is 2 cm^2 . The longitudinal strain in the wire is ($g = 10 \text{ m/s}^2$ and $Y = 2 \times 10^{11} \text{ Nm}^{-2}$) [2014]

a. 4×10^{11} b. 3×10^{-6}
 c. 8×10^{-6} d. 2×10^{-6}

5. Two wires are made of the same material and have the same volume. However wire 1 has cross-sectional area A and wire 2 has cross-sectional area $3A$. If length of wire 1 increased by Δx on applying force F ,

how much force is needed to stretch wire 2 by the same amount? [2011]

a. $4F$ b. $6F$
 c. $9F$ d. F

6. The Poisson's ratio of a material is 0.5. If a force is applied to a wire of this material, there is a decrease in the cross-sectional area by 4%. The percentage increase in the length is [2011]

a. 1% b. 2%
 c. 2.5% d. 4%

7. A load of 1 kg weight is attached to one end of a steel wire of area of cross-section 3 mm^2 and Young's modulus 10^{11} N/m^2 . The other end is suspended vertically from a hook on a wall, then the load is pulled horizontally and released. When the load passes through its lowest position the fractional change in length is (Take $g = 10 \text{ m/s}^2$) [2008]

a. 0.3×10^{-4} b. 0.3×10^{-3}
 c. 0.3×10^3 d. 0.3×10^4

8. There is some change in length when a 33000 N tensile force is applied on a steel rod of area of cross-section 10^{-3} m^2 . The change of temperature required to produce the same elongation, if the steel rod is heated, is (The modulus of elasticity is $3 \times 10^{11} \text{ N/m}^2$ and the coefficient of linear expansion of steel is $11 \times 10^{-5} / ^\circ \text{C}$). [2008]

a. 20°C b. 15°C
 c. 10°C d. 0°C

9. Which one of the following is not a unit of Young's modulus? [2005]

a. Nm^{-1} b. Nm^{-2}
 c. dyne cm^{-2} d. mega pascal

Answer with Solutions

Practice Exercise

1. (b) Let p = pressure of the gas in compressed state.

Condition for isothermal process is

$$p \times 900 = 72 \times 1000 \Rightarrow p = 80 \text{ cm}$$

Stress = increase in pressure = $(80 - 72) = 8 \text{ cm of Hg}$

$$= 0.08 \times 13.6 \times 10^3 \times 10 = 10.88 \times 10^3 \text{ N/m}^2$$

2. (a) Let the extension of wire be x for an external force F .

$$\text{Stress} = \frac{F}{A}$$

$\Rightarrow$

$$\text{Strain} = \frac{x}{L}$$

$$Y = \frac{F/A}{x/L} = \frac{FL}{xA}$$

$$\text{Equivalent force constant} = k = \frac{F}{x} = \frac{YA}{L}$$

3. (c) $x = \frac{F}{k}$

If spring constant is k for the first case,

it is $\frac{k}{2}$ for second case.

$$\text{For first case, } 1 = \frac{4}{k} \quad \dots(i)$$

$$\text{For second case, } x' = \frac{6}{k/2} = \frac{12}{k} \quad \dots(ii)$$

Dividing Eqs. (i) and (ii), we get $x' = \frac{12/k}{4/k} = 3 \text{ cm}$

4. (d) $T = 2\pi\sqrt{\left(\frac{m}{2k}\right)} \Rightarrow k = \frac{2\pi^2 m}{T^2} = \frac{\pi^2}{2} \quad \left(\because T = 2 \text{ s}\right)$
 $(m = 1 \text{ kg})$

5. (a) As, $Y = \frac{Fl}{A \cdot \Delta l}$
 $\Rightarrow F = \left(\frac{AY}{l}\right) \cdot \Delta l$

$$\text{As, } |F| = kl$$

$$\text{So, } k \propto \frac{AY}{l} \therefore k \propto \frac{1}{l}$$

$$\text{Length of bigger spring, } l' = \frac{3}{5} l$$

$$\text{So, } \frac{k'}{k} = \frac{l}{\frac{3}{5}l} = \frac{5}{3}$$

6. (c) Stress in $A = \frac{T_A}{A_A}$, where A_A is cross-sectional area of wire A .

Stress in $B = \frac{T_B}{A_B}$, where A_B is cross-sectional area of wire B .

$$\text{It is given, } A_A = \frac{A_B}{2}, \frac{T_A}{A_A} = \frac{T_B}{A_B} \text{ which gives } x = \frac{2L}{3}$$

7. (b) $Y_S = \frac{FL_S}{A_S \Delta l_S}$ and $Y_C = \frac{FL_C}{A_C \Delta l_C}$

$$\therefore \frac{L_C}{L_S} = \frac{\frac{Y_C A_C \Delta l_C}{F}}{\frac{Y_S A_S \Delta l_S}{F}} = \left(\frac{Y_C}{Y_S}\right) \left(\frac{A_C}{A_S}\right) \left(\frac{\Delta l_C}{\Delta l_S}\right)$$

$$\text{Here } \frac{A_C}{A_S} = 2, \frac{\Delta l_C}{\Delta l_S} = 1, \frac{Y_C}{Y_S} = \frac{11}{2}$$

$$\therefore \frac{L_C}{L_S} = \left(\frac{11}{2}\right) (2) (1) = 11$$

8. (c) Let δl = total elongation of the bar, A = area,
 $E = 8 \times 10^2$. Let make the free body diagram.

$$\text{Using equation } \delta l = \frac{1}{AE} (F_1 l_1 + F_2 l_2 + F_3 l_3)$$

$$\delta l = \frac{1}{10 \times 8 \times 10^2} (5 \times 60 + 2 \times 60 + 1 \times 120)$$

$$\delta l = 0.0675 \text{ cm}$$

9. (c) Let unstretched length = l

$$T_1 = k(l_1 - l) \Rightarrow T_2 = k(l_2 - l)$$

$$\frac{T_1}{T_2} = \frac{l_1 - l}{l_2 - l} \Rightarrow l = \left(\frac{T_2 l_1 - T_1 l_2}{T_2 - T_1}\right)$$

10. (b) Here, $T = m(g + a_0) = 10(10 + 2) = 120 \text{ N}$

$$\therefore \text{Stress} = \frac{T}{A} = \frac{120}{2 \times 10^{-4}} = 60 \times 10^4 \text{ N/m}^2$$

$$\therefore Y = \frac{\text{stress}}{\text{strain}}$$

$$\therefore \text{Strain} = \frac{\text{stress}}{Y} = \frac{60 \times 10^4}{2 \times 10^{11}} = 30 \times 10^{-7} = 3 \times 10^{-6}$$

11. (a) $\Delta l = \frac{F}{A} \frac{l}{Y}$

$\frac{F}{A}$ is identical for both the wire.

$$\frac{\Delta l_1 (\text{copper})}{\Delta l_2 (\text{steel})} = \frac{l_1}{l_2} \cdot \frac{Y_2}{Y_1}$$

$$\Delta l_2 = \Delta l_1 \frac{Y_1}{Y_2} \cdot \frac{l_2}{l_1} = (1) \left(\frac{0.5}{1}\right) \left(\frac{1 \times 10^{11}}{2 \times 10^{11}}\right) = 0.25 \text{ mm}$$

$$\text{Total extension} = 1 + 0.25 = 1.125 \text{ mm}$$

12. (b)

$$13. (c) \Delta L = \frac{FL}{YA} = \frac{FL}{Y\sqrt{A_1 A_2}} = \frac{FL}{Y\sqrt{\pi r_1^2 \cdot \pi r_2^2}}, \Delta L = \frac{FL}{Y\pi r_1 r_2}$$

$$14. (a) \frac{Y}{3B} = 1 - 2\sigma$$

$$\text{and } 0 < \sigma < \frac{1}{2}$$

$$\Rightarrow 0 < 1 - 2\sigma < 1$$

$$\text{Hence, } \frac{Y}{3B} < 1 \therefore Y < 3B$$

$$15. (a) \text{ Bulk modulus, } B = \frac{\Delta p}{-\Delta V/V} \Rightarrow -\frac{\Delta V}{V} = \frac{0.01}{100} = 10^{-4}$$

$$\Delta p = \text{pressure of water} = H\rho g = (10)^3 \times (1 \times 10^3) \times (9.8)$$

$$\Delta p = 9.8 \times 10^6 \Rightarrow B = \frac{9.8 \times 10^6}{10^{-4}} = 9.8 \times 10^{10} \text{ N/m}^2$$

16. (b)

17. (a) $(\Delta l - w)$ graph is a straight line, where

$$\frac{w}{\Delta l} = \frac{(80 - 20)}{(4 - 1) \times 10^{-4}} = 2 \times 10^5 \text{ Nm}^{-2}$$

$$\text{Moreover, } L = 1 \text{ m and } A = 10^{-6} \text{ m}^2$$

$$\text{Hence, } Y = \frac{FL}{A\Delta l} = \frac{wL}{A\Delta l} = \frac{2 \times 10^5 \times 1}{10^{-6}} = 2 \times 10^{11} \text{ Nm}^{-2}$$

18. (c) Consider an element of wire of width dx at a distance x from bottom end of wire.

The force experienced by this element is due to the gravitational force of portion of wire lower to it.

$$\text{So, } Y = \frac{T/A}{\Delta(dx)/dx}, \text{ where } \Delta(dx) \text{ is the}$$

elongation in

this element.

$$\text{Now, } \Delta(dx) = \frac{T}{YA} dx = \frac{mg}{YA} \times x dx$$

$$\text{Total elongation, } \Delta l = \int_0^l \Delta(dx) = \int_0^l \frac{mg \times x dx}{YA} = \frac{mgl}{2YA}$$

19. (a) Breaking strength = tension in the wire = $mr\omega^2$

$$4.8 \times 10^7 \times 10^{-6} = 10 \times 0.3 \times \omega^2$$

$$\omega^2 = \frac{48}{0.3 \times 10} = 16 \Rightarrow \omega = 4 \text{ rad/s}$$

20. (a) Equivalent rubber constant of rubber cord

$$k = \frac{YA}{l} = \frac{(5 \times 10^8)(1 \times 10^{-6})}{(0.1)} = 5 \times 10^3 \text{ N/m}$$

From conservation of energy

$$\text{Elastic PE of cord} = \text{KE of missile } \frac{1}{2}k(\Delta l)^2 = \frac{1}{2}mv^2$$

$$v = \sqrt{\left(\frac{k}{m}\right) \cdot \Delta l} = \sqrt{\left(\frac{5 \times 10^3}{5 \times 10^{-3}}\right) \times (12 - 10) \times 10^{-2}}$$

$$v = 20 \text{ m/s}$$

21. (c) Elastic potential energy stored in the catapult

$$\left(U = \frac{1}{2}F\Delta L = \frac{1}{2}\frac{YA}{L}\Delta L^2\right) \text{ is converted into the kinetic}$$

$$\text{energy of the projectile } \left(K = \frac{1}{2}mv^2\right) \Rightarrow v = \sqrt{\frac{YA\Delta L^2}{Lm}}$$

$$= \left[\frac{(5 \times 10^8) \times (25 \times 10^{-6}) \times (5 \times 10^{-2})^2}{(10 \times 10^{-2}) \times (5 \times 10^{-3})}\right]^{1/2} = 250 \text{ ms}^{-1}$$

22. (a) For equilibrium of the boy,

$$\text{Tension in wire, } T = \text{weight of boy} = mg = 100 \text{ N}$$

$$= \frac{100 \times 10^6}{3.14} \text{ N/m}^2 \Rightarrow \text{Strain} = \frac{\Delta L}{L} = \frac{\Delta L}{2}$$

$$\therefore Y = \frac{\text{stress}}{\text{strain}} = \frac{100 \times 10^6 \times 2}{3.14 \times \Delta L}$$

$$\therefore \Delta L = \frac{100 \times 10^6 \times 2}{3.14 \times 2 \times 10^{11}} = 31.85 \times 10^{-5} \text{ m}$$

$$23. (c) \therefore \sigma = \frac{\Delta dL}{d\Delta L}$$

$$\therefore \Delta d = \frac{\sigma d\Delta L}{L} = \frac{0.1 \times 2 \times 10^{-3} \times 31.84 \times 10^{-5}}{2} = 3.184 \times 10^{-8} \text{ m}$$

24. (b)

From force diagram,

$$T = 3a \quad \dots (i)$$

$$T_1 - T = 3a \quad \dots (ii)$$

$$3g - T_1 = 3a \quad \dots (iii)$$

After solving Eqs. (i) and (ii), we get $T = 10 \text{ N}$

$$\therefore \text{Stress} = \frac{T}{A} = \frac{10}{0.005 \times 10^{-4}}$$

 $\therefore$ The elastic energy stored per unit volume

$$= \frac{1}{2} \times \text{stress} \times \text{strain} = \frac{1}{2} \times \text{stress} \times \frac{\text{stress}}{Y} \quad \left(\because Y = \frac{\text{stress}}{\text{strain}}\right)$$

$$= \frac{\text{stress}^2}{2Y} = \frac{\left(\frac{10}{0.005 \times 10^{-4}}\right)^2}{2 \times 2 \times 10^{11}}$$

$$= \frac{100}{25 \times 10^{-6} \times 10^{-8} \times 4 \times 10^{11}} = \frac{100}{100 \times 10^{-14} \times 10^{11}}$$

$$= 10^3 \text{ J/m}^3 = 1000 \text{ J/m}^3$$

25. (d)

26. (b)

27. (c)

$$28. (c) \text{ Energy stored} = \frac{1}{2} \times \text{stress} \times \text{strain} \times \text{volume}$$

$$= \frac{1}{2} \times \sigma \times \epsilon \times (AL)$$

$$\text{As, } Y = \frac{\sigma}{\epsilon} \Rightarrow \sigma = \epsilon Y$$

$$\text{So, } E = \frac{1}{2} \cdot \epsilon^2 Y \cdot (AL)$$

BITSAT Archives

1. (b) As stress is shown on x-axis and strain on y-axis.

So, we can say that $y = \cot \theta = \frac{1}{\tan \theta} = \frac{1}{\text{slope}}$

So, elasticity of wire P is minimum and R is maximum.

2. (d) As given for steel wire

$$A_1 = 3 \times 10^{-5} \text{ m}^2, l_1 = 4.7 \text{ m}, \Delta l_1 = \Delta l; F_1 = F$$

For copper wire,

$$A_2 = 4 \times 10^{-5} \text{ m}^2,$$

$$l_2 = 3.5 \text{ m}, \Delta l_2 = \Delta l, F_2 = F$$

Let Y_1 and Y_2 be the Young's modulus of steel wire and copper wire, respectively.

$$\text{So, } Y_1 = \frac{F_1}{A_1} \times \frac{l_1}{\Delta l_1} = \frac{F}{3 \times 10^{-5}} \times \frac{4.7}{\Delta l}$$

$$\text{and } Y_2 = \frac{F_2}{A_2} \times \frac{l_2}{\Delta l_2} = \frac{F \times 3.5}{4 \times 10^{-5} \times \Delta l}$$

$$\frac{Y_1}{Y_2} = \frac{4.7 \times 4 \times 10^{-5}}{3.5 \times 3 \times 10^{-5}} = 1.8$$

So, $Y_1 : Y_2 = 1.8 : 1$

3. (a) The pressure exerted by a 3000 m column of water on the bottom layer.

$$p = h\rho g = 3000 \times 1000 \times 10 \\ = 3 \times 10^7 \text{ kg m}^{-1}\text{s}^{-2} = 3 \times 10^7 \text{ N/m}^2$$

Fractional compression $\left(\frac{\Delta V}{V}\right)$

$$= \frac{\text{Stress}}{B} = \frac{3 \times 10^7}{2.2 \times 10^9} = 1.36 \times 10^{-2}$$

$$\frac{\Delta V}{V} \times 100 = 1.36\%$$

4. (b) As, $T = m(g + a_0) = 10(10 + 2) = 120 \text{ N}$

$$\text{Stress} = \frac{T}{A} = \frac{120}{2 \times 10^{-4}} = 60 \times 10^4 \text{ Nm}^{-2}$$

$$\text{and } Y = \frac{\text{Stress}}{\text{Strain}}, \text{ Strain} = \frac{\text{Stress}}{Y}$$

$$= \frac{60 \times 10^4}{2 \times 10^{11}}$$

$$= 30 \times 10^{-7} = 3 \times 10^{-6}$$

5. (c) $Y = \frac{FL}{A\Delta L}$

$$\text{or } F = \frac{YA\Delta L}{L} = \frac{YA^2\Delta L}{AL} = \frac{YA^2\Delta L}{V} = \frac{YA^2\Delta x}{V}$$

where, $AL = V = \text{volume of wire}$, Young modulus in the same as both the wires are made of same material. It is given that both the wires have same volume and same extension in length.

$$\therefore \frac{F'}{F} = \frac{A'^2}{A^2} = \frac{(3A)^2}{A^2} = 9 \\ F' = 9F$$

6. (d) Poisson's ratio = 0.5

Since, density is constant therefore change in volume is zero, we have

$$V = A \times l = \text{constant}$$

$$\log V = \log A + \log l$$

$$\text{or } \frac{dA}{A} + \frac{dl}{l} = 0$$

$$\frac{dl}{l} = -\frac{dA}{A}$$

$\therefore$ Percentage increase in length = 4%

7. (a) $Y = \frac{mgl}{A\Delta l}$

$$\Rightarrow \frac{\Delta l}{l} = \frac{mg}{AY}$$

$$\therefore \frac{\Delta l}{l} = \frac{1 \times 10}{3 \times 10^{-6} \times 10^{11}}$$

$$= 0.3 \times 10^{-4}$$

8. (c) Modulus of elasticity = $\frac{\text{Force}}{\text{Area}} \times \frac{l}{\Delta l}$

$$3 \times 10^{11} = \frac{33000}{10^{-3}} \times \frac{l}{\Delta l}$$

$$\frac{\Delta l}{l} = \frac{33000}{10^{-3}} \times \frac{1}{3 \times 10^{11}}$$

$$= 11 \times 10^{-5}$$

$$\text{Change in length, } \frac{\Delta l}{l} = \alpha \Delta T$$

$$11 \times 10^{-5} = 11 \times 10^{-5} \times \Delta T$$

$$\Rightarrow \Delta T = 10 \text{ K or } 10^\circ \text{ C}$$

9. (a) $Y = \frac{\text{stress}}{\text{strain}} = \text{N/m}^2$ or pascal (in SI system)

$$\text{and } Y = \frac{\text{dyne}}{\text{cm}^2} \quad (\text{in CGS System})$$

Thus, Nm^{-1} is not the unit of Young's modulus.

13

Wave Motion

Wave

In physics, a **wave** is a disturbance or oscillation that travels through space and matter, accompanied by a transfer of energy. In simple terms, we can say that wave motion involves transfer of disturbance (energy) from one point to the another with particles of medium oscillating about their mean positions, i.e. particles of the medium do not travel themselves along with the wave.

Types of Waves

Types of waves are shown as below

Mechanical Waves Waves which can be produced or propagated only in material medium are defined as mechanical waves, e.g. waves on water surface, waves on strings, sound waves, etc.

Non-mechanical Waves Waves which can be independent of propagation medium are defined as non-mechanical waves, e.g. visible light, ultraviolet light, X-rays, etc.

Transverse Waves

A wave motion in which the particles of the medium oscillate in simple harmonic motion in a direction perpendicular to its direction of propagation, are defined as **transverse waves**.

e.g. Movement of string of a sitar or violin. On propagation of transverse waves, medium is divided into alternate crests and troughs.

The distance between two consecutive crests or troughs is called wavelength of the transverse wave. It is denoted by λ .

Speed of Transverse Wave

The expression for speed of transverse waves in a solid and in case of a stretched string can be obtained theoretically given as

(i) In solids, $v = \sqrt{\frac{\eta}{d}}$

where, η is the modulus of rigidity and d is the density of the medium.

(ii) In a stretched string, $v = \sqrt{\frac{T}{m}} = \sqrt{\frac{Mg}{\pi r^2 d}}$

where, T = the tension in the string,

m = the mass per unit length of the string,

M = mass suspended from the string,

r = radius of the string and

d = density of the material of the string.

Progressive Waves

A wave which travels continuously in the same direction without any change in its amplitude is called a progressive wave or a travelling wave. A progressive wave may be transverse or longitudinal.

Displacement Relation for a Progressive Wave

- (i) If a plane wave travels in a medium along the positive x -direction, then the displacement y of a particle located at x at time t is given by

$$y(x, t) = A \sin(\omega t - kx)$$

where, A = amplitude of the wave

$$\omega = \frac{2\pi}{T} \text{ or } 2\pi\nu \text{ is angular frequency}$$

$$k = \left(\frac{2\pi}{\lambda}\right), \text{ i.e. angular wave number}$$

- (ii) If a wave is travelling along the negative x -direction, then

$$y(x, t) = A \sin(\omega t + kx)$$

- (iii) **Phase change with position** At any instant t , if ϕ_1 and ϕ_2 are the phase of two particles whose distance from origin are x_1 and x_2 .

$$\text{Then, } \phi_1 = (\omega t - kx_1) \text{ and } \phi_2 = (\omega t - kx_2)$$

$$\phi_1 - \phi_2 = k(x_2 - x_1)$$

$$\text{So, phase difference, } \Delta\phi = \frac{2\pi}{\lambda} \times \text{path difference } (\Delta x)$$

- (iv) **Phase change with time** If a particle at a distance x from origin has phase ϕ_1 at t_1 and ϕ_2 at t_2 .

$$\text{Then, } \phi_1 = (\omega t_1 - kx) \text{ and } \phi_2 = (\omega t_2 - kx)$$

$$\phi_1 - \phi_2 = \omega(t_1 - t_2)$$

$$\text{So, phase difference, } \Delta\phi = \frac{2\pi}{T} \times \text{time difference } (\Delta t)$$

- (v) A particle velocity at a given position at a given time is equal to product of wave velocity and negative of slope of the wave curve at the given position and time.

$$u(x, t) = \frac{d}{dt}[y(x, t)]$$

- (vi) Acceleration of a particle at (x, t) , $a = \frac{d^2 y}{dt^2}$

$$\text{Also, } |a_{\max}| = -\omega^2 A$$

- (vii) **Intensity** A flow of energy per unit area of cross-section of the string in unit time is defined as intensity.

$$\text{Thus, } I = \frac{\text{Power}}{\text{Area of cross-section}}$$

$$= \frac{P}{S} = \frac{1}{2} \rho \omega^2 A^2 v$$

where, ρ is density of string and v is speed of the wave.

NOTE From the formula for intensity, we can write $I \propto A^2$, where A is amplitude.

Principle of Superposition of Waves

When two or more than two waves of similar type propagate in a medium simultaneously, then resultant displacement of any particle of the medium is equal to the vector sum of displacements produced by individual waves separately. This principle is called principle of superposition of waves.

$$y = y_1 + y_2 + y_3 + \dots$$

Interference of Waves

When two waves of same frequency (or same wavelength) travelling along same path superimpose each other, there occurs redistribution of energy in the medium. If at a given position (x being constant) displacement due to two waves be

$$y_1 = A_1 \sin \omega t \text{ and } y_2 = A_2 \sin(\omega t + \phi)$$

Then, resultant displacement

$$y = y_1 + y_2 = A \sin(\omega t + \phi)$$

where,

$$A = \sqrt{A_1^2 + A_2^2 + 2A_1A_2 \cos \phi}$$

and

$$\tan \theta = \frac{A_2 \sin \phi}{A_1 + A_2 \cos \phi}$$

At those points where phase difference $\phi = 0^\circ$ or $2n\pi$, i.e. an integer multiple of 2π ($n = 1, 2, 3, \dots$),

$$A = A_1 + A_2 = A_{\max}$$

This is known as **constructive interference**.

At those points where $\phi = (2n - 1)\pi$, i.e. phase difference is an odd multiple of π and hence,

$$A = A_1 \sim A_2 = A_{\min}$$

This is known as **destructive interference**.

If I_1 and I_2 are intensities of the interfering waves and ϕ is the phase difference, then resultant intensity is given by

$$I = I_1 + I_2 + 2\sqrt{I_1 I_2} \cos \phi$$

$$I_{\max} = I_1 + I_2 + 2\sqrt{I_1 I_2} = (\sqrt{I_1} + \sqrt{I_2})^2 \text{ for } \phi = 2\pi n$$

and $I_{\min} = I_1 + I_2 - 2\sqrt{I_1 I_2}$

$$I_{\min} = (\sqrt{I_1} - \sqrt{I_2})^2 \text{ for } \phi = (2n + 1)\pi$$

Stationary or Standing Waves in String

When two sets of progressive waves of the same type having same amplitude, same frequency and same speed along the same straight line in opposite directions superimposed, then a new wave is formed. This is called stationary wave or standing wave. Consider two waves of the same frequency, speed and amplitude, which are travelling in opposite directions along a string. Two such waves may be represented by the equations

$$y_1 = A \sin(kx - \omega t) \text{ and } y_2 = A \sin(kx + \omega t)$$

Hence, the resultant may be written as

$$y = y_1 + y_2 = A \sin(kx - \omega t) + A \sin(kx + \omega t)$$

$$y = 2A \sin kx \cos \omega t$$

This is the equation of a standing wave.

Characteristics of Stationary Waves

- (i) There are certain points in the medium in a standing wave, which are permanently at rest. These are called as nodes. Distance between two consecutive nodes is $\frac{\lambda}{2}$.
- (ii) Some points in the medium in a standing wave, have maximum amplitude. These are called as ant-nodes. Distance between two consecutive ant-nodes is $\frac{\lambda}{2}$.

Laws of Vibrations of Stretched Strings

- (i) **Law of length** If T and m are constants, then fundamental frequency of vibration of stretched string (f) is inversely proportional to the length (l) of the string.

i.e. $f \propto \frac{1}{l}$

- (ii) **Law of tension** If l and m are constants, then frequency of vibration of stretched string (f) is directly proportional to the square root of tension (T) of the string.

i.e. $f \propto \sqrt{T}$

- (iii) **Law of mass** If l and T are constants, then frequency of vibration of stretched string (f) is inversely proportional to the square root of mass per unit length of wire.

i.e. $f \propto \frac{1}{\sqrt{m}}$

- (iv) **Law of density** If l, T and D are constants, then frequency of vibration of stretched string (f) is inversely proportional to the square root of the density of wire.

$$\left[\because f = \frac{n}{2l} \sqrt{\frac{T}{m}} = \frac{n}{2l} \sqrt{\frac{TA}{MA}} = \frac{n}{2l} \sqrt{\frac{4T}{\rho D^2 \pi}} \right], \text{ i.e. } f \propto \frac{1}{\sqrt{\rho}}$$

Fundamental Mode and Harmonics

Normal modes of vibration in a string fixed at both ends are discussed as below

Note (i) For string fixed at both ends, the waves produced having all harmonics. (ii) For a string fixed at only one end antinode will be formed at free end and node at fixed end, only odd harmonics are present.

n th harmonic
 $f_n = n f_1 \Rightarrow \lambda_n = \frac{2l}{n}$

Practice Exercise

1. The equation of a wave travelling on a stretched string along the x -axis is $y = ae^{-(bx + ct)}$. The direction of propagation of wave is

a. along negative y -axis b. along positive y -axis
c. along negative x -axis d. along positive x -axis

2. In (Q. 1.) the maximum displacement of particle of string is

a. a b. b c. c d. c/b

3. In (Q. 1.) the speed of wave is

a. c/b b. b/c c. a d. c

4. The wave travels along a string whose equation is

$$y = \frac{p^3}{p^2 + (px - qt)^2}, \text{ where } p = 2 \text{ unit and } q = 0.5 \text{ unit.}$$

Find the direction of propagation of wave.

a. along $+y$ -axis b. along $-x$ -axis
c. along $+x$ -axis d. None of these

5. If wave $y = A \cos(\omega t + kx)$ is moving along x -axis.

The shape of pulse at $t = 0$ and $t = 2$ s

a. are different b. are same
c. may not be same d. None of these

6. At any instant a wave travelling along the string shown in figure. Here, point A is moving upward. Which of the following statement is true?

a. The wave is travelling to the right
b. The displacement amplitude of wave is equal to displacement of B at this instant
c. At this instant C also directed upward.
d. None of the above

7. In the given figure,

a. the velocity of particles B and C are same
b. the velocity of particles A, C and E are maximum
c. the particle F moves upward
d. all particles have same velocity

8. If a wave propagates through a medium. Then, the velocity of particle of medium is given by

a. wave velocity $\times$ strain b. $\frac{\text{wave velocity}}{\text{strain}}$
c. wave velocity d. $\frac{\text{angular frequency}}{\text{propagation constant}}$

9. In a wave motion $y = a \sin(kx - \omega t)$, y can represent

a. electric field b. magnetic field
c. displacement, pressure d. All of these

10. The equation of a wave travelling on a stretched string

$$\text{is } y = 4 \sin 2\pi \left(\frac{t}{0.02} - \frac{x}{100} \right)$$

Here, x and y are in cm and t is in second. The speed of wave is

a. 50 m/s b. 40 m/s c. 50 cm/s d. 40 cm/s

11. In (Q. 10.) the ratio of particle velocity amplitude and wavelength is

a. π b. 2π c. 3π d. 4π

12. In (Q. 10.) the relative deformation amplitude of medium is

a. 0.02π b. 0.08π
c. 0.06π d. None of these

13. Along a stretched string equation of transverse wave

$$\text{is } y = 3 \sin \left[2\pi \left(\frac{x}{20} - \frac{t}{0.01} \right) \right]$$

where, x, y are in cm and t is in second. Calculate wave velocity.

a. 20 m/s b. 30 m/s c. 15 m/s d. 25 m/s

14. A transverse wave along a string is given by

$$y = 2 \sin \left(2\pi (3t - x) + \frac{\pi}{4} \right)$$

where x and y are in cm and t in second. Find acceleration of a particle located at $x = 4$ cm at $t = 1$ s.

a. $36\sqrt{2}\pi^2 \text{ cm/s}^2$ b. $36\pi^2 \text{ cm/s}^2$
c. $-36\sqrt{2}\pi^2 \text{ cm/s}^2$ d. $-36\pi^2 \text{ cm/s}^2$

15. If $y = y_0 \sin 2\pi \left(ft - \frac{x}{\lambda} \right)$ is the equation of transverse

wave, then for what value of λ the maximum particle velocity is equal to four times the wave velocity?

a. $y_0\pi$ b. $\frac{y_0\pi}{2}$ c. $2y_0\pi$ d. $1.5y_0\pi$

16. Along a stretched wire a transverse wave passes with speed 3000 m/s. If the tension in the wire increased four times, then the velocity of the wave is

a. 1500 m/s b. 3000 m/s
c. 6000 m/s d. 9000 m/s

17. A long rubber tube having mass 0.9 kg is fastened to a fixed support and the free end of the tube is attached to a cord which passes over a pulley and supports an object, with a mass of 5 kg as shown in figure. If the tube is struck by a transverse blow at one end, find the time required for the pulse to reach the other end.

- a. 5 s b. 0.47 s c. 4.7 s d. 3.2 s
18. The time taken by a transverse wave going on a wire having mass 5 g, from one end to another end of wire is 0.5 s. The area of cross-section of wire is 1 mm^2 and Young's modulus of elasticity is $16 \times 10^{11} \text{ N/m}^2$. The speed of wave is 80 m/s. The strain in wire is
- a. 5×10^{-7} b. 2×10^{-7} c. 3×10^{-6} d. 4×10^{-6}
19. Find the time taken by a transverse wave to travel the full length of a uniform rope of mass 0.1 kg and length 2.45 m hangs from the ceiling
- a. 1 s b. 0.5 s c. 2 s d. 1.5 s
20. A transverse wave of equation $y = 2 \sin(0.01x + 30t)$ moves on a stretched string from one end to another end. In the equation of wave, x and y are in cm and t is in second. The time taken by wave to reach from one end to another end of string is 5 s. The length of string is
- a. 10 m b. 100 m c. 150 m d. 160 m
21. A sinusoidal wave travelling in the same direction have amplitudes of 3 cm and 4 cm and difference in phase by $\pi/2$. The resultant amplitude of the superimposed wave is
- a. 7 cm b. 5 cm
c. 2 cm d. 0.5 cm
22. Two simple harmonic motions are represented by the equations $y_1 = 10 \sin\left(3\pi t + \frac{\pi}{4}\right)$ and $y_2 = 5(3 \sin 3\pi t + \sqrt{3} \cos 3\pi t)$. Their amplitudes are in the ratio of
- a. $\sqrt{3}$ b. $1/\sqrt{3}$ c. 2 d. 1/6
23. Predict for the wave $y = A \cos \frac{2\pi x}{\lambda} \sin\left(\frac{2\pi vt}{\lambda}\right)$
- a. It is a progressive wave
b. It is a transverse progressive wave
c. It is a longitudinal progressive wave
d. It is a stationary wave
24. A string of length l is fixed at both ends and is vibrating in second harmonic. The amplitude at anti-node is 2 mm. The amplitude of a particle at distance $l/8$ from the fixed end is
- a. $5\sqrt{2} \text{ mm}$ b. $\frac{5}{\sqrt{2}} \text{ mm}$ c. 5 mm d. $\frac{10}{\sqrt{2}} \text{ mm}$

25. In (Q. 24.) the tension in string is T and the linear mass density of string is μ . The ratio of magnitude of maximum velocity of particle and the magnitude of maximum acceleration is

a. $\frac{1}{2\pi} \sqrt{\frac{\mu l^2}{T}}$ b. $2\pi \sqrt{\frac{\mu l^2}{T}}$ c. $\frac{1}{2\pi} \sqrt{\frac{T}{\mu l^2}}$ d. $\frac{1}{4\pi} \sqrt{\frac{\mu l^2}{T}}$

26. In (Q. 24.) if at $t = 0$, $y = 2.5 \text{ mm}$, the equation of standing wave is

a. $(2.5 \text{ mm}) \sin \frac{2\pi}{l} x \cos \left(2\pi \sqrt{\frac{T}{\mu l^2}} t\right)$

b. $5 \text{ mm} \sin \frac{\pi}{l} x \cos 2\pi t$

c. $5 \text{ mm} \sin \frac{2\pi}{l} x \cos \left(2\pi \sqrt{\frac{T}{\mu l^2}} t\right)$

d. $5 \text{ mm} \cos \frac{2\pi}{l} x \cos \left(2\pi \sqrt{\frac{T}{\mu l^2}} t\right)$

27. If a string fixed at both ends vibrates in four loops. The wavelength is 10 cm. The length of string is

a. 5 cm b. 15 cm c. 30 cm d. None

28. In (Q. 27.) the distance of plucking point from the fixed end is

a. 5 cm b. 10 cm c. 2.5 cm d. 7.5 cm

29. A stretched wire carries a body of density $\sigma = 8000 \text{ kg/m}^3$ at its end. The fundamental frequency of vibration of wire is 280 Hz. The body is dipped completely in a vessel of water. Find the new frequency of fundamental mode of vibrations. (Density of water is $\rho = 1000 \text{ kg/m}^3$)

a. 262 Hz b. 260 Hz c. 243.2 Hz d. 255.5 Hz

30. An elastic string of length 2 m is fixed at its end. The string starts to vibrate in third overtone with a frequency 1200 Hz. The ratio of frequency of lower overtone and fundamental is

a. 1 b. 2 c. 3 d. 4

31. If a string is stretched with a weight 4 kg then the fundamental frequency is equal to 256 Hz. What weight is needed to produce its octave?

a. 4 kg-wt b. 12 kg-wt c. 16 kg-wt d. 24 kg-wt

32. Calculate the minimum possible length of the string when both ends of string are fixed and has consecutive standing wave mode for which distance between adjacent nodes are 18 cm and 16 cm respectively.

a. 150 cm b. 144 cm c. 140 cm d. 142 cm

33. A sonometer wire of length 114 cm is fixed at both the ends. Where should the two bridges be placed so as to divide the wire into three segments whose fundamental frequencies are in the ratio 1:3:4?

a. At 36 cm and 84 cm from one end
b. At 24 cm and 72 cm from one end
c. At 48 cm and 96 cm from one end
d. At 72 cm and 96 cm from one end

34. A wave of angular frequency ω propagates so that a certain phase of oscillation moves along x -axis, y -axis, z -axis with speeds c_1 , c_2 and c_3 respectively. Find the propagation constant k .

a. $\frac{\omega}{\sqrt{c_1^2 + c_2^2 + c_3^2}} (\hat{i} + \hat{j} + \hat{k})$ b. $\frac{\omega}{c_1} \hat{i} + \frac{\omega}{c_2} \hat{j} + \frac{\omega}{c_3} \hat{k}$
 c. $(\omega \hat{i} + \omega \hat{j} + \omega \hat{k}) \frac{1}{c}$ d. None of these

35. Wave of frequency 500 Hz has a phase velocity 360 m/s. The phase difference between two displacement at a certain point at time 10^{-3} s apart will be

a. π rad b. $\frac{\pi}{2}$ rad c. $\frac{\pi}{4}$ rad d. 2π rad

36. Equation of a plane wave is given by $4 \sin \frac{\pi}{4} \left[2t + \frac{x}{8} \right]$.

The phase difference at any given instant of two particles 16 cm apart is

a. 60° b. 90° c. 30° d. 120°

37. The transverse displacement $y(x, t)$ of a wave on a string is given by $y(x, t) = e^{-(ax^2 + bt^2 + 2\sqrt{ab}xt)}$. This represents a

a. wave moving in $-x$ -direction with speed $\sqrt{\frac{b}{a}}$
 b. standing wave of frequency $\sqrt{b}$
 c. standing wave of frequency $\frac{1}{\sqrt{b}}$
 d. wave moving in $+x$ -direction with speed $\sqrt{a/b}$

38. For a wave $y = 0.0002 \sin \left[2\pi \left(110t - \frac{x}{3} \right) + \frac{\pi}{3} \right]$

is travelling in a medium. Find energy per unit volume being transferred by wave if density of medium is 1.5 kg/m^3 .

a. $14 \times 10^{-4} \text{ J/m}^3$
 b. $143.2 \times 10^{-4} \text{ J/m}^3$
 c. $14.3 \times 10^{-4} \text{ J/m}^3$
 d. $143 \times 10^{-4} \text{ J/m}^3$

BITSAT Archives

1. The equation of a simple harmonic motion is given by $y = 3 \sin \frac{\pi}{2} (50t - x)$, where x and y are in metres and

t is in seconds, the ratio of maximum particle velocity to the wave velocity is [2014]

a. 25 m/s b. 30 m/s
 c. 50 m/s d. None of these

2. A stretched string of length 2 m vibrates in 4 segments. The distance between consecutive nodes is [2010]

a. 0.5 m b. 0.25 m c. 1.0 m d. 0.75 m

3. At $t = 0$, a transverse wave pulse in a wire is described by the function $y = \frac{6}{x^2 - 3}$, where x and y are in

metre. The function $y(x, t)$ that describes this wave equation, if it is travelling in the positive x -direction with a speed of 4.5 ms^{-1} is [2010]

a. $y = \frac{6}{(x + 4.5t)^3 - 3}$ b. $y = \frac{6}{(x - 4.5t^2) + 3}$
 c. $y = \frac{6}{(x + 4.5t)^2 - 3}$ d. $y = \frac{6}{(x - 4.5t)^2 - 3}$

4. In a sine wave, position of different particles at time $t = 0$ is shown in figure. The equation for this wave travelling along positive x -axis can be [2009]

a. $y = A \sin(\omega t - kx)$ b. $y = A \cos(kx - \omega t)$
 c. $y = A \cos(\omega t - kx)$ d. $y = A \sin(kx - \omega t)$

5. A wave has velocity v in medium P and velocity $2v$ in medium Q . If the wave is incident in medium P at an angle of 30° , then the angle of refraction will be [2007]

a. 30°
 b. 45°
 c. 60°
 d. 90°

6. The equation of progressive wave is $y = 0.2 \sin 2\pi \left[\frac{t}{0.01} - \frac{x}{0.3} \right]$, where x and y are in metre and t is in second. The velocity of propagation of the wave is [2007]

a. 30 m/s
 b. 40 m/s
 c. 300 m/s
 d. 400 m/s

7. Two progressive waves having equation $x_1 = 3 \sin \omega t$ and $x_2 = 4 \sin(\omega t + 90^\circ)$ are superimposed. The amplitude of the resultant wave is [2006]

a. 5 unit
 b. 1 unit
 c. 3 unit
 d. 4 unit

8. A particle on the trough of a wave at any instant will come to the mean position after a time (T = time period) [2005]

a. $T/2$ b. $T/4$ c. T d. $2T$

Answer with Solutions

Practice Exercise

1. (c)

2. (a) $\therefore y = ae^{-(bx + ct)}$

At $t = 0, y = ae^{-bx}$

The value of y is $y_{\max} = a$.

3. (a) $\therefore bx + ct = \text{constant}$

$$\therefore b \frac{dx}{dt} + c \frac{dt}{dt} = 0$$

$$\therefore \text{Wave speed} = \left| \frac{dx}{dt} \right| = \frac{c}{b}$$

4. (c) At $t = 0, y = \frac{p^3}{(p^2 + p^2 x^2)} = \frac{p}{1 + x^2}$

$$y = f(px - qt)$$

$$y = f(\omega t - kx)$$

Here, sign of f and x are opposite, so direction should be + x -axis.

5. (b)

6. (b)

7. (b)

8. (a) Strain = $\frac{\partial y}{\partial x}$,

$$\text{As we know, } v_{\text{particle}} = -c \frac{\partial y}{\partial x}$$

$$= \text{wave velocity} \times \text{strain}$$

9. (d)

10. (a)

11. (d) We know that,

$$k = \frac{2\pi}{100}$$

$$\text{or } \frac{2\pi}{\lambda} = \frac{2\pi}{100}$$

$$\therefore \lambda = 100 \text{ cm}$$

$$\text{But } v_{\text{Particle}} = \frac{\partial y}{\partial t} = a\omega \cos(\omega t - kx)$$

$$(v_{\text{Particle}})_{\max} = a\omega = 4 \times \frac{2\pi}{0.02} = 400\pi \text{ cm/s}$$

$$\therefore \frac{(v_{\text{Particle}})_{\max}}{\lambda} = \frac{400\pi}{100} = 4\pi$$

12. (b) The relative deformation is

$$\frac{\partial y}{\partial x} = \frac{\partial}{\partial x} [4 \sin(\omega t - kx)]$$

$$= -4k \cos(\omega t - kx)$$

The relative deformation amplitude

$$\left(\frac{\partial y}{\partial x} \right)_{\max} = ak = 4 \times \frac{2\pi}{100} = 0.08\pi$$

13. (a) Let wave velocity = v

$$v = \lambda f$$

The given equation of wave

$$y = 3 \sin \left[2\pi \left(\frac{x}{20} - \frac{t}{0.01} \right) \right]$$

Compare the given equation with standard equation

$$y = A \sin \left[2\pi \left(\frac{x}{\lambda} - \frac{t}{T} \right) \right]$$

We get $A = 3 \text{ cm}$

$$\lambda = 20 \text{ cm}$$

$$f = \frac{1}{T} = 100 \text{ Hz}$$

$$v = \lambda f = \frac{20 \times 100}{100} = 20 \text{ m/s}$$

14. (c)

15. (b) $\omega = 2\pi f$ and $v_{\max} = \omega r = 2\pi f y_0$

$$\text{Wave velocity} = f\lambda$$

$$2\pi f y_0 = 4f\lambda$$

(Given, velocity of particle is four times of wave velocity)

$$\lambda = \frac{y_0 \pi}{2}$$

16. (c) From relation, $v = \sqrt{\left(\frac{T}{m} \right)} = 3000 \text{ m/s}$

$$v' = \sqrt{\left(\frac{4T}{m} \right)} = 2 \times \sqrt{\left(\frac{T}{m} \right)}$$

$$v' = 2 \times 3000 = 6000 \text{ m/s}$$

17. (b) Let μ = mass per unit length of rubber tube

$$\mu = \frac{0.9}{12} = 0.075 \text{ kg/m}$$

$$\text{Tension in tube, } T = mg = 5 \times 9.8 = 49 \text{ N}$$

Speed of wave on the tube

$$v = \sqrt{\left(\frac{T}{\mu} \right)} = \sqrt{\frac{49}{0.075}} = 25.56 \text{ m/s}$$

$$\text{Time required} = t = \frac{AB}{v} = \frac{12}{25.56} = 0.47 \text{ s}$$

18. (a) $c = \sqrt{\left(\frac{T}{\mu} \right)}$

$$\therefore T = \mu c^2, y = \frac{T}{A \text{ strain}}$$

$$\therefore \text{Strain} = \frac{T}{AY} = \frac{\mu c^2}{AY} = \frac{mc^2}{lAY}$$

$$= \frac{mc^2}{(ct)AY} = \frac{mc}{AYt} = \frac{5 \times 10^{-3} \times 80}{10^{-6} \times 16 \times 10^{11} \times 0.5} = 5 \times 10^{-7}$$

19. (a) Speed of transverse wave at lower end = 0.

$$\text{Speed of transverse wave at the upper end} = \sqrt{lg}$$

Let, acceleration = a , time to travel = t

$$a = \left(\frac{\sqrt{gl}}{t} \right) \therefore s = \frac{1}{2} at^2$$

$$l = \frac{1}{2} \left(\frac{\sqrt{gl}}{t} \right) t^2$$

$$t = 2 \sqrt{\left(\frac{l}{g} \right)} = 2 \sqrt{\left(\frac{2.45}{9.8} \right)}$$

$$t = 1 \text{ s}$$

20. (c)

21. (b)

22. (b)

23. (d)

24. (b) The equation of stationary wave on a string fixed at both ends is

$$y = 2a \sin kx \cos \omega t$$

 The amplitude of a particle at distance x from fixed end is

$$A = 2a \sin kx.$$

For second harmonic, string vibrates in two loops (shown in figure).

$$\therefore \frac{\lambda}{2} = \frac{l}{2}$$

$$\therefore \lambda = l$$

$$\therefore k = \frac{2\pi}{\lambda} = \frac{2\pi}{l}$$

$$\therefore A = 2a \sin kx = 2a \sin \frac{2\pi}{l} \times \frac{l}{8} = 2a \sin \frac{\pi}{4}$$

 The amplitude at antinode is $2a = 5 \text{ mm}$

$$\therefore A = 5 \sin \frac{\pi}{4} = \frac{5}{\sqrt{2}} \text{ mm}$$

 25. (a) Here, $v_{\max} = A\omega = 2a\omega$ (at antinode $A = 2a$) and acceleration is

$$f_{\max} = \omega^2 A = 2a\omega^2$$

$$\therefore \text{Ratio} = \frac{2a\omega}{2a\omega^2} = \frac{1}{\omega}$$

$$\therefore \text{Frequency, } \nu = \frac{n}{2l} \sqrt{\left(\frac{T}{\mu} \right)} = \frac{2}{2l} \sqrt{\left(\frac{T}{\mu} \right)}$$

 (for second harmonic, $n = 2$)

$$= \sqrt{\left(\frac{T}{\mu l^2} \right)}$$

$$\therefore \omega = 2\pi\nu$$

$$\therefore \text{Ratio} = \frac{1}{2\pi\nu}$$

$$= \frac{1}{2\pi} \sqrt{\left(\frac{\mu l^2}{T} \right)}$$

26. (c) The equation of standing wave on a string fixed both ends is

$$y = 2a \sin kx \cos \omega t$$

Here,

$$2a = 5 \text{ mm}$$

$$k = \frac{2\pi}{l}$$

$$\omega = 2\pi\nu = 2\pi \sqrt{\left(\frac{T}{\mu l^2} \right)}$$

$$\therefore y = (5 \text{ mm}) \sin \frac{2\pi}{l} x \cos 2\pi \sqrt{\left(\frac{T}{\mu l^2} \right)} t$$

27. (b)

28. (c)

29. (c)

30. (b)

31. (c) To produce an octave, force should be 4 times the initial value as octave has double frequency.

 32. (b) Let length of string = l

$$18n = l$$

$$16(n+1) = l$$

$$n = 8$$

$$l = 144 \text{ cm}$$

33. (c)

34. (b) Propagation constant is a vector quantity.

$$\therefore \mathbf{k} = k_x \hat{i} + k_y \hat{j} + k_z \hat{k}$$

Here,

$$k_x = \frac{\omega}{v_x} = \frac{\omega}{c_1}$$

$$k_y = \frac{\omega}{v_y} = \frac{\omega}{c_2}$$

and

$$k_z = \frac{\omega}{v_z} = \frac{\omega}{c_3}$$

$$\therefore \mathbf{k} = \frac{\omega}{c_1} \hat{i} + \frac{\omega}{c_2} \hat{j} + \frac{\omega}{c_3} \hat{k}$$

 35. (a) $\Delta x = ct$

... (i)

$$\therefore \Delta\phi = \frac{2\pi}{\lambda} \Delta x = \frac{2\pi}{c/f} \Delta x$$

$$= \frac{2\pi ct}{c/f} = 2\pi ft$$

[from Eq. (i)]

$$= 2\pi \times 500 \times 10^{-3}$$

$$= \pi \text{ rad}$$

$$36. (b) y = 4 \sin \left(2t + \frac{x}{8} \right)$$

... (i)

$$\text{or } y = 4 \sin \left(\frac{\pi}{2} t + \frac{\pi x}{32} \right)$$

... (ii)

The standard equation is

$$y = 4 \sin (\omega t \pm kx)$$

Comparing the Eq. (i) with Eq. (ii), we get

$$\begin{aligned}
 k &= \frac{\pi}{32} \\
 \therefore \frac{2\pi}{\lambda} &= \frac{\pi}{32} \\
 \therefore \frac{\lambda}{2} &= 32 \\
 \therefore \lambda &= 64 \\
 \therefore \Delta\phi &= \frac{2\pi}{\lambda} \Delta x \\
 &= \frac{2\pi}{64} \times 16 = \frac{\pi}{2} = 90^\circ
 \end{aligned}$$

BITSAT Archives

1. (c) The given wave equation is

$$\begin{aligned}
 y &= 3 \sin \frac{\pi}{2} (50t - x) \\
 \Rightarrow y &= 3 \sin \left(25\pi t - \frac{\pi}{2} x \right) \quad \dots(i)
 \end{aligned}$$

Comparing with standard equation

$$\begin{aligned}
 y &= a \sin(\omega t - kx) \quad \dots(ii) \\
 \omega &= 25\pi, k = \pi/2
 \end{aligned}$$

Wave velocity,

$$v = \frac{\omega}{k} = \frac{25\pi}{\pi/2} = 50 \text{ m/s}$$

2. (a) Since, it vibrates in 4 segments, so we must get 5 nodes and 4 antinodes.

$$\Rightarrow 2 = 2\lambda \Rightarrow \lambda = 1 \text{ m}$$

Distance between two consecutive nodes is

$$\frac{\lambda}{2} = \frac{1}{2} = 0.5 \text{ m}$$

3. (c) $y(x, t) = \frac{a}{(x \pm vt)^2 + b}$ is another form of progressive

wave equation propagating with a speed v . Negative sign to be taken for propagation along $+x$ -axis and positive sign to be taken for propagation along $-x$ -axis.

4. (d) It is clear from figure that at $t = 0$, $x = 0$ displacement $y = 0$. Therefore, option (a) or (b) may be correct.

In case of (d), $y = A \sin(kx - \omega t)$

$$\frac{dy}{dt} = A \cos(kx - \omega t)(-\omega)$$

$$\frac{dy}{dx} = A \cos(kx - \omega t)(k)$$

$$37. (a) y(x, t) = e^{-(ax^2 + bt^2 + 2\sqrt{ab}xt)} = e^{-(\sqrt{a}x + \sqrt{b}t)^2}$$

It is a function of type

$$y = f(\omega t + kx)$$

$\therefore y(x, t)$ represents wave travelling along $-x$ -direction.

$$\text{Speed of wave} = \frac{\omega}{k} = \frac{\sqrt{b}}{\sqrt{a}} = \sqrt{\frac{b}{a}}$$

$$\begin{aligned}
 38. (b) \text{ We know } E_0 &= 2\pi^2 \rho A^2 v^2 = \frac{1}{2} \rho A^2 \omega^2 \\
 &= \frac{1}{2} \times 15 \times (0.02)^2 (220\pi)^2 \times 10^{-4} \\
 E_0 &= 143.2 \times 10^{-4} \text{ J/m}^3
 \end{aligned}$$

$$\therefore \frac{dy/dt}{dy/dx} = \frac{-\omega A \cos(kx - \omega t)}{kA \cos(kx - \omega t)}$$

$$\frac{dx}{dt} = -\frac{\omega}{k} = -v$$

$$\therefore \frac{dy}{dt} = -v \left(\frac{dy}{dx} \right)$$

i.e. particle velocity = $-(\text{wave speed}) \times \text{slope}$.

And slope at $x = 0$ and $t = 0$ is positive in figure. Therefore, particle velocity is in negative y -direction. Therefore, (d) is correct option.

$$5. (a) v = \frac{\sin i}{\sin r} = \frac{v_1}{v_2}$$

$$\Rightarrow \sin r = \sin 30^\circ \times \frac{2v}{v}$$

$$\Rightarrow \sin r = \frac{1}{2} \times 2 \times 1$$

$$\Rightarrow r = 90^\circ$$

$$6. (d) v = \frac{\text{Coefficient of } t}{\text{Coefficient of } x} = \frac{2\pi / 0.01}{2\pi / 0.3} = 30 \text{ m/s}$$

$$7. (d) x_1 = 2 \sin \omega t \text{ and } x_2 = 4 \sin(\omega t + 90^\circ)$$

The phase difference between the two waves is 90° .

So, resultant amplitude

$$\begin{aligned}
 a &= \sqrt{(3)^2 + (4)^2} = \sqrt{9 + 16} = \sqrt{25} \\
 &= 5 \text{ unit}
 \end{aligned}$$

8. (b) The time taken by the particle to come to mean position from the trough = $\frac{T}{4}$

14

Sound Wave

Introduction

Sound may be defined as the physical cause which enables us to have the sensation of hearing. Sound wave is a longitudinal wave.

Longitudinal Waves

In this wave motion, the particles of the medium oscillate about their mean or equilibrium position along the direction of propagation of the wave motion itself. Longitudinal wave travels in the form of compression and rarefactions.

- **Compression** It is a region of the medium in which particles are compressed (i.e. come closer), so distance between particles become less than the normal distance between them.
- **Rarefaction** It is a region of the medium in which particles of the medium are rarefied, i.e. particles get farther apart than the normal distance between them.

Speed of Longitudinal Wave (or Sound Wave)

According to Newton's formula, speed of sound in a gas is

(i) Newton's Formula

$v = \sqrt{\frac{B}{D}}$, where B denotes bulk modulus of elasticity and D denotes density of medium.

(ii) Laplace's Correction

For gases, E = coefficient of adiabatic elasticity.

$$E = \gamma p$$

Here, p is the pressure of the gas.

$$v = \sqrt{\frac{\gamma p}{D}}, \text{ where } \gamma \text{ denotes adiabatic constant} = \frac{C_p}{C_v}$$

(iii) Effect of Temperature on Velocity

With rise in temperature then velocity of sound increases

$$\text{as } v = \sqrt{\frac{\gamma RT}{M}}; \frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}}$$

$$\text{i.e. } v \propto \sqrt{T}$$

(iv) Effect of Pressure for Gases Medium

$\frac{P}{D}$ remains constant. Pressure has no effect on the velocity of sound, provide temperature remains constant.

(v) Effect of Humidity

When humidity in air increases, its density decreases and so velocity of sound increases.

$$\text{For solids, } v = \sqrt{\frac{Y}{D}}. \text{ For liquids, } v = \sqrt{\frac{K}{D}}$$

where, Y = Young's modulus of elasticity

K = bulk modulus of elasticity.

(vi) Effect of Wind Velocity

The velocity of sound in a particular direction is the algebraic sum of the velocity of sound and the component of wind velocity.

NOTE The density of a gas mixture can be calculated as

$$\rho_m = \frac{\rho_1 V_1 + \rho_2 V_2 + \dots + \rho_n V_n}{V_1 + V_2 + \dots + V_n}$$

where, ρ_m = Density of the gas mixture

$\rho_1 \dots \rho_n$ = Density of each of the components

$V_1, V_2 \dots V_n$ = Volume share of each of the components

Sound Waves

Mechanical waves in air having a frequency ranging from 20 Hz to 20 kHz are known as **audio waves** or sound waves. Waves having frequencies less than 20 Hz are known as the infrasonic waves. Waves in air having frequencies greater than 20 kHz are known as **ultrasonic waves**.

Sound waves do not undergo polarisation. Transverse waves only get polarised.

Sound exhibits reflection, refraction, interference and diffraction but not polarisation. A person can emit 5 syllables in 1s. Each syllable is produced in 0.2 s.

Relation between Phase Difference, Path Difference and Time Difference

$$\text{Phase difference } (\phi) = \frac{2\pi}{\lambda} \times \text{path difference } (x)$$

$$\Rightarrow \phi = \frac{2\pi x}{\lambda} \Rightarrow x = \frac{\phi \lambda}{2\pi}$$

$$\text{Phase difference } (\phi) = \frac{2\pi}{T} \times \text{time difference } (t)$$

$$\Rightarrow \phi = \frac{2\pi t}{T}$$

$$\Rightarrow t = \frac{T\phi}{2\pi}$$

$$\text{Time difference } (t) = \frac{T}{\lambda} \times \text{path difference } (x)$$

$$\Rightarrow t = \frac{Tx}{\lambda} \Rightarrow x = \frac{\lambda t}{T}$$

(i) For a wave, velocity

$$v = \text{frequency } (n) \times \text{wavelength } (\lambda)$$

$$\Rightarrow v = n\lambda$$

$$(ii) \text{ Angular speed, } \omega = 2\pi n = \frac{2\pi}{T} = \frac{2\pi v}{\lambda}$$

Reflection and Transmission of Waves

When sound waves are incident on a boundary separating two media, a part of it is reflected back into the initial medium while the remaining is partly absorbed and partly transmitted into the second medium.

Characteristics

(i) In case of reflection and transmission of sound, the frequency of the wave remains unchanged, i.e. $\omega_i = \omega_r = \omega_t = \omega$.

(ii) The incident ray, the reflected ray, normal and the refracted ray are always in the same plane.

(iii) In case of reflection of sound, angle of incidence = angle of reflection

(iv) In case of refraction of sound, $\frac{\sin i}{\sin r} = \frac{v_i}{v_t}$

(v) When a longitudinal wave is reflected from a denser medium, compression and as rarefaction do not invert after reflection.

Standing Wave in Organ Pipes

Organ pipes are the musical instruments which are used for producing musical sound by blowing air into the pipe.

Closed Organ Pipes

If one end of a pipe is closed, the reflected wave is 180° out of phase with the incoming wave. The displacement of the small volume elements at the closed end must always be zero. Hence, the closed end must be a displacement node.

Various modes of vibrations of air column in a closed organ pipe are shown below

First harmonic (fundamental mode)		$\Rightarrow l = \frac{\lambda_1}{4}$ $\Rightarrow \lambda_1 = 4l$ $\Rightarrow f_1 = \frac{v}{4l}$
Third harmonic (first overtone)		$\Rightarrow l = \frac{3\lambda_3}{4}$ $\Rightarrow \lambda_3 = \frac{4l}{3}$ $\Rightarrow f_3 = \frac{3v}{4l}$ $\Rightarrow f_3 = 3f_1$
Fifth harmonic (second overtone)		$\Rightarrow l = \frac{5\lambda_5}{4}$ $\Rightarrow \lambda_5 = \frac{4l}{5}$ $\Rightarrow f_5 = \frac{5v}{4l}$ $\Rightarrow f_5 = 5f_1$
Note In open organ pipe, only odd harmonics are present nth harmonic $\lambda_n = \frac{4l}{(2n-1)}$ $v_n = (2n-1)v_1$		

Open Organ Pipes

If both ends of a pipe are open and a system of air is directed against an edge, standing longitudinal waves can be set up in the tube. The open end has a displacement antinode.

Various modes of vibration of air column in an open organ pipe are shown below

First harmonic (fundamental mode)		$\Rightarrow l = \frac{\lambda_1}{2}$ $\Rightarrow \lambda_1 = 2l$ $\Rightarrow f_1 = \frac{v}{2l}$
Second harmonic or first overtone		$\Rightarrow l = \lambda_2$ $\Rightarrow f_2 = \frac{2v}{2l}$ $\Rightarrow f_2 = 2f_1$
Third harmonic or second overtone		$\Rightarrow l = \frac{3\lambda_3}{2}$ $\Rightarrow f_3 = \frac{3v}{2l}$ $\Rightarrow f_3 = 3f_1$
nth harmonic $f_n = nf_1$ $\lambda_n = 2l/n$		

Beats

- When two sound waves of nearly equal (but never equal) or slightly different frequencies and equal or nearly equal amplitudes travelling along the same direction superimpose at a given point, the resultant sound intensity alternately rises and falls. This alternate rise and fall of sound at a given position is called **beats**.
- One beat is said to be formed when starting from minimum sound the intensity once rises to its maximum value and then falls back to the minimum level.
- Number of beats formed per second is called the frequency of beats. If two sound waves of frequencies v_1 and v_2 superimpose, then frequency of beats $= (v_1 - v_2)$, i.e. either $(v_1 - v_2)$ or $(v_2 - v_1)$.
- For formation of distinct beats then difference between the frequencies of two superposing notes should be less than 10 Hz.
- If source of sound is linear, then at a distance d from the line source, $I = \frac{P}{2\pi / d}$
- Our perception of loudness is better correlated with the second level measured in decibel (dB) and defined as follows $\beta = 10 \log_{10} \left(\frac{I}{I_0} \right)$, where $I_0 = 10^{-12} \text{ Wm}^2$ at 1 kHz.

Doppler's Effect in Sound

When apparent change in the frequency of sound caused by the relative motion between source of sound and the observer, it is called Doppler's effect. Doppler's effect is a wave phenomena, it holds not only for sound waves but also for electromagnetic waves. So, change in frequency can be analysed under three different situations

- Observer is stationary but the source is moving.
- Observer is moving but the source is stationary.
- Both the observer and source are moving.

Expression for Apparent Frequency

Consider a source of sound and an observer are moving with velocity v_s and v_o , respectively. The source is provided a sound of frequency f and the frequency of sound heard by the observer be f' .

Velocity of sound w.r.t. source $= v - v_s$

Apparent wavelength, $\lambda' = \frac{v - v_s}{f}$

Velocity of sound wave w.r.t. listener $= v - v_o$

Wavelength of wave reacting by the listeners $= \lambda'$

Hence, apparent frequency of sound wave heard by listener is

$$f' = \frac{v - v_o}{\lambda'} = \frac{v - v_o}{v - v_s} f$$

Change in frequency can be analysed under different situations, which are given below

- (i) If source is moving towards _____
listener but listener is at rest,
then v_s is positive and
 $v_o = 0$

$$\therefore f' = \frac{v}{v - v_s} \times f, \text{ i.e. } f' > f$$

- (ii) If source is moving away _____
from listener but listener is
at rest, then v_s is negative
and $v_o = 0$.

$$\therefore f' = \left(\frac{v}{v - (-v_s)} \right) \times f = \left(\frac{v}{v + v_s} \right) \times f$$

$$\text{i.e. } f' < f$$

- (iii) If source is at rest and
listener is moving away _____
from source, then $v_s = 0$ and
 v_o is positive.

$$\therefore f' = \left(\frac{v - v_o}{v} \right) \times f$$

$$\text{i.e. } f' < f$$

- (iv) If source is at rest and
listener is moving towards _____
the source, then $v_s = 0$ and
 v_o is negative.

$$\therefore f' = \left[\frac{v - (-v_o)}{v} \right] \times f = \left(\frac{v + v_o}{v} \right) \times f$$

$$\text{i.e. } f' > f$$

- (v) If source and listener are approaching each other,
then v_s is positive and v_o is negative.

$$\therefore f' = \left[\frac{v - (-v_o)}{v - v_s} \right] \times f = \left(\frac{v + v_o}{v - v_s} \right) \times f$$

$$\text{i.e. } f' > f$$

- (vi) If source and listener are moving away from each
other, then v_s is negative and v_o is positive.

$$\therefore f' = \left[\frac{v - v_o}{v - (-v_s)} \right] \times f = \left(\frac{v - v_o}{v + v_s} \right) \times f$$

$$\text{i.e. } f' < f$$

- (vii) If source and listener both are in motion in the same
direction and with same velocity, then

$$\therefore f' = \left[\frac{(v - v')}{(v - v')} \right] \times f$$

$$\text{i.e. } f' = f$$

- (viii) If source and listener moves at right angles to the
direction of wave propagation, then velocity of
source and listener along the direction of wave
propagation is $v_s \cos 90^\circ = 0$ and $v_o \cos 90^\circ = 0$

$$\therefore f' = \frac{(v - 0)}{(v - 0)} \times f \text{ or } f' = f$$

NOTE • Velocity of source and observer measured in above expressions are with respect to the medium in which the sound wave travels.

• If the medium carrying the sound wave is itself moving then we have to consider speed of the wave relative to the speed of the medium.

Practice Exercise

- A physicist points out that glass is rarer than water.
 - This statement is correct in the case of sound
 - This statement is always wrong
 - This statement is correct in the case of light
 - This statement is always correct
- When height increases, velocity of sound decreases
 - this is due to decrease of pressure
 - this is due to decrease in temperature
 - this is due to both decrease in temperature and pressure
 - statement is wrong
- The velocity of sound is not affected by change in
 - temperature
 - medium
 - pressure
 - wavelength
- If copper has modulus of rigidity $4 \times 10^{10} \text{ N/m}^2$ and Bulk modulus $1.2 \times 10^{11} \text{ N/m}^2$ and density 9 g/cm^3 , then find the velocity of longitudinal wave, when set-up in solid copper.
 - 4389 m/s
 - 5000 m/s
 - 4000 m/s
 - 4300 m/s
- A piezo electric quartz plate of Young's modulus of elasticity $8 \times 10^{10} \text{ N/m}^2$ and density $2.65 \times 10^3 \text{ kg/m}^3$ is vibrating in resonant condition. The fundamental frequency of vibrating is 550 kHz. What is thickness of the plate?
 - 0.05 cm
 - 0.5 cm
 - 1.25 cm
 - 0.55 cm

6. The value of adiabatic constant γ for oxygen and nitrogen is same. The speed of sound in oxygen is 470 m/s at STP. The speed of sound in nitrogen at STP is
 a. 340 m/s b. 580 m/s
 c. 502 m/s d. None of these
7. At STP, the speed of sound in hydrogen is 1324 m/s then the speed of sound in air
 a. 331 m/s b. 220 m/s c. 340 m/s d. 230 m/s
8. If the speed of sound is changed by 1 per cent, how much must the temperature of air near 0°C be changed
 a. 5°C b. 6°C c. 5.5°C d. 6.5°C
9. If the speed of sound wave in a stretched string is v and Hooke's law is obeyed, then the extension in string is x . Find the extension in the string if the speed of sound wave will become $1.22v$.
 a. $1.5x$ b. $1x$ c. $0.5x$ d. $2x$
10. A boy watches a jet plane flying from north to south. When the jet is just seen above his head, the sound of jet appears to reach him making some angle with horizontal from north. If the velocity of sound is v and velocity of jet is $v/2$, then find the angle.
 a. 60° b. 30° c. 45° d. 15°
11. A stone is dropped into a lake from a tower of 500 m high. The sound of the splash will be heard by the man approximately after (Take $g = 10\text{ ms}^{-2}$)
 a. 11.5 s b. 21 s c. 10 s d. 14 s
12. A light pointer fixed to one prong of a tuning fork touches a vertical plate. The fork is set vibrating at a frequency of 56 Hz and allowed to free fall. Calculate how many complete oscillation are counted when plate falls at 10 cm.
 a. 10 b. 9 c. 8 d. 7
13. The equation of a sound wave in air is $P = 0.01 \cos(1000t - 3x)$ where, P , x and t are in SI. The bulk modulus of elasticity is $1.4 \times 10^5 \text{ N/m}^2$. The displacement amplitude is
 a. 0.24 m b. $0.24 \times 10^{-7} \text{ m}$
 c. $8 \times 10^{-7} \text{ m}$ d. 10 m
14. A sound wave of pressure amplitude 14 pascal propagates through the air medium. The normal pressure of air is $1.0 \times 10^5 \text{ N/m}^2$. The difference between maximum and minimum pressure in the medium is
 a. $5 \times 10^5 \text{ N/m}^2$ b. $10 \times 10^5 \text{ N/m}^2$
 c. 10 N/m^2 d. None of these
15. A sound wave having a frequency of 100 Hz and pressure amplitude of 10 Pa, then calculate the displacement amplitude (Given speed of sound in air = 340 m/s and density of air = 1.29 kg/m^3)
 a. $3.63 \times 10^{-5} \text{ m}$ b. $3 \times 10^{-5} \text{ m}$
 c. $4.2 \times 10^{-5} \text{ m}$ d. $6.4 \times 10^{-5} \text{ m}$
16. When a wave is propagated from rarer medium to denser medium. Which of the following will remain unchanged?
 a. Wave speed b. Propagation constant
 c. Frequency d. None of these
17. A sonar system fixed in a submarine operates at a frequency 40.0 kHz. An enemy submarine moves towards the sonar with a speed of 360 km/h. What is the frequency of sound reflected by the submarine? (Take the speed of sound in water to be 1450 m/s)
 a. 52.3 kHz b. 45.93 kHz c. 62.49 Hz d. 54.34 kHz
18. A small speaker has a capacity of power 3 W. A microphone is placed at distance 2 m from the speaker. Find the displacement amplitude of particles of air near the microphone. The frequency of sound emitted by speaker is 1.0 kHz.
 (Density of air = 1.2 kg/m^3) and speed of sound in air = 330 m/s)
 a. $2.76 \times 10^{-4} \text{ cm}$ b. $4 \times 10^{-4} \text{ cm}$
 c. $10 \times 10^{-4} \text{ cm}$ d. $3.8 \times 10^{-3} \text{ cm}$
19. From a height of 2 m, a drop of water of radius $2 \times 10^{-3} \text{ m}$ fall and produces a sound. The sound produced can be heard upto a distance of 20 m. If the gravitational energy is converted into sound energy in 0.5 s, then calculate the intensity at a distance of 20 m.
 a. $2 \times 10^{-7} \text{ W/m}^2$ b. $2.6 \times 10^{-6} \text{ W/m}^2$
 c. $2.6 \times 10^{-7} \text{ W/m}^2$ d. $3 \times 10^{-7} \text{ W/m}^2$
20. Velocity of sound wave in air is 330 m/s for a particular sound in air. A path difference of 40 cm is equivalent to a phase difference of 1.6π . The frequency of this wave is
 a. 165 Hz b. 150 Hz c. 660 Hz d. 330 Hz
21. A tuning fork A of frequency 512 Hz produces 4 beats per second when sounded with a tuning fork B. Due to filing of the prongs of the tuning fork B, the number of the beats per second becomes 6. The actual frequency of B is
 a. 516 Hz b. 508 Hz
 c. 512 Hz d. None of these
22. A tuning fork A of frequency 260 c/s produces 4 beats per second with tuning fork B. When the tuning fork A is loaded with wax, then the number of beats produced per second becomes 3. Then, what is the frequency of tuning fork B?
 a. 264 b. 263 c. 256 d. 260
23. When temperature of air is 20°C , a tuning fork sounded over the open end of an air column produces 4 beats per second, the tuning fork given a lower note. If the frequency of tuning fork is 34 Hz, then find how many beats will be produced by the tuning fork if temperature falls to 5°C ?
 a. 2 beat/s b. 4 beat/s c. 1 beat/s d. 3 beat/s

24. Two wires A and B are of same length, radius and same material are in unison. If tension in A is increased by 4%, 4 beats are heard, then the frequency of the note produced when they were in unison, will be
a. 50 Hz b. 100 Hz c. 150 Hz d. 200 Hz
25. The velocity of sound in air at NTP is 331 m/s. Find its velocity when temperature rises to 91°C and its pressure is doubled.
a. 372 m/s b. 382.1 m/s c. 423 m/s d. 392.5 m/s
26. The fundamental frequency of a closed organ pipe is equal to second overtone of an open organ pipe. If the length of closed organ pipe is 15 cm. The length of open organ pipe is
a. 90 cm b. 30 cm c. 15 cm d. 20 cm
27. An organ pipe closed at one end resonates with a tuning fork of frequencies 180 Hz and 300 Hz. It will also resonate with tuning fork of frequencies
a. 360 Hz b. 420 Hz c. 480 Hz d. 540 Hz
28. Figures shows the vibrations of four air columns. The ratio of frequencies $n_p : n_q : n_r : n_s$ is

- a. 12 : 6 : 3 : 4 b. 1 : 2 : 4 : 3
c. 4 : 2 : 3 : 1 d. 4 : 3 : 2 : 1
29. A steel rod 100 cm long is clamped at its middle. The fundamental frequency of longitudinal vibrations of the rod are given to be 2.53 kHz. What is the speed of sound in steel?
a. 6.2 km/s b. 5.06 km/s c. 7.23 km/s d. 7.45 km/s
30. Two organ pipes are emitting their fundamental notes, when each closed at end, give 5 beat/s. If their fundamental frequencies are 250 Hz and 255 Hz, then find the ratio of their lengths.
a. $\frac{49}{50}$ b. $\frac{49}{51}$ c. $\frac{50}{51}$ d. $\frac{51}{50}$
31. In the case of vibration of closed end organ pipe in fundamental mode of vibration, the pressure is maximum at
a. open end b. closed end
c. at middle d. None of these
32. An air column in a pipe which is closed at one end will be in resonance with a vibrating tuning fork of frequency 264 Hz if the length of the air column in cm is (Speed of sound in air = 340 m/s)
a. 32.19 cm b. 64.39 cm c. 100 cm d. 140 cm

33. When two waves of almost equal frequencies n_1 and n_2 are produced simultaneously, then the time interval between successive maxima is

a. $\frac{1}{n_1 - n_2}$ b. $\frac{1}{n_1} - \frac{1}{n_2}$ c. $\frac{1}{n_1} + \frac{1}{n_2}$ d. $\frac{1}{n_1 + n_2}$

34. A metal rod of length 1.5 m is clamped at the centre. When it is set with longitudinal vibrations it emits a note of 1000 Hz. Determine the Young's modulus if the density of material = $8 \times 10^3 \text{ kg/m}^3$

a. $7 \times 10^{10} \text{ N/m}^2$ b. $7.2 \times 10^{10} \text{ N/m}^2$
c. $0.7 \times 10^{10} \text{ N/m}^2$ d. $6.8 \times 10^{10} \text{ N/m}^2$

35. A long tube of length $l = 25 \text{ cm}$ and diameter equal to 2 cm is taken and at its mouth air is blown as shown in figure. The sound emitted by tube will have all the frequencies of the group (velocity of sound = 330 m/s)

a. 660, 1320, 2640 Hz b. 660, 1000, 3300 Hz
c. 302, 684, 1320 Hz d. 330, 990, 1690 Hz

36. In the above situation, bus is at rest blowing horn of frequency f_0 . A boy is at rest at some distance. What will be apparent frequency of sound, if the air start moving with the speed of 20 m/s from bus towards boy?

a. $< f_0$ b. $> f_0$ c. $= f_0$ d. None of these

37. The first overtone of an open organ pipe beats with the first overtone of a closed organ pipe with a beat frequency of 2.2 Hz. The fundamental frequency of closed organ pipe is 110 Hz. Find length of the open pipe. (Given, sound in air = 330 m/s)

a. 2.43 m b. 0.73 m c. 0.993 m d. 2.93 m

38. The apparent frequency is f_1 when a source of sound approaches a stationary observer with a speed u and f_2 when the observer approaches the stationary source with same speed. If v is the velocity of sound, then

a. $f_1 = f_2$ b. $f_1 > f_2$ if $u < v$
c. $f_2 > f_1$ if $u < v$ d. $f_2 > f_1$ if $u < v$

39. A locomotive engine approaches a railway station and whistles at a frequency of 400 Hz. A stationary observer on the platform observes a changes of 40 Hz as the engine passes across him. If the velocity of sound is 330 m/s. The speed of the engine is

a. 33 m/s b. 18 m/s c. 16.5 m/s d. 24 m/s

40. Two trains, one moving at a speed of 30 mile/h and other at 60 mile/h, approaching each other. When a faster train blows a whistle, the apparent frequency of the note heard by an observer at rest behind the faster train is 1852 Hz. Calculate the frequency of note produced by faster train (Assume speed of sound to be 1100 ft/s)
- a. 2000 vib/s b. 1500 vib/s c. 1000 vib/s d. 2500 vib/s
41. A boy with a radio, playing a music at a frequency ' f ', is moving towards a wall with velocity v_b . A motorist is following the boy with a speed v_m . Find the expression for the beat frequency heard by the motorist., if the speed of sound is v

$$\begin{array}{ll} \text{a. } \left(\frac{v + v_m}{v + v_b} \right) f & \text{b. } \frac{v + v_m}{v - v_b} f \\ \text{c. } \frac{2v_b(v + v_m)}{(v^2 - v_b^2)} f & \text{d. } \frac{2v_m(v + v_b)}{(v^2 - v_m^2)} f \end{array}$$

42. There is a road between two parallel rows of building and distance between the rows of building is 106 m. Find the velocity of car if a car blows a horn whose echo is heard by the driver after 1 s. (Given, speed of sound = 340 m/s)
- a. 180 m/s b. 165 m/s
c. 323 m/s d. 150 m/s

BITSAT Archives

1. A sound source is moving towards stationary listener with $\frac{1}{10}$ th of the speed of sound. The ratio of apparent to real frequency is [2012]
- a. $\left(\frac{9}{10}\right)^2$ b. $\frac{10}{9}$
c. $\frac{11}{10}$ d. $\left(\frac{11}{10}\right)^2$
2. The produced rays in sonography are [2012]
- a. microwaves
b. infrared waves
c. sound waves
d. ultra sound
3. The source of sound generating a frequency of 3 kHz reaches an observer with a speed of 0.5 times the velocity of sound in air. The frequency heard by the observer is [2011]
- a. 1 kHz b. 2 kHz
c. 4 kHz d. 6 kHz
4. If v_m is the speed of sound in moist air and v_d is the speed of sound in dry air under identical conditions of pressure and temperature, then [2011]
- a. $v_m > v_d$
b. $v_m < v_d$
c. $v_m = v_d$
d. $v_m \cdot v_d = 1$
5. Two loudspeakers L_1 and L_2 , driven by a common oscillator and amplifier, are arranged as shown. The frequency of the oscillator is gradually increased from zero and the detector at D records a series of maxima

and minima. If the speed of sound is 330 ms^{-1} , then the frequency at which the first maximum is observed is [2010]

- a. 165 Hz b. 330 Hz c. 495 Hz d. 660 Hz
6. When a sound wave of wavelength λ is propagating in a medium, the maximum velocity of the particle is equal to the wave velocity. The amplitude of wave is [2008]
- a. λ b. $\frac{\lambda}{2}$ c. $\frac{\lambda}{2\lambda}$ d. $\frac{\lambda}{4\lambda}$
7. The disc of a siren containing 60 holes rotates at a constant speed of 360 rpm. The emitted sound is in unison with a tuning fork of frequency [2005]
- a. 10 Hz b. 360 Hz c. 216 Hz d. 60 Hz
8. The ratio of velocity of sound in hydrogen and oxygen at STP is [2005]
- a. 16 : 1 b. 8 : 1 c. 4 : 1 d. 2 : 1
9. In an experiment with sonometer a tuning fork of frequency 256 Hz resonates with a length of 25 cm and another tuning fork resonates with a length of 16 cm. Tension of the string remaining constant the frequency of the second tuning fork is [2005]
- a. 163.84 Hz b. 400 Hz
c. 320 Hz d. 204.8 Hz

Answer with Solutions

Practice Exercise

1. (a) 2. (b) 3. (c) 4. (a)

$$5. (b) \text{ Here, } c = \sqrt{\left(\frac{Y}{\rho}\right)} = \sqrt{\left(\frac{8 \times 10^{10}}{2.65 \times 10^3}\right)}$$

$$= \sqrt{\left(\frac{80 \times 10^6}{2.65}\right)} = 5494.4 \text{ m/s}$$

$$\therefore \lambda = \frac{c}{f} = \frac{5494.4}{550 \times 10^3}$$

$\therefore$ For fundamental mode of vibration, thickness

$$t = \frac{\lambda}{2} = 0.4995 = 0.5 \text{ cm}$$

$$6. (c) c = \sqrt{\left(\frac{\gamma RT}{M}\right)}$$

$$\therefore \frac{c_2}{c_1} = \sqrt{\left(\frac{M_1}{M_2}\right)} \text{ or } \frac{c_{\text{nitrogen}}}{c_{\text{oxygen}}} = \sqrt{\left(\frac{32}{28}\right)} = \sqrt{\left(\frac{8}{7}\right)}$$

$$\therefore c_{\text{nitrogen}} = \sqrt{\left(\frac{8}{7}\right)} c_{\text{oxygen}} = \sqrt{\left(\frac{8}{7}\right)} \times 470$$

$$= 502.45 \text{ m/s} \approx 502 \text{ m/s}$$

7. (a) Molecular weight of hydrogen = 2

Molecular weight of oxygen = 32

$$\text{Both are diatomic } v_{\text{air}} = \sqrt{\left(\frac{\gamma_{\text{air}} P_{\text{air}}}{\rho_{\text{air}}}\right)}, v_{\text{H}} = \sqrt{\frac{\gamma_{\text{H}} P_{\text{H}}}{\rho_{\text{H}}}}$$

$$\frac{\rho_{\text{air}}}{\rho_{\text{H}}} = \frac{M_{\text{air}}}{M_{\text{H}}} = \frac{32}{2} = \frac{16}{1}$$

$$\frac{v_{\text{air}}}{v_{\text{H}}} = \sqrt{\left(\frac{\gamma_{\text{air}} P_{\text{H}}}{\gamma_{\text{H}} P_{\text{air}}}\right)} \Rightarrow \frac{v_{\text{air}}}{1324} = \sqrt{\left(\frac{\rho_{\text{H}}}{\rho_{\text{air}}}\right)}$$

$$v_{\text{air}} = \frac{1324}{4} = 331 \text{ m/s}$$

8. (c)

9. (a) $T \propto x$

So, $T' \propto x'$

$$v = \sqrt{\left(\frac{T}{m}\right)}; v' = \sqrt{\left(\frac{T'}{m}\right)}$$

$$\frac{v'}{v} = \sqrt{\left(\frac{T'}{T}\right)} \Rightarrow \sqrt{\left(\frac{x'}{x}\right)} = \frac{1.22}{v} \Rightarrow x' \approx 1.5x$$

10. (a) Distance covered by sound to reach the boy
 $= \frac{\text{Distance covered by jet}}{\cos \theta}$

Velocity of jet = (velocity of sound) $\times \cos \theta$

$$\Rightarrow \frac{v}{2} = v \cos \theta \Rightarrow \theta = 60^\circ$$

11. (a)

12. (c) Let n = frequency

and N = number of oscillations

Time taken to fall freely to a distance 10 cm

$$s = \frac{1}{2}gt^2 \Rightarrow t = \sqrt{\frac{2 \times 10}{g}}$$

The frequency of oscillation during this time

$$n = \frac{N}{t} \Rightarrow N = nt \Rightarrow N = 56 \times \sqrt{\frac{2 \times 10}{980}}$$

$$N = 7.999 \approx 8$$

13. (b) The standard equation is

$$p = p_0 \cos(\omega t - x) \quad \dots(i)$$

The given equation is

$$P = 0.01 \cos(1000t - 3x) \quad \dots(ii)$$

Comparing the Eq. (i) and Eq. (ii), we get

$$p_0 = 0.01 \text{ N/m}^2$$

$$\omega = 1000 \text{ rad/s}$$

$$k = 3 \text{ per metre}$$

But

$$p_0 = B \Delta k$$

$$\therefore A = \frac{p_0}{Bk} \quad [B = \text{Bulk modulus of elasticity}]$$

$$= \frac{0.01}{14 \times 10^5 \times 3} = 0.2381 \times 10^{-7} \text{ m} \approx 0.24 \times 10^{-7} \text{ m}$$

14. (c) The minimum pressure is $p_{\text{min}} = (10^5 - 5) \text{ N/m}^2$

The maximum pressure is $p_{\text{max}} = (10^5 + 5) \text{ N/m}^2$

$$\therefore \Delta p = p_{\text{max}} - p_{\text{min}} = 10 \text{ N/m}^2$$

15. (a) 16. (c)

17. (b) Sonar frequency,

$$v_s = 40 \text{ kHz} = 40 \times 10^3 \text{ Hz}$$

Speed of enemy submarine,

$$v_s = 360 \text{ km/h} = 360 \times \frac{5}{18} \text{ m/s} = 100 \text{ m/s} \left(\because 1 \text{ km/h} = \frac{5}{18} \text{ m/s} \right)$$

Speed of sound in water = 1450 m/s

Apparent frequency received by the enemy submarine,

$$v' = \left(\frac{v + v_0}{v}\right) v = \left(\frac{1450 + 100}{1450}\right) \times 40 \times 10^3$$

$$= 42.76 \times 10^3 \text{ Hz}$$

Now, the reflected waves received by sonar having a different frequency

$$v'' = \left(\frac{v}{v - v_s}\right) v'$$

Here, $v_s = 100 \text{ m/s}$ is velocity of enemy submarine.

$$\therefore v'' = \left(\frac{1450}{1450 - 100}\right) \times 42.76 \times 10^3$$

$$= 45.93 \times 10^3 \text{ Hz}$$

$$= 45.93 \text{ kHz}$$

$$18. (a) \because l = \frac{P}{4\pi r^2} = \frac{3}{4\pi \times 2^2} = \frac{3}{16\pi}$$

$$\text{But } l = 2\pi^2 A^2 v^2 \rho_0 c \text{ or } A^2 = \frac{l}{2\pi^2 v^2 \rho_0 c}$$

$$\therefore A = \sqrt{\left(\frac{l}{2\pi^2 v^2 \rho_0 c}\right)} = \sqrt{\left(\frac{3}{16\pi \times 2\pi^2 \times 10^6 \times 12 \times 330}\right)}$$

$$= 0.002764 \times 10^{-3} \text{ m} = 2.76 \times 10^{-4} \text{ cm}$$

19. (c) Change in gravitational energy = mgh

$$= \left(\frac{4}{3}\pi r^3\right) \rho gh \text{ joule}$$

$$\text{Hence, power} = \frac{\frac{4}{3}\pi r^3 \rho gh}{t} \text{ watt}$$

$$\text{and intensity} = \frac{\frac{4}{3}\pi r^3 \rho gh}{(4\pi R^2)t} = 2.6 \times 10^{-7} \text{ Wm}^2$$

20. (c) As, phase difference = $\frac{2\pi}{\lambda} \times \text{Path difference}$

$$\Rightarrow 1.6\pi = \frac{2\pi}{\lambda} \times 40 \Rightarrow \lambda = 50 \text{ cm} = 0.5 \text{ m}$$

$$\text{Now, as } v = \lambda f \Rightarrow f = \frac{v}{\lambda} = \frac{330}{0.5} = 660 \text{ Hz}$$

21. (a) Due to filing, frequency of tuning fork B increases. Since, after filing beats frequency increases.

$$\therefore f_B > f_A \quad \therefore f_B - f_A = 4$$

$$\therefore f_B = 4 + f_A = 4 + 512 = 516 \text{ Hz}$$

22. (c) When tuning fork A is loaded with wax, then its frequency decreases

$$\therefore f_A - f_B = 4 \quad \therefore 260 - f_B = 4$$

$$\therefore f_B = 256 \text{ Hz}$$

23. (d) Let beat produced at $5^\circ\text{C} = b$

$$\text{Frequency of air column at } 20^\circ\text{C} = 34 + 4$$

$$\text{Frequency of air column at } 5^\circ\text{C} = 34 + b$$

$$\text{Ratio of velocity of sound at temperature } 20^\circ\text{C and } 5^\circ\text{C}$$

$$\frac{v_{20^\circ}}{v_{5^\circ}} = \sqrt{\left(\frac{273 + 20}{273 + 5}\right)} \Rightarrow \frac{34 + 4}{34 + b} = \sqrt{\left(\frac{293}{278}\right)}$$

$$b = 3 \text{ beat/s}$$

$$24. (d) \frac{104}{100} = \left(\frac{n+4}{n}\right)^2 \text{ or } \sqrt{\frac{104}{100}} = \frac{n+4}{n} \Rightarrow n = 200 \text{ Hz}$$

25. (b) Given velocity of sound in air $v_0 = 331 \text{ m/s}$

$$t = 91^\circ\text{C}$$

$$v_t = v_0 \sqrt{\frac{273 + t}{273}} = 331 \sqrt{\frac{273 + 91}{273}} = 331 \sqrt{1 + \frac{91}{273}}$$

$$v_t = 331 \sqrt{1 + \frac{1}{3}} = 331 \times \frac{2}{\sqrt{3}}$$

$$= 382.1 \text{ m/s}$$

26. (a) For closed organ pipe $f_1 = \frac{v}{4l_1}$ [for fundamental]

$$\text{For open organ pipe, } f_2 = \frac{3v}{2l_2} \quad [\text{second overtone}]$$

$$\therefore f_1 = f_2 \quad \therefore \frac{v}{4l_1} = \frac{3v}{2l_2} \Rightarrow \frac{l_2}{l_1} = 6$$

$$\therefore l_2 = 6l_1 = 6 \times 15 = 90 \text{ cm}$$

27. (b) Resonate frequencies are $n_1 f$ and $n_2 f$, where n_1 and n_2 are integers and f is fundamental frequency.

$$\text{Here, } n_1 f = 180 \text{ and } n_2 f = 300$$

$$\therefore \frac{n_1}{n_2} = \frac{180}{300} = \frac{18}{30} = \frac{3}{5} \quad \therefore n_1 = 3 \text{ and } n_2 = 5$$

$$\therefore 3f = 180 \quad \therefore f = \frac{180}{3} = 60 \text{ Hz}$$

Possible harmonics in the case of closed end organ pipe is 1, 3, 5, 7, 9, 11, 13, ...

The corresponding frequencies are 60, 180, 300, 420, ...

28. (b)

29. (b) In fundamental mode,

$$l = 2\left(\frac{\lambda}{4}\right) = \frac{\lambda}{2} \Rightarrow \lambda = 2l$$

$$\text{Given, } l = 100 \text{ cm, } v = 253 \text{ kHz}$$

$$\text{Using } v = \lambda f$$

$$\Rightarrow v = 2.53 \times 10^3 \times 2 \times 1000 \times 10^{-2}$$

$$= 5.06 \times 10^3 \text{ m/s} = 5.06 \text{ km/s}$$

30. (c)

31. (b)

32. (a) For fundamental mode of vibration,

$$\therefore \frac{\lambda}{4} = l \quad \therefore \lambda = 4l$$

$$\therefore v = f\lambda \text{ or } 340 = 264 \times 4l$$

$$\therefore l = 32.19 \text{ cm}$$

33. (a) Number of beats per second = $n_1 - n_2$

$$\therefore \text{Time interval between two successive maxima} = \frac{1}{n_1 - n_2}$$

34. (b)

$$35. (a) n = \frac{v}{2l} = \frac{330}{2 \times 25} \times 100 = 660 \text{ Hz}$$

$$n_1 = 2 \times 660 = 1320 \text{ Hz}$$

$$n_2 = 3 \times 660 = 1980 \text{ Hz}$$

36. (c)

37. (c) Fundamental frequency of closed organ pipe,

$$v_c = \frac{v}{4L_c} \Rightarrow L_c = \frac{v}{4 \times 110} = 0.75 \text{ m}$$

Frequency of first overtone of open organ pipe,

$$v_1 = 2 \times \frac{v}{2L_0} = \frac{v}{L_0}$$

Frequency of first overtone of closed organ pipe, $v_2 = 3v_c$

$$= 3 \times \frac{v}{4L_c} = \frac{3 \times 330}{4 \times 0.75} = 330 \text{ Hz}$$

$$\therefore v_1 - v_2 = 2.2; \frac{v}{L_0} - 330 = 2.2$$

$$\Rightarrow \frac{v}{L_0} = 332.2$$

$$\Rightarrow L_0 = \frac{330}{332.2} = 0.993 \text{ m}$$

38. (d) When source approaches the observer,

$$f_1 = \left(\frac{v}{v - v_s} \right) f = \left(\frac{v}{v - u} \right) f = \left\{ \frac{1}{\left(1 - \frac{u}{v} \right)} \right\} f$$

When observer approaches towards the source

$$f_2 = \left(\frac{v + v_o}{v} \right) f = \left(\frac{v + u}{v} \right) f = \left(1 + \frac{u}{v} \right) f$$

$$\therefore f_2 > f_1$$

39. (c) Here,
- $n' = \left(\frac{v}{v - v_s} \right) n$
- and
- $n'' = \left(\frac{v}{v + v_s} \right) n$

According to problem,

$$40 = n' - n'' = \left(\frac{v}{v - v_s} \right) n - \left(\frac{v}{v + v_s} \right) n$$

$$\text{or } 40 = \left(\frac{330 \times 400}{330 - v_s} \right) - \left(\frac{330 \times 400}{330 + v_s} \right)$$

After solving, $v_s = 16.5 \text{ m/s}$

40. (a)
- $\therefore 60 \text{ mile/h} = 88 \text{ ft/s}$

$$n' = \left(\frac{v}{v + v_s} \right) n \text{ or } \left(\frac{1100}{1100 + 88} \right) \times n = 1852$$

$$n = \frac{1852 \times 1188}{1100} = 2000.16 = 2000 \text{ vib/s}$$

41. (c) Motorist will receive two sounds.

$$\text{For direct sound waves, } f' = \left(\frac{v + v_m}{v + v_b} \right) f$$

$$\text{For reflected sound waves } f'' = \left(\frac{v}{v - v_b} \right) \times f$$

 $\Rightarrow$ Sound reflected from wall

$$f''' = \left(\frac{v + v_m}{v} \right) \times f'' = \left(\frac{v + v_m}{v + v_b} \right) f$$

Beat frequency $f''' - f'$

$$= \left(\frac{v + v_m}{v - v_b} \right) f - \left(\frac{v + v_m}{v + v_b} \right) f = \frac{2v_b(v + v_m)}{(v^2 - v_b^2)} f$$

42. (c) Signal goes from A to B. Let the velocity of car =
- v
- .

Distance travelled $AB = v$, $OA = \frac{v}{2}$

$$\frac{2x}{1} = 340 \Rightarrow x = 170 \text{ m}$$

$$(170)^2 = (53)^2 + \frac{v^2}{4}$$

$$\sqrt{4(28900 - 2809)} = v \Rightarrow v = 323 \text{ m/s}$$

BITSAT Archives

1. (b) Given,
- $n_s = \frac{n}{10}$

$$\text{Apparent frequency } n' = n \left(\frac{v}{v - v_s} \right)$$

where, n = real frequency of source v = velocity of sound, v_s = velocity of source

$$\text{So, } \frac{n'}{n} = \frac{v}{v - \frac{v}{10}} = \frac{10}{9}$$

2. (d) The produced rays in sonography are ultrasound.

3. (d) Apparent frequency heard will be
- $n' = n \left(\frac{v}{v - v_s} \right)$

 v = velocity of sound, v_s = velocity of source of sound n = frequency = 3 kHz

$$\therefore n' = 3 \times \frac{v}{v - 0.5v} = 3 \times \frac{v}{0.5v} = 6 \text{ kHz}$$

4. (a) Under identical pressure and temperature condition, speed of sound in moist air is more than that in dry air, i.e.
- $v_m > v_d$

5. (b) Let
- Δx
- = path difference

$$\Rightarrow \Delta x = L_2 D - L_1 D \Rightarrow \Delta x = \sqrt{40^2 + 9^2} - 40$$

$$\Rightarrow \Delta x = 41 - 40 \Rightarrow \Delta x = 1 \text{ m}$$

$$\text{For first maximum, } \Delta x = (2n) \frac{\lambda}{2} \quad (\text{where } n = 1)$$

$$\Rightarrow 1 = 2(1) \frac{\lambda}{2} \Rightarrow \lambda = 1 \text{ m} \Rightarrow f = \frac{v}{\lambda} = 330 \text{ Hz}$$

6. (c)
- $v_{\max} = v \Rightarrow A\omega = v \Rightarrow A \times 2\pi v = v\lambda$
- or
- $A = \frac{\lambda}{2\pi}$

7. (b) Speed =
- $360 \text{ rev/min} = \frac{360}{60} \text{ rev/s} = 6$

$$\therefore \text{Frequency} = 6 \times 60 = 360$$

8. (c) Velocity of sound,
- $v = \sqrt{\frac{\gamma RT}{M}}$

$$\frac{v_H}{v_O} = \sqrt{\frac{M_O}{M_H}} = \sqrt{\frac{16}{1}} = 4:1$$

9. (b) For sonometer,
- $n \propto \frac{1}{l}$

$$\therefore \frac{n_1}{n_2} = \frac{l_2}{l_1} \Rightarrow \frac{256}{n_2} = \frac{16}{25} \Rightarrow n_2 = \frac{256 \times 25}{16} = 400 \text{ Hz}$$

15

Heat, Temperature and Calorimetry

Heat

Heat is the energy, which is transferred between system and surroundings due to the temperature difference. In other words, heat is a form of energy that flows from one body to another because of temperature difference between them.

The conventional unit of heat is called the calorie. It is defined as the amount of heat required to raise the temperature of 1 g of water through 1°C. $1 \text{ cal} = 4.186 \text{ J}$.

Temperature

Temperature is the measure of degree of hotness or coldness of a body. So, a body at higher temperature would be hotter relative to a body at lower temperature.

Whenever, there is a difference of temperature between a body and its surroundings, then exchange of energy takes place. This energy is called **heat energy**. So, heat is a form of energy transferred between two (or more) systems or a system and its surroundings by virtue of its temperature difference.

Measurement of Temperature

Temperature is measured by using a thermometer. Various temperature scales such as celsius scale, fahrenheit scale and kelvin scale is used for measuring the temperature.

Properties of matter such as volume expansion or contraction with the change of temperature is the generally used principle of thermometers. In commonly used thermometers (liquid in glass), mercury or alcohol are the generally used liquids. Whereas, the Kelvin scale was derived by using the gas thermometers which is based on ideal gas equation.

The minimum temperature for an ideal gas at which its pressure is reduced to zero is called **absolute zero** (0 K), which is found to be equal to -273.15°C .

Relation between the three mentioned temperature scales is given below

$$\frac{T - 273.15}{100} = \frac{t_C - 0}{100} = \frac{t_F - 32}{180}$$

where, T = Absolute temperature (in kelvin),

t_C = Celsius temperature

t_F = Fahrenheit temperature

Since, at melting point of water $t_C = 0^\circ\text{C}$

So, $T_{\text{melting}} = 273.15\text{ K}$ and $t_{F, \text{melting}} = 32^\circ\text{F}$

And at boiling point of water $t_C = 100^\circ\text{C}$

So, $T_{\text{boiling}} = 373.15\text{ K}$ and $t_{F, \text{boiling}} = 212^\circ\text{F}$

Thermometry

The branch dealing with measurement of temperature is called thermometry and the devices used to measure temperature are called thermometers.

At changing temperature, change in pressure of a gas at constant volume, change in electric resistance of a metallic wire etc. Such property of a substance is called thermometric property. Let thermometric properties at temperatures 0°C (ice point), 100°C (steam point) and $t^\circ\text{C}$ (unknown temperature) are X_0 , X_{100} , and X_t respectively. Then,

$$\frac{X_t - X_0}{t} = \frac{X_{100} - X_0}{100}$$

$$\text{or } \frac{X_t - X_0}{X_{100} - X_0} = \frac{t}{100}$$

$$\text{Thus, } t = \left(\frac{X_t - X_0}{X_{100} - X_0} \right) \times 100^\circ\text{C}$$

Triple Point

Triple point is a state in which ice, water and water vapour can stay together in equilibrium. It refers to temperature at the equilibrium.

$\therefore$ The temperature scale by the equation

$$T = \lim_{p_{\text{tr}} \rightarrow 0} \frac{p}{p_{\text{tr}}} \times 273.16\text{ K}$$

where, p = pressure

p_{tr} = pressure at equilibrium and K stands for Kelvin scale of temperature.

If values of thermometric properties at 0 K , 273.16 K and $T\text{ K}$ are 0 , X_{tr} and X respectively, then

$$\frac{T}{T_{\text{tr}}} = \frac{X}{X_{\text{tr}}} \text{ or } T = \frac{X}{X_{\text{tr}}} T_{\text{tr}} = \left[\frac{X}{X_{\text{tr}}} \times 273.16 \right] \text{ K}$$

Different Thermometers

Constant Volume Gas Thermometer

If p_0 , p_{100} , p_{tr} and p_t are the pressures of gas at temperatures 0°C , 100°C , triple point of water and unknown temperature ($t^\circ\text{C}$) respectively keeping the volume constant, then

$$t = \left(\frac{p - p_0}{p_{100} - p_0} \times 100 \right)^\circ\text{C} \text{ or } T = \left(273.16 \frac{p}{p_{\text{tr}}} \right) \text{ K}$$

Platinum Resistance Thermometer

If R_0 , R_{100} , R_{tr} and R_t are the resistances of a platinum wire at temperatures 0°C , 100°C , triple point of water and unknown temperature ($t^\circ\text{C}$) respectively, then

$$t = \left(\frac{R_t - R_0}{R_{100} - R_0} \times 100 \right)^\circ\text{C}$$

$$\text{or } T = \left(\frac{R_t}{R_{\text{tr}}} \times T_{\text{tr}} \right) \text{ K} = \left(\frac{R_t}{R_{\text{tr}}} \times 273.16 \right) \text{ K}$$

Mercury Thermometer

In this thermometer, the length of a mercury column from some fixed point is taken as thermometric property. Thus,

$$t = \left(\frac{l_t - l_0}{l_{100} - l_0} \right) \times 100^\circ\text{C} \text{ or } T = \left(\frac{l_t}{l_{\text{tr}}} \times 273.16 \right) \text{ K}$$

Thermal Expansion

A change in temperature of a body causes change in its dimensions. When the body's temperature is increased, body expands in dimensions. It is called **thermal expansion**.

Linear Expansion

(Expansion in Length of a Solid)

Consider a rod of length l_1 at a temperature θ_1 . Let it be heated to a temperature θ_2 and the increased length of the rod be l_2 , then

$$l_2 = l_1 (1 + \alpha \Delta\theta)$$

where, α = coefficient of linear expansion and $\theta = \theta_2 - \theta_1$

Areal Expansion

(Expansion in Surface Area)

If A_1 is the area of solid at $\theta_1^\circ\text{C}$ and A_2 is the area at $\theta_2^\circ\text{C}$, then

$$A_2 = A_1 (1 + \beta \Delta\theta)$$

where, β = coefficient of areal (superficial) expansion and $\Delta\theta = \theta_2 - \theta_1$

Volume Expansion (Expansion in Volume)

If V_1 is the volume of solid at $\theta_1^\circ\text{C}$ and V_2 is the volume at $\theta_2^\circ\text{C}$, then

$$V_2 = V_1(1 + \gamma \Delta\theta)$$

where, γ = coefficient of cubical (volume) expansion and $\Delta\theta = \theta_2 - \theta_1$

Apparent Expansion of Liquid

If in a beaker (container) a liquid is fully filled and if the temperature of the system increases, then because of the fact that $\gamma_{\text{liquid}} > \gamma_{\text{solid}}$, the expansion in liquid is more than the expansion in solid and thus the liquid overflows from the container. This is termed as apparent expansion of liquid.

Consider a vessel of volume V_0 fully filled with a liquid of coefficient of cubical expansion γ_l . If temperature of the system is increased by ΔT , then

$\Delta V_l = V_0 \gamma_l \Delta T$, $\Delta V_c = V_0 \gamma_c \Delta T$, where subscript c denotes the container.

The volume of overflowing liquid is

$$\Delta V = V_0(\gamma_l - \gamma_c) \Delta T = V_0 \gamma_{lc} \Delta T$$

where, $\gamma_{lc} = \gamma_l - \gamma_c$ is termed as the apparent coefficient of cubical expansion.

Dulong and Petit's method In this method, a column of experimental liquid at $t^\circ\text{C}$ is balanced against other column of the experimental liquid at 0°C is by taking them in U-tube.

Here,

$$\gamma = \frac{h_t - h_0}{h_0 t}$$

Anomalous Behaviour of Water

Water exhibits an anomalous behaviour. It contracts on heating between 0°C and 4°C . But it shows normal behaviour above 4°C i.e. it expands above 4°C . For this reason, water has maximum density at 4°C (see graph).

Since, $pV = nRT$

So, at constant pressure,

$$p \cdot \Delta V = nR \cdot \Delta T$$

So,

$$\frac{\Delta V}{V} = \frac{\Delta T}{T}$$

or

$$\gamma = \frac{1}{\Delta T} \cdot \left(\frac{\Delta V}{V} \right) = \frac{1}{T}$$

Specific Heat Capacity

The specific heat of a substance is the quantity of heat in calorie required to raise the temperature of 1 g of that substance by 1°C . Its unit is $\text{cal g}^{-1} \text{C}^{-1}$.

The quantity of heat ΔQ required to change the temperature of a body of mass m by ΔT , is approximately proportional to the product of m and ΔT i.e. $\Delta Q \propto m \Delta T$ or $\Delta Q = ms \Delta T$, where s is the specific heat capacity of the material. The product of mass of the body and specific heat capacity is termed as heat capacity.

$s = \frac{\Delta Q}{\Delta T}$ i.e. heat capacity is defined as the amount of heat required to raise the temperature of a body by 1°C .

Principle of Calorimetry

Let two bodies of masses m_1 and m_2 , specific heats s_1 and s_2 and at temperatures θ_1 and θ_2 are brought in contact with each other. Assuming $\theta_1 > \theta_2$, heat will flow from body 1 to body 2. If θ is the common temperature of the two bodies at the state of thermal equilibrium, then (assuming no heat is gained or lost from or to the surroundings)

Heat lost by body 1 = Heat gained by body 2

$$m_1 s_1 (\theta_1 - \theta) = m_2 s_2 (\theta - \theta_2) \because (\theta_2 < \theta < \theta_1)$$

Latent Heat

The heat required to change the state of a system is proportional to the mass of the system, i.e. $Q \propto m \Rightarrow Q = mL$, where L is the **latent heat**.

Water Equivalent of a Substance

Water equivalent of certain amount of substance is defined as the amount of water, which when replaced by the substance requires the same amount of heat for the same rise in temperature.

$$m_w = \frac{mS}{S_w},$$

where, m_w = water equivalent of substance whose mass is m ,

S = specific heat capacity of substance and

S_w = specific heat capacity of water.

Heating Curve

A plot of temperature *versus* heat energy for 1 kg of water is shown below

Debyer T^3 law: Specific heat of a solid varies with temperature. It is $3R$ at higher temperature and near absolute zero $C_V \propto T^3$. Clausius Clapeyron's equation (or latent heat equation) representing change of MP or BP with pressure is

$$\frac{dp}{dt} = \frac{Jl}{T(V_2 - V_1)}$$

Hygrometry It is a branch in which we study and measure of water vapours in atmosphere.

$$RH = \frac{m}{M} \times 100$$

Here, m = mass of water, M = mass of water vapour to saturate the same volume of air.

Let p and P are the actual and maximum vapour pressures respectively at the temperature, then

$$RH = \left(\frac{\text{Maximum vapour pressure at dew point}}{\text{Maximum vapour pressure at } t^\circ \text{C}} \right) \times 100\% \\ = \frac{p}{P} \times 100\%$$

Practice Exercise

- The temperature at which Centigrade thermometer and Kelvin thermometer gives the same reading, is
a. 4° b. 273°
c. not possible d. 0
- What is the change in the temperature on Fahrenheit scale and on Kelvin scale, if a iron piece is heated from 30 to 90°C ?
a. 108°F , 60 K b. 100°F , 55 K
c. 100°F , 65 K d. 60°F , 108 K
- At 30°C , the hole in a steel plate has diameter of 0.99970 cm . A cylinder of diameter exactly 1 cm at 30°C is to be slide into the hole. To what temperature the plate must be heated?
(Given $\alpha_{\text{steel}} = 11 \times 10^{-5} \text{ }^\circ\text{C}^{-1}$)
a. 58°C b. 55°C c. 57.3°C d. 60°C
- A monoatomic ideal gas, initially at temperature T_1 , is enclosed in a cylinder fitted with a frictionless piston. The gas is allowed to expand adiabatically to a temperature T_2 by releasing the piston suddenly. If L_1 and L_2 be the lengths of the gas column before and after expansion respectively, then $\frac{T_1}{T_2}$ is given by

- $\left(\frac{L_1}{L_2}\right)^{2/3}$
- $\left(\frac{L_1}{L_2}\right)$
- $\left(\frac{L_2}{L_1}\right)$
- $\left(\frac{L_2}{L_1}\right)^{2/3}$

- The graph between two temperature scales A and B is shown in figure given below. Between upper fixed point and lower fixed point, there are 150 equal divisions on scale A and 100 on scale B . The relationship for conversion between two scales is given by

- $\frac{t_A - 180}{100} = \frac{t_B}{150}$
 - $\frac{t_A - 30}{150} = \frac{t_B}{100}$
 - $\frac{t_B - 180}{150} = \frac{t_A}{100}$
 - $\frac{t_B - 40}{100} = \frac{t_A}{180}$
- Heat given to a system can be associated with
a. kinetic energy of random motion of molecules
b. kinetic energy of orderly motion of molecules
c. total kinetic energy of random and orderly motion of molecules
d. kinetic energy of random motion in some cases and kinetic energy of orderly motion in other
 - At what temperature (in $^\circ\text{C}$), the fahrenheit and celsius scale gives same reading?
a. 40 b. -40 c. 8 d. -8

8. Which one of the following would raise the temperature of 40 g of water at 20°C most when mixed with?
- 20 g of water at 40°C
 - 30 g of water at 30°C
 - 10 g of water at 60°C
 - 4 g of water at 100°C
9. If same amount of heat is supplied to two identical spheres (one is hollow and other is solid), then
- the expansion in hollow is greater than the solid
 - the expansion in hollow is same as that in solid
 - the expansion in hollow is lesser than the solid
 - the temperature of both must be same to each other
10. At 30°C, a lead bullet of 50 g, is fired vertically upwards with a speed of 840 m/s. The specific heat of lead is 0.02 cal/g°C. On returning to the starting level, it strikes to a cake of ice at 0°C. Calculate the amount of ice melted (Assume all the energy is spent in melting only)
- 62.7 g
 - 55 g
 - 52.875 g
 - 52.875 kg
11. A second's pendulum clock having steel wire is calibrated at 20°C. When temperature is increased to 30°C, then calculate how much time does the clock lose or gain in one week?
- $[\alpha_{\text{steel}} = 12 \times 10^{-5} (^{\circ}\text{C}^{-1})]$
- 0.3628 s
 - 3.626 s
 - 362.8 s
 - 36.23 s
12. A plate composed of welded sheets of aluminium and iron is connected to an electrical circuit as shown in figure. What will happen if a fairly strong current be passed through the circuit?
- 
- Strip bends upward
 - Strip bends downward
 - Strip remains in its initial condition
 - None of the above
13. A copper rod of length l_0 at 0°C is placed on smooth surface. Now, the rod is heated upto 100°C. Find the longitudinal strain developed.
- (α = coefficient of linear expansion)
- $\frac{100l_0\alpha}{l_0 + 100l_0\alpha}$
 - 100α
 - zero
 - None of these
14. Two metal rods are fixed end to end between two rigid supports, as shown in figure. Each rod is of length ' l ' and area of cross-section is A . When the system is heated up, determine the condition when the junction between rods does not shift.
- 

[Given, Y_1 and Y_2 are Young's modulus of materials of the rods, α_1 and α_2 are coefficient at linear expansion.]

- $\alpha_1 Y_2 = \alpha_2 Y_1$
 - $\alpha_1 Y_1 = \alpha_2 Y_2$
 - $\alpha_1 = \alpha_2$
 - $Y_1 = Y_2$
15. What will be the stress at -20°C , if a steel rod with a cross-sectional area of 150 mm^2 is stretched between two fixed points? The tensile load at 20°C is 5000 N (Assume, $\alpha = 11.7 \times 10^{-6} /^{\circ}\text{C}$ and $Y = 200 \times 10^{11}\text{ N/m}^2$)
- $12.7 \times 10^6\text{ N/m}^2$
 - $127 \times 10^6\text{ N/m}^2$
 - $127 \times 10^6\text{ N/m}^2$
 - $0.127 \times 10^6\text{ N/m}^2$
16. In an anisotropic medium, the coefficients of linear expansion of a solid are α_1 , α_2 and α_3 in three mutually perpendicular directions. The coefficient of volume expansion for the solid is
- $\alpha_1 - \alpha_2 + \alpha_3$
 - $\frac{\alpha_1 + \alpha_2 + \alpha_3}{3}$
 - $\alpha_1 + \alpha_2 + \alpha_3$
 - None of these
17. A liquid when heated in a copper vessel and when heated in a silver vessel, the apparent coefficient of expansion is C and S , respectively. If coefficients of linear expansion of copper is A , then coefficient of linear expansion of silver is
- $\frac{C + S - 3A}{3}$
 - $\frac{C + 3A - S}{3}$
 - $\frac{3A - S - C}{3}$
 - $\frac{C + S + 3A}{3}$
18. Using the following data, calculate at what temperature will the wood just sink in benzene
- Density of wood at $0^{\circ}\text{C} = 8.8 \times 10^2\text{ kg/m}^3$
 Density of benzene at $0^{\circ}\text{C} = 9 \times 10^2\text{ kg/m}^3$
 Cubical expansivity of wood = $1.5 \times 10^{-4}\text{ K}^{-1}$
 Cubical expansivity of benzene = $1.2 \times 10^{-3}\text{ K}^{-1}$
- 27°C
 - 21.7°C
 - 31°C
 - 31.7°C
19. The radius of metal sphere at room temperature T is R and the coefficient of linear expansion of the metal is α . The sphere is heated a little by a temperature T , so that new temperature is $T + \Delta T$. The increase in volume of sphere is approximately
- $2\pi R \alpha \Delta T$
 - $\pi R^2 \alpha \Delta T$
 - $4\pi R^3 \alpha \Delta T / 3$
 - $4\pi R^3 \alpha \Delta T$
20. A copper rod and steel rod having length L_c and L_s respectively at certain temperature. It is observed that difference between their length remains constant at all temperatures. If α_c and α_s are their respective coefficient of linear expansions. Then, ratio of $\frac{L_s}{L_c}$ is
- $\frac{\alpha_c}{\alpha_s}$
 - $\frac{\alpha_s}{\alpha_c}$
 - $\left(1 + \frac{\alpha_s}{\alpha_c}\right)$
 - $\left(1 + \frac{\alpha_c}{\alpha_s}\right)$

21. One mole of an ideal monoatomic gas is heated at a constant pressure of 1 atmosphere from 0°C to 100°C . Work done by the gas is

a. $8.31 \times 10^3 \text{ J}$ b. $8.31 \times 10^{-3} \text{ J}$
c. $8.31 \times 10^{-2} \text{ J}$ d. $8.31 \times 10^2 \text{ J}$

22. The following figure represents the temperature versus time plot for a given amount of a substance when heat energy is supplied to it at a fixed rate and at a constant pressure. Which part of plot represent a phase change?

a. a to b and e to f
b. b to c and c to d
c. a to e and e to f
d. b to c and d to e

23. A sphere A is placed at smooth table. Another sphere B is suspended as shown in figure. Both spheres are identical in all respects. Equal quantity of heat is supplied to both spheres. All kinds of heat loss are neglected. The final temperatures of A and B are T_A and T_B respectively, then

a. $T_A = T_B$ b. $T_A > T_B$
c. $T_A < T_B$ d. None of these

24. Calculate the resulting temperature when 20 g of boiling water is poured into an ice-cold brass vessel (specific heat = $0.1 \text{ cal/g}^\circ\text{C}$) of mass 100 g.

a. 66.66°C b. 6.66°C
c. 0.66°C d. 50°C

25. In similar calorimeters, equal volumes of water and alcohol, when poured, take 100 s and 74 s respectively to cool from 50°C to 40°C . If the thermal capacity of each calorimeter is numerically equal to volume of either liquid, then calculate the specific heat capacity of alcohol.

(Given, the relative density of alcohol as 0.8 and specific heat capacity of water as $1 \text{ cal/g}^\circ\text{C}$)

a. $0.8 \text{ cal/g}^\circ\text{C}$
b. $0.6 \text{ cal/g}^\circ\text{C}$
c. $0.9 \text{ cal/g}^\circ\text{C}$
d. $1 \text{ cal/g}^\circ\text{C}$

26. The ratio of thermal capacities of two spheres A and B, if their diameters are in the ratio 1 : 2, densities in the ratio 2 : 1, and the specific heat in the ratio of 1 : 3, will be

a. 1 : 6 b. 1 : 12
c. 1 : 3 d. 1 : 4

27. The molar heat capacity of rock salt at low temperatures varies with temperature according to Debye's T^3 law.

Thus, $C = k \frac{T^3}{\theta^3}$, where $k = 1940 \text{ Jmol}^{-1}\text{K}^{-1}$, $\theta = 281 \text{ K}$

Calculate how much heat is required to raise the temperature of 2 moles of rock salt from 10 K to 50 K?

a. 800 J b. 373 J
c. 273 J d. None of these

28. Equal masses of two liquids A and B contained in vessels of negligible heat capacity are supplied heat at the same rate. The temperature-time graphs for the two liquids are shown in the figure. If S represents specific heat and L represents latent heat of liquid, then

a. $S_A > S_B$, $L_A < L_B$ b. $S_A > S_B$, $L_A > L_B$
c. $S_A < S_B$, $L_A < L_B$ d. $S_A < S_B$, $L_A > L_B$

29. The specific heat of a substance at temperature $t^\circ\text{C}$ is $s = at^2 + bt + c$. Calculate the amount of heat required to raise the temperature of $m \text{ g}$ of the substance from 0°C to $t_0^\circ\text{C}$

a. $\frac{mt_0^3a}{3} + \frac{bt_0^2}{2} + ct_0$ b. $\frac{mt_0^3a}{3} + \frac{mbt_0^2}{2} + mct_0$
c. $\frac{mt_0^3a}{3} + \frac{mbt_0^2}{2}$ d. None of these

30. In Q. No. 29 find the average value of specific heat.

a. $\frac{at_0^3}{3} + \frac{bt_0^2}{2} + ct_0$ b. $\frac{at_0}{3} + \frac{bt_0^2}{2} + c$
c. $at_0^2 + bt_0 + c$ d. zero

31. A drilling machine of 10 kW power is used to drill a bore in a small aluminium block of mass 8 kg. If 50% of power is used up in heating the machine itself or lost to the surroundings then how much is the rise in temperature of the block in 2.5 min?

(Given, specific heat of aluminium = $0.91 \text{ J/g}^\circ\text{C}$)

a. 103°C b. 130°C c. 105°C d. 30°C

32. A thermally insulated piece of metal is heated under atmosphere by an electric current so that it receives electric energy at a constant power P . This leads to an increase of the absolute temperature T of the metal with time t as follows $T = a^{1/4}$

Then, the heat capacity C_p is

a. $\frac{4PT^3}{a^4}$ b. $\frac{4PT^2}{a^3}$
c. $4PT^2$ d. None of these

33. If in 1.1 kg of water which is contained in a calorimeter of water equivalent 0.02 kg at 15°C, steam at 100°C is passed, till the temperature of calorimeter and its contents rises to 80°C. The mass of steam condensed in kilogram is
a. 0.131 b. 0.065 c. 0.260 d. 0.135
34. 5 g of water at 30°C and 5 g of ice at – 20°C are mixed together in a calorimeter. The water equivalent of calorimeter is negligible and specific heat and latent heat of ice are 0.5 cal/g°C and 80 cal/g respectively. The final temperature of the mixture is
a. 0°C b. – 8°C c. – 4°C d. 2°C
35. Water at – 10°C is present in a thermally insulated container. Calculate the ratio of mass of ice formed and initial mass of water, if a small crystal of ice is thrown into it
- a. 1/15 b. 1/17
c. 2/15 d. 1/8
36. It takes 20 minutes to melt 10 g of ice, when ray from the sun are focussed by a lens of diameter 5 cm on to a block of ice. Calculate the heat received from the sun on 1 cm² per minute.
(Given, $L = 80$ kcal/kg)
a. $R = 2.04$ cal/cm²-min b. $R = 3.04$ cal/cm²-min
c. $R = 0.204$ cal/cm²-min d. $R = 204$ cal/cm²-min
37. In an energy recycling process, X g of steam at 100°C becomes water at 100°C which converts Y g of ice at 0°C into water at 100°C. The ratio of X / Y will be
a. 1/3 b. 2/3
c. 3 d. 2

BITSAT Archives

1. In an experiment on the specific heat of a metal a 0.20 kg block of the metal at 150°C is dropped in a copper calorimeter (of water equivalent 0.025 kg) containing 150 cc of water at 27°C. The final temperature is 40°C. Calculate the specific heat of the metal. If heat losses to the surroundings are not negligible, is our answer greater or smaller than the actual value of specific heat of the metal? [2014]
a. 0.02 b. 0.2 c. 0.01 d. 0.1
2. A partition wall has two layers of different materials A and B in contact with each other. They have the same thickness but the thermal conductivity of layer A is twice that of B . At steady state, if the temperature difference across the layer B is 50 K, then the corresponding difference across the layer A is [2013]
a. 50 K b. 12.5 K c. 25 K d. 60 K
3. A monoatomic gas is suddenly compressed to $(1/8)$ th of its initial volume adiabatically. The ratio of its final pressure to the initial pressure is (Given, the ratio of the specific heats of the given gas to be 5/3) [2012]
a. 32 b. 40/3 c. 24/5 d. 8
4. 1g of water (volume 1 cm³) becomes 1671 cm³ of steam when boiled at a pressure of 1 atm. The latent heat of vaporisation is 540 cal/g, then the external work done is ($1 \text{ atm} = 1.013 \times 10^5 \text{ N/m}^2$) [2011]
a. 499.7 J b. 40.3 J
c. 169.2 J d. 128.57 J
5. The end A of rod AB of length 1 m is maintained at 80°C and the end B at 0°C. The temperature at a distance of 60 cm from the end A is [2010]
a. 16°C b. 32°C c. 48°C d. 64°C
6. One junction of a thermocouple is at a particular temperature T_r , and another is at T . Its thermoemf is expressed as $E = k(T - T_r) \left\{ T_0 - \frac{1}{2}(T + T_r) \right\}$.
At temperature $T = \frac{T_0}{2}$, the value of thermo electric power will be [2010]
a. $\frac{1}{2} kT_0$ b. kT_0
c. $\frac{1}{2} kT_0^2$ d. $\frac{1}{2} k(T_0 - T_r)^2$
7. In a 10 m deep lake, the bottom is at a constant temperature of 4°C. The air temperature is constant at – 4°C. The thermal conductivity of ice is 3 times that of water. Neglecting the expansion of water on freezing, the maximum thickness of ice will be [2010]
a. 7.5 m b. 6 m c. 6 m d. 2.5 m
8. A metal string is fixed between rigid supports. It is initially at negligible tension. Its Young's modulus is Y , density is ρ and coefficient of thermal expansion is α . If it is now cooled through a temperature $= t$, transverse wave will move along it with speed. [2009]
a. $Y \sqrt{\frac{\alpha t}{\rho}}$ b. $\alpha t \sqrt{\frac{Y}{\rho}}$ c. $\sqrt{\frac{Y \alpha t}{\rho}}$ d. $t \sqrt{\frac{Y \alpha}{\rho}}$
9. There is some change in length when a 33000 N tensile force is applied on a steel rod of area of cross-section 10^{-3} m^2 . The change of temperature required to produce the same elongation, if the steel rod is heated is (The modulus of elasticity is $3 \times 10^{11} \text{ N/m}^2$ and the coefficient of linear expansion of steel is $11 \times 10^{-5} / ^\circ \text{C}$) [2008]
a. 20 °C b. 15 °C c. 10 °C d. 0 °C

Answer with Solutions

Practice Exercise

1. (c)

2. (a) $\Delta T_C = 90^\circ - 30^\circ\text{C} = 60^\circ\text{C}$

$$\Delta T_F = \frac{9}{5} \Delta T_C = \frac{9}{5} (60^\circ) = 108^\circ\text{F}$$

$$\Delta T = \Delta T_C = 60\text{ K}$$

3. (c) $\Delta l = 1 - 0.99970 = 0.00030\text{ cm}$

$$\Delta l = \alpha l \Delta t$$

$$\Delta t = \frac{\Delta l}{\alpha l} = \frac{0.0003}{1.1 \times 10^{-5} \times 0.9997} = 27.3^\circ\text{C}$$

So, plate temperature must be raised to $30^\circ + 27.36 = 57.3^\circ\text{C}$

4. (d) For an adiabatic process,

$$T_1 V_1^{\gamma-1} = T_2 V_2^{\gamma-1}$$

or $T_1 L_1^{\gamma-1} = T_2 L_2^{\gamma-1}$ ($\because A = \text{constant}$)

or $\frac{T_1}{T_2} = \left(\frac{L_2}{L_1}\right)^{\gamma-1}$

$\therefore \gamma = \frac{5}{3}$ for a monoatomic gas,

$\therefore \gamma - 1 = \frac{2}{3}$

Thus, $\frac{T_1}{T_2} = \left(\frac{L_2}{L_1}\right)^{2/3}$

5. (b)

6. (a)

7. (b)

8. (c) If m is the mass of water added at $\theta^\circ\text{C}$, then resultant temperature T is given as

Heat lost = Heat gained

$$\Rightarrow m(\theta - T) = 40(T - 20) \Rightarrow T = \frac{800 + m \cdot \theta}{40 + m}$$

So, for option (a), $T = \frac{800 + 20 \times 40}{40 + 20} = 26.6^\circ\text{C}$

For option b, $T = \frac{800 + 30 \times 30}{40 + 30} = 24.28^\circ\text{C}$

For option (c), $T = \frac{800 + 10 \times 60}{40 + 10} = 28^\circ\text{C}$

For option (d), $T = \frac{800 + 400}{40 + 4} = 27.27^\circ\text{C}$

9. (a)

10. (d)

11. (d) Time period of second's pendulum = 2 s

Change in time period,

$$\Delta T = \frac{1}{2} T \alpha \Delta \theta$$

$$\Delta T = \left(\frac{1}{2}\right)(2)(1.2 \times 10^{-5})(30^\circ - 206) = 1.2 \times 10^{-4}\text{ s}$$

New time period, $T' = T + \Delta T \Rightarrow T' = 2.00012\text{ s}$

Time lost in a week

$$\Delta t = \frac{\Delta T}{T'} \times t = \frac{1.2 \times 10^{-4}}{2.00012} \times (7 \times 24 \times 3600) = 36.23\text{ s}$$

12. (a)

13. (c)

14. (b) Since, each rod is prevented from expansion so they are under compression and mechanical strain. The net strain in each rod

$$\epsilon_1 = \alpha_1 \Delta T - \frac{F l}{A Y_1} \Rightarrow \epsilon_2 = \alpha_2 \Delta T - \frac{F l}{A Y_2}$$

$$\epsilon_1 = \epsilon_2 = 0$$

$$\alpha_1 \Delta T - \frac{F l}{A Y_1} = 0 \text{ and } \alpha_2 \Delta T - \frac{F l}{A Y_2}$$

Solving, we get

$$\alpha_1 Y_1 = \alpha_2 Y_2$$

15. (c) Let L = free length at 0°C

L_0 = final stretched length in each case.

L_1 and L_2 are free lengths at $+20^\circ\text{C}$ and -20°C , respectively.

We know,

$$s_2 = s_1 + 2\alpha L \Delta T$$

Here, s_1 and s_2 are load deformation

$$\frac{F_2 L}{A Y} = \frac{F_1 L}{A Y} + 2\alpha L \Delta T$$

$$\Rightarrow \sigma_2 = \frac{F_2}{A} = \frac{F_1}{A} + 2\alpha \Delta T Y$$

$$= \frac{5000}{150 \times 10^{-6}} + (2)(11.7 \times 10^{-6})(20)(2 \times 10^{11})$$

$$= 127 \times 10^6 \text{ N/m}^2$$

16. (c)

17. (b) According to relation,

Coefficient of apparent expansion = coefficient of real expansion – coefficient of volume expansion

$$C = \gamma_L - 3A \quad \dots(i)$$

$$S = \gamma_L - 3A_0 \quad \dots(ii)$$

where, A_0 = linear expansion of coefficient of silver.

Subtracting Eq. (i) from Eq. (ii), we get

$$S - C = -3A_0 + 3A \therefore A_0 = \left(\frac{3A + C - S}{3}\right)$$

18. (b) $\rho_1 + \rho_1 \gamma_2 \Delta T = \rho_2 + \rho_2 \gamma_1 \Delta T$

$$\Delta T = \frac{\rho_1 - \rho_2}{\rho_2 \gamma_1 - \rho_1 \gamma_2}$$

$$\Delta T_2 = \frac{900 - 800}{880 \times 1.2 \times 10^{-3} - 900 \times 1.5 \times 10^{-4}} \Rightarrow \Delta T = 21.7^\circ\text{C}$$

19. (d) Since, coefficient of volume expansion,
 $\gamma = 3 \times \text{coefficient of linear expansion}$

$$\Rightarrow \gamma = 3\alpha$$

Now, $\frac{1}{\Delta T} \cdot \left(\frac{\Delta V}{V} \right) = 3\alpha \Rightarrow \Delta V = 3V \cdot \alpha \cdot \Delta T$

$$\Rightarrow \Delta V = \frac{4}{3} \pi R^3 \times 3\alpha \times \Delta T = 4\pi R^3 \alpha \Delta T$$

20. (a) If rods are heated to $\Delta t^\circ\text{C}$, the increases in length of steel and copper rods are

$$\Delta L_s = L_s \alpha_s \Delta t, \quad \text{and} \quad \Delta L_c = L_c \alpha_c \Delta t$$

Difference between their lengths will remain constant.

$$\Rightarrow \Delta L_s = \Delta L_c$$

$$\Rightarrow L_s \alpha_s \Delta t = L_c \alpha_c \Delta t \text{ or } \frac{L_s}{L_c} = \frac{\alpha_c}{\alpha_s}$$

21. (a) $dW = dQ - dU$

$$= C_p (T_2 - T_1) - C_v (T_2 - T_1) = R [T_2 - T_1]$$

$$= 8.31 \times 100 = 8.31 \times 10^2 \text{ J}$$

22. (d) 23. (c) 24. (a)

25. (b) Let $V \text{ cm}^3$ be volume of either liquid

Mass of water = $V \times 1 \text{ g}$

Mass of alcohol = $V \times 0.8 = 0.8V \text{ g}$

Rate of cooling of the water calorimeter

$$= \frac{1}{100} [V \times (50^\circ - 40^\circ) + V \times 1 (50^\circ - 40^\circ)] = \frac{1}{5} V \text{ cal/s}$$

Rate of cooling of alcohol calorimeter

$$= \frac{1}{74} [V \times (50^\circ - 40^\circ) + 0.8 V \times s (50^\circ - 40^\circ)]$$

$$= \frac{1}{74} (10V + 8Vs) \text{ cal/s}$$

As, rate of cooling of both is same

$$5V = \frac{1}{74} (10V + 8Vs) \Rightarrow s = 0.6 \text{ cal/g}^\circ\text{C}$$

26. (b) $\frac{m_A c_A}{m_B c_B} = \frac{\left(\frac{4}{3}\right) \pi r_A^3 \rho_A c_A}{\left(\frac{4}{3}\right) \pi r_B^3 \rho_B c_B} = \left(\frac{r_A}{r_B}\right)^3 \frac{\rho_A c_A}{\rho_B c_B}$

$$\frac{m_A c_A}{m_B c_B} = \left(\frac{1}{2}\right)^3 \times \frac{2}{1} \times \left(\frac{1}{3}\right) = \frac{1}{12}$$

27. (c) $dQ = nCdT, dQ = nk \frac{T^3}{\theta^3} dT$

$$Q = \frac{nk}{\theta^3} \int_{T_1}^{T_2} T^3 dT = \frac{nk}{\theta^3} \left(\frac{T_2^4 - T_1^4}{4} \right)$$

$$= \frac{2 \times 1940 (50^4 - 10^4)}{(281)^3 \times 4} = 272.79 \text{ J} \Rightarrow Q = 273 \text{ J}$$

28. (d)

29. (b) $\Delta H = \int ms dt$

$$= m \int_0^{t_0} (at^2 + bt + c) dt = m \left[\frac{at_0^3}{3} + \frac{bt_0^2}{2} + ct_0 \right]$$

30. (a) $\bar{s} = \int_0^{t_0} s dt = \int_0^{t_0} (at^2 + bt + c) dt = \frac{at_0^3}{3} + \frac{bt_0^2}{2} + ct_0$

31. (a) $P = \frac{W}{t}$

Total work done by drill machine in $2.5 \times 60 \text{ s}$
 $= (10 \times 10^3)(2.5 \times 60) = 15 \times 10^5 \text{ J}$

$\therefore$ Energy lost = 50% of $15 \times 10^5 \text{ J} = 7.5 \times 10^5 \text{ J}$

Energy taken by its surroundings, i.e. aluminium block.

$$\Delta Q = mc\Delta t = 8 \times 10^3 \times 0.91 \times \Delta T \text{ J}$$

Energy given = Energy taken

$$7.5 \times 10^5 = 8 \times 10^3 \times 0.91 \times \Delta T$$

$$\Delta T = 103^\circ\text{C}$$

32. (a) $\therefore dH = Pdt \therefore C_p = \frac{Pdt}{dT} = \frac{P}{\frac{dT}{dt}}$

Here, $T = at^{1/4}$ or $\frac{T}{a} = t^{1/4} \therefore t = \frac{T^4}{a^4}$

$$\therefore \frac{dT}{dt} = \frac{a}{4} \left(\frac{T^4}{a^4} \right)^{-3/4} = \frac{a}{4} \left(\frac{T}{a} \right)^{-3} = \frac{a^4}{4T^3} \Rightarrow C_p = \frac{P}{\frac{dT}{dt}} = \frac{4PT^3}{a^4}$$

33. (a)

34. (a) Total heat required to convert the temperature of ice from -20°C to 0°C water is

$$\Delta H = mL + ms \Delta \theta = 5 \times 80 + 5 \times 0.5 \times [0^\circ - (-20^\circ)]$$

$$= 400 + 2.5 \times 20 = 400 + 50 = 450 \text{ cal}$$

The total heat released to loss the temperature of water from 30°C to water at 0°C is

$$\Delta H = 5 \times 1 \times (30 - 0) = 150$$

Since, heat released is lesser than heat required. Hence, total ice is not converted into water. Hence, final temperature of mixture is 0°C .

35. (d) Let initial mass of water in the container be m .

m_1 = the mass of water converted into ice.

At final thermal equilibrium state, temperature of mixture should be zero.

$\therefore$ Heat loss by water = heat of fusion of water

or $ms [0 - (-10)] = m_1 L$

or $m \times 1 \times 10 = m_1 \times 80$ or $\frac{m_1}{m} = \frac{10}{80} = \frac{1}{8}$

36. (a) Let R = rate at which heat is received

$$Q_1 = R \times A \times t = R \times \pi (2.5)^2 \times (20 \text{ min}) = 392.5 R \text{ cal}$$

Heat required to melt the 10 g of ice

$$Q_2 = mL = 80 \times 10 = 800 \text{ cal}$$

$$Q_1 = Q_2 \Rightarrow 392.5 R = 800$$

$$R = \frac{800}{392.5} = 2.04 \text{ cal/cm}^2 \cdot \text{min}$$

37. (a) Specific heat of water = 4200 J/kg·K

Specific latent heat of fusion = 3.36×10^5 J/kg

BITSAT Archives

1. (a) Mass of metal, $m = 0.2 \text{ kg} = 200 \text{ g}$

Fall in temperature of metal $\Delta T = 150 - 40 = 110^\circ \text{C}$

If s is specific heat of metal, the heat lost by the metal

$$\Delta Q = ms \Delta T = 200 \times 110 \times s$$

Volume of water, = 150 cc

Mass of water $m' = 150 \text{ g}$

Water equivalent of calorimeter

$$w = 0.025 \text{ kg} = 25 \text{ g}$$

Rise in temperature of water in calorimeter

$$\Delta T' = 40 - 27 = 13^\circ \text{C}$$

Heat gained by water and calorimeter

$$\Delta Q' = (m' + w) \Delta T' = (150 + 25) \times 13$$

$$\Delta Q' = 175 \times 13 = \Delta Q$$

$$\text{So, } 200 \times s \times 110 = 175 \times 13$$

$$\Rightarrow s = \frac{175 \times 13}{200 \times 110} \approx 0.1$$

2. (c) Let T be the junction temperature

Here, $K_A = 2K_B$, $T - T_B = 50 \text{ K}$

At the steady state $H_A = H_B$

$$\Rightarrow \frac{K_A A (T_A - T)}{L} = \frac{K_B A (T - T_B)}{L}$$

$$\Rightarrow 2K_B (T_A - T) = K_B (T - T_B)$$

$$\Rightarrow T_A - T = \frac{T - T_B}{2} = \frac{50}{2} = 25 \text{ K}$$

3. (a) In an adiabatic process,

$$pV^\gamma = \text{constant}$$

$$\Rightarrow \frac{p_1}{p_2} = \left(\frac{V_2}{V_1} \right)^\gamma \Rightarrow \frac{p_1}{p_2} = \left(\frac{1}{8} \right)^{5/3}$$

$$\Rightarrow \frac{p_1}{p_2} = \left(\frac{1}{2^3} \right)^{5/3} = \frac{1}{32} \therefore \frac{p_2}{p_1} = 32$$

4. (c) Work done, $W = p \Delta V = 1.013 \times 10^5 \times (1671 - 1) \times 10^{-6}$
 $= 1.013 \times 10^5 \times 1670 \times 10^{-6} = 169.2 \text{ J}$

$$5. (b) \frac{\Delta T}{l} = \frac{80 - 0}{1} = 80 \text{ cm}^{-1}$$

$$\Delta T_1 = (0.60)(80) = 48^\circ \text{C}$$

Decrease in temperature after a distance of 60 cm is 48°C and hence actual temperature is $(80 - 48)^\circ \text{C} = 32^\circ \text{C}$.

6. (a) Thermoelectric power,

$$S = \frac{dE}{dT} = \frac{d}{dT} \left[k(T - T_r) \cdot \left\{ T_0 - \frac{1}{2}(T + T_r) \right\} \right]$$

Specific latent heat of vaporisation

$$= 22.68 \times 10^5 \text{ J/kg} = X \times 10^{-3} \times 22.68 \times 10^5$$

$$= Y \times 10^{-3} \times 3.36 \times 10^5 + Y \times 10^{-3} \times 4200 \times 100$$

$$\therefore \frac{X}{Y} = \frac{7.56}{22.68} = \frac{1}{3}$$

$$S = k(T - T_r) \times \left(-\frac{1}{2} \right) + \left[T_0 - \frac{1}{2}(T + T_r) \right] \times k$$

$$\text{When } T = \frac{T_0}{2}$$

$$S = -\frac{k}{2} \left(\frac{T_0}{2} - T_r \right) + \left\{ T_0 - \frac{1}{2} \left(\frac{T_0}{2} + T_r \right) \right\} \times k$$

$$= -\frac{kT_0}{4} + \frac{kT_r}{2} + kT_0 - \frac{kT_0}{4} - \frac{kT_r}{2} = \frac{1}{2} kT_0$$

$$7. (a) KA \left(\frac{4 - 0}{10 - x} \right) = 3KA \left(\frac{0 - (-4)}{x} \right)$$

$$\Rightarrow x = 7.5 \text{ m}$$

$$8. (c) \text{ From, } Y = \frac{F/A}{\Delta L/L} = \frac{T \cdot L}{A \Delta L}$$

where, $F = T = \text{tension}$.

On cooling, $\Delta L = \alpha L (\Delta \theta) = \alpha L t$

$$\therefore Y = \frac{TL}{A \alpha L t}$$

$$T = Y A \alpha t$$

Also, mass per unit length of string

$$m = A \rho$$

$$\text{As wave velocity} = \sqrt{\left(\frac{T}{m} \right)} \therefore v = \sqrt{\frac{Y A \alpha t}{A \rho}} = \sqrt{\left(\frac{Y \alpha t}{\rho} \right)}$$

$$9. (c) \text{ Modulus of elasticity} = \frac{\text{Force}}{\text{Area}} \times \frac{l}{\Delta l}$$

$$3 \times 10^{11} = \frac{33000}{10^{-3}} \times \frac{l}{\Delta l}$$

$$\frac{\Delta l}{l} = \frac{33000}{10^{-3}} \times \frac{1}{3 \times 10^{11}} = 11 \times 10^{-5}$$

$$\text{Change in length, } \frac{\Delta l}{l} = \alpha \Delta T$$

$$11 \times 10^{-5} = 11 \times 10^{-5} \times \Delta T \Rightarrow \Delta T = 10 \text{ K or } 10^\circ \text{C}$$

16

Physics for Gaseous State

Ideal Gas or Perfect Gas

An ideal gas or perfect gas is that gas which strictly obeys the gas laws such as Boyle's law, Charles' law, Gay-Lussac's law, etc., at all values of temperature and pressure.

Gas Laws

There are some laws given below

Boyle's Law

It states that for a given mass of an ideal gas at constant temperature (called isothermal process), the volume of a gas is inversely proportional to its pressure, i.e.

$$V \propto \frac{1}{p}$$

(where, V = volume, p = pressure, m = mass and T = temperature or $pV = \text{constant}$)

or

$$p_1V_1 = p_2V_2 = p_3V_3 = \dots$$

This law can also be shown graphically as

(m and T are constants in all cases)

Charles' Law

It states that for a given mass of an ideal gas at constant pressure, (called isobaric process) volume of a gas is directly proportional to its absolute temperature

i.e. $V \propto T$ [if m and p are constants]

or $\frac{V}{T} = \text{constant}$ or $\frac{V_1}{T_1} = \frac{V_2}{T_2} = \dots$

This law can also be shown graphically as

(m and p are constants in all cases)

Gay-Lussac's Law or Pressure Law

It states that for a given mass of an ideal gas at constant volume (called isochoric process), pressure of a gas is directly proportional to its absolute temperature

i.e. $p \propto T$ [if m and V are constants]

or $\frac{p}{T} = \text{constant}$

or $\frac{p_1}{T_1} = \frac{p_2}{T_2} = \dots$

Here, temperature is in kelvin.

This law can also be shown graphically as

(m and V are constants in all cases)

Ideal Gas Equation

An ideal gas is one whose molecules are free from intermolecular attraction and obeys gas laws at all values of temperature and pressure.

Ideal gas equation is a form of combined effect of above four laws, thus its equation is given by

$$pV = nRT = \frac{m}{M} RT$$

Kinetic Theory of Gases

The kinetic theory of gases is based on the following assumptions

1. Molecules of a gas are small hard spheres and these molecules are very far apart in comparison to their sizes.
2. The total volume of the molecules is negligible as compared to the size of the gas.
3. The molecules collide elastically with each other.
4. The molecules exert no force on each other except during collisions.

Concept of Pressure

The pressure of the gas is equal to the force exerted per unit area of the walls by the gas.

Pressure of an ideal gas

$$p = \frac{1}{3} \frac{mn}{V} v_{\text{rms}}^2 = \frac{1}{3} \rho v_{\text{rms}}^2$$

Kinetic Interpretation of Temperature

According to kinetic theory of gases, for 1 mole of an ideal gas

$$p = \frac{1}{3} \frac{M}{V} (v_{\text{rms}})^2$$

$$\Rightarrow pV = \frac{1}{3} M (v_{\text{rms}})^2 \quad \dots(i)$$

(here, M = total mass)

So, $(v_{\text{rms}})^2 = \frac{3RT}{M}$ (for 1 mole, i.e. $n = 1$) ... (ii)

Also, $pV = RT$
 $v_{\text{rms}} = \sqrt{\frac{3RT}{M}}$

$$\Rightarrow v_{\text{rms}} \propto \sqrt{T}$$

The absolute temperature of an ideal gas is directly proportional to mean square velocity of its molecule.

Also, $\frac{1}{3} M v_{\text{rms}}^2 = RT$ [From Eqs. (i) and (ii)]

$$\Rightarrow \frac{1}{3} \frac{M}{N_0} v_{\text{rms}}^2 = \frac{R}{N_0} T \Rightarrow \frac{1}{2} m v_{\text{rms}}^2 = \frac{3}{2} k_B T$$

$$\left(k_B = \frac{R}{N_0} = \text{Boltzmann constant} \right)$$

$$\Rightarrow (\text{KE})_{\text{trans}} = \frac{3}{2} k_B T$$

where, $\frac{1}{2} m v_{\text{rms}}^2$ is average translational energy per molecule

$$(\text{KE})_{\text{trans}} \propto T$$

Relation between Pressure and Kinetic Energy of the Gas

By using the expression for pressure (p) in terms of mean square speed ($\bar{v}^2$), we can find the relation between pressure and kinetic energy (E) as shown below.

$$\text{Since, } p = \frac{1}{3} \rho (\bar{v}^2) \quad \dots(i)$$

Mass of unit volume of gas = $1 \times \rho = \rho$

Mean kinetic energy of translation per unit volume of the gas is

$$E = \frac{1}{2} \rho (\bar{v}^2) \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{p}{E} = \frac{2}{3} \text{ or } p = \frac{2}{3} E \quad (\text{for unit volume})$$

The pressure exerted by an ideal gas is numerically equal to two-third of the mean kinetic energy of translation per unit volume of the gas.

Various Speeds of Gas Molecules

RMS Speed of Gas Molecules

The square root of the mean of the squares of the speed of gas molecules is called their root mean square speed (v_{rms}).

$$v_{\text{rms}} = \sqrt{\frac{3RT}{m}} \quad [v_{\text{rms}} \propto \sqrt{T}]$$

where, m = molecular weight.

Mean Speed or Average Speed

It is the arithmetic mean of the speeds of molecules in a gas. If $v_1, v_2, \dots, v_n$ are individual speeds of n molecules, then

$$v_{\text{av}} = \frac{v_1 + v_2 + \dots + v_n}{n}$$

According to kinetic theory of gases, it can be shown that

$$v_{\text{av}} = \sqrt{\frac{8k_B T}{\pi m}}$$

Most Probable Speed

It is defined as speed which is possessed by maximum fraction of total number of molecules of gas.

According to kinetic theory of gases, it can be shown that

$$v_{\text{mp}} = \sqrt{\frac{2k_B T}{m}}$$

Degree of Freedom

Degree of freedom represents the number of independent possible ways in which the system can have energy (due to its motion or configuration). A system can possess energy due to translational, rotational or vibrational motion or due to vibrational configuration or any combination of these.

- (i) For an ideal monoatomic gas, $f = 3$ due to translational motion in three directions.
- (ii) For an ideal diatomic gas at room temperature $f = 5$ due to 3 translational and 2 rotational. At high temperature, $f = 7$ because of 2 additional ways due to vibration (one kinetic energy and other potential energy).
- (iii) For an ideal polyatomic gas at room temperature, $f = 6$ due to 3 translational and 3 rotational. At high temperature, the vibrational mode will also come into existence. For a polyatomic gas, number of vibrational terms can be greater than two.
- (iv) For solids, $f = 6$ due to vibrational motion in all three directions.

Law of Equipartition of Energy

Total internal energy of an ideal gas distributes equally in all degrees of freedom and energy per degree of freedom of one mole of gas is $\frac{1}{2} RT$, where T is the absolute temperature of the gas.

If f is the degree of freedom and n is number of moles of the gas, then the internal energy of the gas is given by

$$U = \frac{n}{2} f RT$$

Mean Free Path

Every gas consists of a large number of molecules undergoing frequent collisions. These molecules are in a state of continuous random motion. They undergo perfectly elastic collision against one another. The zig-zag path of different lengths is called free path and their mean is called **mean free path**. If $\lambda_1, \lambda_2, \lambda_3, \dots, \lambda_n$ are successive free paths, then

$$\text{Mean free path, } \lambda = \frac{\lambda_1 + \lambda_2 + \lambda_3 + \dots + \lambda_n}{n}$$

So, mean free path of gas molecules is average distance travelled by a molecule between two successive collisions.

Mathematically, it can be expressed as

$$\lambda = \frac{1}{\sqrt{2} \pi d^2 n}$$

where, n = number of molecules per unit volume
 d = diameter of molecules

Specific Heat Capacity

It is the amount of heat required to raise the temperature of unit mass of a substance through 1°C . Consider a container containing m gram of gas of molecular mass M . If n is number of moles of gas in a container, ΔQ is the heat supplied and rise in temperature is ΔT , then

Specific heat, $c = \frac{1}{m} \frac{\Delta Q}{\Delta T}$ and SI unit = $\text{J kg}^{-1} \text{K}^{-1}$

Molar Specific Heat of Gases

Molar specific heat (C) of a substance is defined as the amount of heat required to raise the temperature of 1 mole of substance through one degree celsius

$$C = \frac{1}{n} \frac{\Delta Q}{\Delta T}$$

Also, relation between specific heat and molar specific heat

$$C = Mc$$

Here, M = molar mass of gas, n = number of moles,

C = molar specific heat and c = specific heat

(or gram specific heat)

It is of two types

Specific Heat at Constant Volume (C_V)

When heat is supplied to gas at constant volume, the entire heat supplied just increases the internal energy of gas, so specific heat at constant volume is

$$C_V = \frac{1}{n} \left(\frac{\Delta Q}{\Delta T} \right)_V$$

$\Rightarrow$

$$C_V = \frac{1}{n} \left(\frac{\Delta U}{\Delta T} \right)$$

Specific Heat at Constant Pressure (C_p)

When heat is supplied to the gas at constant pressure, a part of it increases the internal energy of the gas and remaining does an external work, so specific heat at constant pressure is

$$C_p = \frac{1}{n} \left(\frac{\Delta Q}{\Delta T} \right)_p$$

At constant pressure, to increase internal energy of gas by the same amount (as in case of heat supplied at constant volume), more amount of heat has to be supplied, so we conclude $C_p > C_V$.

Practice Exercise

- In an ideal gas without preferred direction of motion of molecules,
 - $v_x = v_y = v_z$
 - $v_x^2 = v_y^2 = v_z^2$
 - $\bar{v}_x^2 = \bar{v}_y^2 = \bar{v}_z^2$
 - None of the above
- Two perfect gases at absolute temperatures T_1 and T_2 are mixed. The absolute temperature of the mixture is T . There is no loss of energy. If m_1 and m_2 are masses of molecules and n_1 and n_2 are number of molecules, then
 - $T = \frac{T_1 + T_2}{2}$
 - $T = \frac{n_1 T_1 + n_2 T_2}{n_1 + n_2}$
 - $T = \frac{n_1 T_1 + n_2 T_2}{T_1 + T_2}$
 - None of the above
- In troposphere, temperature varies linearly with elevation as $T = T_0 - ay$, where T_0 is the temperature at the earth's surface, then
 - the pressure does not change with elevation in troposphere
 - the variation of pressure with elevation is linear
 - the dimension of a is $[\text{M}^0 \text{L}^{-1} \theta]$
 - the pressure is independent of variation with temperature in the given situation
- A vessel contains a mixture of nitrogen of mass 7 g and carbon dioxide of mass 11 g at temperature 290 K and pressure 1 atm. Find the density of the mixture.
 - 1.1 g/L
 - 1.2 g/L
 - 1.515 g/L
 - 1.6 g/L
- 12 g of gas occupy a volume of $4 \times 10^{-3} \text{ m}^3$ at a temperature of 7°C . After the gas is heated at constant pressure, its density becomes $6 \times 10^{-4} \text{ g/cm}^3$. What is the temperature to which the gas was heated?
 - 1000 K
 - 1400 K
 - 1200 K
 - 800 K

6. A closed vessel with a capacity of 1 m^3 contains 0.9 kg of water and 1.6 kg of O_2 . Find the pressure in the vessel at a temperature of 500°C at which all the water will be converted into steam.
- a. $3.2 \times 10^5 \text{ N/m}^2$ b. $6.4 \times 10^5 \text{ N/m}^2$
c. $1.6 \times 10^5 \text{ N/m}^2$ d. $9.6 \times 10^5 \text{ N/m}^2$
7. The pressure of a gas kept in an isothermal container is 200 kPa . If half the gas is removed from it, the pressure will be
a. 100 kPa b. 200 kPa c. 400 kPa d. 800 kPa
8. The pressure inside a tyre is 4 atm at 27°C . If the tyre bursts suddenly, its final temperature will be
a. $300(4)^{7/2}$ b. $300(4)^{2/7}$ c. $300(2)^{7/2}$ d. $300(4)^{-2/7}$
9. A uniform tube is shown in figure. Which is open at one end and closed at the other. To enclose a column of air inside the tube, a pellet of mercury is introduced. If the length of air column at 27°C is 18 cm , at what temperature its length will be 21.6 cm ?

- a. 87°C b. 91°C c. 85°C d. 97°C
10. Pressure of an ideal gas is increased by keeping temperature constant. What is its effect on kinetic energy of molecules?
a. Increase b. Decrease
c. No change d. Cannot be determined
11. How many cylinders of hydrogen at atmospheric pressure are required to fill a balloon whose volume is 500 m^3 , if hydrogen is stored in cylinders of volume 0.05 m^3 at an absolute pressure of $15 \times 10^5 \text{ Pa}$?
a. 700 b. 675 c. 605 d. 710
12. Two identical containers A and B have frictionless pistons. Both contain same volume of ideal gas at same temperature. The gas in each cylinder is allowed to expand isothermally to double the initial volume. The mass of the gas in A is m_A and the mass of the gas in B is m_B . The changes in the pressure in A and B are Δp and $1.5 \Delta p$, respectively, then
a. $4m_A = 9m_B$ b. $2m_A = 3m_B$ c. $3m_A = 2m_B$ d. $9m_A = 4m_B$
13. The figure shows, the p - V diagram of two different masses m_1 and m_2 drawn at constant temperature T , then
a. $m_1 > m_2$
b. $m_2 > m_1$
c. $m_1 = m_2$
d. insufficient data

14. Figure shows graph of pressure *versus* density for an ideal gas at two temperatures T_1 and T_2 , then

- a. $T_1 > T_2$
b. $T_1 = T_2$
c. $T_1 < T_2$
d. any three is possible
15. A gas is contained in a closed vessel at 250 K , then calculate the percentage increase in pressure, if the gas is heated through 1°C .
a. 0.4% b. 0.6%
c. 0.8% d. 1.0%
16. What volume will be occupied by the molecules contained in 4.5 kg water at STP, if the intermolecular forces vanish away?
a. 5.6 m^3 b. 4.5 m^3
c. 11.2 m^3 d. 5.6 L
17. Find the pressure exerted by 6×10^{23} hydrogen molecules which will strike per second a wall of area 10^{-4} m^2 at 60° with normal. The mass of hydrogen molecules and speed are $3.32 \times 10^{-27} \text{ kg}$ and 10^3 m/s respectively.
a. $19.92 \times 10^3 \text{ N/m}^2$
b. $18.2 \times 10^3 \text{ N/m}^2$
c. $1.992 \times 10^3 \text{ N/m}^2$
d. $0.1992 \times 10^3 \text{ N/m}^2$
18. Four molecules of a gas have speeds $1, 2, 3$ and 4 km/s . The value of the root mean square speed of the gas molecules is
a. $\frac{1}{2} \sqrt{15} \text{ km/s}$ b. $\frac{1}{2} \sqrt{10} \text{ km/s}$
c. 2.5 km/s d. $\sqrt{\left(\frac{15}{2}\right)} \text{ km/s}$
19. The temperature of H_2 at which the rms velocity of its molecules is seven times the rms velocity of the molecules of nitrogen at 300 K , is
a. 2100 K b. 1700 K c. 1350 K d. 1050 K
20. Choose the correct order of the root mean square velocity (v_{rms}), the average velocity (v_{av}) and the most probable velocity (v_{mp}).
a. $v_{\text{mp}} > v_{\text{av}} > v_{\text{rms}}$ b. $v_{\text{rms}} > v_{\text{av}} > v_{\text{mp}}$
c. $v_{\text{av}} > v_{\text{mp}} > v_{\text{rms}}$ d. $v_{\text{mp}} > v_{\text{rms}} > v_{\text{av}}$
21. The average kinetic energy of a gas molecule at 27°C is $6.21 \times 10^{-21} \text{ J}$. Its average kinetic energy at 127°C will be
a. $12.2 \times 10^{-21} \text{ J}$
b. $8.28 \times 10^{-21} \text{ J}$
c. $10.35 \times 10^{-21} \text{ J}$
d. $11.35 \times 10^{-21} \text{ J}$

22. Ratio of v_{mp} (most probable speed), v_{av} (average speed), v_{rms} (root mean square speed) of gas molecules are related as

a. $\sqrt{3} : \sqrt{2} : \sqrt{\frac{8}{\pi}}$ b. $2 : \sqrt{3} : \sqrt{\frac{\pi}{8}}$
 c. $\sqrt{2} : \sqrt{3} : \sqrt{\frac{8}{\pi}}$ d. $\sqrt{2} : \sqrt{\frac{8}{\pi}} : \sqrt{3}$

23. Five gas molecules chosen at random are found to have speeds of 500, 600, 700, 800 and 900 m/s. Then,

- a. the rms speed and the average speed are the same
 b. the rms speed is 14 m/s higher than the average speed
 c. the rms speed is 14 m/s lower than the average speed
 d. the rms speed is $\sqrt{14}$ m/s higher than the average speed

24. In case of molecules of an ideal gas, which of the following, average velocities cannot be zero?

- a. $\langle \vec{v} \rangle$ b. $\langle \vec{v}^3 \rangle$
 c. $\langle \vec{v}^4 \rangle$ d. $\langle \vec{v}^5 \rangle$

25. Choose the correct relation between the rms speed (v_{rms}) of the gas molecules and the velocity of sound in that gas (v_s) in identical situations of pressure and temperature.

a. $v_{rms} = v_s$ b. $v_{rms} = \sqrt{\left(\frac{3}{\gamma}\right)} v_s$
 c. $v_{rms} = \sqrt{\left(\frac{\gamma}{3}\right)} v_s$ d. $\gamma v_{rms} = 3 v_s$

26. At what temperature is the effective speed of gaseous hydrogen molecules equal to that of oxygen molecules at 47°C ?

- a. 50 K b. 20 K
 c. 40 K d. 100 K

27. Volume *versus* temperature graphs for a given mass of an ideal gas are shown in figure at two different values of constant pressure. What can be inferred about relation between p_1 and p_2 ?

- a. $p_1 > p_2$ b. $p_1 < p_2$
 c. $p_1 = p_2$ d. Data is insufficient

28. Given the graph between $\frac{pV}{T}$ and p for 1 g of oxygen gas at two different temperatures T_1 and T_2 (in figure). Given, density of oxygen = 1.427 kg/m^3 . The value of $\frac{pV}{T}$ at point A and the relation between T_1 and T_2 are respectively

- a. 0.256 JK^{-1} and $T_1 < T_2$
 b. $8.314 \text{ J mol}^{-1} \text{ K}^{-1}$ and $T_1 > T_2$
 c. 0.256 JK^{-1} and $T_1 > T_2$
 d. 4.28 JK^{-1} and $T_1 < T_2$
29. Which of the following quantities is zero on an average for the molecules of an ideal gas in equilibrium?
- a. Kinetic energy b. Momentum
 c. Density d. Speed
30. On a fast moving train, a container is placed enclosing some gas at 300 K, while the train is in motion, the temperature of the gas
- a. rises above 300 K b. falls below 300 K
 c. remains unchanged d. becomes unsteady
31. If at a pressure of 10^6 dyne/cm^2 , one gram mole of nitrogen occupies $2 \times 10^4 \text{ cc}$ volume, then calculate the average energy of a nitrogen molecules in erg. (Given, Avogadro's number = 6×10^{23})
- a. 14×10^{-13} b. 10×10^{-12} c. 10^6 d. 2×10^6
32. Calculate the temperature at which average translational KE of a molecule is equal to the KE of an electron accelerated from rest through a potential difference of 1 V.
- a. $T = 7729 \text{ K}$ b. $T = 8879 \text{ K}$
 c. $T = 7.72 \text{ K}$ d. $T = 772.9 \text{ K}$
33. In a model of chlorine (Cl_2), two Cl-atoms are rotated about their centre of mass as shown. Here the two Cl-atoms are $2 \times 10^{-10} \text{ m}$ apart and angular speed $\omega = 2 \times 10^{12} \text{ rad/s}$. If the molar mass of chlorine is 70 g/mol, then what is the rotational kinetic energy of one Cl_2 molecule?
- a. $2.32 \times 10^{-20} \text{ J}$ b. $2.32 \times 10^{-21} \text{ J}$
 c. $2.32 \times 10^{-19} \text{ J}$ d. $2.32 \times 10^{-22} \text{ J}$

34. At 20 °C temperature, an argon gas at atmospheric pressure is confined in a vessel with a volume of 1 m³. The effective hard sphere diameter of argon atom is 3.10×10^{-10} m. Determine mean free path.
- 100 nm
 - 90 nm
 - 93.6 nm
 - 95 nm

8. The ratio of velocity of sound in hydrogen and oxygen at STP is [2005]
- 16 : 1
 - 8 : 1
 - 4 : 1
 - 2 : 1

Answer with Solutions

Practice Exercise

- (c) An isotropic gas is one which have same properties throughout and their molecules are all moving in random directions, so only average values of square of their velocity components are equal.
- (b) Average KE per molecule of a gas = $\frac{3}{2} kT$
Before mixing two gases, the average KE of all molecules of 2 gases

$$= \frac{3}{2} kn_1T_1 + \frac{3}{2} kn_2T_2$$

After mixing, the average KE of both gases

$$= \frac{3}{2} k (n_1 + n_2) T$$

where, T is temperature of mixture.

∴ No loss of energy.

$$\therefore \frac{3}{2} k (n_1 + n_2) T = \frac{3}{2} kn_1T_1 + \frac{3}{2} kn_2T_2$$

$$T = \frac{n_1T_1 + n_2T_2}{(n_1 + n_2)}$$

3. (c)

4. (c) $p_1 V = \frac{7}{28} \times R \times 290$

$$p_2 V = \frac{11}{44} \times R \times 290$$

$$\therefore (p_1 + p_2) V = \left(\frac{7}{28} + \frac{11}{44} \right) R \times 290$$

$$\therefore p_1 + p_2 = 1 \text{ atm}$$

$$V = \frac{\left(\frac{7}{28} + \frac{11}{44} \right) \times 8.3 \times 10^7 \times 290}{1.013 \times 10^6}$$

$$\therefore \text{Density} = \frac{\text{mass}}{\text{volume}} = \frac{18}{V} = 1.515 \text{ g/L}$$

5. (b) Volume at $7^\circ\text{C} = 4 \times 10^{-3} \text{ m}^3$

Let it be heated to x K.

$$\begin{aligned} \text{Volume} &= \frac{12}{6 \times 10^{-4}} \text{ cm}^3 = 2 \times 10^4 \text{ cm}^3 \\ &= 2 \times 10^{-2} \text{ m}^3 \end{aligned}$$

$$\text{Since, } \frac{V}{T} = \text{constant}$$

$$\therefore \frac{4 \times 10^{-3}}{280} = \frac{2 \times 10^{-2}}{x}$$

$$\therefore x = \frac{2 \times 10^{-2} \times 280}{4 \times 10^{-3}} = 1400 \text{ K}$$

6. (b)

7. (a) For isothermal process, temperature remains constant. According to ideal gas equation,

$$pV = nRT$$

For a given container, V remains constant.

$$\therefore p \propto n$$

When half of gas is removed, number of moles becomes half. Hence, pressure becomes half.

8. (d) In an adiabatic process,

$$p_2^{(1-\gamma)} T_2^\gamma = p_1^{(1-\gamma)} T_1^\gamma$$

$$T_2 = T_1 \left(\frac{p_1}{p_2} \right)^{(1-\gamma)/\gamma} = 300 \left(\frac{4}{1} \right)^{(1-7/5)/7/5} = 300 (4)^{-2/7}$$

9. (a) From Charles' law, $L \propto T$

$$\frac{L_1}{T_1} = \frac{L_2}{T_2}$$

$$\Rightarrow T_2 = \frac{L_2}{L_1} \times T_1$$

$$T_2 = \frac{21.6}{18} \times 300$$

$$T_2 = 87^\circ\text{C}$$

10. (c) As kinetic energy depends on temperature, so there will be no change.

11. (b) $15 \times 10^5 \times V_2 = 500 \times 1.013 \times 10^5$

$$V_2 = 33.77 \text{ m}^3$$

$$\therefore \text{Number of cylinders} = \frac{33.77}{0.05} = 675$$

12. (c)

13. (b) We know that,

$$pV = nRT = \frac{m}{M} RT$$

$$m = (pV) \left(\frac{M}{RT} \right)$$

$$m \propto pV$$

$$p_2 V_2 > p_1 V_1$$

$$\text{From the curve, } m_2 > m_1$$

14. (a) According to ideal gas equation,

$$pV = nRT$$

$$pV = \frac{m}{M} RT$$

or

$$p = \frac{\rho RT}{M}$$

or

$$p = \frac{RT}{M} \rho$$

Hence, more temperature means more slope.

15. (a) $p_t = p_0 (1 + \gamma d\theta) = p_0 \left(1 + \frac{d\theta}{237} \right)$

$$\frac{p_t - p_0}{p_0} \times 100 = \frac{1}{273} \times 100$$

$$= 0.36\% \approx 0.4\%$$

16. (a) If intermolecular forces vanish away, the liquid will convert into vapours.

Molecular mass of water vapours

$$= 18 \text{ g} = 18 \times 10^{-3} \text{ kg}$$

$$\text{So, } 18 \times 10^{-3} \text{ kg of water vapour will occupy } 22400 \text{ m}^3$$

then, 4.5 kg of water vapour will occupy

$$\frac{22.4 \times 10^{-3}}{18 \times 10^{-3}} \times 4.5 = 5.6 \text{ m}^3$$

17. (a) Change in momentum $= 2mv \cos \theta$

$$\text{Force, } F = 2mv \cos \theta \times n$$

$$p = \frac{F}{A} = \frac{2mv n \cos \theta}{A}$$

$$= \frac{2 \times 3.32 \times 10^{-27} \times 10^3 \times \frac{1}{2} \times 6 \times 10^{23}}{10^{-4}}$$

$$= 19.92 \times 10^3 \text{ N/m}^2$$

18. (d) $\therefore v_{\text{rms}} = \sqrt{\left(\frac{v_1^2 + v_2^2 + \dots + v_n^2}{n} \right)}$

$$v_{\text{rms}} = \sqrt{\left(\frac{1^2 + 2^2 + 3^2 + 4^2}{4} \right)} = \sqrt{\left(\frac{1+4+9+16}{4} \right)}$$

$$= \sqrt{\left(\frac{30}{4} \right)} = \sqrt{\left(\frac{15}{2} \right)} \text{ km/s}$$

$$\therefore v_{\text{rms}} = \sqrt{\left(\frac{15}{2} \right)} \text{ km/s}$$

19. (d)

$$20. (b) v_{rms} = \sqrt{\left(\frac{3kT}{m}\right)}, v_{av} = \sqrt{\left(\frac{8kT}{\pi m}\right)},$$

$$v_{mp} = \sqrt{\left(\frac{2kT}{m}\right)}$$

$$\therefore v_{rms} > v_{av} > v_{mp}$$

$$21. (b) \text{ As, } KE \propto T \Rightarrow \frac{E_{127}}{E_{27}} = \frac{(127 + 273)}{(27 + 273)}$$

$$E_{127} = 6.21 \times 10^{-21} \times \frac{400}{300}$$

$$= 8.28 \times 10^{-21} \text{ J}$$

$$22. (d) v_{mp} : v_{av} : v_{rms} = \sqrt{2} : \sqrt{\frac{8}{\pi}} : \sqrt{3}$$

$$23. (b) \therefore v_{av} = \frac{500 + 600 + 700 + 800 + 900}{5}$$

$$= \frac{3500}{5} = 700 \text{ m/s}$$

$$\text{and } v_{rms} = \sqrt{\frac{(500)^2 + (600)^2 + (700)^2 + (800)^2 + (900)^2}{5}}$$

$$= 714 \text{ m/s}$$

Hence, the rms speed is 14 m/s higher than the average speed.

24. (c) The average velocity of even power quantity cannot be zero.

$$25. (b) v_{rms} = \sqrt{\left(\frac{3RT}{m}\right)} \text{ and } v_s = \sqrt{\left(\frac{\gamma RT}{m}\right)}$$

$$\therefore v_{rms} = \sqrt{\left(\frac{3}{\gamma}\right)} v_s$$

26. (b)

27. (a) When pressure is constant, Charles' law is obeyed
i.e. $V \propto T$ or $\frac{V}{T} = \text{constant} = \frac{1}{p}$

From slope of curves, $p_1 > p_2$.

$$28. (c) pV = nRT = \frac{m}{M} RT$$

where, m = mass of gas

and $\frac{m}{M} = n$ = number of moles

$\Rightarrow \frac{pV}{T} = nR = \text{constant}$ for all values of p (ideally, it is a straight line).

$$\therefore \frac{pV}{T} = \frac{1 \text{ g}}{32 \text{ g}} \times 8.31 \text{ J mol}^{-1} \text{ K}^{-1} = 0.256 \text{ JK}^{-1}$$

Also, $T_1 > T_2$

29. (b) The average of speed, density and kinetic energy can never be zero. Because these quantities have only positive values. But momentum is a vector quantity. So, average value of momentum may be zero.

30. (a) Random motion of molecules is not ordered motion, causes rise of temperature.

$$31. (a) \text{ Average KE} = \frac{1}{2} m v_{rms}^2 = \frac{1}{2} m \frac{3p}{\rho} = \frac{1}{2} \frac{M}{N} \times \frac{3p}{\rho}$$

$$= \frac{1}{2} \times \frac{28}{6 \times 10^{23}} \times \frac{3 \times 10^6}{\left(\frac{1}{2 \times 10^4}\right)}$$

$$= 14 \times 10^{-13} \text{ erg}$$

32. (a)

33. (b) Let I = moment of inertia

$$I = 2 (mr^2)$$

$$m = \frac{70 \times 10^{-3}}{2 \times 6.02 \times 10^{23}} = 5.81 \times 10^{-26} \text{ kg}$$

$$r = \frac{2 \times 10^{-10}}{2} = 1 \times 10^{-10} \text{ m}$$

$$I = 1.16 \times 10^{-45} \text{ kg/m}^2$$

$$\therefore k = \frac{1}{2} I \omega^2$$

$$= \frac{1}{2} (1.16 \times 10^{-45}) (2 \times 10^{12})^2$$

$$= 2.32 \times 10^{-21} \text{ J}$$

34. (c) Mean free path,

$$\lambda = \frac{kT}{\sqrt{2} \pi \rho d^2}$$

$$\lambda = \frac{(1.381 \times 10^{-23}) (293)}{\sqrt{2} \pi (1.013 \times 10^5) (3.10 \times 10^{-10})^2}$$

$$\lambda = 93.6 \text{ nm}$$

35. (b) The p - T graph for saturated vapour is shown in figure.

From graph, it is clear that pressure varies non-linearly with temperature at constant volume.

BITSAT Archives

1. (b) Assuming the balloons have the same volume, as $pV = nRT$. If p , V and T are the same, n the number of moles present will be the same, whether it is He or air. Hence, number of molecules per unit volume will be same in both the balloons.

2. (c) Applying gas equation, $pV = nRT$

We can write, $p_1V = n_1RT_1$

and

$$p_2V = n_2RT_2$$

$\Rightarrow$

$$\begin{aligned} \frac{p_2}{p_1} &= \frac{n_2}{n_1} \times \frac{T_2}{T_1} \\ &= \frac{1}{1} \times \frac{2T}{T} = 2 \end{aligned}$$

$\Rightarrow$

$$p_2 = 2p$$

3. (d) We know, $v_{\text{rms}} = \sqrt{\frac{3RT}{M}}$

$\Rightarrow$ % increase in

$$\begin{aligned} v_{\text{rms}} &= \frac{\sqrt{\frac{3RT_2}{M}} - \sqrt{\frac{3RT_1}{M}}}{\sqrt{\frac{3RT_1}{M}}} \times 100 \\ &= \frac{\sqrt{T_2} - \sqrt{T_1}}{\sqrt{T_1}} \times 100 \\ &= \frac{\sqrt{400} - \sqrt{300}}{\sqrt{300}} \times 100 \\ &= \frac{20 - 17.32}{17.32} \times 100 \\ &= 15.5\% \end{aligned}$$

4. (c) $\frac{E_s}{E_T} = \frac{C_p}{C_V} = \gamma = 1 + \frac{2}{f}$

5. (b) Collision frequency $= \frac{v}{l}$

6. (a) As V - T graph is a straight line with positive slope, therefore its equation, may be written as

$$V = aT + b$$

From standard gas equation,

$$p = \frac{RT}{V} = \frac{RT}{aT + b} = \frac{R}{a + b/T}$$

As,

$$T_2 > T_1$$

$\therefore$

$$p_2 > p_1 \text{ or } p_1 < p_2$$

7. (c) Ideal gas equation is given by

$$pV = nRT$$

...(i)

For oxygen, $p = 1 \text{ atm}$, $V = 1 \text{ L}$, $n = n_0$

Therefore, Eq. (i) becomes

$$\therefore 1 \times 1 = n_{\text{O}_2} RT \Rightarrow n_{\text{O}_2} = \frac{1}{RT}$$

$$\text{and } 0.5 \times 2 = n_{\text{N}_2} RT \Rightarrow n_{\text{N}_2} = \frac{1}{RT}$$

For mixture of gas,

$$p_{\text{mix}} V_{\text{mix}} = n_{\text{mix}} RT$$

Here,

$$n_{\text{mix}} = n_{\text{O}_2} + n_{\text{N}_2}$$

$$\therefore \frac{p_{\text{mix}} V_{\text{mix}}}{RT} = \frac{1}{RT} + \frac{1}{RT}$$

$\Rightarrow$

$$p_{\text{mix}} V_{\text{mix}} = 2$$

8. (c) Velocity of sound, $v = \sqrt{\frac{\gamma RT}{M}}$

$$\frac{v_{\text{H}}}{v_{\text{O}}} = \sqrt{\frac{M_{\text{O}}}{M_{\text{H}}}} = \sqrt{\frac{16}{1}} = 4 : 1$$

17

Laws of Thermodynamics

Thermal Equilibrium

When there is no exchange of heat between two objects placed in contact, then both are said to be in thermal equilibrium. Thus, the temperature remains constant throughout all the portions. Thermodynamics is a branch of science which deals with transformation of heat energy into other forms of energy and *vice-versa*.

Zeroth Law of Thermodynamics

If two objects A and B are separately in thermal equilibrium with another object C , then objects A and B will also be in thermal equilibrium.

Cylinder has a cross-sectional area A and pressure exerted by system on the piston face is p . The work done by the system on the surroundings for small displacement dx is $dW = pAdx$ as shown in figure.

$$W = \int dW = \int_{V_i}^{V_f} p dV$$

Work

Work done can be defined as ability to do work. In thermodynamics, work is actually done due to pressure of the gas.

If a gas placed in a cylinder with frictionless piston is allowed to expand from the state A to the state B , when pressure and change in volume are p and ΔV . If during expansion, piston moves by small distance dx , then work done is

$$dW = pA(dx) = p dV \Rightarrow W = \int_{V_1}^{V_2} p dV$$

If V increases, then work done by the gas is positive. If V decreases, then work done by the gas is negative.

Work done = area bounded by p - V curve.

Work done in Different Cases

Case I When volume is constant.

Case II When volume is increasing.

Case III When volume is decreasing.

Case IV Work done in cyclic process.

(i) Work done by clockwise cycle

$ABCDE = + \text{shaded area}$

[In Fig. (a)]

(ii) Work done by anti-clockwise cycle

$PQRS = - \text{shaded area}$

[In Fig. (b)]

Case V Work done in incomplete cycle.

First Law of Thermodynamics

This law is based on law of conservation of energy. If δQ is heat supplied to a thermodynamical system and δW is work done by the thermodynamical system and resulting δU is the change in internal energy, then

$$\delta Q = \delta W + \delta U$$

This equation is the **first law of thermodynamics**.

Sign Conventions for First Law of Thermodynamics

δQ , δW and δU must be in the same units.

Heat supplied to the system = Positive

Heat rejected by the system = Negative

Work done by the system = Positive

Work done on the system = Negative

If temperature increases, δU = Positive

If temperature decreases, δU = Negative

Different Thermodynamical Processes

We are going to discuss different types of thermodynamics processes.

1. Reversible and Irreversible Processes

A reversible process means, if a process takes up the path AB (as shown in figure), then on reversing the conditions it comes back by BA .

A thermal process could be reversible, if the change is extremely small (infinitesimally small).

In irreversible process, one will not reach back to A , if the process AB has occurred.

Reversible process

Irreversible process

2. Isothermal Process

- In this process, temperature of the system is kept constant during the change of state.
- As $Q = nC_{iso}dT \Rightarrow C_{iso} = \frac{Q}{ndT} = \infty$, i.e. molar heat capacity for an isothermal process is infinity.
- From $dU = nC_V dT$ as $dT = 0$, so $dU = 0$, i.e. internal energy is constant.
- Gas equation is $pV = \text{constant}$.

- From first law of thermodynamics, $dQ = dW$ i.e. heat given to the system is equal to the work done by system on the surroundings.

$$W = nRT \ln\left(\frac{V_f}{V_i}\right) = nRT \ln\left(\frac{p_i}{p_f}\right)$$

- After differentiating $pV = \text{constant}$, we have $\frac{dp}{dV} = -\frac{p}{V}$ (slope of p - V curve) and $\frac{-dp}{dV/V} = p$, i.e. bulk modulus of a gas in isothermal process, $B = p$

- p - V curve is a rectangular hyperbola.

3. Adiabatic Process

- In this process, no heat exchange takes place between the system and the surroundings, i.e. $dQ = 0$ or $Q = \text{constant}$
- From $dQ = nCdT$, $C_{ad} = 0$ as $dQ = 0$, i.e. molar heat capacity for an adiabatic process is zero.
- From first law, $dU = -dW$ i.e. work done by the system is equal to decrease in internal energy. When a system expands adiabatically, work done is positive and hence internal energy decreases i.e. the system cools down and *vice-versa*.
- Gas equation is $pV^\gamma = \text{constant}$. Gas equation can be written in many other ways as $TV^{\gamma-1} = \text{constant}$ or $p^{1-\gamma}T^\gamma = \text{constant}$, where $\gamma = \frac{C_p}{C_v}$.

- Work done in an adiabatic process is

$$W = \frac{nR(T_1 - T_2)}{\gamma - 1} = \frac{p_1V_1 - p_2V_2}{\gamma - 1}$$

- Using $pV = nRT$ and $pV^\gamma = \text{constant}$, we can have $\frac{dp}{dV} = -\frac{\gamma p}{V}$ i.e. slope of p - V curve in an adiabatic process is γ times the slope of p - V curve in isothermal process.

4. Isobaric Process

- This is the process in which pressure is kept constant.
- Molar heat capacity of the process is C_p and $dQ = nC_p dT$

- $dU = nC_v dT$

- From the first law of thermodynamics, $dQ = dU + dW$; $dW = pdV = nRdT$
 $\Rightarrow W = p(V_f - V_i) = nR(T_f - T_i)$
- Gas equation is $\frac{V}{T} = \text{constant}$.
- p - V curve is a straight line parallel to the volume axis.

5. Isochoric Process

- This is the process in which volume is kept constant.
- $dQ = nC_v dT$, molar heat capacity for isochoric process is C_v .

- Volume is constant, so $dW = 0$
- From the first law of thermodynamics, $dQ = dU$. As heat is supplied to the system, internal energy increases and hence the temperature increases.
- Gas equation is $\frac{p}{T} = \text{constant}$.
- p - V curve is a straight line parallel to the pressure axis.

6. Cyclic Process

In cyclic process, final state of gas is same as the initial state of gas. For one complete cycle process, $dU = 0$.

Work done by the gas

is equal to the area enclosed by the p - V curve.

Here, net heat in the process is given by

Net heat = Total heat supplied + Total heat rejected

Efficiency of cyclic process

$$\eta = \frac{\text{Total work done in cycle}}{\text{Total heat supplied}} \times 100\%$$

Heat Engine

It is a device which is used to convert heat energy into mechanical energy, in a cyclic process.

Components of a heat engine are

- (i) A body at higher temperature T_1 from which heat is extracted is called the source.
- (ii) Body of the engine contains a working substance which performs mechanical work, when heat is supplied to it.
- (iii) A body at lower temperature T_2 to which heat can be rejected is called the sink.

Efficiency of Heat Engine

Efficiency of heat engine (η) is defined as the fraction of total heat supplied (Q_1) to the engine which is converted into work (W).

Mathematically,

$$\eta = \frac{W}{Q_1} \text{ or } \eta = \frac{Q_1 - Q_2}{Q_1} = 1 - \frac{Q_2}{Q_1} = 1 - \frac{T_2}{T_1} \left[\because \frac{Q_2}{Q_1} = \frac{T_2}{T_1} \right]$$

Refrigerator

Refrigerator is a device which takes heat from a cold body, work is done on it and the work done together with the heat absorbed is rejected to the source. An ideal refrigerator can be regarded as an ideal heat engine working in the reverse direction.

Coefficient of Performance of a Refrigerator (β)

It is defined as the ratio of quantity of heat removed per cycle (Q_2) to the work done on the working substance per cycle to remove this heat.

$$\beta = \frac{Q_2}{W} = \frac{Q_2}{Q_1 - Q_2} \text{ or } \beta = \frac{T_2}{T_1 - T_2} = \frac{1 - \eta}{\eta}$$

Second Law of Thermodynamics

Second law of thermodynamics tells us whether in a given process conservation of energy will actually take place or not. This law gives the direction of heat flow. It can be stated as follows

- (i) **Clausius statement** It is impossible to make any such machine that can transfer heat from an object with low temperature to an object with high temperature without any external source.
- (ii) **Kelvin statement** It is impossible to obtain work continuously by cooling an object below the temperature of its surroundings.
- (iii) **Kelvin-Planck statement** It is impossible to construct any such machine that works on a cyclic process and absorbs heat from a source, converts all that heat into work and rejects no heat to sink.

Carnot Cycle

Carnot engine is an ideal reversible heat engine that operates between two temperatures T_1 (source) and T_2 (sink).

As the engine works, the working substance of the engine undergoes a cycle, known as **Carnot cycle**.

Net Work done by the Gas per Cycle

During the four strokes, W_1, W_2 are the work done by the gas and W_3, W_4 are the work done on the gas. Therefore, the net work performed by the engine,

$$\begin{aligned} W &= W_1 + W_2 - W_3 - W_4 \\ &= \text{Area } ABGE + \text{Area } BCHG - \text{Area } CDFH - \text{Area } ADEF \\ &= \text{Area } ABCD \end{aligned}$$

Thus, net work done by the engine during one cycle is equal to the area enclosed by the indicator diagram of the cycle.

Practice Exercise

- A boy weighing 50 kg eats bananas. The energy content of banana is 1000 cal, if this energy is used to lift the boy from ground, then the height through which he is lifted, is
a. 8.57 m b. 10.57 m c. 6.57 m d. 5.57 m
- 1 kg mass of water, boils at standard atmosphere pressure, turns completely into saturated vapour. Assume saturated vapour to be an ideal gas. Find the increment of internal energy of the system and internal work done.
(Given, specific latent heat of vaporisation of water = 2250 kJ/kg)
a. 3×10^6 J b. 2.1×10^6 J c. 3.2×10^6 J d. 4.2×10^6 J
- An ideal gas is heated at constant pressure and absorbs amount of heat Q . If the adiabatic exponent is γ , then find the fraction of heat absorbed in raising the internal energy and performing the work is
a. $1 - \frac{1}{\gamma}$ b. $1 + \frac{1}{\gamma}$ c. $1 - \frac{2}{\gamma}$ d. $1 + \frac{2}{\gamma}$
- The latent heat of vaporisation of water is 2240 J. If the work done in the process of vaporisation of 1 g is 168 J, then increase in internal energy is
a. 2408 J b. 2240 J c. 2072 J d. 1904 J
- The molar heat capacity in a process of a diatomic gas if it does a work of $Q/4$, when Q amount of heat is supplied to it is
a. $\frac{2}{5}R$ b. $\frac{5}{2}R$ c. $\frac{10}{3}R$ d. $\frac{6}{7}R$
- Starting with the same initial conditions, an ideal gas expands from volume V_1 to V_2 in three different ways. The work done by the gas is W_1 if the process is purely isothermal, W_2 if purely isobaric and W_3 if purely adiabatic. Then,
a. $W_2 > W_1 > W_3$ b. $W_2 > W_3 > W_1$
c. $W_1 > W_2 > W_3$ d. $W_1 > W_3 > W_2$
- Calculate the work done (W_{AB}) by the gas, if 5 moles of an ideal gas is carried by a quasi state isothermal process at 500 K to twice its volume.

- a. 1500 J b. 14407 J c. 13380 J d. 14890 J

- The work done for the cycle shown in given figure, will be

- a. 45 J b. 54 J c. 22.5 J d. 32.5 J

- An ideal monoatomic gas is taken around the cycle ABCDA as shown in the p - V diagram. The work done during cycle is given by

- a. $\frac{1}{2}pV$ b. pV
c. $2pV$ d. $4pV$

- A balloon that is initially flat, is inflated by filling it from a tank of compressed air. The final volume of the balloon is 5 m^3 . The barometer reads 95 kPa. The work done in this process is
a. 475×10^5 J b. 4.75×10^7 J
c. 4.75×10^3 J d. 4.75×10^5 J
- What work will be done, when 3 moles of an ideal gas are compressed to half the initial volume at a constant temperature of 300 K?
a. -5188 J b. 5000 J c. 5188 J d. -5000 J
- A gas is contained in a cylinder and expands according to the relation $pV^{1.3} = \text{Constant}$. The initial pressure and initial volume of the gas are 30 atm and 30 L respectively. If the final pressure is 15 atm, then calculate the work done on the face of piston by the pressure force of the gas.
a. 5×10^4 J b. 4.36×10^4 J
c. 3×10^4 J d. 4×10^4 J
- A vertical cylinder divided into two parts by a frictionless piston in the ratio of 5 : 4. The piston is free to slide along the length of the vessel and length of the vessel is 90 cm. Each of the two parts of the vessel contains 0.1 mole of an ideal gas and the temperature of gas is 300 K. Calculate the mass of the piston.
a. 14 kg b. 12.7 kg c. 16 kg d. 15 kg

14. During an isothermal expansion of an ideal gas,
 a. its internal energy decreases
 b. its internal energy does not change
 c. the work done by the gas is equal to the quantity of heat absorbed by it
 d. both (b) and (c) are correct
15. In the given graph, adiabatic and isothermal curves are shown. Then,

- a. the curve A is isothermal b. the curve B is isothermal
 c. the curve A is adiabatic d. the curve B is adiabatic
16. 0.2 moles of an ideal gas, is taken around the cycle *abc* as shown in the figure. The path *b-c* is adiabatic process, *a-b* is isovolumic process and *c-a* is isobaric process. The temperature at *a* and *b* are $T_a = 300\text{ K}$ and $T_b = 500\text{ K}$ and pressure at *a* is 1 atmosphere. Find the volume at *c*.
 (Given, $\gamma = \frac{C_p}{C_v} = \frac{5}{3}$, $R = 8.205 \times 10^{-2}\text{ L/atm/mol-K}$)
- a. 6.9 L b. 6.68 L c. 5.52 L d. 5.82 L
17. At 27°C a motor car tyre has pressure of 2 atmosphere. Find the temperature, if the tyre suddenly bursts.
 (Given, $\gamma_{\text{air}} = 1.4$)
- a. 24.1 K b. 250 K c. 246.1 K d. 248 K
18. In an adiabatic expansion, a gas does 25 J of work while in an adiabatic compression 100 J of work is done on a gas. The change of internal energy in the two processes respectively are
- a. 25 J and -100 J b. -25 J and 100 J
 c. -25 J and -100 J d. 25 J and 100 J
19. The molar heat capacity of oxygen gas at STP is nearly $2.5R$. As the temperature is increased, it gradually increases and approaches $3.5R$. The most appropriate reason for this behaviour is that at high temperature,
- a. oxygen does not behave as an ideal gas
 b. oxygen molecules dissociate in atoms
 c. the molecules collide more frequently
 d. molecular vibrations gradually become effective
20. *p-V* diagram of a diatomic gas is a straight line passing through origin. The molar heat capacity of the gas in the process will be
- a. $4R$ b. $3R$ c. $4R/3$ d. $2.5R$

21. An ideal gas is taken from the state *A* (pressure *p*, volume *V*) to the state *B* (pressure $p/2$, volume $2V$), a long straight line path in the *p-V* diagram. Select the correct statement from the following.
- a. The work done by the gas in the process *A* to *B*, exceeds the work that would be done by it, if system were taken along the isotherm
 b. In the *T-V* diagram, the path *AB* becomes a part of a hyperbola
 c. In the *p-T* diagram, the path *AB* becomes a part of a hyperbola
 d. In going from *A* to *B*, the temperature *T* of the gas first decreases to a minimum value and then increases
22. During adiabatic change, specific heat is
- a. zero b. greater than zero
 c. less than zero d. infinity
23. Molar heat capacity is directly related to
- a. temperature b. heat energy
 c. molecular structure d. mass
24. If at NTP, velocity of sound in a gas is 1150 m/s, then find out the rms velocity of gas molecules at NTP.
 (Given, $R = 8.3\text{ J/mol-K}$, $C_p = 4.8\text{ cal/mol-K}$)
- a. 1600 m/s b. 1532.19 m/s
 c. 160 m/s d. 16 m/s
25. What is the molar heat capacity for the process, when 10 J of heat added to a monoatomic ideal gas in a process in which the gas performs a work of 5 J on its surrounding?
- a. $2R$ b. $3R$ c. $4R$ d. $5R$
26. A gaseous mixture consists of $\mu_1 = 2$ moles of oxygen and $\mu_2 = 3$ moles of carbon dioxide. Assume gases to be ideal. Calculate, $\gamma = \frac{C_p}{C_v}$ for the gaseous mixture.
- a. 2.33 b. 1.33 c. 0.33 d. 3.33
27. Find the molar specific heat of mixture at constant volume, if one mole of a monoatomic gas is mixed with three moles of a diatomic gas.
- a. $3.33R$ b. $2.25R$ c. $1.15R$ d. $6.72R$
28. If a gas heated at constant pressure, then what percentage of total heat supplied is used up for external work? (Given, γ for gas = $\frac{4}{3}$)
- a. 25% b. 50% c. 75% d. 80%
29. One mole of a gas isobarically heated by 40 K receives an amount of heat 1.162 kJ. What is the ratio of specific heats of the gas?
- a. 1.7 b. 1.4 c. 1.3 d. 1.5
30. In a process $PT = \text{constant}$, if molar heat capacity of a gas is $C = 37.35\text{ J/mol-K}$, then find the number of degrees of freedom of molecules in the gas.
- a. $n = 10$ b. $n = 5$
 c. $n = 6$ d. $n = 7$

31. If in an adiabatic process, the pressure is increased by $\frac{2}{3}\%$, then volume decreases by $\left(\text{Assume } \frac{C_p}{C_v} = \frac{3}{2}\right)$
- a. $-\frac{4}{9}\%$ b. $\frac{2}{3}\%$ c. 4% d. $\frac{9}{4}\%$
32. A monoatomic ideal gas is expanded adiabatically to n times of its initial volume. The ratio of final rate of collision of molecules with unit area of container walls to the initial rate will be
- a. $n^{-4/3}$ b. $n^{4/3}$ c. $n^{2/3}$ d. $n^{-5/3}$
33. In the case of solid, number of degrees of freedom is
- a. 3 b. 5 c. 6 d. 7
34. A given quantity of an ideal gas is at the pressure p and the absolute temperature T . The isothermal bulk modulus of the gas is
- a. $\frac{2}{3}p$ b. p c. $\frac{3}{2}p$ d. $2p$
35. A non-conducting cylindrical vessel of cross-sectional area $29.15 \times 10^{-5} \text{ m}^2$ and volume 10^3 m^3 contains 10^{-4} kg oxygen in it. The cylinder is closed by a frictionless non-conducting piston which is free to move in vertical direction. If the piston is slightly depressed and released, it will execute simple harmonic motion, then find its frequency. (Assume $\frac{C_p}{C_v} = 1.4$ for oxygen and ignore atmosphere pressure)
- a. 0.13 s b. 0.318 s c. 0.23 s d. 0.36 s
36. At a temperature t , the moment of inertia of a body is I . When the temperature of the body is increased from $t + \Delta t$, its moment of inertia also increases from I to $(I + \Delta I)$. If coefficient of linear expansion of the body is α , then find the ratio $\frac{\Delta I}{I}$.
- a. $\frac{\Delta t}{t}$ b. $\frac{2\Delta t}{t}$ c. $\alpha \Delta t$ d. $2\alpha \Delta t$
37. A Carnot engine, whose efficiency is 40%, takes in heat from a source maintained at a temperature of 500 K. It is desired to have an engine of efficiency 60%. Then, the intake temperature for the same exhaust (sink) temperature must be
- a. efficiency of Carnot engine cannot be made larger than 50%
b. 1200 K c. 750 K d. 600 K
38. The inside and outside temperatures of a refrigerator are 273 K and 303 K respectively. Assuming that refrigerator cycle is reversible, for every joule of work done, the heat delivered to the surrounding will be
- a. 10 J b. 20 J c. 30 J d. 50 J
39. Find coefficient of performance, if in a mechanical refrigerator, the lower temperature coils of a evaporator are at -23°C and compressed gas in the condenser has a temperature of 77°C .
- a. 70% b. 20% c. 0.23% d. 2.5%
40. A refrigerator works between the temperature of melting ice and room temperature (17°C). The amount of energy (in kWh) that must be supplied to freeze 1 kg of water at 0°C is
- a. 1.4 b. 1.8
c. 0.058 d. 2.5

BITSAT Archives

1. The heat energy [2014]
- a. is a state variable
b. does not depend on the state of the system
c. is equal to internal energy of the system
d. None of the above
2. In a thermodynamic process, the pressure of a fixed mass of a gas is changed in such a manner that the gas releases 20 J of heat and 8 J of work is done on the gas. If the initial internal energy of the gas was 30 J, then the final internal energy will be [2014]
- a. 2 J b. 42 J c. 18 J d. 58 J
3. A thermodynamical system is changed from state (p_1, V_1) to (p_2, V_2) by two different process, the quantity which will remain same will be [2013]
- a. ΔQ b. ΔW c. $\Delta Q + \Delta W$ d. $\Delta Q - \Delta W$
4. A sample of ideal monoatomic gas is taken round the cycle ABCA as shown in the figure. The work done during the cycle is [2012]

- a. $3 pV$ b. zero
c. $9 pV$ d. $6 pV$

5. An ideal refrigerator has a freezer at a temperature of -13°C . The coefficient of performance of the engine is 5. The temperature of the air (to which heat is rejected) will be [2011]
 a. 325°C b. 325 K c. 39°C d. 320°C
6. In the adiabatic compression, the decrease in volume is associated with [2008]
 a. increase in temperature and decrease in pressure
 b. decrease in temperature and increase in pressure
 c. decrease in temperature and decrease in pressure
 d. increase in temperature and increase in pressure
7. Which of the following is true in the case of an adiabatic process, where $\gamma = \frac{C_p}{C_v}$? [2008]
 a. $p^{1-\gamma}T^{\gamma} = \text{constant}$ b. $p^{\gamma}T^{1-\gamma} = \text{constant}$
 c. $pT^{\gamma} = \text{constant}$ d. $p^{\gamma}T = \text{constant}$
8. Initially two gas samples 1 and 2 are at the same condition. The volume of the two are halved, one isothermally and the other adiabatically. What is the relation between the final pressures p_1 and p_2 ? [2006]
 a. $p_1 = p_2$
 b. $p_1 > p_2$
 c. $p_2 > p_1$
 d. Cannot be determined
9. A can is taken out from a refrigerator at 0°C . The atmospheric temperature is 25°C . If t_1 is the time taken to heat from 0°C to 5°C and t_2 is the time taken from 10°C to 15°C , then [2006]
 a. $t_1 > t_2$
 b. $t_1 < t_2$
 c. $t_1 = t_2$
 d. there is no relation

Answer with Solutions

Practice Exercise

1. (a)
2. (b) We know, $\Delta Q = \Delta U + \Delta W_{\text{ex}} + \Delta W_{\text{in}}$
 $\Delta U = 0$, $\Delta Q = mL$
 $\Delta W_{\text{ex}} = p_0(V_{\text{vapour}} - V_{\text{water}}) = p_0 V_{\text{vapour}}$
 $PV = \frac{m}{M}RT$
 $\Rightarrow \Delta W_{\text{ex}} = p_0 V_{\text{vapour}} = \frac{m}{M}RT$
 $\Delta W_{\text{in}} = \Delta Q - \Delta W_{\text{ex}} = mL - \frac{m}{M}RT$
 $= m \left[L - \frac{RT}{M} \right] = 2.1 \times 10^6 \text{ J}$
3. (a) Heat absorbed by the system at constant pressure $Q = nC_p \Delta T$ and change in internal energy

$$\begin{aligned} \Delta U &= nC_v \Delta T \\ W &= Q - \Delta U \\ \text{Fraction} &= \frac{W}{Q} = \frac{Q - \Delta U}{Q} = 1 - \frac{\Delta U}{Q} \\ &= 1 - \frac{\Delta U}{Q} = \left(1 - \frac{1}{\gamma} \right) \end{aligned}$$

4. (c) Given, $L = 2240 \text{ J}$, $m = 1 \text{ g}$
 $dW = 168 \text{ J}$
 From first law of thermodynamics,
 $dU = 2072 \text{ J}$

5. (c) $dU = C_v dT = \left(\frac{5}{2} R \right) dT$
 $\Rightarrow dT = \frac{2(dU)}{5R}$

From first law of thermodynamics, $dU = dQ - dW$

$$\text{or } dU = Q - \frac{Q}{4} = \frac{3Q}{4}$$

Now, molar heat capacity,

$$C = \frac{dQ}{dT} = \frac{Q}{2 \left(\frac{dU}{5R} \right)} = \frac{5QR}{2 \left(\frac{3Q}{4} \right)} = \frac{10}{3} R$$

6. (a)

It is clear from the graph that on the basis of area under p - V curve for different processes $W_2 > W_1 > W_3$.

7. (b)
8. (a) The area of p - V diagram gives work.
 $= 45 \text{ J} = \text{work done}$
9. (b) $W = (2V - V)(2p - p) = pV$
10. (d)
11. (a) As process is isothermal
 $W = 2.303 nRT \log \left(\frac{V_2}{V_1} \right)$
 $W = 2.303 \times 3 \times 8.315 \times 300 \times \log \left(\frac{1}{2} \right)$
 $W = -5188 \text{ J}$

12. (b) $W = \int_{V_1}^{V_2} p dV$ and $pV^{1.3} = C, p = CV^{-1.3}$

$$W = \int_{V_1}^{V_2} CV^{-1.3} dV = \frac{-C}{0.3} [V^{0.3}]_{V_1}^{V_2}$$

$$C = p_1 V_1^{1.3} = p_2 V_2^{1.3}$$

$$W = \frac{p_2 V_2 - p_1 V_1}{-0.3}$$

Final volume, $V_2 = V_1 \left(\frac{p_1}{p_2} \right)^{1/1.3}$

$$= 30 \times 10^{-3} (2)^{0.77} = 30 \times 10^{-3} \times 1.71$$

$$V_2 = 51.3 \times 10^{-3} \text{ m}^3$$

$$W = \frac{15 \times 10^5 \times 51.3 \times 10^{-3} - 30 \times 10^5 \times 30 \times 10^{-3}}{0.3}$$

$$W = 4.36 \times 10^4 \text{ J}$$

13. (b)

14. (d) In isothermal process, temperature remains constant

$$\therefore \Delta U = nC_V \Delta T = 0 \quad (\because \Delta T = 0)$$

According to the first law of thermodynamics,

$$\Delta H = \Delta U + \Delta W$$

$$\therefore \Delta H = \Delta W \quad (\because \Delta U = 0)$$

Hence, (d) is correct.

15. (b, c)

16. (b) From a - b, volume is constant

$$\frac{p_a}{T_a} = \frac{p_b}{T_b}$$

$$p_b = \frac{500}{300} \times 1 = \frac{5}{3} \text{ atm}$$

For b - c, adiabatic process

$$\frac{T_c}{T_b} = \left(\frac{p_c}{p_b} \right)^{\frac{\gamma-1}{\gamma}} = \left[\frac{1}{5/3} \right]^{\frac{5/3-1}{5/3}} = \left(\frac{3}{5} \right)^{2/5}$$

Also,

$$p_b V_b^\gamma = p_c V_c^\gamma$$

$$V_c = (V_b) \left(\frac{p_b}{p_c} \right)^{1/\gamma}$$

$$= (4.928) \left(\frac{5/3}{1} \right)^{3/5} = 6.68 \text{ litre}$$

17. (c)

18. (b) In adiabatic process, $\Delta H = 0$

$\therefore$ For expansion,

$$\Delta H = \Delta U + \Delta W$$

$$0 = \Delta U + 25$$

$$U = -25 \text{ J}$$

For adiabatic compression,

$$\Delta H' = \Delta U' + \Delta W'$$

$$0 = \Delta U' - 100$$

$$\Delta U = 100 \text{ J}$$

Hence, (b) is correct.

19. (a)

20. (b) As p-V diagram is a straight line passing through origin, therefore, $p \propto V$ or $pV^{-1} = \text{constant}$

In the process, $pV^x = \text{constant}$, molar heat capacity is

given by $C = \frac{R}{\gamma-1} + \frac{R}{1-x}$

where, $x = -1$ and $\gamma = 1.4$ for diatomic gas

$$C = \frac{R}{1.4-1} + \frac{R}{1-(-1)} = \frac{5}{2}R + \frac{R}{2}$$

$$C = 3R$$

21. (a) $W = \frac{1}{2} \left(p + \frac{p}{2} \right) V = \frac{3}{4} pV = 0.75 pV$

$$W_{\text{iso}} = RT \times 2.3026 \log_{10} \left(\frac{2V}{V} \right) = 0.693 pV$$

Thus, statement (a) is correct.

22. (a)

23. (c) Since, $C_p - C_V = R$

$$\frac{C_p}{C_V} = \gamma \text{ or } C_p = \gamma C_V$$

$$\therefore C_p - C_V = R$$

$$C_V(\gamma - 1) = R$$

$$\therefore C_V = \frac{R}{(\gamma - 1)}$$

Also,

$$C_p = \frac{\gamma R}{(\gamma - 1)}$$

But R is universal constant. The value of γ depends upon molecular structure.

24. (b) $R = \frac{8.3}{4.2} \text{ cal/mol/K}$

$$C_V = C_p - R = \left(4.8 - \frac{8.3}{4.2} \right) = 2.824$$

$$\gamma = \frac{C_p}{C_V} = \frac{4.8}{2.824} = 1.69$$

Since, $V = \sqrt{\left(\frac{3}{\gamma} \right)} \cdot V_s = 1532.19 \text{ m/s}$

25. (b)

26. (b) Let $n = n_1 + n_2$

$$nC_p = n_1 C_{p1} + n_2 C_{p2}$$

$$C_p = \frac{n_1 C_{p1} + n_2 C_{p2}}{n}$$

Similarly,

$$C_V = \frac{n_1 C_{V1} + n_2 C_{V2}}{n}$$

$$\gamma = \frac{C_p}{C_V} = \frac{n_1 C_{p1} + n_2 C_{p2}}{n_1 C_{V1} + n_2 C_{V2}}$$

$$\text{But } C_{p1} = \frac{\gamma_1 R}{(\gamma_1 - 1)} \text{ and } C_{p2} = \frac{\gamma_2 R}{(\gamma_2 - 1)}$$

$$\text{also } C_{V1} = \frac{R}{\gamma_1 - 1} \text{ and } C_{V2} = \frac{R}{\gamma_2 - 1}$$

$$\gamma = \frac{n_1 \left[\frac{\gamma_1 R}{(\gamma_1 - 1)} \right] + n_2 \left[\frac{\gamma_2 R}{(\gamma_2 - 1)} \right]}{\frac{n_1 R}{(\gamma_1 - 1)} + \frac{n_2 R}{(\gamma_2 - 1)}}$$

After solving, $\gamma = 1.33$

27. (b) Let C_{vm} = molar specific heat of mixture at constant volume.

$$\text{For mixture, } (n_1 + n_2)C_{vm} = n_1 C_{V1} + n_2 C_{V2}$$

$$\text{Here, } C_{V1} = \frac{3R}{2}, n_1 = 1 \text{ mole}$$

$$C_{V2} = \frac{5R}{2}, n_2 = 3 \text{ moles}$$

$$(1 + 3)C_{vm} = 1 \times \frac{3}{2}R + 3 \times \frac{5}{2}R$$

$$C_{vm} = \frac{9}{4}R = 2.25R$$

28. (a) Heat supplied, $dQ = nC_p dT$

$$\text{Heat used for work} = dW = nRdT$$

$$\begin{aligned} \frac{dW}{dQ} &= \frac{R}{C_p} = \frac{C_p - C_v}{C_p} = 1 - \frac{C_v}{C_p} \\ &= \left(1 - \frac{1}{\gamma}\right) = \left(1 - \frac{3}{4}\right) \\ &= \frac{1}{4} \times 100 = 25\% \end{aligned}$$

29. (b)

30. (b) $pV = nRT$ and $pT = k = \text{constant}$

$$\begin{aligned} \Rightarrow p &= \frac{k}{T} \\ V &= \frac{nR}{k} T^2, \\ dV &= \frac{2nRTdT}{k} \end{aligned}$$

For

$$\begin{aligned} n = 1, dU &= \int_0^T PdV \\ &= \int_0^T \frac{k}{T} \frac{2R}{k} TdT = 2RdT \end{aligned}$$

$$dW = nC_v dT = n \frac{R}{\gamma - 1} dT = \frac{R}{\gamma - 1} dT$$

According to law, $\Delta Q = \Delta U + \Delta W$

$$= \frac{R}{\gamma - 1} dT + 2RdT = R \left[\frac{2\gamma - 1}{\gamma - 1} \right] dT$$

$$C = \frac{dQ}{dT} = R \left[\frac{2\gamma - 1}{\gamma - 1} \right]$$

$$\gamma = \frac{7}{5} \text{ and } 1 + \frac{2}{n} = \frac{7}{5}$$

$$n = 5$$

31. (a) $\frac{C_p}{C_v} = \gamma = \frac{3}{2}$

Let $k = \text{constant}$

We know for an adiabatic process, $pV^\gamma = k$

$$pV^{3/2} = k$$

$$\log p + \frac{3}{2} \log V = \log k$$

$$\frac{\Delta p}{p} + \frac{3}{2} \frac{\Delta V}{V} = 0 \Rightarrow \frac{\Delta V}{V} = -\frac{2}{3} \frac{\Delta p}{p}$$

$$\begin{aligned} \frac{\Delta V}{V} \times 100 &= \left(-\frac{2}{3}\right) \left(\frac{\Delta p}{p} \times 100\right) \\ &= -\frac{2}{3} \times \frac{2}{3} = -\frac{4}{9} \% \end{aligned}$$

32. (d) The rate of collision of molecules with unit area of walls of container is proportional to pressure.

$$p_1 V_1^\gamma = p_2 V_2^\gamma$$

$$V_2 = n V_1$$

$$\therefore \frac{p_2}{p_1} = \left(\frac{V_1}{V_2}\right)^\gamma = \left(\frac{V_1}{n V_1}\right)^\gamma = \frac{1}{n^\gamma}$$

$$p_2 = p_1 n^{-\gamma}$$

For monoatomic gas, $\gamma = 1 + \frac{2}{3} = \frac{5}{3}$

$$p_2 = p_1 n^{-5/3}$$

33. (c)

$$34. (b) \beta = \frac{\Delta p}{\frac{\Delta V}{V}}$$

$\therefore$ In isothermal process $(p + \Delta p)(V - \Delta V) = pV$

or $pV - p\Delta V + V\Delta p - \Delta p\Delta V = pV$

But $\Delta p\Delta V$ may be neglected.

$$\therefore V\Delta p = p\Delta V \text{ or } \frac{\Delta p}{\frac{\Delta V}{V}} = p$$

35. (b) In equilibrium state, $p = \frac{mg}{A}$

Also Poisson's law, $pV^\gamma = \text{constant}$ as process is adiabatic.

When it is depressed, volume will decrease by ΔV and pressure increase by Δp

$$pV^\gamma = (p + \Delta p)(V - \Delta V)^\gamma$$

$$\Delta p = \gamma p \left(\frac{\Delta V}{V} \right)$$

When piston is released, restoring force will act on it.

$$F = -\Delta p(A) = -\gamma pA \left(\frac{\Delta V}{V} \right)$$

$$\Delta V = An$$

$$F = \frac{-\gamma pA^2}{V} \cdot n$$

$$\text{Acceleration of piston, } \alpha = \frac{F}{m} = \left(\frac{-\gamma p A^2}{mV} \right) x = -\omega^2 x$$

$$n = \frac{\omega}{2\pi} \Rightarrow n = \frac{1}{2\pi} \sqrt{\frac{\gamma g A}{V}} \quad \left[\because p = \frac{mg}{A} \right]$$

$$n = 0.318 \text{ s}$$

$$36. (d) I = \Sigma mr^2$$

$$\therefore I + \Delta I = \Sigma m [r(1 + \alpha \Delta t)]^2$$

$$I + \Delta I = \Sigma [mr^2(1 + 2\alpha \Delta t)] = I(1 + 2\alpha \Delta t)$$

$$\frac{\Delta I}{I} = 2\alpha \Delta t$$

$$37. (c)$$

$$38. (a)$$

$$39. (c)$$

$$40. (c)$$

BITSAT Archives

1. (b) Heat energy is not a state variable, it is just energy in transition.

2. (c) Given, $Q = -20 \text{ J}$, $W = -8 \text{ J}$

$$\text{Using 1st law, } Q = \Delta U + W \Rightarrow -20 = \Delta U + (-8)$$

$$\Rightarrow \Delta U = -12 \text{ J} \Rightarrow U_f - U_i = -12 \text{ J}$$

$$\Rightarrow U_f - 30 = -12 \text{ J} \Rightarrow U_f = 18 \text{ J}$$

3. (d) For all processes, change in internal energy $\Delta U = (\Delta Q - \Delta W)$ does not change. It depends only on initial and final states.

4. (a) The work done = area of p - V graph
= area of triangle ABC
 $= \frac{1}{2} \times 3p \times 2V = 3pV$

5. (c) Given, $T_2 = -13^\circ\text{C} = 260 \text{ K}$ and $\beta = 5$

$$\beta = \frac{T_2}{T_1 - T_2}$$

$$5 = \frac{260}{T_1 - 260}$$

$$T_1 = 312 \text{ K or } T_1 = 312 \text{ K} = 39^\circ\text{C}$$

6. (d) In adiabatic compression, temperature and hence internal energy of the gas increases. In compression pressure will increase.

7. (a) For adiabatic change, equation of state is
 $pV^\gamma = \text{constant}$

It can also be written as

$$TV^{\gamma-1} = \text{constant} \left[\text{as } p = \frac{nRT}{V} \right]$$

$$\text{and } p^{1-\gamma} T^\gamma = \text{constant} \left[\text{as } V = \frac{nRT}{p} \right]$$

8. (c) For isothermal process

$$pV = K$$

$$\Rightarrow p_1 = \frac{K}{V} \quad \dots(i)$$

$$\frac{K}{\frac{V}{2}} = 2K$$

For adiabatic process

$$pV^\gamma = K \quad (\text{constant})$$

$$\therefore p_2 = \frac{K}{V^\gamma} \quad \dots(ii)$$

$$= \frac{K}{\left(\frac{V}{2}\right)^\gamma} = K(2^\gamma)$$

From Eqs. (i) and (ii), we have

$$p_2 > p_1$$

9. (b) According to Newton's law of cooling, $t_1 < t_2$

18

Transmission

Modes of Heat Transfer

The heat can be transferred within the body and from one body to the other body through the following modes

- (i) Conduction (ii) Convection (iii) Radiation

Conduction

This process of heat transfer from one end of rod to other end, which does not involve any mass movement of molecules is called **conduction**.

Thermal Conductivity

The amount of heat transmitted through a conductor is given by

$$\Delta Q = \frac{KA\Delta T\Delta t}{l}$$

or in differential form, we can write

$$\frac{dQ}{dt} = -KA \frac{dT}{dx}$$

(where, $\frac{dT}{dx}$ = temperature gradient, A = area of cross-section, ΔT = temperature difference,

Δt = time elapsed, K = thermal conductivity and l = length)

The rate of transmission of heat by conduction is given by

$$H = \frac{\Delta Q}{\Delta t} = \frac{KA\Delta T}{l}$$

The unit of thermal conductivity is $\text{Wm}^{-1}\text{K}^{-1}$.

We can write

$$\frac{dQ}{dt} = mc \frac{dT}{dt} = \pm L \frac{dm}{dt}$$

Convection

Convection is the mode of heat transfer by actual motion of the matter (or particles of matter). Convection is not possible in solids and can take place in fluids only.

Radiation

Conduction and convection require some material as a transport medium. However, the third mechanism for heat transfer needs no medium. It is called **radiation**. The electromagnetic waves which require no medium for its propagation is the carrier of this radiant energy.

Some Common Terms and Points

The thermal radiation emitted by a body comprises of all the wavelengths; intensities of radiation corresponding to different wavelengths are different.

- **Absorptive power (a)** It is defined as the ratio of the radiant energy absorbed by it in a given time to the total radiant energy incident on it in the same interval of time

$$a = \frac{\text{energy absorbed}}{\text{energy incident}}$$

As a perfectly black body absorbs all radiations incident on it, the absorptive power of a perfectly black body is maximum and unity.

- **Spectral absorptive power (a_λ)** The spectral absorptive power is the ratio of radiant energy absorbed by a surface to the radiant energy incident on it for a particular wavelength λ . It may have different values for different wavelengths for a given surface. The spectral absorptive power a_λ is related to absorptive power through the relation $a = \int_0^\infty a_\lambda d\lambda$.

- **Emissive power (e)** For a given surface it is defined as the radiant energy emitted per second per unit area of the surface. It is the total amount of energy radiated by a body per second per unit area of surface

i.e.
$$e = \frac{1}{A} \frac{\Delta Q}{\Delta t}$$

- **Spectral emissive power (e_λ)** It is emissive power for a particular wavelength λ . Thus, $e = \int_0^\infty e_\lambda d\lambda$
- **Emissivity (ϵ)** Emissivity of a body at a given temperature is defined as the ratio of the total emissive power of the body (e) to the total emissive power of a perfect black body (E) at that temperature.

i.e.
$$\epsilon = \frac{e}{E}$$

Absorption, Reflection and Transmission

When radiations are incident on a surface, then three things happen—A part of the radiation is absorbed, some is reflected back, and remaining is transmitted.

$$Q_{\text{incident}} = Q_{\text{absorbed}} + Q_{\text{reflected}} + Q_{\text{transmitted}}$$

where, Q represents the energy of thermal radiation.

Absorptivity or absorptive power, $a = \frac{Q_{\text{absorbed}}}{Q_{\text{incident}}}$

Reflectivity, $r = \frac{Q_{\text{reflected}}}{Q_{\text{incident}}}$

Transmissivity, $t = \frac{Q_{\text{transmitted}}}{Q_{\text{incident}}}$

$$\frac{Q_s}{Q} + \frac{Q_r}{Q} + \frac{Q_t}{Q} = a + r + t = 1$$

For a perfect black body, $a = 1, r = t = 0$

For a perfect reflector, $a = t = 0, r = 1$

For a perfect transmitter, $a = r = 0, t = 1$

Perfectly Black Body

A perfectly black body is the one which completely absorbs the radiations of all the wavelengths that are incident on it. Thus, absorbing power of a perfectly black body is 1 (i.e. $a = 1$).

No material body is a perfectly black body. However, lamp black and platinum black are nearly perfectly black bodies.

Kirchhoff's Law

It states that the ratio of emissive power to absorptive power is the same for all the bodies at a given temperature and is equal to the emissive power of a black body at that temperature.

Thus, $\frac{e(\text{body})}{a(\text{body})} = E(\text{black body}) = \text{constant}$

So, a body with high emissive power, should also have high absorptive power and *vice-versa*.

Absorptive power is dimensionless quantity but emissive power is not.

Stefan-Boltzmann Law

It states that "energy emitted per unit area per unit time of perfectly black body is proportional to T^4 ," where T is temperature on absolute scale.

i.e.
$$U(\text{J/sm}^2) = \sigma T^4$$

Here, σ is Stefan's constant.

Measured value of σ is $5.67 \times 10^{-8} \text{ Wm}^{-2} \text{ K}^{-4}$.

If A is the area, then radiant energy per unit time of perfectly black body is $U(\text{J/s}) = \sigma AT^4$.

For a body which is not perfectly black, energy radiated per second is given by $U = \epsilon \sigma AT^4$.

where, e is emissivity which is equal to absorptive power a of the body. (i.e. $e = a$)

Also, if a body is placed where surrounding temperature is T_0 , then energy absorbed by the body will be given by

$$U = e\sigma AT_0^4$$

Thus, net loss of thermal power is given by

$$\Delta U = U - U_0 = e\sigma A(T^4 - T_0^4)$$

Wien's Displacement Law

The black body spectrum is a continuous spectrum as shown in the figure. At a given temperature, initially the intensity of thermal radiation increases with an increase in wavelength and reaches a maximum value at a particular wavelength λ_m . On increasing the wavelength beyond λ_m , the intensity of radiation E_λ starts decreasing.

The total area under E_λ - λ curve gives the total intensity of radiation at that temperature.

The area, in accordance with the Stefan's law of radiation, is directly proportional to the fourth power of the temperature.

$$\text{Emissive power, } E = \int_0^\infty E_\lambda d\lambda = \text{Area under } E_\lambda\text{-}\lambda \text{ graph} = \sigma T^4$$

From E_λ - λ graph, we find that as the temperature T of a black body increases, the wavelength λ_m corresponding to the maximum emission decreases such that

$$\lambda_m \propto \frac{1}{T} \text{ or } \lambda_m T = \text{constant} = b$$

where, b is known as the Wien's constant and its value is 2.89×10^{-3} mK.

Newton's Law of Cooling

According to the Newton's law of cooling, the rate of cooling of a body is directly proportional to the temperature difference between the body and the surroundings, provided the temperature difference is small.

$$\text{Mathematically, } \frac{dT}{dt} \propto (T - T_0) \text{ or } -\frac{dT}{dt} = k(T - T_0)$$

where, k is a constant.

Newton's law of cooling is a special case of Stefan's law under the condition that the temperature difference is small enough.

If a body cools by radiation through a small temperature difference from T_1 to T_2 in a short time t when the surrounding temperature is T_0 , then

$$\frac{dT}{dt} = \frac{T_1 - T_2}{t} = k \left[\frac{T_1 + T_2}{2} - T_0 \right]$$

Practice Exercise

- One end of a metal rod is kept in steam. In steady state, the temperature gradient $\left(\frac{d\theta}{dx}\right)$
 - may be variable
 - must be constant
 - must be variable
 - None of the above
- Calculate the daily loss of energy by the earth, if the temperature gradient in the earth's crust is 32°C per km and mean conductivity of the rock is 0.008 of CGS unit. (Given, radius of earth = 6400 km)
 - 10^{40} cal
 - 10^{30} cal
 - 10^{18} cal
 - 10^{10} cal
- Cylindrical rod of copper of length 2 m and cross-sectional area 2 cm^2 is insulated at its curved surface. The one end of rod is maintained in steam chamber and other is maintained in ice at 0°C (The thermal conductivity of copper is $386 \text{ J/m}\cdot\text{s}\cdot^\circ\text{C}$). Find the temperature at a point which is at a distance of 120 cm from the colder end.
 - 80°C
 - 60°C
 - 50°C
 - None of the above
- In previous problem, the amount of ice melts per second is

a. 48.25 g/s	b. 80 g/s
c. 20.8 g/s	d. None of these

5. A cylindrical copper rod of length 1 m and a cylindrical steel rod of length 1.5 m are joined together end to end. The cross-sectional area of each rod is 3.14 cm^2 . The free ends of steel rod and copper rods are maintained at 0°C and 100°C , respectively. The surfaces of rods are thermally insulated. Find the temperature of copper-steel junction. (Given, thermal conductivity of steel = $46 \text{ J/m-s } ^\circ\text{C}$ and the thermal conductivity of copper = $386 \text{ J/m-s } ^\circ\text{C}$)
 - a. 40°C
 - b. 60°C
 - c. 93°C
 - d. 80.64°C
6. In previous problem, the rate of loss of heat at free end of copper is
 - a. 2 J/s
 - b. 0.89 J/s
 - c. 1.07 J/s
 - d. None of the above
7. A block of ice at 0°C rest on the upper surface of the slab of stone of area 3600 cm^2 and thickness of 10 cm. The slab is exposed on the lower surface to steam at 100°C . If 4800 g of ice is melted in one hour, then calculate the thermal conductivity of stone.
(Given, the latent heat of fusion of ice = 80 cal/g)
 - a. $K = 2.96 \times 10^{-3} \text{ cal/cm s}^\circ\text{C}$
 - b. $K = 1.96 \times 10^3 \text{ cal/cm s}^\circ\text{C}$
 - c. $K = 0.96 \times 10^3 \text{ cal/cm s}^\circ\text{C}$
 - d. None of the above
8. The ice is filled in a hollow glass sphere of thickness 2 mm and external radius 10 cm. This hollow glass sphere with ice now placed in a bath containing boiling water at 100°C . Calculate the rate at which ice melts. Neglect volume change in ice.
(Given, thermal conductivity of glass 1.1 W/m/K , latent heat of ice = $336 \times 10^3 \text{ J/kg}$)
 - a. $\frac{m}{t} = 0.01 \text{ kg/s}$
 - b. $\frac{m}{t} = 0.002 \text{ kg/s}$
 - c. $\frac{m}{t} = 0.02 \text{ kg/s}$
 - d. $\frac{m}{t} = 0.001 \text{ kg/s}$
9. 5 cm thick walls of a box like cooler is made of plastic foam. Its total surface area is 1.5 m^2 . If outside temperature is 30°C , then how much ice melts each hour inside the cooler to hold its temperature at 0°C .
(Given, K for plastic = 0.04 W/mK , $L_0 = 80 \text{ cal/g}$ and $1 \text{ kcal} = 4.184 \text{ kJ/kcal}$)
 - a. 4 kg
 - b. 0.39 kg
 - c. 3.9 kg
 - d. 0.2 kg
10. If in two identical containers, equal quantities of ice melts completely in 30 and 20 minutes respectively, then find the ratio of the thermal conductivities of the material of two containers.
 - a. 1 : 1
 - b. 1 : 2
 - c. 3 : 2
 - d. 2 : 3

11. A compound rod is formed of a steel core of diameter 1cm and outer casing is of copper, whose outer diameter is 2 cm. The length of this compound rod is 2 m and one end is maintained as 100°C , and the end is at 0°C . If the outer surface of the rod is thermally insulated, then heat current in the rod will be (Given, thermal conductivity of steel = 12 cal/m/K/s , thermal conductivity of copper = 92 cal/m/K/s)
- a. 2 cal/s b. 1.13 cal/s c. 1.42 cal/s d. 2.68 cal/s
12. An aluminium rod of length L and cross-sectional area $2A$ is joined with a copper rod of length $2L$ and area of cross-section is A , as shown in figure. Find the temperature of aluminium-copper junction in the steady state of the system.

- (Given, thermal conductivity $K_{Al} = 240 \text{ J/m/s/}^\circ\text{C}$, $K_{Cu} = 400 \text{ J/m/s/}^\circ\text{C}$)
- a. 300°C b. 400°C c. 288.24°C d. 275.4°C
- 13.** A uniform metal ring with centre C have two points A and B , such that angle ACB is θ . A and B are maintained at two different constant temperature.
- If the angle between A and B , i.e. $\theta = 180^\circ$, the rate of heat flow from A to B is 1.2 W , then what will be the rate, when $\theta = 90^\circ$?
- a. 0.6 W b. 0.9 W c. 1.6 W d. 1.8 W
- 14.** What amount of ice at -14°C required to cool 200 g of water from 25°C to 10°C ?
- (Given, $C_{ice} = 0.5 \text{ cal/g/}^\circ\text{C}$, L_f for ice $= 80 \text{ cal/g}$)
- a. 31 g b. 41 g c. 51 g d. 21 g
- 15.** A metallic sphere having inner and outer radii a and b respectively has thermal conductivity

$$K = \frac{K_0}{r} \quad (a \leq r \leq b)$$

Find the thermal resistance between inner surface and outer surface.

16. In above problem, if the temperature of inner and outer surfaces are $\theta_1^\circ\text{C}$ and $\theta_2^\circ\text{C}$ ($\theta_2 > \theta_1$). The rate of flow of heat in steady state is
- $\frac{4\pi K_0(\theta_1 - \theta_2)}{(b - a)}$
 - $\frac{4\pi K_0(b - a)}{(\theta_1 - \theta_2)}$
 - $\frac{4\pi K_0 ab (\theta_1 - \theta_2)}{(b^2 - a^2)}$
 - None of these

17. A body initially at 60°C cools to 50°C in 10 minutes. What will be its temperature at the end of next 10 minutes, if the room temperature is 25°C ? Assume Newton's law of cooling.
 a. 42.85°C b. 45°C c. 40.46°C d. 44.23°C
18. Find the time in which a layer of ice of thickness h will grow on the surface of the pond of surface area A , when the surrounding temperature falls to $-T^{\circ}\text{C}$.
 (Assume, K = thermal conductivity of ice, ρ = density of water, L = latent heat of fusion)
 a. $t = \frac{\rho L}{2KT} h^2$ b. $t = \frac{\rho L}{KT} h^2$
 c. $t = \frac{\rho L h^2}{3KT}$ d. $t = \frac{\rho L h^2}{4KT}$
19. A black body maintained at a certain temperature radiates heat energy at the rate Q watt. If its surface is smoothened so as to lower its emissivity by 10%, what will be the increase in its rate of radiation at double the initial temperature?
 a. $(0.9 \times 2^4 - 1) Q$ watt b. $0.9 \times 2^4 Q$ watt
 c. $(0.9 \times 2)^4 Q$ watt d. $(0.9)^4 \times 2Q$ watt
20. The thermal radiation emitted by a body per second per unit area is $\frac{\Delta H}{A \Delta t} = kT^4$. If σ is Stefan's constant, then body
 a. may be polished b. may be black body
 c. must be black body d. must not be black body
21. If temperature of black body increases from 300 K to 900 K, then the rate of energy radiation increases by
 a. 81 b. 3 c. 9 d. 2
22. Three objects coloured black, grey and white can withstand hostile conditions at 2800°C . These objects are thrown into furnace where each of them attains a temperature of 2000°C . Which object will have the brightest glow?
 a. The white object
 b. The black object
 c. All glow with equal brightness
 d. Grey object
23. The power P is received by a surface at temperature T_0 K from a small sphere at temperature T ($T \gg T_0$) and at a distance ' d '. If both ' T ' and ' d ' are doubled, then power received by surface will become
 a. P b. $2P$ c. $4P$ d. $16P$
24. A cylindrical rod is having temperatures T_1 and T_2 at its ends. The rate of flow of heat is Q_1 . If all the linear dimensions are doubled keeping the temperature constant, then rate of flow of heat Q_2 will be
 a. $4Q_1$ b. $2Q_1$
 c. $\frac{Q_1}{4}$ d. $\frac{Q_1}{2}$
25. Assuming the sun to be a spherical body of radius R at a temperature of T K, evaluate the total radiant power, incident on earth, at a distance r from the sun. Given, r_0 is the radius of earth and σ is the Stefan's constant.
 a. $4\pi r_0^2 R^2 \sigma T^4 / r^2$ b. $\pi r_0^2 R^2 \sigma T^4 / r^2$
 c. $r_0^2 R^2 \sigma T^4 / 4\pi r^2$ d. $R^2 \sigma T^4 / r^2$
26. What will be the increment in heat energy radiated when the temperature of hot body is raised by 5%?
 a. 5% b. 6% c. 11.65% d. 21.55%
27. Two spheres of the same material having radii r and $4r$ and temperatures $2T_0$ and T_0 respectively. The ratio of rate of radiation of energy by the spheres is
 a. 1 : 1 b. 1 : 2 c. 2 : 1 d. 3 : 1
28. A sphere, a cube and a thin circular plate all of same material having same mass are initially heated to 200°C . Which of these will cool fastest?
 a. Circular plate b. Sphere
 c. Cube d. All of these
29. A body at a temperature of 727°C and has surface area 5 cm^2 , radiates 300 J of energy each minute. Calculate the emissivity.
 (Given, Boltzmann constant = $5.67 \times 10^{-8} \text{ Wm}^2\text{K}^4$)
 a. $e = 0.18$ b. $e = 0.02$ c. $e = 0.2$ d. $e = 0.15$
30. Choose the correct relation, when the temperature of an isolated black body falls from T_1 to T_2 in time ' t ', and assume ' c ' to be a constant.
 a. $t = c \left(\frac{1}{T_2} - \frac{1}{T_1} \right)$ b. $t = c \left(\frac{1}{T_2^2} - \frac{1}{T_1^2} \right)$
 c. $t = c \left(\frac{1}{T_2^3} - \frac{1}{T_1^3} \right)$ d. $t = c \left(\frac{1}{T_2^4} - \frac{1}{T_1^4} \right)$
31. The temperature and the surface area of the body are 227°C and 0.15 m^2 , respectively. If its transmitting power is negligible and reflecting power is 0.5, then calculate the thermal power of the body.
 (Given, $\sigma = 5.67 \times 10^{-8} \text{ J/m}^2\text{s/K}$)
 a. 300 W b. 265.78 W c. 201 W d. 320.89 W
32. The surface temperature of the sun is ' T ' K and the solar constant for a plate is ' s '. The sun subtends an angle θ at the planet. Then,
 a. $s \propto T^4$ b. $s \propto T^2$
 c. $s \propto \theta^2$ d. $s \propto \theta$
33. When a blackened platinum wire is heated gradually, it appears
 a. first blue, then red and finally white
 b. first red, then blue and finally white
 c. first white, then blue and finally red
 d. first red, then white and finally blue

34. Surface temperature of the sun as estimated is 6032.25 K. Find the wavelength at which sun radiates maximum energy (Given, Wien's constant = 0.2898 cm-K)
- $\lambda_m = 5000 \text{ \AA}$
 - $\lambda_m = 4804.2 \text{ \AA}$
 - $\lambda_m = 3809.5 \text{ \AA}$
 - $\lambda_m = 2891.6 \text{ \AA}$

35. The plots of intensity of radiation *versus* wavelength of 3 black bodies of temperatures T_1, T_2 and T_3 as shown in the figure, then

- $T_1 > T_2 > T_3$
- $T_3 > T_2 > T_1$
- $T_1 > T_3 > T_2$
- $T_1 < T_3 < T_2$

BITSAT Archives

- A partition wall has two layers of different materials *A* and *B* in contact with each other. They have the same thickness but the thermal conductivity of layer *A* is twice that of *B*. At steady state, if the temperature difference across the layer *B* is 50 K, then the corresponding difference across the layer *A* is [2013]
 - 50 K
 - 12.5 K
 - 25 K
 - 60 K
- The rate at which a black body emits radiation at a temperature *T* is proportional to [2012]
 - $\frac{1}{T}$
 - T
 - T^3
 - T^4
- A hot and a cold body are kept in vacuum separated from each other. Which of the following cause decrease in temperature of the hot body? [2011]
 - Radiation
 - Convection
 - Conduction
 - Temperature remains unchanged
- In a 10 m deep lake, the bottom is at a constant temperature of 4°C. The air temperature is constant at -4°C. The thermal conductivity of ice is 3 times that of water. Neglecting the expansion of water on freezing, the maximum thickness of ice will be [2010]
 - 7.5 m
 - 6 m
 - 6 m
 - 2.5 m
- Two slabs *A* and *B* of equal surface area are placed one over the other such that their surfaces are completely in contact. The thickness of slab *A* is twice that of *B*. The coefficient of thermal conductivity of slab *A* is twice that of *B*. The first surface of slab *A* is maintained at 100°C, while the second surface of slab *B* is maintained at 25°C. The temperature at the contact of their surfaces is [2008]
 - 62.5°C
 - 45°C
 - 55°C
 - 85°C
- The wavelength of the radiation emitted by a body depends upon [2005]
 - the nature of the surface
 - the area of the surface
 - the temperature of the surface
 - All of the above factors

Answer with Solutions

Practice Exercise

1. (b) In steady state,

$$\frac{\Delta H}{\Delta t} = -KA \frac{d\theta}{dx}$$

Here, $\frac{\Delta H}{\Delta t} = \text{constant} \therefore \frac{\Delta\theta}{dx} = \text{constant}$

2. (c) Temperature gradient $\frac{d\theta}{dx} = \frac{32}{1000} \text{ } ^\circ\text{C/m} = \frac{32}{10^5} \text{ } ^\circ\text{C/cm}$

Loss of energy by earth is given by

$$\begin{aligned} Q &= KA \frac{d\theta}{dx} \times 86400 \\ &= 0.008 \times \frac{4 \times 22}{7} \times (64 \times 10^8)^2 \times \frac{32}{10^5} \times 86400 \\ &= 1.1 \times 10^{18} \text{ cal} = 10^{18} \text{ cal} \end{aligned}$$

3. (b) In steady state, temperature gradient of rod remains constant.

$$\begin{aligned} \therefore \frac{100^\circ - \theta}{80} &= \frac{\theta - 0}{120} \\ \text{or } 100^\circ - \theta &= \left(\frac{80}{120}\right)\theta \\ \text{or } 100^\circ - \theta &= \frac{2}{3}\theta \quad \text{or } 100^\circ = \frac{5}{3}\theta \\ \therefore \theta &= \frac{100 \times 3}{5} = 60^\circ\text{C} \end{aligned}$$

4. (a)
- $\therefore$
- Rate of transmission of heat

$$\frac{\Delta H}{\Delta t} = \frac{KA(100 - 0)}{l} = \frac{386 \times 2 \times 10^{-4} \times 100}{2}$$

or $\frac{\Delta mL}{\Delta t} = \frac{386 \times 2 \times 10^{-4} \times 100}{2}$

$$\therefore \frac{\Delta m}{\Delta t} = \frac{386 \times 2 \times 10^{-4} \times 100}{2 \times 80} \quad (\because L = 80)$$

$$= 4.825 \times 10^{-2} \text{ kg/s} = 48.25 \text{ g/s}$$

5. (c) Since, both rods are in series. So, the rate of flow of heat through both wires will be same.

- $\therefore$
- Rate of heat transfer

$$\frac{\Delta H}{\Delta t} = \frac{K_1 A (100 - \theta)}{l_1} = \frac{K_2 A (\theta - 0)}{l_2}$$

or $100 - \theta = \left(\frac{l_1}{l_2}\right) \left(\frac{K_2}{K_1}\right) \theta$ or $100 - \theta = \left(\frac{1}{1.5}\right) \left(\frac{46}{386}\right) \theta$

$$\therefore \theta = 92.64 \approx 93^\circ \text{C}$$

6. (b) The rate of flow of heat is equal to rate of loss of heat of free end of copper

$$\therefore \frac{\Delta H}{\Delta t} = \frac{K_1 A (100 - \theta)}{l_1}$$

$$= \frac{386 \times 3.14 \times 10^{-4} (100 - 92.64)}{1} = 0.89 \text{ J/s}$$

7. (a) We know,
- $\theta = \frac{KA \Delta T}{\Delta x} t$

Quantity of heat flowing through the stone in one hour

$$= 4800 \times 80 = 384 \times 10^3 \text{ cal}$$

$$K = \frac{\theta}{t} \times \frac{\Delta x}{\Delta T} \times \frac{1}{A} = \frac{384 \times 10^3}{3600} \times \frac{10}{100} \times \frac{1}{3600}$$

$$K = 2.96 \times 10^{-3} \text{ cal/cm s } ^\circ \text{C}$$

8. (c) Rate of transmission of heat
- $\frac{dQ}{dt} = \frac{4\pi K r_1 r_2 \Delta \theta}{(r_2 - r_1)}$

$$\therefore \frac{dQ}{dt} = \frac{4 \times \pi \times 1.1 \times 0.098 \times 0.1 \times 100}{0.002} = 6769.8 \approx 6770 \text{ W}$$

Rate of ice melt = $\frac{m}{t} \Rightarrow \left(\frac{m}{t}\right) L = \frac{d\theta}{dt}$

$$\left(\frac{m}{t}\right) \times 336 \times 10^3 = 6770 \Rightarrow \frac{m}{t} = 0.02 \text{ kg/s}$$

9. (b) Heat flow into the box =
- $\frac{\Delta Q}{\Delta t}$

$$\frac{\Delta Q}{\Delta t} = KA \left(\frac{\Delta T}{\Delta x}\right) = (0.04) (1.5) \left(\frac{30}{0.05}\right) = 36 \text{ W}$$

$\Delta Q =$ In an hour total energy

$$= 36 \times \text{one hour} = 36 \times 60 \times 60 \text{ J} = 129.6 \text{ kJ}$$

$$\therefore \Delta Q = mL = m (80 \text{ kcal/kg}) (4.184 \text{ kJ/kcal})$$

$$\therefore m = \frac{\Delta Q}{80 \times 4.184} = \frac{129.6}{80 \times 4.184} \text{ kg} = 0.39 \text{ kg ice will melt}$$

10. (d)

11. (b)
- $Q = Q_{\text{steel}} + Q_{\text{copper}}$

$$= \frac{12\pi (0.5)^2 \times 10^{-4} \times 100}{2} + \frac{92\pi (1^2 - 0.5^2) \times 10^{-4} \times 100}{2}$$

$$= 150\pi \times 10^{-4} + 3450\pi \times 10^{-4} = 3600\pi \times 10^{-4} = 1.13 \text{ cal/s}$$

12. (c) In steady state condition rate of heat flow in both rods must be equal. Let junction temperature =
- T

$$H = \frac{Q}{T} = \frac{K_{\text{Al}} A_{\text{Al}} (400^\circ - T)}{L_{\text{Al}}} = \frac{K_{\text{Cu}} A_{\text{Cu}} (T - 20^\circ)}{L_{\text{Cu}}}$$

$$= \frac{240 (2A) (400^\circ - T)}{L} = \frac{400 \times A \times (T - 20^\circ)}{2L}$$

$$T = 288.24^\circ \text{C}$$

13. (c) Let
- ΔT
- = temperature difference between the rings

R = total thermal resistance of the ring when $\theta = 180^\circ$.

The resistance will be $R/2$, $R/2$ and both are in parallel, so, equivalent resistance = $R/4$

$$\text{Rate of total heat flow} = \frac{Q_1}{t} = 1.2 = \frac{\Delta T}{(R/4)} \Rightarrow$$

When $\theta = 90^\circ$ there are two sections with resistances, $R/4$ and $3R/4$ in parallel.

So, equivalent resistance = $\frac{3R}{16}$

$$\text{Rate of heat flow} = \frac{Q_2}{t} = \frac{\Delta T}{\left(\frac{3R}{16}\right)}$$

$$\Rightarrow I_2 = \frac{16}{3} \left(\frac{\Delta T}{R}\right)$$

$$I_2 = 1.6 \text{ W}$$

$$\Rightarrow I_2 = 1.6 \text{ W}$$

14. (a) Heat given by water in cooling from
- 25°
- to
- 10°C
- .

$$Q_1 = (cm \Delta T)_w = 200 \times 1 \times (25 - 10) = 3000 \text{ cal}$$

Heat absorbed by m g of ice at -14°C

$$Q_2 = (mc \Delta T)_{\text{ice}} + mL_f + (mc \Delta T)_w$$

$$= m[(0.5)[0 - \{-14\}] + 80 + 1(10 - 0)]$$

$$= 97 \text{ m cal}$$

$$Q_2 = Q_1$$

$$97m = 3000 = 30.93 \text{ g}$$

$$m = 31 \text{ g}$$

15. (a) We consider a spherical element of radius
- r
- and thickness
- dr
- . The resistance of considered element is

$$dR = \frac{dr}{KA} = \frac{dr}{K 4\pi r^2} = \frac{dr}{\frac{K_0}{r^2} 4\pi r^2}$$

$$\therefore dR = \frac{1}{4\pi K_0} dr$$

The equivalent resistance, $R = \frac{1}{4\pi K_0} \int_a^b dr = \frac{(b-a)}{4\pi K_0}$

16. (a) Rate of transmission of heat flow

$$\frac{\Delta H}{\Delta t} = \frac{\theta_1 - \theta_2}{R} = \frac{4\pi K_0 (\theta_1 - \theta_2)}{b - a}$$

17. (a) According to Newton's law of cooling,

$$\frac{d\theta}{dt} = -K(\theta - \theta_0)$$

where, θ = temperature of body θ_0 = temperature of surroundings

$$\int_{\theta_1}^{\theta_2} \frac{d\theta}{\theta - \theta_0} = -K \int_0^1 dt$$

$$\log \left(\frac{\theta_2 - \theta_0}{\theta_1 - \theta_0} \right) = -Kt$$

$$\log \left(\frac{60 - 25}{50 - 25} \right) = -K \times 10 \times 60$$

Let α = temperature at end of 10 minutes.

$$\log \left(\frac{50 - 25}{\alpha - 25} \right) = -K \times 10 \times 60$$

$$\alpha = 42.85^\circ \text{C}$$

18. (a)

19. (a) For a black body,

Rate of radiation, $Q = \sigma T^4$ After smoothing and doubling the temperature = Rate Q

$$= 0.9 \sigma (2T)^4 = 0.9 \times 10^4 Q$$

Charge = $(0.9 \times 2^4 - 1) Q$ watt

20. (c) 21. (a) 22. (b)

23. (c) Radiation
- $\propto \frac{T^4}{d^2}$

$$P \propto \frac{T_0^2}{d_0^2}$$

When T and d are doubled

$$p' \propto \frac{(2)^4 T_0^4}{2^2 d_0^2} \propto \frac{4T_0^4}{d_0^2} \propto 4P$$

Therefore, power received by surface will become $4P$.

24. (b) Initially,
- $Q_1 = \frac{KA_1(T_1 - T_2)}{l_1}$
- but on doubling all

dimensions $l_2 = 2l_1$ and $A_2 = 4A_1$.

$$\text{Hence, } Q_2 = \frac{KA_2(T_1 - T_2)}{l_2} = \frac{K4A_1(T_1 - T_2)}{2l_1}$$

$$= 2 \frac{KA_1(T_1 - T_2)}{l_1} = 2Q_1$$

25. (b)

26. (d)
- $\frac{E + \Delta E}{E} = \frac{[T + (5/100)T]^4}{T^4}$

$$\left(1 + \frac{\Delta E}{E} \right) = (1 + 0.05)^4 = (1.05)^4$$

$$\frac{\Delta E}{E} = 1.2155 - 1 = 0.2155$$

$$\frac{\Delta E}{E} \times 100 = 0.2155 \times 100 = 21.55\%$$

27. (a) Energy radiated per second
- $P = e \sigma AT^4$

$$\therefore \frac{P_1}{P_2} = \frac{A_1 T_1^4}{A_2 T_2^4} = \left(\frac{4\pi r^2}{4\pi (4r)^2} \right) \frac{16T_0^4}{T_0^4} = \frac{r^2}{16r^2} \times \frac{16T_0^4}{T_0^4} = 1:1$$

28. (a) Radiation is directly proportional to the radiating area cooling fast.

For a given mass, area of circular plate is maximum. So, it cools first.

29. (a)
- $Q = EAt = e\sigma (T^4 - T_0^4) At$

where, t = time T_0 = temperature of surrounding when, $T > T_0$

$$Q = e\sigma T^4 At$$

$$300 = e \times (5.67 \times 10^{-8})(1000)^4 (5.00 \times 10^{-4})(60)$$

$$e = 0.18$$

30. (c) We know,
- $P = 4\pi r^2 \sigma T^4 = mS \left(-\frac{dT}{dt} \right)$

$$= -\frac{4}{3} \pi r^3 \rho \frac{dT}{dt} \text{ and } R = \frac{dT}{dt}$$

$$P \propto r^2 \text{ and } R \propto \frac{1}{r}$$

$$\int_{T_1}^{T_2} \frac{dT}{T^4} = (\text{constant}) \int_0^1 dt$$

$$t = c \left[\frac{1}{T_2^3} - \frac{1}{T_1^3} \right]$$

31. (b) Absorbing power of a body is equal to emissivity of the body.

$$\text{And also } a + r + t = 1 \Rightarrow 0 + 0.5 + a = 1$$

$$a = 0.5, \quad \varepsilon = a = 0.5$$

$$\frac{Q}{t} = \varepsilon \sigma AT^4 = (0.5)(5.67) \times 10^{-8} (0.15) \times (273 + 227)^4$$

$$\frac{Q}{t} = 265.78 \text{ W}$$

32. (a) Let radius of sun =
- R

Distance of earth from the sun = d

$$\text{Power radiated from the sun} = (4\pi R^2) \sigma T^4 = P$$

$$\text{Energy received/area/s} = S = \frac{P}{4\pi d^2}$$

$$= 4\pi R^2 \sigma \frac{T^4}{4\pi d^2} = \sigma T^4 \frac{R^2}{d^2} = \frac{1}{4} \sigma T^4 \left(\frac{2R}{d} \right)^2$$

$$\text{Angle subtended by sun at earth, } \alpha = \frac{2R}{d}$$

$$S = \text{constant} \times T^4 \times \alpha^2$$

$$\therefore S \propto T^4$$

33. (b) According to Wien's law

$$\lambda_m T = \text{constant}$$

When temperature increases, wavelength decreases.

Due to this the colour of object appears first red (of longer wavelength) then blue (shorter wavelength) and finally white (all wavelengths).

34. (b) 35. (c)

BITSAT Archives

1. (c) Let
- T
- be the junction temperature

Here, $K_A = 2K_B$, $T - T_B = 50$ KAt the steady state, $H_A = H_B$

$$\Rightarrow \frac{K_A A (T_A - T)}{L} = \frac{K_B A (T - T_B)}{L}$$

$$\Rightarrow 2K_B (T_A - T) = K_B (T - T_B)$$

$$\Rightarrow T_A - T = \frac{T - T_B}{2}$$

$$= \frac{50}{2} = 25 \text{ K}$$

2. (d) From Stefan's law, the rate of emission of energy per unit surface area of a black body is inversely proportional to the fourth power of absolute temperature (
- T
-) of the body.

$$E = \sigma T^4 (\sigma = \text{Stefan's constant})$$

3. (a) Heat flow through vacuum is possible in radiation mode due to which temperature of hot body falls.

$$4. (a) KA \left(\frac{4 - 0}{10 - x} \right) = 3KA \left(\frac{0 - (-4)}{x} \right)$$

$$\Rightarrow x = 7.5 \text{ m}$$

5. (a) The temperature at the contact of the surface

$$= \frac{k_2 d_2 \theta_1 + k_1 d_1 \theta_2}{k_1 d_2 + k_2 d_1}$$

$$= \frac{2k_2 d_2 \times 100 + 2d_2 \times k_2 \times 35}{2k_2 d_2 + k_2 2d_2}$$

$$= \frac{200 + 50}{4} = 62.5^\circ \text{C}$$

6. (c) According to Wien's law,

$$\lambda \propto \frac{1}{T}$$

i.e. it depends on the temperature of the surface.

19

Ray Optics

Reflection of Light

The phenomenon of bouncing back of light rays in the same medium on striking a smooth surface is called reflection of light.

Laws of Reflection

It follows two laws, i.e.

(i) Angle of incidence, ($\angle i$) is equal to angle of reflection, ($\angle r$)

i.e. $\angle i = \angle r$

(ii) Incident ray, normal ray and reflected ray lie in the same plane.

Reflection from a Plane Mirror

1. If a ray is incident on a plane mirror at an angle of incidence i , then it suffers a deviation of $(\pi - 2i)$.
2. While keeping an object fixed, a plane mirror is rotated in its plane by an angle θ , then the reflected ray rotates in the same direction by an angle 2θ .
3. Focal length as well as the radius of curvature of a plane mirror is infinity. Power of a plane mirror is zero.
4. If two plane mirrors are inclined to each other at an angle θ , the total number of images formed of an object kept between them, is $n = \frac{2\pi}{\theta}$ or $\left(\frac{2\pi}{\theta} - 1\right)$ whichever is odd.
5. The minimum size of a plane mirror fixed on a wall of a room, so that a person at the centre of the room may see the full image of the wall behind him, should be $\frac{1}{3}$ rd the size of the wall.

Reflection of Light at a Spherical Surface or Spherical Mirror

Mirrors having their reflecting surface spherical are called spherical mirrors. Spherical mirrors are of two types

- (i) **Concave mirror** If reflection takes place from the inner surface, then the mirror is called concave [Fig. (a)].
- (ii) **Convex mirror** If reflection takes place from the outer surface, then the mirror is called convex [Fig. (b)].

- (iii) **Focal length** It is the distance between focus F and pole P of the mirror. It is represented by f .

i.e. $f = \frac{R}{2}$, where R = radius of curvature

Mirror Formula

Mirror formula is the relation between object distance (u), image distance (v) and focal length (f) for a spherical mirror and it is given by

$$\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$$

Magnification of Image in a Spherical Mirror

The size of an image reflected through a spherical mirror varies with the original size of object. This is called **linear magnification** of the image, which is the ratio of height of image to the height of object given by

$$m = -\frac{v}{u} = \frac{h'}{h}$$

where, m = magnification, v = image distance, u = object distance, h' = height of image and h = height of object.

Refraction of Light

When light passes from one medium, say air, to another medium, say glass, a part is reflected back into the first medium and the rest passes into the second medium. When it passes into the second medium, it either bends towards the normal or away from the normal. This phenomenon is known as refraction.

Laws of Refraction

- (i) When light goes from one medium to another, the frequency and phase of light do not change, however velocity and wavelength of light changes.
- (ii) The incident ray, the refracted ray and normal to the interface at point of incidence, all lie in the same plane.
- (iii) The product of refractive index and sine of angle of incidence/refraction at a point in a medium is constant

i.e. $\mu \times \sin i = \text{constant}$

So, from figure $\frac{\mu_2}{\mu_1} = \frac{\sin i}{\sin r} = {}_1\mu_2$

where, ${}_1\mu_2$ is refractive index of medium 2 with respect to medium 1.

This law is also known as **Snell's law**.

Apparent Shift of an Object due to Refraction

Due to bending of light at the interface of two different media, the image formation due to refraction creates an illusion of shifting of the object position.

$$\frac{\text{Real depth}}{\text{Apparent depth}} = \frac{1}{\mu_2}$$

Total Internal Reflection

When light travelling in a denser medium incident on the interface between denser medium (medium with higher refractive index) and rarer medium (medium with lesser refractive index), then refracted ray bends away from the normal forming a greater angle of refraction than angle of incidence.

In this situation, when the angle of incidence exceeds a particular angle, the incident ray comes back into first medium (denser medium). This angle is called **critical angle** (θ_c).

At critical angle, there is no refracted ray found because $\angle r = 90^\circ$.

$$\frac{\sin \theta_c}{\sin 90^\circ} = \frac{\mu_{\text{rarer}}}{\mu_{\text{denser}}} = \frac{\mu_r}{\mu_d}$$

$$\Rightarrow \sin \theta_c = \frac{\mu_r}{\mu_d} \Rightarrow \theta_c = \sin^{-1} \left(\frac{\mu_r}{\mu_d} \right)$$

where, μ_r = refractive index of rarer medium
and μ_d = refractive index of denser medium

Refraction from a Spherical Surface

Let an object be placed in a medium of refractive index n_1 at a distance u from the pole of a spherical surface of radius of curvature R and after refraction, its image is formed in a medium of refractive index n_2 at a distance v , then

$$\frac{n_2}{v} - \frac{n_1}{u} = \frac{n_2 - n_1}{R}$$

The relation is true for all surfaces, whether the image formed is real or virtual.

Lens

The lens formula is given by $\frac{1}{v} - \frac{1}{u} = \frac{1}{f}$

For a thin object of height h placed perpendicular to the principal axis at a distance u , if the height of image formed is h' , then **lateral** or **transverse magnification** m is given by

$$m = \frac{h'}{h} = \frac{v}{u} = \frac{f}{f+u} = \frac{f-v}{f}$$

For a small sized object placed linearly along the principal axis, its **axial** or **longitudinal magnification** is given by

$$\text{Axial magnification} = -\frac{dv}{du} = \left(\frac{v}{u} \right)^2 = \left(\frac{f}{f+u} \right)^2 = \left(\frac{f-v}{f} \right)^2$$

The **power of a lens** is mathematically given by the reciprocal of its focal length,

$$\text{i.e. power, } P = \frac{1}{f(\text{in m})}$$

SI unit of power is dioptre (D). Power of a converging lens is positive and that of a diverging lens is negative.

Lens Maker's Formula

Focal length of the lens is given by

$$\frac{1}{f} = \left(\frac{\mu_2}{\mu_1} - 1 \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

If $\mu_2 = \mu$ and $\mu_1 = 1$, then

$$\Rightarrow \frac{1}{f} = (\mu - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

Combination of Thin Lenses in Contact

If two or more lenses are placed in contact, then

Combination of convex lenses

Total focal length of the combination,

$$\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2} + \frac{1}{f_3} + \dots = \sum_{i=1}^n \frac{1}{f_i}$$

Total power of combination,

$$P = P_1 + P_2 + P_3 + \dots = \sum_{i=1}^n P_i$$

Total magnification of combination,

$$M = m_1 \times m_2 \times m_3 \times \dots \text{ or } M = m_1 m_2 m_3 \dots$$

NOTE If the lenses are separated by a distance d , then

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} - \frac{d}{f_1 f_2} \quad \text{and} \quad P = P_1 + P_2 - P_1 P_2 d$$

Deviation by a Prism

A prism is a homogeneous, transparent medium bounded by two plane surfaces inclined at an angle A with each other. These surfaces are called as refracting surfaces and the angle between them is called angle of prism A . Deviation produced by a prism is

$$\delta = i + i' - A \Rightarrow r + r' = A$$

For grazing incidence $i = 90^\circ$, and grazing emergence $i' = 90^\circ$.
For minimum deviation,

$$(i) \ i = i' \text{ and } r = r'$$

$$(ii) \ \mu = \frac{\sin\left(\frac{\delta_m + A}{2}\right)}{\sin\frac{A}{2}}$$

(iii) $S = i + e - A$, where i is the angle of incidence, e is the angle of emergence and A is the angle of prism. In case of minimum deviation, ray is passing through prism symmetrically.

For maximum deviation ($\delta_{\max}$), $i = 90^\circ$ or $i' = 90^\circ$

For thin prism, $\delta = (\mu - 1) A$

Dispersion by a Prism

Dispersion of light is the phenomenon of splitting of white light into its constituent colours on passing light through a prism. This is because different colours have different wavelength, and hence different refractive indices

Angular dispersion $= \delta_v - \delta_r = (n_v - n_r) A$, where n_v and n_r represent refractive index for violet and red lights.

$$\text{Dispersive power, } \omega = \frac{n_v - n_r}{n - 1}$$

where $n = \frac{n_v + n_r}{2}$ is the mean refractive index.

By combining two prisms with angles A and A' and RI n and n' respectively we can create conditions of

$$(a) \text{ Dispersion without deviation when, } A' = -\frac{(n-1)A}{(n'-1)}$$

$$(b) \text{ Deviation without dispersion when } A' = -\left[\frac{n_v - n_r}{n'_v - n'_r}\right] A$$

Microscope

It is an optical instrument which forms a magnified image of a small nearby object and thus, increases the visual angle subtended by the image at the eye so that the object is seen to be bigger and distinct.

Simple Microscope (Magnifying Glass)

It consists of a single convex lens of small focal length and forms a magnified image of an object placed between the optical centre and the principal focus of the lens. If the image is formed at the near point of eye.

Then $m = \left(1 + \frac{D}{f}\right)$ but if the image is formed at infinity, then

$m = \frac{D}{f}$, where D = normal distance (25 cm), f = focal length of magnifying lens.

Compound Microscope

It has two converging (convex) lenses i.e. one near object, called objective lens and other near eye, called eyepiece. Objective has smaller focal length and aperture than eyepiece.

Set up of compound microscope

Magnifying Power of Compound Microscope

Magnification produced by the compound microscope is given by,

$$m = \frac{v}{a} \left(\frac{D}{f_e} \right)$$

$$\text{For relaxed eye, } M_\infty = -\frac{v_o}{u_o} \left(\frac{D}{f_e} \right)$$

and length of microscope, $L_\infty = v_o + f_e$. When final image is formed at least distance of distinct vision, then

$$M_D = -\frac{v_o}{u_o} \left(1 + \frac{D}{f_e} \right)$$

and length of microscope, $L_D = v_o + u_e$

where, v_o = distance of first image from objective lens

u_o = distance of object from objective lens

f_e = focal length of eyepiece.

Astronomical Telescope

It is an optical device which increases the angle at the eye by forming the image of a distant object at the least distance of distinct vision, so that the object is seen distinct and bigger.

Set up of astronomical telescope

Magnifying Power of Astronomical Telescope

For relaxed eye, $M_{\infty} = -\frac{f_o}{f_e}$

Length of telescope, $L_{\infty} = f_o + f_e$

When a final image is formed at least distance of distinct vision, then,

$$M_D = -\frac{f_o}{f_e} \left(1 + \frac{f_e}{D}\right)$$

Length of telescope, $L_D = f_o + u_e$

where, f_o = Focal length of objective
 f_e = Focal length of eyepiece.

Terrestrial Telescope

In an astronomical telescope, the final image is inverted with respect to the object. To remove this difficulty, a convex lens of focal length f is included between the objective and the eyepiece in such a way that the focal plane of the objective is a distance $2f$ away from this lens.

Set up of terrestrial telescope

Magnification of Terrestrial Telescope

(a) For relaxed eye, $M_{\infty} = f_o / f_e$

In this position, length of telescope,

$$L_{\infty} = f_o + 4f + f_e$$

(b) When a final image is formed at least distance of distinct vision,

$$M_D = \frac{f_o}{f_e} \left(1 + \frac{f_e}{D}\right)$$

Length of telescope,

$$L_{\infty} = f_o + 4f + u_e$$

where, f_o = Focal length of objective lens

f_e = Focal length of eyepiece.

Galilean Telescope

A simple model of Galilean telescope is shown in figure. A convergent lens is used as the objective and a divergent lens as the eyepiece.

Set up of Galilean telescope

Magnification of Galilean Telescope

(a) For relaxed eye, $M_{\infty} = \frac{f_o}{f_e}$

In this position, length of telescope, $L_{\infty} = f_o - f_e$

(b) When final image is formed at least distance of distinct vision,

$$M_D = \frac{f_o}{f_e} \left(1 + \frac{f_e}{D}\right)$$

Length of telescope, $L_D = f_o - u_e$

Resolving Power of an Optical Instrument

Resolving power of an optical instrument is its ability to produce distinct images of two points of an object (or two nearby objects) very close together.

The minimum distance (or angular distance) between two points of an object whose images can be formed distinctly by the lens of an optical instrument, is called its **limit of resolution**.

Resolving Power of a Telescope

If the aperture (diameter) of the telescope objective be the D , then the minimum angular separation ($d\theta$) between two distant objects, whose images are just resolved by the telescope, is

$$d\theta = \frac{1.22\lambda}{D}$$

and resolving power of the telescope,

$$RP = \frac{1}{d\theta} = \frac{D}{1.22\lambda}$$

Resolving Power of a Microscope

The least distance (d) between two points, whose images are just seen distinctly by a microscope, is given by

$$d = \frac{1.22\lambda}{2n_m \sin\theta}$$

where, λ = wavelength of light used to illuminate the object,

n_m = refractive index of the medium between the object and the objective lens

θ = semi angle of the cone of light from the point object

The term $n_m \sin\theta$ is generally called the **numerical aperture** of the microscope the objective.

$\therefore$ Resolving power of the microscope,

$$RP = \frac{1}{d} = \frac{2n_m \sin\theta}{1.22\lambda} = \frac{(NA)}{0.61\lambda}$$

Practice Exercise

1. A hair dresser stand with her nose 20 cm in front of a plane mirror. For what distance must she focus her eyes in order to see her nose in the mirror?

a. 40 cm b. 50 cm
c. 30 cm d. 60 cm

2. On a plane mirror, a ray of light is incident at an angle of 30° with horizontal. To make the reflected ray vertical, at what angle with horizontal must a plane mirror be placed?

a. 30° b. 60°
c. 45° d. 54°

3. A mirror is inclined at an angle of θ with the horizontal. If a ray of light is incident at an angle of incidence θ , then the reflected ray makes the following angle with horizontal

a. θ b. 2θ
c. $\frac{\theta}{2}$ d. None of these

4. Two mirrors each 1.6 m long are facing each other. The distance between the mirrors is 20 cm. A light ray is incident on one end of the mirror at an angle of incidence of 30° . How many times in the ray reflected before it reaches the other end?

a. There are 15 reflections counting the first one
b. There are 13 reflections counting the first one
c. There are 12 reflections counting the first one
d. None of the above

5. A pole 5 m high is situated on a horizontal surface. Sun rays are incident at an angle 30° with the vertical. The size of shadow on horizontal surface is

a. 5 m
b. $\frac{5}{\sqrt{3}}$ m
c. $\frac{10}{\sqrt{3}}$ m
d. None of these

6. A beautiful girl with two normal eyes wants to see full width of her face by a plane mirror. The eye to eye and ear to ear distances of her face are 4 inch and 6 inch respectively. Find the minimum width of the required mirror.

a. 1 inch b. 2 inch c. 3 inch d. 4 inch

7. A ray of light falls on a plane mirror. When the mirror is turned, about an axis at right angle to the plane of the mirror through 20° , the angle between the incident ray and new reflected ray is 45° . Find the angle between the incident ray and original reflected ray.

a. 15° b. 30° c. 45° d. 60°

8. The shortest height of a vertical mirror required to see the entire image of a man, will be

a. one-third the man's height
b. half the man's height
c. two-third the man's height
d. data insufficient

9. Two plane mirrors are perpendicular to each other. A ray after suffering reflection from the two mirrors will be
- perpendicular to the original ray
 - parallel to the original ray
 - parallel to the first mirror
 - at 45° to the original ray

10. A vessel consists of two plane mirrors at right angles (as shown in figure). The vessel is filled with water. The total deviation in incident ray is

- 0°
 - 90°
 - 180°
 - None of the above
11. A light ray is incident on a horizontal plane mirror at an angle of 45° . At what angle should a second plane mirror be placed in order that the reflected ray finally be reflected horizontally from the second mirror, as shown in figure?

- $\theta = 30^\circ$
 - $\theta = 24^\circ$
 - $\theta = 22.5^\circ$
 - $\theta = 67.5^\circ$
12. If two mirrors are inclined at some angle and an object is placed between the mirrors and there are 7 images formed for an object. Then, what is angle between the mirrors?
- 54°
 - 50°
 - 60°
 - 64°
13. Two plane mirrors are placed at some angle. There are five images formed when an object is placed symmetrically between them. Find the angle between the mirrors.
- 60°
 - 65°
 - 30°
 - 45°
14. If two adjacent walls and the ceiling of a rectangular room are mirror surfaced, then how many images of himself, a man can see?
- 3
 - 5
 - 6
 - 9

15. A convex mirror of focal length 10 cm is shown in figure. A linear object $AB = 5$ cm is placed along the optical axis. Point B is at distance 25 cm from the pole of mirror. The size of image of AB is

- 2.5 cm
- 0.64 cm
- 0.36 cm
- None of these

16. If u represents object distance from pole of spherical mirror and v represents image distance from pole of mirror and f is the focal length of the mirror, then a straight line $u = v$ will cut u versus v graph at
- (f, f)
 - $(2f, 2f)$
 - $(f, 2f)$
 - $(0, 0)$

17. A short linear object of length l lies on the axis of a spherical mirror of focal length f , at a distance x from the mirror. Then, the length of the image (P) so obtained will be

- $\frac{lf}{(x-f)}$
 - $\frac{lf^2}{(x-f)^2}$
 - $\frac{lf}{x}$
 - $\frac{l(x-f)}{x}$
18. A rear view mirror of a vehicle is cylindrical having radius of curvature 10 cm and length of arc of curved surface is 10 cm. Find the field of view in radian, if it is assumed that the eye of the driver is at a large distance from the mirror.
- 0.5
 - 1
 - 2
 - 4

19. In the figure, AB and BK represents incident and reflected rays. If angle $BCF = \theta$, then $\angle BFP$ will be equal to

- θ
 - 2θ
 - 3θ
 - 3.5θ
20. Find the position of 1 cm tall object which is placed 8 cm in front of a concave mirror of radius of curvature 24 cm.
- 24 cm
 - 25 cm
 - 26 cm
 - 27 cm
21. A convex driving mirror of focal length 20 cm, is fitted in a motor car. If the second car 2 m broad and 1.6 m high is 6 m away from first car and overtake the first car at a relative speed of 15 m/s, then how fast will the image be moving?
- 0.016 m/s
 - 0.0257 m/s
 - 0.162 m/s
 - 0.0073 m/s

22. When an object is placed at a distance of 25 cm from a mirror, the magnification is m_1 . But the magnification becomes m_2 , when the object is moved 15 cm farther away with respect to the earlier position. If $\frac{m_1}{m_2} = 4$,

then find the focal length of the mirror and what type of mirror it is?

- 20 cm, convex
 - 20 cm, concave
 - 10 cm, convex
 - 10 cm, concave
23. Two objects A and B when placed in turns in front of a concave mirror, give images of equal size. The focal length of the concave mirror is 7.5 cm and size of object A is three times the size of object B . Find the distance of B from the mirror, if A is placed 30 cm from the mirror.
- 18 cm
 - 15 cm
 - 20 cm
 - 25 cm

24. An object of height 5 cm is placed in midway between a concave mirror of radius of curvature 30 cm and a convex mirror of placed opposite to each other and are 60 cm apart. Find the position of the image formed by reflection at convex mirror.

a. 10 cm b. 20 cm c. 15 cm d. 13 cm

25. The focal length of plano-convex lens, the convex surface of which is silvered is 0.3 m, if μ of the lens is $7/4$, the radius of curvature of the convex surface is

a. 0.45 m b. 1.05 m c. 3 m d. 0.9 m

26. The magnification of a compound microscope is 30 and the focal length of its eye piece is 5 cm. Calculate the magnification produced by the objective, when the image is to be formed at least distance of distinct vision (25 cm).

a. 5 b. 6 c. 8 d. 10

27. A convergent doublet of separated lens, corrected for spherical aberration, are separated by 2 m and has an equivalent focal length of 10 cm. Calculate the focal length of its component lenses.

a. $f_1 = 18$ cm, $f_2 = 10$ cm

b. $f_1 = 20$ cm, $f_2 = 28$ cm

c. $f_1 = 20$ cm, $f_2 = 18$ cm

d. $f_1 = 24$ cm, $f_2 = 18$ cm

28. A ray of light falls on a transparent glass slab of refractive index 1.62. What is the angle of incidence, if the reflected ray and refracted ray are mutually perpendicular?

a. $\tan^{-1}(1.62)$ b. $\tan^{-1}\left(\frac{1}{1.62}\right)$

c. $\frac{1}{\tan^{-1}(1.62)}$ d. None of these

29. A ray of light travelling in glass having refractive index $\mu_g = 3/2$, is incident at a critical angle C on the glass-air interface. If a thin layer of water is poured on glass air interface, then what will be the angle of emergence of this ray in air when it emerges from water-air interface?

a. 180° b. 0°

c. 90° d. 45°

30. Calculate the time taken by the light to travel a distance of 500 m in water of refractive index of $4/3$. (Given, velocity of light in vacuum = 3×10^{10} cm/s)

a. 3×10^{-10} s b. 2.22×10^{-6} s

c. 4.3×10^{-5} s d. 3×10^{-6} s

31. In a medium of refractive index n_1 , a monochromatic light of wavelength λ_1 is travelling. When it enters in a denser medium of refractive index n_2 , the wavelength of the light in the second medium is

a. $\lambda_1 \left(\frac{n_1}{n_2} \right)$ b. $\lambda_1 \left(\frac{n_2}{n_1} \right)$ c. $\frac{\lambda_1(n_2 - n_1)}{n_2}$ d. $\frac{\lambda_1(n_2 - n_1)}{n_1}$

32. A ray of light is incident on the surface of separation of a medium at an angle 45° and is refracted in the medium at an angle 30° . What will be the speed of light in the medium?

a. 1.96×10^8 ms $^{-1}$ b. 2.12×10^8 ms $^{-1}$

c. 3.18×10^8 ms $^{-1}$ d. 3.33×10^8 ms $^{-1}$

33. The optical path of a monochromatic light is same if, it goes through 4.0 cm of glass or 4.5 cm of water. If the refractive index of glass is 1.53, the refractive index of the water is

a. 1.30 b. 1.36

c. 1.42 d. 1.46

34. A small coin is resting on the bottom of a beaker filled with a liquid. A ray of light from the coin travels upto the surface of the liquid and moves along its surface (see figure).

How fast is the light travelling in the liquid?

a. 1.8×10^8 ms $^{-1}$ b. 2.4×10^8 ms $^{-1}$

c. 3.0×10^8 ms $^{-1}$ d. 1.2×10^8 ms $^{-1}$

35. If c is the velocity of light in vacuum, then find the time taken by the light to travel through a glass plane of thickness t and having refractive index μ .

a. $\left(\frac{t}{\mu c} \right)$ b. $t \mu c$ c. $\frac{\mu t}{c}$ d. $\frac{tc}{\mu}$

36. Considering normal incidence of ray, find equivalent refractive index of combination of two slabs shown in figure.

a. 1.8

b. 1.43

c. 2

d. None of these

37. A tank contains two different liquids which do not mix with each other. The lower and upper liquid are at depth h_1 and h_2 respectively and of refractive indices μ_1 and μ_2 . An object O is located at the bottom, when seen vertically from above. Locate the position of image of the object O as seen from above.

a. $\frac{h_1}{\mu_1} - \frac{h_2}{\mu_2}$

b. $\frac{h_1}{\mu_1} + \frac{h_2}{\mu_2}$

c. $\frac{h_1}{\mu_1} + \frac{h_2}{\mu_1}$

d. $\frac{h_1}{\mu_2} - \frac{h_2}{\mu_1}$

38. In a lake, a fish rising vertically to the surface of water uniformly at the rate of 3 m/s, observe a bird diving vertically towards the water at a rate of 9 m/s vertically above it. Calculate the actual velocity of the dive of the bird. (Given, refractive index of water = $4/3$)
 a. 9.2 m/s b. 4.5 m/s c. 9.0 m/s d. 3.2 m/s
39. A compound microscope has an eyepiece of focal length 10 m and an objective of focal length 4 cm. Calculate the magnification if an object is kept at a distance of 5 cm from the objective then final image is formed at the least distance of distinct vision.
 a. 10 b. 11 c. 12 d. 13
40. A simple microscope consists of a concave lens of power -10 D and a convex lens of power $+20$ D in contact. If the image formed at infinity, then calculate the magnifying power ($D = 25$ cm).
 a. 2.5 b. 3.5 c. 2.0 d. 3.0
41. A telescope consists of two lenses of focal lengths 10 cm and 1 cm. Calculate the length of the telescope, when an object is kept at a distance of 60 cm from the objective, and the final image is formed at least distance of distinct vision.
 a. 15.05 cm b. 12.96 cm c. 13.63 cm d. 14.44 cm
42. Calculate the limit of resolution of microscope, if the numerical aperture of microscope is 0.12 and the wavelength of light used is 600 nm.
 a. $0.3 \mu\text{m}$ b. $1.2 \mu\text{m}$ c. $2.3 \mu\text{m}$ d. $3 \mu\text{m}$
43. An equilateral prism deviates a ray through 45° for the two angle of incidence differing by 20° . The angle of incidence is
 a. 60° b. 40°
 c. 120° d. None of these
44. Find the refractive index of the material of prism, if a thin prism of angle $A = 6^\circ$, produces a deviation $\delta = 3^\circ$.
 a. 1.5 b. 1.2
 c. 1.1 d. 1.25
45. Figure shows, a glass prism ABC (refractive index 1.5), immersed in water (refractive index $4/3$). A ray of light incident normally on face AB . If it is totally reflected at face AC , then

- a. $\sin \theta \geq \frac{8}{9}$ b. $\sin \theta \geq \frac{2}{3}$
 c. $\sin \theta = \frac{\sqrt{3}}{2}$ d. $\frac{2}{3} < \sin \theta < \frac{8}{9}$

46. Find the refractive index of the material, if a prism having an angle $A = 60^\circ$ which produces a minimum deviation of 30° .

a. $\sqrt{3}$ b. $\sqrt{2}$ c. $\sqrt{5}$ d. $\frac{1}{\sqrt{2}}$

47. Find the power and type of the lens by which a person can see clearly the distant objects, if a person cannot see objects beyond 40 cm.

a. -2.5 D and concave lens b. -2.5 D and convex lens
 c. -3.5 D and concave lens d. -3.5 D and convex lens

48. If the resolution limit of the eye is 1 minute and at a distance x km from the eye, two persons stand with a lateral separation of 3 m, then calculate x for which the two persons can be just resolved by the naked eye.

a. 10 km b. 15 km c. 20 km d. 30 km

49. The prism shown in the figure has one side silvered. The angle of the prism is 30° and $\mu = \sqrt{2}$. What should be the angle of incidence, if the incident ray retraces its initial path?

a. 50°
 b. 45°
 c. 60°
 d. 75°

50. If a crown glass prism of refracting angle 10° have refractive indices for red and violet rays 1.514 and 1.523 respectively, then find the dispersion caused by a crown glass prism.

a. 0.07° b. 0.08° c. 0.09° d. 0.10°

51. A thin prism of angle 6° made of glass of refractive index 1.5 is combined with another prism made of glass of $\mu = 1.75$ to produce dispersion without deviation. The angle of second prism is

a. 7° b. 4.67° c. 9° d. 5°

52. A small object is enclosed in a sphere of solid glass 8 cm in radius. It is situated 2 cm from the centre and is viewed from the side to which it is nearer. Where will it appear to be if μ of glass = 1.5?

a. 6 cm from the centre
 b. 4 cm from the nearer surface
 c. $3\frac{1}{5}$ cm from the nearer surface
 d. $3\frac{2}{3}$ cm from the centre

53. In a glass sphere, there is a small bubble 2×10^{-2} m from its centre, if the bubble is viewed along a diameter of the sphere, from the side on which it lies, how far from the surface will it appear, the radius of glass sphere is 5×10^{-2} m and refractive index of glass is 1.5?

a. 2.5×10^{-2} m b. 3.2×10^{-2} m
 c. 6.5×10^{-2} m d. 0.2×10^{-2} m

54. A ray incident at a point at an angle of incidence 60° enters a glass sphere of $\mu = \sqrt{3}$ and is reflected and refracted at the further surface of the sphere. The angle between the reflected and the refracted rays at this surface is
 a. 50° b. 90°
 c. 60° d. 40°
55. The focal length of a thin convex lens for red and violet colour are 44.6 cm and 42.5 cm. Calculate the focal length for the mean colour and dispersive power of the lens.
 a. Focal length = 43.53 cm, dispersive power = 0.048
 b. Focal length = 28.53 cm dispersive power = 0.048
 c. Focal length = 63.53 cm, dispersive power = 8.48
 d. Focal length = 30.43 cm, dispersive power = 4.8
56. A wire mesh consisting of very small squares is viewed at a distance of 8 cm through a magnifying lens of focal length 10 cm, kept close to the eye. The magnification produced by the lens is
 a. 5 b. 8
 c. 10 d. 20
57. A double convex lens made of glass (refractive index $n = 1.5$) has the radii of curvature of both the surfaces as 20 cm. Incident light rays parallel to the axis of the lens will converge at a distance L such that
 a. $L = 20$ cm b. $L = 10$ cm
 c. $L = 40$ cm d. $L = \frac{20}{3}$ cm
58. An object approaches a convergent lens from the left of the lens with a uniform speed 5 m/s and stops at the focus. The image
 a. moves away from the lens with a uniform speed 5 m/s
 b. moves away from the lens with a uniform acceleration
 c. moves away from the lens with a non-uniform acceleration
 d. moves towards the lens with a non-uniform acceleration
59. A concave lens and a convex lens have the same focal length of 20 cm and both are kept in contact. The combination is used to view an object 5 cm long kept at a distance of 20 cm from the lens combination. As compared to the object, the image will be
 a. magnified and inverted
 b. diminished and erect
 c. of the same size and erect
 d. of the same size and inverted
60. A source of light lies on the angle bisector of two plane mirrors inclined at angle θ . The values of θ , so that the light reflected from one mirror does not reach the other mirror will be
 a. $\theta \geq 120^\circ$ b. $\theta \geq 90^\circ$
 c. $\theta \leq 120^\circ$ d. $\theta < 30^\circ$
61. On the axis of a spherical mirror of focal length f , a short linear object of length L lies on the axis at a distance μ from the mirror. Its image has an axial length L' equal to
 a. $L \left[\frac{f}{(\mu - f)} \right]^{1/2}$ b. $L \left[\frac{(\mu + f)}{f} \right]^{1/2}$ c. $L \left[\frac{(\mu - f)}{f} \right]^2$ d. $L \left[\frac{f}{(\mu - f)} \right]^2$
62. The radius of curvature of the face of plano-convex lens is 12 cm and its refractive index is 1.5. If the plane surface of the lens is now silvered, then find the focal length of the lens.
 a. 26 cm b. 22 cm c. 24 cm d. 20 cm
63. The speed at which the image of the luminous point object is moving, if the luminous point object is moving at speed v_o towards a spherical mirror, along its axis is
 (Given, R = radius of curvature, u = object distance)
 a. $v_i = -v_o$ b. $v_i = -v_o \left[\frac{R}{2u - R} \right]^2$
 c. $v_i = -v_o \left(\frac{2u - R}{R} \right)$ d. $v_i = -v_o \left(\frac{R}{2u - R} \right)$
64. When a thin convergent glass lens ($\mu_g = 1.5$) and has power of +5.0 D, is immersed in a liquid of refractive index μ_l , it acts as a divergent lens of focal length 100 cm. find the value of μ_l .
 a. $4/3$ b. $5/3$ c. $5/4$ d. $6/5$
65. Find the change in the focal length of the lens, if a convex lens of focal length 20 cm and refractive index 1.5, is immersed in water having refractive index 1.33.
 a. 62.2 cm b. 5.82 cm c. 58.2 cm d. 6.22 cm
66. The reflective surface is given by $y = 2 \sin x$. The reflective surface is facing positive axis. What is the least value of coordinate of the point where a ray parallel to positive x-axis becomes parallel to positive y-axis after reflection?
 a. $\left(\frac{\pi}{3}, \sqrt{3} \right)$ b. $\left(\frac{\pi}{2}, \sqrt{2} \right)$ c. $\left(\frac{\pi}{3}, \sqrt{2} \right)$ d. $\left(\frac{\pi}{4}, \sqrt{3} \right)$
67. An object is placed at the focus of convex mirror. The image will be at
 a. c b. f
 c. infinity d. None of these
68. A 4.5 cm needle is placed 12 cm away from a convex mirror of focal length 15 cm. Give the location of the image and the magnification.
 a. 6.7 cm, 5/9 b. 7.5 cm, 5/9
 c. 6.7 cm, 9/5 d. 7.5 cm, 9/5
69. With a concave mirror, an object is placed at a distance x_1 from the principal focus, on the principal axis. The image is formed at a distance x_2 from the principal focus. The focal length of the mirror is
 a. $x_1 x_2$ b. $\frac{x_1 + x_2}{2}$ c. $\sqrt{\frac{x_1}{x_2}}$ d. $\sqrt{x_1 x_2}$

70. Electromagnetic radiation of frequency n , wavelength λ , travelling with velocity v in air, enters a glass slab of refractive index μ . The frequency, wavelength and velocity of light in the glass slab will be respectively

a. $\frac{n}{\mu}, \frac{\lambda}{\mu}, \frac{v}{\mu}$ b. $n, \frac{\lambda}{\mu}, \frac{v}{\mu}$ c. $n, \lambda, \frac{v}{\mu}$ d. $\frac{n}{\mu}, \frac{\lambda}{\mu}, v$

71. When a glass slab is placed on a cross made on a sheet, the cross appears to be raised by 1 cm. The thickness of the glass is 3 cm. The critical angle for glass is

a. $\sin^{-1}(0.33)$ b. $\sin^{-1}(0.5)$ c. $\sin^{-1}(0.67)$ d. $\sin^{-1}\left(\frac{\sqrt{3}}{2}\right)$

72. A layered lens is made of materials indicated by shades in the figure. The number of images formed is

a. 1 b. 2
c. 3 d. 4

BITSAT Archives

1. Resolving power of a telescope will be more, if the diameter (a) of the objective is [2014]
a. larger
b. smaller
c. resolving power does not depend on a
d. None of the above

2. A glass piece is dipped in a liquid of refractive index $4/3$, it gets disappeared in the liquid. The refractive index of the glass piece is [2013]

a. $\frac{3}{4}$ b. $\frac{5}{3}$ c. $\frac{4}{5}$ d. $\frac{4}{3}$

3. If the bio-convex lens is cut as shown in the figure, the new focal length f' is [2013]

a. $2f$ b. f c. $f/2$ d. infinite

4. Refractive index of a medium depends [2013]

a. on the medium only
b. on the incident light only
c. on both the conditions given in options a. and b.
d. None of the above

5. A point object is placed at the focus of a convex mirror, the image will be formed at [2013]

a. infinity b. centre of curvature
c. at focus itself d. None of these

6. [2013]

A point object is placed at the focus of the bio-convex lens. What should be the value of X , so the final image forms at infinity? [2013]

a. 10 cm b. 20 cm
c. 15 cm d. None of these

7. The image formed by a concave spherical mirror [2013]

a. is always virtual b. is always real
c. is always inverted d. may be erect

8. A ray of light is incident on the interface between water and glass at an angle i and refracted parallel to the water surface, then value of μ_g will be [2012]

a. $(4/3) \sin i$ b. $\frac{1}{\sin i}$ c. $\frac{4}{3}$ d. 1

9. A mica slit of thickness t and refractive index μ is introduced in the ray from the first source S_1 . By how much distance of fringes pattern will be displaced? [2012]

a. $\frac{d}{D}(\mu - 1)t$ b. $\frac{D}{d}(\mu - 1)t$
c. $\frac{d}{(\mu - 1)D}$ d. $\frac{D}{d}(\mu - 1)$

10. The refractive index of water is $4/3$ and that of glass is $5/3$. What will be the critical angle for the ray of light entering water from the glass? [2012]

a. $\sin^{-1}\left(\frac{4}{5}\right)$ b. $\sin^{-1}\left(\frac{5}{4}\right)$ c. $\sin^{-1}\left(\frac{1}{2}\right)$ d. $\sin^{-1}\left(\frac{2}{1}\right)$

11. A film projector magnifies a 100 cm^2 film strip on a screen. If the linear magnification is 4, the area of the magnified film on the screen is [2011]

a. 1600 cm^2 b. 400 cm^2
c. 800 cm^2 d. 6400 cm^2

12. A convex lens makes a real image 4 cm long on a screen. When the lens is shifted to new position without disturbing the object, we again get a real image on the screen which is 16 cm tall. The length of the object must be [2010]

a. $\frac{1}{4}$ cm b. 8 cm c. 12 cm d. 20 cm

13. Rays of light fall on a glass slab ($\mu > 1$) as shown in figure. If μ at A is maximum and at B it is minimum, then what will happen to these rays? [2009]

a. They will tilt towards A
b. They will tilt towards B
c. They will not deviate
d. There will be total internal reflection

14. The maximum value of index of refraction of a material of a prism which allows the passage of light through it when the refracting angle of the prism is A , is [2009]

a. $\sqrt{1 + \sin\left(\frac{A}{2}\right)}$ b. $\sqrt{1 + \cos\left(\frac{A}{2}\right)}$
c. $\sqrt{1 + \tan^2\left(\frac{A}{2}\right)}$ d. $\sqrt{1 + \cot^2\left(\frac{A}{2}\right)}$

15. The focal lengths of objective and the eyepiece of a compound microscope are f_o and f_e respectively. Then, [2009]

a. $f_o > f_e$ b. $f_o < f_e$ c. $f_o = f_e$ d. None

16. The refractive index of a material of a plano-concave lens is $5/3$, the radius of curvature is 0.3 m. The focal length of the lens in air is [2008]

a. -0.45 m b. -0.6 m c. -0.75 m d. -1.0 m

17. The optical path of a monochromatic light is same if it goes through 4.0 cm of glass of 4.5 cm of water. If the refractive index of glass is 1.53, the refractive index of the water is [2007]

a. 1.30 b. 1.36 c. 1.42 d. 1.46

18. What is the refractive index of a prism whose angle $A = 60^\circ$ and angle of minimum deviation $d_m = 30^\circ$? [2006]

a. $\sqrt{2}$ b. $\frac{1}{\sqrt{2}}$ c. 1 d. $\frac{1}{\sqrt{3}}$

19. An object is placed at a distance 20 cm from the pole of a convex mirror of focal length 20 cm. The image is produced at [2006]

a. 13.3 cm b. 20 cm c. 25 cm d. 10 cm

20. The plano-convex lens of focal length 20 cm and 30 cm are placed together to form a double convex lens. The final focal length will be [2006]

a. 12 cm b. 60 cm
c. 20 cm d. 30 cm

21. Which mirror is to be used to obtain a parallel beam of light from a small lamp? [2005]

a. Plane mirror b. Convex mirror
c. Concave mirror d. Any one of these

22. Which of the following is a wrong statement? [2005]

a. $D = 1/f$, where f is the focal length and D is called the refractive power of a lens
b. Power is expressed in a diopter when f is in metres
c. Power is expressed in diopter and does not depend on the system of unit used to measure f
d. D is positive for convergent lens and negative for divergent lens

Answer with Solutions

Practice Exercise

1. (a) From the figure, image is situated at 40 cm from eye.

2. (a) 3. (d)

4. (a) From the figure given in question,

$$\tan 30^\circ = \frac{l_0}{d} \Rightarrow l_0 = d \tan 30^\circ = \frac{20}{\sqrt{3}}$$

$$\therefore \text{Number of reflections} = \left[\frac{L}{l_0} \right] = \left[\frac{16 \times 100 \text{ cm}}{\frac{20}{\sqrt{3}} \text{ cm}} \right] = 14$$

If first reflection is considered, then $n = 14 + 1 = 15$

5. (b) From figure,

$$\tan 30^\circ = \frac{BC}{5}$$

$\therefore$

$$BC = 5 \tan 30^\circ = \frac{5}{\sqrt{3}} \text{ m}$$

6. (a) Here the minimum size of mirror

$$= \frac{b-a}{2} = \frac{6-4}{2} = 1 \text{ inch}$$

7. (c) When mirror is rotated through an angle θ about an axis in the plane of mirror, then reflected ray is rotated through an angle 2θ .

When mirror is rotated about an axis perpendicular to the plane of mirror. The angle of incidence and angle of reflection does not change.

8. (b) Let MN = height of a man
 E = position of eye

As, $\triangle NGQ$ and $\triangle QGE$ are similar,
 $\triangle ESP$ and $\triangle PSM$ are congruent.

Now,

$$MP = PE = EQ = QN$$

$$SG = PQ = PE + EQ$$

$$SG = \frac{ME}{2} + \frac{EN}{2}$$

$$SG = \frac{1}{2} MN$$

9. (b) Here angular deviation is $\delta = 2\pi - 2\theta$

$$= 2\pi - 2 \times \frac{\pi}{2} = \pi$$

Hence, final emergent ray is parallel to incident ray.

10. (c) The phenomenon of reflection is independent of medium.

The deviation produced by combination of two plane mirrors is

$$\delta = \pi - 2\theta$$

or
$$\delta = 2\pi - 2 \times \frac{\pi}{2} \quad (\because \theta = 90^\circ)$$

$$\therefore \delta = \pi = 180^\circ$$

11. (c) From figure, CD = emergent ray and CD is parallel to PQ and BC is a line intersecting these parallel lines.

So,
$$\angle DCB + \angle CBQ = 180^\circ$$

$$\angle DCN + \angle NCB + \angle CBQ = 180^\circ$$

$$\alpha + \alpha + 45^\circ = 180^\circ$$

$$\alpha = 67.5^\circ$$

But

$$\angle NCS = 90^\circ$$

So, second mirror is at an angle of 22.5° with horizontal.

12. (b) 13. (a)

14. (c) Total number of images formed = 6, because with an object placed between two plane mirrors inclined at an angle of 90° , one image is produced due to each mirror

and one due to their combination. With three images right angles to each other, one image is produced by each plane mirror and one by each of the three pairs of combination of two mirrors each.

15. (c) For point A, $u = -25 \text{ cm}$,
 $f = +10 \text{ cm}$

$$\therefore \frac{1}{v} + \frac{1}{u} = \frac{1}{f}$$

or
$$\frac{1}{v} - \frac{1}{25} = \frac{1}{10}$$

or
$$\frac{1}{v} = \frac{1}{10} + \frac{1}{25} \quad \text{or} \quad \frac{1}{v} = \frac{5+2}{50}$$

$$\therefore v = \frac{50}{7} = 7.14 \text{ cm}$$

For point B, $u' = -30 \text{ cm}$

$$f' = 10 \text{ cm}$$

$$\frac{1}{v'} + \frac{1}{u'} = \frac{1}{f'}$$

or
$$\frac{1}{v'} - \frac{1}{30} = \frac{1}{10} \quad \text{or} \quad \frac{1}{v'} = \frac{1}{30} + \frac{1}{10} = \frac{1+3}{30} = \frac{4}{30}$$

$$\therefore v' = \frac{30}{4} = 7.5 \text{ cm}$$

$$\therefore A'B' = |v' - v| = |7.5 - 7.14| = 0.36$$

16. (b) From $u-v$ graph, (b) is correct.

17. (b) Here, $u = -x$, $F = -f$

$$\therefore \frac{1}{v} + \frac{1}{u} = \frac{1}{F}$$

or
$$\frac{1}{v} - \frac{1}{x} = -\frac{1}{f} \quad \text{or} \quad \frac{1}{v} = \frac{1}{x} - \frac{1}{f} = \frac{f-x}{xf}$$

$$\therefore v = \frac{xf}{f-x}$$

$$\therefore \frac{\Delta v}{\Delta u} = \frac{v^2}{u^2} = \left(\frac{xf}{f-x} \right)^2 \times \frac{1}{x^2} = \frac{f^2}{(f-x)^2}$$

$$\therefore \Delta v = \frac{f^2 l}{(x-f)^2} \quad [\because \Delta u = l]$$

18. (c) $\theta = \frac{l}{r} \Rightarrow \theta = \frac{10}{5} = 2 \text{ rad}$

19. (b) Here, incident ray is parallel to principal axis, so

$$\angle AMN = \angle BCF = \theta$$

also

$$\angle CBF = \angle KMN = \angle AMN$$

$\therefore$

$$\angle BFP = \theta + \angle CBF = \theta + \theta = 2\theta$$

20. (a) $\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$

$$\frac{1}{v} - \frac{1}{8} = -\frac{1}{12} \Rightarrow v = 24 \text{ cm}$$

21. (a) Mirror formula $\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$

Differentiating w.r.t. t , we get

$$0 = -\frac{1}{v^2} \frac{dv}{dt} - \frac{1}{u^2} \frac{du}{dt}$$

$$\frac{du}{dt} = -\frac{v^2}{u^2} \frac{dv}{dt}$$

But $\frac{du}{dt} = 15 \text{ m/s}$

Now $\frac{1}{v} = \left(\frac{1}{20} + \frac{1}{600} \right)$

$$\therefore v = \frac{600}{31} \text{ cm and } \frac{v}{u} = \frac{\frac{600}{31}}{600} = \frac{1}{31}$$

$$\therefore \text{Speed of image} = \frac{dv}{dt} = -\left(\frac{1}{31}\right)^2 \times 15 = 0.016 \text{ m/s}$$

22. (b)

23. (b) Let $m_A = \frac{I_A}{O_A}$ and $m_B = \frac{I_B}{O_B}$

Here, $I_A = O_A$ and $O_A = 3O_B$

$$\frac{m_A}{m_B} = \frac{I_A}{O_A} \times \frac{O_B}{I_B} = \frac{I_A}{I_B} \times \frac{O_B}{O_A} = \frac{1}{3}$$

also, $m_A = \frac{f}{f - u_A}$ and $m_B = \frac{f}{f - u_B}$

$$\frac{m_A}{m_B} = \left(\frac{f - u_B}{f - u_A} \right)$$

$$\frac{1}{3} = \frac{-7.5 - u_B}{-7.5 - (-30)}$$

$$u_B = -15 \text{ cm}$$

24. (a) $u_1 = 30 \text{ cm}$, $f_1 = -\frac{30}{2} = -15 \text{ cm}$, $u_3 = v_1 = ?$

$$-\frac{1}{15} = \frac{1}{30} + \frac{1}{v_1}$$

$$v_1 = -10 \text{ cm}$$

Image formed is virtual which is formed behind the convex mirror.

25. (b) Here, $P = 2P_L + P_m = \frac{2}{f_L} - \frac{1}{f_m}$

$$P = \frac{2}{f_L} + \frac{2}{R}$$

Here, $\frac{1}{f_L} = (\mu - 1) \left(\frac{1}{r_1} - \frac{1}{r_2} \right) = \left(\frac{7}{4} - 1 \right) \left(\frac{1}{\infty} + \frac{1}{R} \right)$

$$\frac{1}{f_L} = \frac{3}{4R}$$

$$\therefore P = -\frac{1}{F} = \frac{6}{4R} + \frac{2}{R} = \frac{6+8}{4R} = \frac{14}{4R}$$

or $-\frac{1}{0.3} = \frac{14}{4R}$

$$\therefore R = -\frac{14 \times 0.3}{4} = -\frac{4.2}{4} = -1.05$$

26. (a) When final image is formed at least distance of distinct vision, then the magnifying power

$$= M_0 \times \left(1 + \frac{D}{f_e} \right)$$

$$30 = M_0 \left(1 + \frac{25}{5} \right)$$

$$M_0 = 5$$

27. (c) Since, the doublet is corrected for spherical aberration, it satisfies the following condition

$$f_1 - f_2 = d = 2 \text{ cm}$$

$$f_1 = f_2 + 2 \text{ cm}$$

Let the equivalent focal length = F

$$F = \frac{f_1 f_2}{f_1 + f_2 - d} = 10 \text{ cm}$$

Solving it, $f_1 = 20 \text{ cm}$, $f_2 = 18 \text{ cm}$

28. (a) Here, $\angle i + 90^\circ + \angle r = 180^\circ$

$$i + r = 90^\circ$$

$$r = (90^\circ - i)$$

From Snell's law

$$\mu = \frac{\sin i}{\sin r} = \frac{\sin i}{\sin (90^\circ - i)}$$

$$= \frac{\sin i}{\cos i} = \tan i$$

$$\mu = \tan i$$

$$i = \tan^{-1}(\mu)$$

$$i = \tan^{-1}(1.62)$$

29. (c) $\sin C = \frac{1}{a\mu_g} = \frac{2}{3}$

Here, $\frac{\sin C}{\sin r_1} = \frac{a\mu_w}{a\mu_g} = \frac{\frac{3}{4}}{\frac{3}{2}} = \frac{8}{9}$

$$\sin r_1 = \frac{9}{8} \sin C = \frac{9}{8} \times \frac{2}{3} = \frac{3}{4}$$

Let r_2 = angle of refraction for water-air interface

$$\frac{\sin r_1}{\sin r_2} = \frac{1}{a\mu_w} = \frac{3}{4}$$

$$\sin r_2 = \frac{4}{3} \sin r_1 = \frac{4}{3} \times \frac{3}{4} = 1 = \sin 90^\circ$$

$$r_2 = 90^\circ$$

30. (b)

$$31. (a) \lambda_{\text{medium}} = \frac{\lambda_{\text{air}}}{n_m} = \frac{\left(\frac{c}{v}\right)}{n_m}$$

$$\lambda_1 = \frac{c}{vn_1}, \lambda_2 = \frac{c}{vn_2} \text{ or } \lambda_1 n_1 = \lambda_2 n_2$$

$$\lambda = \lambda_1 \left(\frac{n_1}{n_2} \right)$$

$$32. (b) n = \frac{\sin i}{\sin r} = \frac{c}{v}$$

Hence,

$$v = \frac{c \sin r}{\sin i} = \frac{3 \times 10^8 \times \sin 30^\circ}{\sin 45^\circ}$$

$$= \frac{3 \times 10^8}{\sqrt{2}} = 2.12 \times 10^8 \text{ ms}^{-1}$$

33. (b) As optical paths are equal, hence

$$n_g \cdot x_g = n_w \cdot x_w \Rightarrow n_w = n_g \cdot \frac{x_g}{x_w} = 1.53 \times \frac{4.0}{4.5} = 1.36$$

34. (a) As shown in figure, a light ray from the coin will not emerge out of liquid, if $i > C$.Therefore, minimum radius R corresponds to $i = C$. In $\triangle SAB$,

$$\frac{R}{h} = \tan C \text{ or } R = h \tan C$$

or

$$R = \frac{h}{\sqrt{n^2 - 1}}$$

$$\left[\because \sin C = \frac{1}{n} \text{ and } \tan C = \frac{\sin C}{\sqrt{1 - \sin^2 C}} \right]$$

Given, $R = 3 \text{ cm}$, $h = 4 \text{ cm}$

Hence,

$$\frac{3}{4} = \frac{1}{\sqrt{n^2 - 1}}$$

or

$$n^2 = \frac{25}{9} \text{ or } n = \frac{5}{3}$$

But $n = \frac{c}{v}$ or $v = \frac{c}{n} = \frac{3 \times 10^8}{5/3} = 1.8 \times 10^8 \text{ ms}^{-1}$

$$35. (c) \mu = \frac{\text{Velocity of light in vacuum}}{\text{Velocity of light in glass plate}} = \frac{c}{c'}$$

or

$$c' = \frac{c}{\mu}$$

$$\text{Time taken} = \frac{\text{distance}}{\text{velocity}} = \frac{t}{\left(\frac{c}{\mu}\right)} = \frac{\mu t}{c}$$

36. (b) The equivalent refractive index of combination of slab for normal incidence is

$$\mu = \frac{\sum t_i}{\sum \frac{t_i}{\mu_i}}$$

In this case, $\mu = \frac{t_1 + t_2}{\frac{t_1}{\mu_1} + \frac{t_2}{\mu_2}} = \frac{10 + 15}{\frac{10}{3} + \frac{15}{2}}$

$$= \frac{25}{\frac{7.5 + 10}{2}} = \frac{25}{17.5} = 1.43$$

37. (b) Let $\angle BOP = \angle i$, $\angle BDP = \angle r$, $\angle CEQ = \angle i'$ 

Refraction at P

$$\mu_1 \sin i = \mu_2 \sin r$$

$$\frac{\mu_1}{\mu_2} = \frac{\sin r}{\sin i} = \frac{\tan r}{\tan i} = \frac{h_1}{BD}$$

$$\Rightarrow BD = \frac{h_1 \mu_2}{\mu_1}$$

At Q, $\mu_2 \sin r = \sin i'$

$$\mu_1 = \frac{\sin i'}{\sin r} = \frac{\tan i'}{\tan r} = \frac{BD + BC}{CE}$$

$$\Rightarrow CE = \frac{BD + BC}{\mu_2} = \frac{h_1}{\mu_1} + \frac{h_2}{\mu_2}$$

38. (b) Let at any time, fish at depth of the x and y height at which bird was above the surface of water

$$\frac{d_{AC}}{d_{AP}} = \frac{\mu_1}{\mu_2} \Rightarrow \frac{y}{d_{AP}} = \frac{1}{\mu}$$

or

$$d_{AP} = \mu y$$

$\therefore$ Total apparent distance of the bird which was seen by a fish x distance in water.

$$h = x + \mu y$$

$$\frac{dh}{dt} = \frac{dx}{dt} + \mu \frac{dy}{dt}$$

$$9 = 3 + \mu \frac{dy}{dt}$$

$$\frac{dy}{dt} = \frac{6}{\left(\frac{4}{3}\right)} = 4.5 \text{ m/s}$$

$$39. (c) \text{ We know, } \frac{1}{v_0} + \frac{1}{5} = \frac{1}{4}$$

$$v_0 = 20 \text{ cm}$$

and magnification (M) = $\frac{v_0}{u_0} \left[1 + \frac{D}{f_e} \right]$

$$M = \frac{20}{5} \left[1 + \frac{20}{10} \right] = 12$$

40. (a) Power of combination

$$P = P_1 + P_2$$

$$P = +20 - 10 = +10 \text{ D}$$

$$F = \frac{1}{P} = \frac{1}{10} \text{ m} = \frac{100}{10} \text{ cm} = 10 \text{ cm}$$

For final image at infinity

$$M = \frac{D}{F} = \frac{25}{10} = 2.5$$

41. (b) Two lenses used are eyepiece and objective.

For eyepiece,

$$f_e = 1 \text{ cm}, D = v_e = 25 \text{ cm}$$

$$\frac{1}{v_e} - \frac{1}{u_e} = \frac{1}{f_e} \text{ or } -\frac{1}{25} - \frac{1}{u_e} = 1$$

$$u_e = -\frac{25}{26} \text{ cm}$$

and for objective, $u_o = -60 \text{ cm}, f_o = 10 \text{ cm}$

$$\therefore \frac{1}{v_o} - \frac{1}{u_o} = \frac{1}{f_o}$$

$$\frac{1}{v_o} + \frac{1}{60} = \frac{1}{10}$$

$$\frac{1}{v_o} = \frac{1}{10} - \frac{1}{60}$$

$$\frac{1}{v_o} = \frac{5}{60}$$

$$v_o = \frac{60}{5}$$

$$v_o = 12 \text{ cm}$$

$$\therefore \text{Length of telescope} = L = v_o - u_e = \left(12 + \frac{25}{26}\right) = 12.96 \text{ cm}$$

42. (d) Let
- x
- = limit of resolution of a microscope

$$x = \frac{0.61\lambda}{\mu \sin \theta}$$

$$x = \frac{(0.61)(6 \times 10^{-7})}{(0.12)}$$

$$x = 3 \mu\text{m}$$

43. (a) Since, prism is equilateral

 $\therefore$ Angle of prism = 60° Also, $i - i' = 20$... (i)
 $\therefore \delta = i + i' - A \text{ or } \delta + A = i + i'$
 $\text{or } 40^\circ + 60^\circ = i + i' \text{ or } i + i' = 100$... (ii)

Adding Eqs. (i) and (ii), we get

$$2i = 120$$

 $\therefore i = 60^\circ$

44. (a) Condition for angle of deviation for prism

$$\delta = A(\mu - 1) \Rightarrow \mu = 1 + \frac{\delta}{A}$$

$$\mu = 1 + \frac{3}{6} = 1.5$$

$$\mu = 1.5$$

45. (a)

46. (b)

47. (a) Here, in this case, the lens used by the person should form the image of distant object of 40 cm

$$\therefore u = \infty, v = -40 \text{ cm and } \frac{1}{f} = \frac{1}{v} - \frac{1}{u}$$

$$\frac{1}{f} = \frac{1}{-40} - \frac{1}{-\infty}$$

$$\frac{1}{f} = -\frac{1}{40}$$

$$\text{Power} = \frac{1}{f} = -\frac{1}{40} = -2.5 \text{ D}$$

Negative sign shows that lens used is concave lens.

48. (a)
- $\theta = \frac{l}{r}$
- , where
- $\theta = 1$
- minute

$$\theta = \frac{1}{60^\circ} = \left(\frac{\pi}{180} \times \frac{1}{60}\right) \text{ rad and } l = 3 \text{ m}$$

$$x = r = \frac{l}{\theta} = \frac{3 \text{ m}}{\left(\frac{\pi}{180} \times \frac{1}{60}\right)} = 10318 \approx 10 \text{ km}$$

49. (b) To retrace the path ray must be incident normally on the silvered face of the prism.

$$\text{In } \triangle AED,$$

$$30^\circ + 90^\circ + \angle D = 180^\circ$$

$$\angle D = 60^\circ$$

$$\text{also } \angle D + \angle r = 90^\circ$$

$$\angle r = 90^\circ - 60^\circ = 30^\circ$$

From Snell's law

$$1 \sin i = (\sqrt{2}) \sin 30^\circ$$

$$i = \sin^{-1}\left(\frac{1}{\sqrt{2}}\right)$$

$$i = 45^\circ$$

50. (c) We know, angular dispersion

$$= \delta_V - \delta_R = (\mu_V - \mu_R) A = (1.523 - 1.514) \times 10^\circ$$

$$= 0.009 \times 10^\circ = 0.09^\circ$$

51. (b)
- $\delta = 0$

$$\therefore \delta_1 - \delta_2 = 0$$

$$\text{or } (\mu_1 - 1) A_1 - (\mu_2 - 1) A_2 = 0$$

$$\text{or } (1.5 - 1) 7^\circ = (1.75 - 1) A_2$$

$$\text{or } \frac{7}{2} = \frac{3}{4} A_2$$

$$\therefore A_2 = \frac{7}{2} \times \frac{4}{3}$$

$$= \frac{14}{3} = 4.67^\circ$$

52. (c) Here,
- $\mu_1 = 1.5, \mu_2 = 1, u = +6 \text{ cm},$

$$r = +8 \text{ cm}$$

$$\frac{\mu_2}{v} - \frac{\mu_1}{u} = \frac{\mu_2 - \mu_1}{r}$$

$$\frac{1}{v} - \frac{1.5}{6} = \frac{1.5 - 1}{8}$$

$$\therefore v = 3\frac{1}{5} \text{ cm}$$

53. (a) For spherical surface

$$\frac{\mu_2}{v} - \frac{\mu_1}{u} = \frac{\mu_2 - \mu_1}{R}$$

Here, $\mu_1 = 1.5, \mu_2 = 1$

$$u = (5 \times 10^{-2} - 2 \times 10^{-2}) \\ = 3 \times 10^{-2} \text{ cm}$$

and $R = 5 \times 10^{-2} \text{ cm}$

$$\therefore \frac{1}{v} - \frac{1.5}{3 \times 10^{-2}} = \frac{1 - 1.5}{5 \times 10^{-2}}$$

$$v = 2.5 \times 10^{-2} \text{ m}$$

Image will form at a distance of $2.5 \times 10^{-2} \text{ m}$ to the right of nearer surface.

54. (b) The angle between the reflected ray and refracted ray is
- $(120^\circ - \theta)$
- .

For calculation of θ ,

$$\mu_1 \sin i = \mu_2 \sin r \\ 1 \times \sin 60^\circ = \sqrt{3} \sin \theta$$

$$\frac{\sqrt{3}}{2} = \sqrt{3} \sin \theta$$

$$\sin \theta = \frac{1}{2} = \sin 30^\circ$$

$$\theta = 30^\circ$$

Hence, $(120^\circ - 30^\circ) = 90^\circ$

55. (a) Mean focal length
- $= f = \sqrt{f_r f_v}$

$$f = \sqrt{44.6 \times 42.5} = 43.53 \text{ cm}$$

$$\therefore \text{Dispersive power} = \frac{f_r - f_v}{f} = \frac{44.6 - 42.5}{43.33} = 0.048$$

56. (a)
- $\frac{1}{f} = \frac{1}{v} - \frac{1}{u} \dots (i)$

Given, $f = 10 \text{ cm}$ (as lens is converging) $u = -8 \text{ cm}$ (as object is placed on left side of the lens)

Substituting these values in Eq. (i), we get

$$\frac{1}{10} = \frac{1}{v} - \frac{1}{-8} \Rightarrow \frac{1}{v} = \frac{1}{10} - \frac{1}{8} \Rightarrow \frac{1}{v} = \frac{8-10}{80}$$

$$\therefore v = \frac{80}{-2} = -40 \text{ cm}$$

Hence, magnification produced by the lens

$$m = \frac{v}{u} = \frac{-40}{-8} = 5$$

57. (a) Here,
- $n = 1.5$
- , as per sign convention followed

 $R_1 = +20 \text{ cm}$ and $R_2 = -20 \text{ cm}$

$$\therefore \frac{1}{f} = (n-1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right) = (1.5-1) \left[\frac{1}{(+20)} - \frac{1}{(-20)} \right] \\ = 0.5 \times \frac{2}{20} = \frac{1}{20} \Rightarrow f = 20 \text{ cm}$$

Incident rays travelling parallel to the axis of lens will converge at its second principal focus. Hence, $L = +20 \text{ cm}$

58. (c) 59. (c)

60. (a)
- $n = \frac{360}{\theta}$

Number of images, $N = n$, which is odd $= n - 1$ For the given condition, no successive reflection takes place. So, the number of images will be $N \leq 2$

$$n - 1 \leq 2$$

$$n \leq 3$$

$$\frac{360}{\theta} \leq 3$$

$$120 \leq \theta \Rightarrow \theta \geq 120^\circ$$

61. (d) For spherical mirror
- $v = \frac{fu}{(u-f)}$

The value of u for two ends of the objects of length L are

$$u_1 = \mu - \frac{L}{2} \text{ and } u_2 = \mu + \frac{L}{2}$$

Then, the axial length of the image

$$L' = v_1 - v_2 = \frac{f \left(\mu - \frac{L}{2} \right)}{\left(\mu - \frac{L}{2} - f \right)} - \frac{f \left(\mu + \frac{L}{2} \right)}{\left(\mu + \frac{L}{2} - f \right)} \\ = f \left[\frac{Lf}{(\mu - f)^2 - \frac{L^2}{4}} \right] = L \left[\frac{f}{\mu - f} \right]^2$$

62. (c)
- $\frac{1}{f} = (\mu - 1) \left(\frac{1}{r_1} - \frac{1}{r_2} \right)$

$$\frac{1}{f} = (1.5 - 1) \left(\frac{1}{12} - \frac{1}{\infty} \right)$$

$$f = +24 \text{ cm}$$

63. (b)
- $\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$

Differentiating both sides $-\frac{1}{v^2} \frac{dv}{dt} = \frac{1}{u^2} \frac{du}{dt}$

$$\frac{dv}{dt} = v_i = - \left(\frac{v}{u} \right)^2 \frac{du}{dt} = - \left(\frac{v}{u} \right)^2 v_o$$

Again,

$$\frac{1}{v} = \frac{1}{f} - \frac{1}{u} = \frac{2}{R} - \frac{1}{u} = \frac{2u - R}{Ru}$$

$$v = \frac{uR}{2u - R}$$

$$v_i = - \left(\frac{v}{u} \right)^2 v_o = - v_o \left(\frac{R}{2u - R} \right)^2$$

64. (b)
- $P_a = \frac{1}{f_a} = \left(\frac{\mu_g - \mu_a}{\mu_a} \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$

$$P_l = \frac{1}{f_l} = \left(\frac{\mu_g - \mu_l}{\mu_l} \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$= 5 \left(\frac{1.5 - 1}{1} \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right) \dots (i)$$

$$-1 = \left(\frac{1.5 - \mu_l}{\mu_l} \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right) \dots (ii)$$

From Eqs. (i) and (ii), we get $\mu_l = \frac{5}{3}$

65. (c) When the lens is in air, $\frac{1}{f_a} = (\mu - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$

$$\frac{1}{20} = (15 - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right) \text{ or } \left(\frac{1}{R_1} - \frac{1}{R_2} \right) = \frac{1}{10}$$

When lens is in water,

$$\frac{1}{f_w} = \left(\frac{\mu_g - \mu_w}{\mu_w} \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right) = \left(\frac{15 - 1.33}{1.33} \right) \times \frac{1}{10}$$

$$f_w = 78.2 \text{ cm}$$

The change in focal length = $78.2 - 20 = 58.2 \text{ cm}$

66. (a) Let the incidence point is $P(x, y)$

$$m = \tan 45^\circ = 1$$

(from law of reflection)

$$y = 2 \sin x$$

$$\therefore m = \frac{dy}{dx} = 2 \cos x = 1$$

$$\cos x = \frac{1}{2} \Rightarrow x = \frac{\pi}{3}$$

The corresponding value of y is $2 \sin \frac{\pi}{3} = \sqrt{3}$

67. (d) If the object is placed on the right of the convex mirror, no image will be formed.

68. (a) Given, focal length of convex mirror $f = +15 \text{ cm}$
(focal length of convex mirror is taken as positive)

Distance of object, $u = -12 \text{ cm}$

Size of object, $O = 4.5 \text{ cm}$

Using the mirror formula,

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

$$\frac{1}{15} = \frac{1}{v} - \frac{1}{12}$$

$$\Rightarrow \frac{1}{v} = \frac{1}{15} + \frac{1}{12} = \frac{4+5}{60} = \frac{9}{60}$$

Distance of image from the mirror, $v = 6.7 \text{ cm}$

The positive sign shows that the image is formed behind the mirror.

Using the formula of magnification,

$$m = -\frac{v}{u} = \frac{l}{O}$$

$$\frac{-6.7}{-12} = \frac{l}{4.5}$$

Size of image, $l = 2.5 \text{ cm}$

As l is positive, so image is erect and virtual.

Magnification m is given by,

$$m = \frac{l}{O} = \frac{2.5}{4.5} = \frac{25}{45} = \frac{5}{9}$$

69. (d) As, $\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$

$$\therefore \frac{1}{(f-x_1)} + \frac{1}{(f-x_2)} = \frac{1}{f}$$

$$\Rightarrow \frac{f-x_2+f-x_1}{(f-x_1)(f-x_2)} = \frac{1}{f}$$

$$\Rightarrow f^2 - fx_2 - fx_1 + x_1x_2 = 2f^2 - f(x_1+x_2)$$

$$\Rightarrow f^2 = x_1x_2 \Rightarrow f = \sqrt{x_1x_2}$$

70. (b) In going from one medium to another, frequency remains same but wavelength and velocity decreases with the increase in refractive index i.e. wavelength becomes $\lambda' = \frac{\lambda}{\mu}$ and velocity becomes, $v' = \frac{v}{\mu}$.

71. (c) We can write shift, $1 = 3 \left(1 - \frac{1}{\mu} \right)$

$$\Rightarrow 1 - \frac{1}{\mu} = \frac{1}{3}$$

$$\text{or } \frac{1}{\mu} = 1 - \frac{1}{3} = \frac{2}{3} \Rightarrow \mu = \frac{3}{2}$$

$$\text{Now, } \frac{1}{\sin i_c} = \frac{3}{2} \Rightarrow \sin i_c = \frac{2}{3}$$

$$\text{or } i_c = \sin^{-1} \left(\frac{2}{3} \right) \Rightarrow i_c = \sin^{-1} (0.67)$$

72. (d)

BITSAT Archives

1. (a)
2. (d) The glass piece will disappear only, if the refractive index of the glass and liquid is same.

So, refractive index of glass piece must be $\frac{4}{3}$.

3. (a) $f = (\mu - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$

$$f = (\mu - 1) \left(\frac{1}{R} + \frac{1}{R} \right)$$

$$f = (\mu - 1) \frac{2}{R} \quad \dots(i)$$

$$\text{and } f' = (\mu - 1) \left(\frac{1}{R} - \frac{1}{\infty} \right)$$

$$f' = \frac{(\mu - 1)}{R} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$f' = 2f$$

4. (c) Refractive index of a medium depends on the medium as well as on the wavelength of the incident light.

5. (d) Image will not form, because object is placed on the side from where reflection is not possible.

6. (b)

The final image will be at infinity only, if the foci of lens and mirror coincide. The situation could be understood on the basis of given diagram.

7. (d) The image formed by a concave mirror could be real, virtual, erect and inverted.

8. (b) ${}_g\mu_w = \frac{\sin i}{\sin r}$

$${}_g\mu_a = \frac{\sin r}{\sin 90^\circ}$$

$$\Rightarrow {}_g\mu_w \times {}_w\mu_a = \frac{\sin i}{\sin r} \times \frac{\sin r}{\sin 90^\circ} = \sin i$$

$$\text{or } \frac{\mu_w}{\mu_g} \times \frac{\mu_a}{\mu_w} = \sin i \Rightarrow \mu_g = \frac{1}{\sin i}$$

9. (b) Fringe displacement, $x_0 = \frac{D(\mu - 1)t}{d}$

10. (a) $\mu = \frac{\mu_1}{\mu_2} = \frac{5/3}{4/3} = \frac{5}{4}$

$$\sin C = \frac{1}{\mu} = \frac{4}{5} \Rightarrow C = \sin^{-1}\left(\frac{4}{5}\right)$$

11. (a) As linear magnification $m = 4$

Hence, a real magnification $m_a = m^2 = (4)^2 = 16$

$$\therefore \text{Surface area of film image on the screen} = 16 \times 100 = 1600 \text{ cm}^2$$

12. (b) $0 = \sqrt{l_1 l_2} = \sqrt{4 \times 16} = 8 \text{ cm}$

13. (c) For normal incidence, whatever be refractive index.

$i = 0, r = 0$, so there is no deviation of ray.

14. (d) Situation is shown in figure.

$$\begin{aligned} r_1 &= C, r_2 = C \\ r_1 + r_2 &= A \\ \therefore 2C &= A, C = \frac{A}{2} \\ \therefore \mu &= \frac{1}{\sin C} = \frac{1}{\sin\left(\frac{A}{2}\right)} \\ &= \frac{\sqrt{\sin^2\left(\frac{A}{2}\right) + \cos^2\left(\frac{A}{2}\right)}}{\sin\left(\frac{A}{2}\right)} = \sqrt{1 + \cot^2\left(\frac{A}{2}\right)} \end{aligned}$$

15. (b) For a microscope $f_o < f_e$.

16. (a) Lens maker's formula $\frac{1}{f} = (\mu - 1) \left[\frac{1}{R_1} - \frac{1}{R_2} \right]$

Where, $R_2 = \infty, R_1 = 0.3 \text{ m}$

$$\therefore \frac{1}{f} = \left(\frac{5}{3} - 1 \right) \left(\frac{1}{0.3} - \frac{1}{\infty} \right)$$

$$\Rightarrow \frac{1}{f} = \frac{2}{3} \times \frac{1}{0.3}$$

$$\text{or } f = 0.45 \text{ m}$$

17. (b) Optical path, $\mu x = \text{constant}$

$$\text{i.e. } \mu_1 x_1 = \mu_2 x_2 \Rightarrow 1.53 \times 4 = \mu_2 \times 4.5$$

$$\Rightarrow \mu_2 = \frac{1.53 \times 4}{4.5} = 1.36$$

18. (a) Refractive index of prism

$$\begin{aligned} \mu &= \frac{\sin \frac{A + \delta_m}{2}}{\sin \frac{A}{2}} = \frac{\sin \frac{60^\circ + 30^\circ}{2}}{\sin \frac{60^\circ}{2}} \\ &= \frac{\sin 45^\circ}{\sin 30^\circ} = \frac{1/\sqrt{2}}{1/2} = \frac{1}{\sqrt{2}} \times \frac{2}{1} = \sqrt{2} \end{aligned}$$

19. (d) $u = -20 \text{ cm}, f = 20 \text{ cm}$

$$\text{From mirror formula, } \frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

$$\frac{1}{20} = \frac{1}{v} + \frac{1}{-20}$$

$$\frac{1}{v} = \frac{1}{20} + \frac{1}{20}$$

$$\frac{1}{v} = \frac{1}{20} + \frac{1}{20}$$

$$\frac{1}{v} = \frac{2}{20}$$

$$\Rightarrow v = 10 \text{ cm}$$

20. (a) Equivalent focal length

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{20} + \frac{1}{30}$$

$$F = \frac{20 \times 30}{20 + 30} = \frac{600}{50} = 12 \text{ cm}$$

21. (c) If lamp is placed at the focus of concave mirror, then we get parallel beam of light.

22. (c) Power is expressed in dioptre and does not depend on the system of unit used to measure F . So, among the given options, option (c) is wrong.

20

Wave Optics

Wave Optics

Wave optics describes the connection between waves and rays of light. According to wave theory of light, the light is a form of energy which travels through a medium in the form of transverse wave motion. The speed of light in a medium depends upon the nature of medium.

Huygens' Principle

Huygens' principle is used to determine the shape of a wavefront at a time t , if the shape of that wavefront is known at time $t = 0$.

It states that "each point of the wavefront is the source of a secondary disturbance and the wavelets emanating from these points spread out in all the directions with the speed of the wave known as **secondary wavelets**. If we draw a common tangent to all these spheres, then we obtain the new position of the wavefront at a later time."

Laws of Reflection and Refraction using Huygens' Principle

Law of Reflection of a Plane Wave by a Plane Surface

Consider the diagram given below showing reflection of a plane wave by a plane surface constructed using Huygens' principle.

Here, AB is a plane wave. MN is the reflecting surface, v is the speed of wave, t is the time taken by the wavefront to reach from B to C . So, $BC = vt = AE$.

The **law of reflection** states that angle of incidence is equal to the angle of reflection, which can be proved by the diagram constructed using **Huygens' principle**.

In the above diagram, we can see that $\triangle AEC$ and $\triangle ABC$ are congruent and hence their corresponding angles are equal, i.e. $\angle i = \angle r$.

Law of Refraction for a Denser Medium

Consider the given diagram showing refraction of a plane wave, constructed using Huygens' principle.

Here, XX' is the boundary between two mediums i.e. medium 1 (μ_1) and medium 2 (μ_2), where v_1, v_2 are the respective speed of light ($v_2 < v_1$), t is the time taken by the wavefront in travelling distance BC . So, CE represents the refracted wavefront.

From the figure, we have

$$\sin i = \frac{BC}{AC} \text{ and } \sin r = \frac{AE}{AC}$$

So that,

$$\frac{\sin i}{\sin r} = \frac{BC}{AC} \times \frac{AC}{AE} = \frac{BC}{AE}$$

$$\Rightarrow \frac{\sin i}{\sin r} = \frac{v_1 t}{v_2 t} = \frac{v_1}{v_2} = \frac{c/\mu_1}{c/\mu_2} = \frac{\mu_2}{\mu_1}$$

$$\Rightarrow \mu_1 \sin i = \mu_2 \sin r$$

This figure proves the **Snell's law of refraction**.

i.e. $\mu_1 \sin i = \mu_2 \sin r$. Here, μ_1 and μ_2 are refractive indices of both the media, respectively.

When a ray passes from an optically denser medium to an optically rarer medium, the angle of refraction r is greater than the angle of incidence i . For a certain angle of incidence $i = i_c$, angle of refraction $r = 90^\circ$, then this angle of incidence i_c is called **critical angle**.

NOTE From law of refraction (Snell's law),

$$\mu_1 \sin i = \mu_2 \sin r \Rightarrow \mu_1 \sin i_c = \mu_2 \sin 90^\circ$$

$$\Rightarrow \sin i_c = \mu_2 / \mu_1 \Rightarrow i_c = \sin^{-1}(\mu_2 / \mu_1)$$

Interference of Light

Interference of light is the phenomenon of redistribution of light energy in space when two or more light waves of same frequency (or same wavelength) emitted by two coherent sources, travelling in a given direction, superimpose on each other.

If a_1 and a_2 be the amplitudes of two light waves of same frequency and ϕ be the phase difference between them, then the amplitude of resultant wave is given by

$$A_R = \sqrt{a_1^2 + a_2^2 + 2a_1a_2 \cos \phi}$$

and in terms of intensity of light

$$I_R = I_1 + I_2 + 2\sqrt{I_1I_2} \cos \phi$$

Condition for Constructive Interference

If at some point in space, the phase difference between two waves, $\phi = 0^\circ$ or $2n\pi$ (or path difference between two waves, $\Delta x = 0$ or $n\lambda$),

where, n is an integer, then

$$A_R = a_1 + a_2$$

or

$$I_R = I_1 + I_2 + 2\sqrt{I_1I_2} \text{ is maximum.}$$

Such an interference is called **constructive interference**.

Condition for Destructive Interference

If at some point in space, the phase difference between two waves, $\phi = (2n - 1)\pi$ [or path difference, $\Delta x = (2n - 1)\frac{\lambda}{2}$,

then at such points $A_R = (a_1 - a_2)$ and $I_R = I_1 + I_2 - 2\sqrt{I_1I_2}$ is minimum leading to a **destructive interference**.

$$\frac{I_{\max}}{I_{\min}} = \frac{I_1 + I_2 + 2\sqrt{I_1I_2}}{I_1 + I_2 - 2\sqrt{I_1I_2}} = \left[\frac{\sqrt{I_1} + \sqrt{I_2}}{\sqrt{I_1} - \sqrt{I_2}} \right]^2 = \left[\frac{a_1 + a_2}{a_1 - a_2} \right]^2 = \left[\frac{r + 1}{r - 1} \right]^2$$

where, $r = \frac{a_1}{a_2}$ = amplitude ratio.

Young's Double Slit Experiment

This experiment is a demonstration that matter and energy can display characteristics of both waves and particles and demonstrates the fundamentally probabilistic nature of quantum mechanical phenomena.

The arrangement is shown in figure. Monochromatic light of same wavelength is used.

For light waves reaching a point P , situated at a distance x from central point O , the path difference

$$\Delta x = S_2P - S_1P = \frac{xd}{D}$$

- (i) If $\frac{xd}{D} = n\lambda$, then we get the **n th bright fringe**. Hence, position of bright fringes on the screen are given by the relation $x = \frac{nD\lambda}{d}$.
- (ii) If $\frac{xd}{D} = (2n-1)\frac{\lambda}{2}$, then we get the **n th dark fringe**. Hence, for n th dark fringe $x = \frac{(2n-1)D\lambda}{2d}$.

Fringe Width

It is the distance between two consecutive bright or two consecutive dark fringes. It is denoted by β . Fringe width between two consecutive bright or dark fringes is same.

Expression for fringe width, $\beta = \frac{\lambda D}{d}$

where, β = fringe width

λ = wavelength of light

D = distance between the screen and plane of two slits

d = distance between the two slits

Path difference between the waves coming from S_1 and S_2 , meets on the screen at a distance Y_n from central maxima

$$(O) = \Delta x \approx \frac{dY_n}{D}$$

- (i) Path difference for bright fringes,

$$\Delta x = \frac{dY_n}{D} = n\lambda$$

Distance of the n th bright fringe from the centre of the fringe system is

$$Y_n = \frac{n\lambda D}{d}; n = 0, 1, 2, \dots, \text{etc.}$$

- (ii) Path difference for dark fringes,

$$\Delta x = \frac{dY_n}{D} = \left(n + \frac{1}{2}\right)\lambda$$

Distance of the n th dark fringe from the centre of the fringe system is

$$Y_n = \left(n + \frac{1}{2}\right) \frac{\lambda D}{d}; n = 0, 1, 2, 3, \dots, \text{etc.}$$

- (iii) Angular separation between n th bright fringe and the central fringe is

$$\theta_n = \frac{Y_n}{D} = \frac{n\lambda}{d}; \theta_n \text{ is in radian.}$$

- (iv) Angular separation between n th dark fringe and the central fringe is

$$\theta_n = \left(n + \frac{1}{2}\right) \frac{\lambda}{d}$$

where, $n = 0, 1, 2, 3, \dots$ etc.

Fringe Shift

- (i) If a refracting slab of refractive index μ and thickness t is placed in front of one of the two slits of Young's double slit experiment, then the whole fringe pattern gets shifted towards the slab by distance

$$\Delta y = (\mu - 1)t$$

- (ii) If both slits are covered by refracting surfaces of thickness t_1 and t_2 and refractive indices μ_1 and μ_2 respectively, then fringe pattern shifted by $\Delta y = (\mu_2 - \mu_1)t$. Net shift will be towards the slit having greater refractive index.

Fresnel's Biprism

Fresnel's biprism is a device for obtaining **coherent sources**. The biprism is a glass prism of very small base angles.

Comparing the situation geometrically with the double slit experiment fringe pattern width $G = W = \frac{D\lambda}{d}$

where, D = distance of screen from the line joining $S_1 S_2$.

λ = wavelength of light used,

d = distance between S_1 and S_2 .

Calculation of Deviation

Let a = distance of source S from biprism

Deviation = $(\mu - 1)\alpha$ (for small angle prism)

$$\Rightarrow d = 2a\delta = 2a(\mu - 1)\alpha$$

Diffraction of Light

Diffraction of light is the deviation of light waves when it encounter any obstacle in its way.

Diffraction happens due to bending of light around the edges of obstacles.

The phenomenon of diffraction is divided mainly in the following two classes

- Fresnel diffraction
- Fraunhofer diffraction

Diffraction due to a Single Slit

To study the diffraction phenomenon, Young's double slit experiment was modified to single slit.

From this experiment, it was observed that when a parallel beam of monochromatic light falls normally on a narrow slit, the diffraction pattern on a screen has bright **central maxima** bordered on both sides by secondary maxima of rapidly decreasing intensity. Suppose, λ is the wavelength of light and a is width of slit.

(i) Thus, for bright fringes, $\sin\theta = 0, \frac{3\lambda}{2a}, \frac{5\lambda}{2a}, \dots$, etc.

(ii) For dark fringes, $\sin\theta = \frac{\lambda}{a}, \frac{2\lambda}{a}, \frac{3\lambda}{a}, \dots$, etc.

Width of Central Maxima

Angular width of central maxima = $\frac{2\lambda}{a}$

Linear width of central maxima = $\frac{2f\lambda}{a}$

where, λ = wavelength of light, a = width of slit
 f = focal length of the convex lens placed close to the slit

Malus Law

When a beam of completely plane polarised light is incident on an analyser, the resultant intensity of light (I) transmitted from the analyser varies directly as the square of cosine of angle (θ) between plane of transmission of analyser and polariser.

i.e.

$$I \propto \cos^2\theta$$

Brewster's Law

According to this law, when unpolarised light is incident at an angle called polarising angle, i_p , on an interface separating air from a medium of refractive index μ , then the reflected light is fully polarised (perpendicular to the plane of incidence), provided

This relation represents Brewster's law.

Practice Exercise

- Light propagates 2 cm distance in glass of refractive index 1.5 in time t_0 . In the same time t_0 , light propagates a distance of 2.25 cm in a medium. The refractive index of the medium is
 a. $4/3$
 b. $3/2$
 c. $8/3$
 d. None of the above
- Two non-coherent sources emit light beam of intensities I and $4I$. The maximum and minimum intensities in the resulting beam are
 a. $9I$ and I
 b. $9I$ and $3I$
 c. $5I$ and I
 d. $5I$ and $3I$
- In an interference pattern, the position of zeroth order maxima is 4.8 mm from a certain point P on the screen. The fringe width is 0.2 mm. The position of second minima from point P is
 a. 5.1 mm
 b. 5 mm
 c. 4 mm
 d. 5.2 mm
- A beam of light AO is incident on a glass slab ($\mu = 1.54$) in a direction as shown in the figure. The reflected ray OB is passed through a nicol prism. On viewing through a nicol prism, we find on rotating the prism that

- the intensity is reduced down to zero and remains zero
 - the intensity reduces down somewhat and rises again
 - there is no change in intensity
 - the intensity gradually reduces to zero and then again increases
- A parallel beam of light of intensity I_0 is incident on a glass plate, 25% of light is reflected by upper surface and 50% of light is reflected from lower surface. The ratio of maximum to minimum intensity in interference region of reflected ray is

- $\left(\frac{1 + \sqrt{\frac{3}{8}}}{2 - \sqrt{\frac{3}{8}}} \right)^2$
- $\left(\frac{1 + \sqrt{\frac{3}{8}}}{2 - \sqrt{\frac{3}{8}}} \right)^2$
- $\frac{5}{8}$
- $\frac{8}{5}$

- Newton's rings are observed by keeping a spherical surface of 100 cm radius on a plane glass plate. The wavelength of light used is 5880 Å. If the diameter of the 15th bright ring is 0.590 cm, then calculate diameter of the 5th ring.
 a. 0.226 cm b. 0.446 cm c. 0.336 cm d. 0.556 cm
- If n coherent sources of intensity I_0 are superimposed at a point, the intensity of the point is
 a. nI_0 b. n^2I_0 c. n^3I_0 d. $\frac{I_0}{n}$
- In Young's double slit experiment with monochromatic light of wavelength 600 nm, the distance between slits is 10^{-3} m. For changing fringe width by 3×10^{-5} m,
 a. the screen is moved away from the slits by 5 cm
 b. the screen is moved by 5 cm towards the slits
 c. the screen is moved by 3 cm towards the slits
 d. Both (a) and (b) are correct
- If Young's double slit experiment, is performed in water
 a. the fringe width will decrease
 b. the fringe width will increase
 c. the fringe width will remain unchanged
 d. there will be no fringe
- In Young's double slit experiment, the spacing between the slits is ' d ' and wavelength of light used is 6000 Å. If the angular width of a fringe formed on a distant screen is 1° , then calculate ' d '.
 a. 1 mm b. 0.05 mm c. 0.03 mm d. 0.01 mm
- In Young's double slit experiment, when violet light of wavelength 4358 Å used, then 84 fringes are seen in the field of view, but when sodium light of certain wavelength is used, then 62 fringes are seen in the field of view, calculate wavelength of sodium light.
 a. 6893 Å b. 5904 Å c. 5523 Å d. 6429 Å
- In a Young's double slit experiment, 5th dark fringe is formed opposite to one of the slits. The wavelength of light is
 a. $\frac{d^2}{6D}$ b. $\frac{d^2}{5D}$ c. $\frac{d^2}{15D}$ d. $\frac{d^2}{9D}$
- In the ideal double slit experiment, when a glass-plate (refractive index 1.5) of thickness t is introduced in the path of one of the interfering beams (wavelength λ), the intensity at the position where the central maximum occurred previously remain unchanged. The minimum thickness of the glass plate is
 a. 2λ b. $\frac{2\lambda}{3}$ c. $\frac{\lambda}{3}$ d. λ

14. For the same objective, find the ratio of the least separation between two points to be distinguished by a microscope for light of $5000 \text{ \AA}$ and electrons accelerated through 100 V used as the illuminating substance.
 a. 1×10^{-4} b. 0.2×10^{-3} c. 5×10^{-2} d. 7×10^{-4}
15. One slit of a double slit experiment is covered by a thin glass plate of refractive index 1.4 and the other by a thin glass plate of the refractive index 1.7 . The point on the screen, where the central maximum fall before the glass plate was inserted, is now occupied by what had been the fifth bright fringe was seen before? Assume the plate have the same thickness t and wavelength of light 480 nm . Then, the value of t is
 a. 2.4 mm b. 4.8 mm c. $8 \mu\text{m}$ d. 16 mm
16. In a Young's experiment, one of the slit is covered with a transparent sheet of thickness $3.6 \times 10^{-3} \text{ cm}$ due to which position of central fringe shifts to a position originally occupied by 30th bright fringe. Find the refractive index of the sheet, if $\lambda = 6000 \text{ \AA}$.
 a. 1.5 b. 1.2 c. 1.3 d. 1.7

17. A beam of light parallel to central line AB is incident on the plane of slits. The number of minima obtained on the large screen is n_1 . Now, if the beam is tilted by same angle ($\neq 90^\circ$) as shown in figure, then the number of minima obtained is n_2 . Then,

- a. $n_1 = n_2$ b. $n_1 > n_2$
 c. $n_2 > n_1$ d. n_2 will be zero

18. In Fresnel's biprism experiment, the distance between biprism and screen is 4 m . The angle of prism is $2 \times 10^{-3} \text{ rad}$, the refractive index of glass of biprism is 1.5 . The fringe width observed on the screen is $15 \times 10^{-4} \text{ m}$. Find the number of fringes on the screen.
 a. 3 b. 2 c. 6 d. 8
19. The first diffraction minimum due to single slit diffraction is θ , for a light of wavelength $5000 \text{ \AA}$. If the width of the slit is $1 \times 10^{-4} \text{ cm}$, then the value of θ is
 a. 30° b. 45°
 c. 60° d. 15°
20. A screen is at a distance of 1 m away from the aperture. If light of wavelength 500 nm falls on an aperture, then calculate the area of first HPZ and radius of third HPZ.
 a. $1.57 \text{ mm}^2, 1.22 \text{ mm}$
 b. $1.22 \text{ mm}^2, 1.57 \text{ mm}$
 c. $1.65 \text{ mm}^2, 2.79 \text{ mm}$
 d. $2.63 \text{ mm}^2, 0.22 \text{ mm}$
21. The sodium yellow doublet has wavelengths $5890 \text{ \AA}$ and $\lambda \text{ \AA}$ and resolving power of a grating to resolve these lines is 982 , then value of λ is
 a. $5896 \text{ \AA}$ b. $5880 \text{ \AA}$
 c. $5869 \text{ \AA}$ d. $5876 \text{ \AA}$
22. An unpolarised beam of light is incident on a group of four polarising sheets which are arranged in such a way that the characteristic direction of each polarising sheet makes an angle of 30° with that of the preceding sheet. The percentage of incident light transmitted by the first polariser will be
 a. 100%
 b. 50%
 c. 25%
 d. 125%

BITSAT Archives

1. The angular size of the central maxima due to a single slit diffraction is ($a \rightarrow$ slit width) [2014]
 a. $\frac{\lambda}{a}$ b. $\frac{2\lambda}{a}$ c. $\frac{3\lambda}{2a}$ d. $\frac{\lambda}{2a}$
2. Find the final intensity of light (I''), if the angle between the axes of two polaroids is 60° . [2014]

- a. $\frac{3I_0}{2}$ b. $\frac{I_0}{2}$
 c. $\frac{I_0}{4}$ d. $\frac{I_0}{8}$

3. A mica slit of thickness t and refractive index μ is introduced in the ray from the first source S_1 . By how much distance of fringes pattern will be displaced? [2012]
 a. $\frac{d}{D}(\mu - 1)t$ b. $\frac{D}{d}(\mu - 1)t$
 c. $\frac{d}{(\mu - 1)D}$ d. $\frac{D}{d}(\mu - 1)$
4. A single slit diffraction is obtained using a beam of red light. If red light is replaced by blue light, what happens? [2009]
 a. The diffraction pattern disappears
 b. There is no change in the diffraction pattern
 c. Diffraction fringes become narrower and crowded together
 d. Diffraction fringes become broader and farther apart

5. **Statement** Using Huygens' eyepiece measurements can be taken but are not correct.

Reason The cross wires, scale and final image are not magnified proportionately because the image of the object is magnified by two lenses, whereas the cross wire scale is magnified by one lens only.

Identify the correct one of the following. [2008]

- a. Both (S) and (R) are true, (R) explains (S)
 b. Both (S) and (R) are true, but (R) cannot explain (S)
 c. (S) is false, (R) is false
 d. (S) is false, (R) is true
6. In Fraunhofer diffraction experiment, L is the distance between screen and the obstacle, b is the size of obstacle and λ is wavelength of incident light. The general condition for the applicability of Fraunhofer diffraction is [2008]
- a. $\frac{b^2}{L\lambda} \gg 1$ b. $\frac{b^2}{L\lambda} = 1$
 c. $\frac{b^2}{L\lambda} \ll 1$ d. $\frac{b^2}{L\lambda} \neq 1$

7. The optical path of a monochromatic light is same if it goes through 4.0 cm of glass of 4.5 cm of water. If the refractive index of glass is 1.53, the refractive index of the water is [2007]

a. 1.30 b. 1.36 c. 1.42 d. 1.46

8. In Young's double slit experiment a minima is observed when path difference between the interfering beam is [2006]

a. λ b. 1.5λ c. 2λ d. 2.25λ

9. Two coherent light beams of intensity I and $4I$ are superposed. The maximum and minimum possible intensities in the resulting beam are [2005]

a. $9I$ and I b. $9I$ and $3I$ c. $5I$ and I d. $5I$ and $3I$

10. When unpolarised light beam is incident from air onto glass ($n = 1.5$) at the polarising angle [2005]

a. reflected beam is polarised 100%
 b. reflected and refracted beams are partially polarised
 c. the reason for (a) is that almost all the light is reflected
 d. All of the above

Answer with Solutions

Practice Exercise

1. (a) For a given time, optical path remains constant
 $\therefore \mu_1 x_1 = \mu_2 x_2$
 or $1.5 \times 2 = \mu_2 \times 2.25$
 $\therefore \mu_2 = \frac{1.5 \times 2}{2.25} = \frac{2}{1.5} = \frac{20}{15} = \frac{4}{3}$
2. (d) When two coherent light beams of intensity I_1 and I_2 superimpose, then maximum intensity is $(\sqrt{I_1} + \sqrt{I_2})^2$ and minimum intensity is $(\sqrt{I_1} - \sqrt{I_2})^2$. But when two incoherent light beams of intensities I_1 and I_2 superimposed, then maximum intensity is $(I_1 + I_2)$ and minimum intensity is $(I_1 - I_2)$.
3. (a) The distance between zeroth order maxima and second order minima is
 $y_1 = \frac{\beta}{2} + \beta = \frac{3}{2}\beta = \frac{3}{2} \times 0.2 \text{ mm} = 0.3 \text{ mm}$
 $\therefore$ The distance of second maxima from point P is
 $y = (4.8 + 0.3) \text{ mm} = 5.1 \text{ mm}$
4. (d) As $i_p = \tan^{-1}(1.54) = 57^\circ$ and in the figure given
 $i = 90^\circ - 33^\circ = 57^\circ = i_p$

$\therefore$ Reflected light along OB is plane polarised. On rotating the nicol prism, intensity gradually reduces to zero and then increases again.

5. (a) The intensity of light reflected from upper surface is

$$I_1 = I_0 \times 25\% = I_0 \times \frac{25}{100} = \frac{I_0}{4}$$

Intensity of transmitted light from upper surface is

$$I = I_0 - \frac{I_0}{4} = \frac{3I_0}{4}$$

$\therefore$ Intensity of reflected light from lower surface is

$$I_2 = \frac{3I_0}{4} \times \frac{50}{100} = \frac{3I_0}{8} \Rightarrow \frac{I_{\max}}{I_{\min}} = \frac{(\sqrt{I_1} + \sqrt{I_2})^2}{(\sqrt{I_1} - \sqrt{I_2})^2}$$

$$\frac{I_{\max}}{I_{\min}} = \frac{\left(\sqrt{\frac{I_0}{4}} + \sqrt{\frac{3I_0}{8}}\right)^2}{\left(\sqrt{\frac{I_0}{4}} - \sqrt{\frac{3I_0}{8}}\right)^2} = \frac{\left(\frac{1}{2} + \sqrt{\frac{3}{8}}\right)^2}{\left(\frac{1}{2} - \sqrt{\frac{3}{8}}\right)^2}$$

6. (c) Let D_{n+p} = diameter of $(n + p)$ th ring

D_n = diameter of n th ring

$D_{15} = 0.590 \text{ cm}$, $D_s = ?$

$\lambda = 5880 \text{ \AA}$, $R = 100 \text{ cm}$

$P = 10$

$$\lambda = \frac{D_{n+p}^2 - D_n^2}{4PR}$$

$$5880 \times 10^{-5} = \frac{(0.59 + D_n)(0.59 - D_n)}{4 \times 10 \times 100}$$

$$D_n = 0.336 \text{ cm}$$

7. (b) The resultant amplitude is $A = na_0$

$$\therefore I \propto A^2$$

$$\therefore I = kA^2 = k n^2 a_0^2 = n^2 I_0$$

$$8. (a) \beta = \frac{D}{d} \lambda \Rightarrow \Delta \beta = \frac{\Delta D}{d} \lambda$$

$$\Delta D = \frac{d \Delta \beta}{\lambda} = \frac{3 \times 10^{-5} \times 10^{-3}}{600 \times 10^{-9}}$$

= 5 cm away or towards the slits

9. (a) As we know,

$$\beta = \frac{D}{d} \lambda \quad \dots(i)$$

$$\text{and} \quad \lambda \propto \frac{1}{\mu} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\beta \propto \lambda \propto \frac{1}{\mu} \therefore \beta \propto \frac{1}{\mu}$$

$$10. (c) \text{ Here, } \sin \theta \approx \theta = \left(\frac{y}{D} \right)$$

$$\text{So, } \Delta \theta = \frac{\Delta y}{D}$$

Angular fringe width $\theta_0 = \Delta \theta$ (width $\Delta y = \beta$)

$$\theta_0 = \frac{\beta}{D} = \frac{D \lambda}{d} \times \frac{1}{D} = \frac{\lambda}{d}$$

$$\theta_0 = 1^\circ = \frac{\pi}{180} \text{ rad and } \lambda = 60 \times 10^{-7} \text{ m}$$

$$d = \frac{\lambda}{\theta_0} = \frac{180}{\pi} \times 6 \times 10^{-7}$$

$$= 3.44 \times 10^{-5} \text{ m} = 0.03 \text{ mm}$$

11. (b)

12. (d) For dark fringe,

$$\frac{Yd}{D} = (2m-1) \frac{\lambda}{2}$$

$$\text{Here, } m=5, Y = \frac{d}{2}$$

$$\therefore \frac{d}{2} \frac{d}{D} = (2 \times 5 - 1) \frac{\lambda}{2}$$

$$\text{or } \frac{d^2}{D} = 9\lambda$$

$$\therefore \lambda = \frac{d^2}{9D}$$

$$13. (a) \text{ We can write, shift} = \frac{(\mu-1)tD}{d} = \text{fringe width, } \beta = \frac{\lambda D}{d}$$

$\therefore$ Thickness, $t = 2\lambda$

$$14. (b) d_{\min} = \frac{1.22 \lambda}{2 \sin \beta}$$

where, λ is the wavelength of light and β is the angle subtended by the objective at the object.

For the light of wavelength $5500 \text{ \AA}$

$$d_{\min} = \frac{1.22 \times 5500 \times 10^{-10}}{2 \sin \beta} \quad \dots(i)$$

For electrons accelerated through 100 V, the de-Broglie wavelength

$$\lambda = \frac{12.27}{\sqrt{V}} = \frac{12.27}{\sqrt{100}} = 0.12 \times 10^{-9} \text{ m}$$

$$d_{\min} = \frac{1.22 \times 0.12 \times 10^{-9}}{2 \sin \beta}$$

Ratio of the least separation

$$\therefore \frac{d'_{\min}}{d_{\min}} = \frac{0.12 \times 10^{-9}}{5500 \times 10^{-10}} = 0.2 \times 10^{-3}$$

15. (c) Due to the introduction of the glass plate, the change in path difference is $(\mu_2 - \mu_1)t$.

$\therefore$ Before inserting the glass plate, the path difference for central maxima is zero.

After introducing glass plate, the change in path difference is equal to 5λ .

$$(\mu_2 - \mu_1)t = 5\lambda$$

$$t = \frac{5\lambda}{\mu_2 - \mu_1} = \frac{5 \times 480 \times 10^{-9}}{1.7 - 1.4} = 8 \mu\text{m}$$

16. (a) The position of 30th bright fringe

$$y_{30} = \frac{30\lambda D}{d}$$

Now, position shift of central fringe is

$$y_0 = \frac{30\lambda D}{d}$$

$$\text{But we know, } y_0 = \frac{D}{d} (\mu - 1)t$$

$$\frac{30\lambda D}{d} = \frac{D}{d} (\mu - 1)t \Rightarrow (\mu - 1) = \frac{30\lambda}{t}$$

$$= \frac{30 \times (6000 \times 10^{-10})}{(3.6 \times 10^{-5})} = 0.5 \Rightarrow \mu = 1.5$$

17. (a) Fringe size will not change due to tilting

$$\therefore n_1 = n_2$$

18. (c) The deviation,

$$S = (\mu - 1) A = 0.5 \times 2 \times 10^{-3} = 10^{-3} \text{ rad}$$

The length of band on either side of centre of screen

$$= l = b\delta = 4 \times 10^{-3} \text{ m}$$

$\therefore$ The number of fringe on either side is

$$n_1 = \frac{l}{\beta} = \frac{4 \times 10^{-3}}{15 \times 10^{-4}} = \frac{40}{15} = 2.67$$

$\therefore$ Total number of fringes

$$= 2[n_1] + 1 = 2[2.67] + 1 = 6$$

19. (a)

20. (a)

$$21. (a) \text{ Mean wavelength, } \lambda_m = \frac{5890 + \lambda}{2}$$

Wavelength difference $d\lambda = \lambda - 5890$

Resolving power R of a grating

$$R = \frac{\lambda_m}{d\lambda} = \frac{5890 + \lambda}{\lambda - 5890} = 982 \Rightarrow \lambda = 5896 \text{ \AA}$$

22. (b) First polariser just polarises the unpolarised light.

Therefore, intensity of polarised light transmitted from first polariser is

$$\frac{1}{2} I_0 = 50\% I_0$$

BITSAT Archives

1. (b)

So, angular size of central maxima is $= 2 \left(\frac{\lambda}{a} \right) = \frac{2\lambda}{a}$

2. (d) From first polaroid the unpolarised light will become polarised with half the intensity.

So, $I' = \frac{I_0}{2}$

From second polaroid

$$I'' = I' \cos^2 \theta = \frac{I_0}{2} \cos^2(60) = \frac{I_0}{2} \cdot \frac{1}{4} = \frac{I_0}{8}$$

3. (b) Fringe displacement, $x_0 = \frac{D(\mu - 1)t}{d}$

4. (c) For red light, $\lambda = \lambda_r$

$$\therefore \beta_{\text{red}} = \frac{D}{a} \lambda_r \quad \dots(i)$$

For blue light, $\lambda = \lambda_b$

$$\therefore \beta_{\text{blue}} = \frac{D}{a} \lambda_b \quad \dots(ii)$$

$$\therefore \frac{\beta_{\text{blue}}}{\beta_{\text{red}}} = \frac{\frac{D}{a} \lambda_b}{\frac{D}{a} \lambda_r} = \frac{\lambda_b}{\lambda_r}$$

$$\Rightarrow \beta_{\text{blue}} = \frac{\lambda_b}{\lambda_r} \times \beta_{\text{red}}$$

$$\because \lambda_b < \lambda_r$$

$$\therefore \beta_{\text{blue}} < \beta_{\text{red}}$$

$\therefore$ Diffraction fringes become narrower and crowded together.

5. (a) Using Huygens' eyepiece, measurements can be taken but not accurately due to the reason given.

6. (c) The general condition for Fraunhofer diffraction is

$$\frac{b^2}{L\lambda} \ll 1$$

7. (b) Optical path $\mu x = \text{constant}$

$$\text{i.e.} \quad \mu_1 x_1 = \mu_2 x_2$$

$$\Rightarrow 1.53 \times 4 = \mu_2 \times 4.5$$

$$\Rightarrow \mu_2 = \frac{1.53 \times 4}{4.5} = 1.36$$

8. (b) In Young's double slit experiment, a minima is observed when path difference between the interfering beam is 1.5λ .

9. (a) As $I \propto a^2$ or $a \propto \sqrt{I}$

$$\therefore \frac{a_1}{a_2} = \sqrt{\frac{I}{4I}} \Rightarrow \frac{a_1}{a_2} = \frac{1}{2}$$

$$\frac{I_{\text{max}}}{I_{\text{min}}} = \left(\frac{a_1 + a_2}{a_1 - a_2} \right)^2 = \left(\frac{1+2}{1-2} \right)^2 = \frac{9}{1}$$

$$\therefore I_{\text{max}} = 9I, I_{\text{min}} = I$$

10. (a) If unpolarised light is incident at polarising angle, then reflected light is completely, i.e. 100% polarised.

21

Electric Charge

Electric Charge

Charge is the property associated with matter due to which it produces and experiences electric and magnetic effects. Electric charge is of two types—positive and negative. Loss of electrons gives **positive charge** and gain of electrons gives **negative charge** to a body. The charge on any body will be an integral multiple of e , i.e. $Q = \pm ne$ where $n = 1, 2, 3, \dots$

The SI unit of charge is ampere $\times$ second = coulomb (C). Charge can also be described in mC, μC , nC.

i.e. $1 \text{ mC} = 10^{-3} \text{ C}$, $1 \mu\text{C} = 10^{-6} \text{ C}$, $1 \text{ nC} = 10^{-9} \text{ C}$

Its CGS unit is coulomb or esu. Its dimensional formula is $[AT]$.

Continuous Charge Distribution

- When charge is distributed along a line, straight or curved, then it is called linear charge distribution and its charge per unit length is called linear charge density (λ).

i.e.
$$\lambda = \frac{\Delta q}{\Delta l}$$

Its unit is coulomb/metre (Cm^{-1}).

- When charge is distributed over a surface area, then it is called surface charge distribution and charge over its per unit area is called surface charge density (σ).

i.e.
$$\sigma = \frac{\Delta q}{\Delta S}$$

Its unit is coulomb-metre⁻² (Cm^{-2}).

- When charge is distributed over entire volume of a body, then it is called volume charge distribution and charge per unit volume is called volume charge density (ρ).

i.e.
$$\rho = \frac{\Delta q}{\Delta V}$$

Its unit is coulomb-metre⁻³ (Cm^{-3}).

Coulomb's Law

If q_1 and q_2 be two stationary point charges in free space separated by a distance r , then the force of attraction or repulsion between them is given by

$$\begin{aligned} F &= \frac{k|q_1||q_2|}{r^2} \\ &= \frac{1}{4\pi\epsilon_0} \cdot \frac{|q_1||q_2|}{r^2} \quad \left[\because k = \frac{1}{4\pi\epsilon_0} \right] \\ &= \frac{9 \times 10^9 \times |q_1||q_2|}{r^2} \quad \left[\because \frac{1}{4\pi\epsilon_0} = 9 \times 10^9 \right] \end{aligned}$$

The term ϵ_0 is called the electric permittivity of free space having a value of $8.85 \times 10^{-12} \text{ C}^2\text{N}^{-1}\text{m}^{-2}$. Its dimensional formula is $[\text{M}^{-1}\text{L}^{-3}\text{T}^4\text{A}^2]$.

If some dielectric medium is completely filled between the given charges, then the Coulomb's force between them becomes

$$\begin{aligned} F_m &= \frac{1}{4\pi\epsilon} \cdot \frac{q_1q_2}{r^2} \\ &= \frac{1}{4\pi\epsilon_0\epsilon_r} \cdot \frac{q_1q_2}{r^2} \\ &= \frac{1}{4\pi K\epsilon_0} \cdot \frac{q_1q_2}{r^2} \\ \frac{\epsilon}{\epsilon_0} &= \epsilon_r \text{ or } K \\ &= \frac{F_{\text{Free space}}}{K} \quad \left[\because F_{\text{Free space}} = \frac{q_1q_2}{4\pi r^2\epsilon_0} \right] \end{aligned}$$

Here, ϵ_0 = absolute electric permittivity of the given medium, K dielectric constant and ϵ_r is the relative permittivity of the given medium.

NOTE • Force of two charges exerts on each other is not changed by the presence of a third charge.

- Coulomb's force between two protons is 10^{36} times the gravitational force between them.

Electric Field

The space surrounding an electric charge q in which another charge q_0 experiences a force of attraction or repulsion is called the electric field of charge q .

Electric field vector E (also known as the electric field intensity) at any point is given by

$$E = \lim_{q_0 \rightarrow 0} \frac{F}{q_0}$$

where, q_0 is a small positive test charge which experiences a force F at a given point.

The SI unit of electric field is NC^{-1} and it is also known as Vm^{-1} . The dimensional formula for electric field is $[\text{MLT}^{-3}\text{A}^{-1}]$.

Motion of a Charged Particle in an Electric Field

In this condition, some cases arise as below

Case I A charged particle is released from rest in an electric field E .

Then force on charged particle is given by $F = qE$

The acceleration produced by this force is given by

$$a = \frac{F}{m} = \frac{qE}{m}$$

Since, E is constant, the acceleration a is also constant. Hence, the particle is uniformly accelerated. Let the particle starts from rest, then velocity of charged particle after time t is given by $v = u + at$

$$v = \left(\frac{qE}{m} \right) t \quad \left(u = 0 \text{ and } a = \frac{qE}{m} \right)$$

The distance travelled by the particle is given by

$$s = ut + \frac{1}{2}at^2 \Rightarrow s = \frac{1}{2} \frac{qE}{m} t^2$$

The kinetic energy gained by the particle

$$= \frac{1}{2}mv^2 = \frac{q^2E^2t^2}{2m}$$

Case II A charged particle enters the field in perpendicular direction.

Let a charged particle of mass m and charge q , enters the electric field along x -axis with speed u . The electric field E is along y -axis is given by

$$F_y = qE$$

and force along x -axis remains zero, i.e. $F_x = 0$

$\therefore$ Acceleration of the particle along y -axis is given by

$$a_y = \frac{F_y}{m} = \frac{qE}{m}$$

The initial velocity is zero along y -axis ($u_y = 0$).

$\therefore$ The deflection of charged particle along y -axis after time

$$t \text{ is given by } y = u_y t + \frac{1}{2} a_y t^2 = \frac{qE}{2m} t^2$$

Along x -axis there is no acceleration, so the distance covered by particle in time t along x -axis is given by $x = ut$

Eliminating t , we have

$$\begin{aligned} y &= \left(\frac{qE}{2mu^2} x^2 \right) \\ y &\propto x^2 \end{aligned}$$

This shows that the path of charged particle in perpendicular field is a parabola.

Electric Field due to a Point Charge

1. Electric Field at a Distance r from a Point Charge q is

$$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r^2}$$

If q_1 and q_2 are two like point charges, separated by a distance r , a neutral point between them is obtained at a point distant r_1 from q_1 , such that

$$r_1 = \frac{r}{1 + \sqrt{\frac{q_2}{q_1}}}$$

If q_1 and q_2 are two charges of opposite nature separated by a distance r , a neutral point is obtained in the extended line joining them, at a distance r_1 from q_1 , such that

$$r_1 = \frac{r}{\sqrt{\frac{q_2}{q_1}} - 1}$$

2. Electric Field due to a Charged Cylinder

(i) For a conducting charged cylinder of linear charge density λ and radius R , the electric field is given by

(a) Conducting cylinder

(b) Non-conducting cylinder

$$E = \frac{\lambda}{2\pi\epsilon_0 r}, \text{ for } r > R,$$

$$E = \frac{\lambda}{2\pi\epsilon_0 R}, \text{ for } r = R$$

and $E = 0$, for $r < R$

(ii) For a non-conducting charged cylinder, for $r \leq R$,

$$E = \frac{\lambda r}{2\pi\epsilon_0 R^2}$$

$$\text{and } E = \frac{\lambda}{2\pi\epsilon_0 r} \text{ for } r > R$$

3. Electric Field due to a Uniformly Charged Thin Spherical Shell

For a charged conducting sphere/ shell of radius R and total charge Q , the electric field is given by

Case I $E = 0$, for $r < R$

Case II $E = \frac{Q}{4\pi\epsilon_0 R^2}$, for $r = R$

Case III and $E = \frac{Q}{4\pi\epsilon_0 r^2}$, for $r > R$

Practice Exercise

1. One brass plate is inserted between two charges. The force between two charges will be
 a. remain the same b. increase
 c. decrease d. fluctuate

2. A sure test of electrification is
 a. attraction b. repulsion c. friction d. induction

3. In relativistic mechanics $m = \frac{m_0}{\sqrt{1 - \frac{v^2}{c^2}}}$ the equivalent

relation in electricity for electric charge is

a. $q = q_0$ b. $q = \frac{q_0}{\sqrt{1 - \frac{v^2}{c^2}}}$
 c. $q_0 = \frac{q}{\sqrt{1 - \frac{v^2}{c^2}}}$ d. $q = \frac{q_0 v}{c}$

4. Two positively charged particles each having charge Q and are d distance apart. A third charge is introduced in midway on the line joining the two charges. Find nature and magnitude of third charge, so that the system is in equilibrium.

a. $q = \frac{-Q}{4}$ b. $q = \frac{Q}{4}$ c. $q = \frac{3Q}{4}$ d. $q = -\frac{3Q}{4}$

5. As shown in the adjoining figure two charge particles each having charge q and mass m are d distance apart from each other. If two particle are in equilibrium under the gravitational and electric force, then determine the ratio q / m .

a. 10^{-8} b. 10^{-10} c. 10^{10} d. None

6. Charges $+2Q$ and $-Q$ are placed as shown in figure. The point at which electric field intensity is zero will be

- a. somewhere between $-Q$ and $+2Q$
 b. somewhere on the left of $-Q$
 c. somewhere on the right of $+2Q$
 d. somewhere on the right bisector of line joining $-Q$ and $+2Q$

7. Two equal and oppositely charged particles are kept at some distance apart from each other. A spherical surface having radius equal to separation between the particles and concentric with their mid-point is considered. Then,

- a. electric field is normal to the surface at two points only
 b. electric field is zero at no point
 c. electric potential is zero at every point of one circle only
 d. All of the above

8. Two bodies A and B of definite shape are placed near one another. Electrostatic attraction is found between the bodies, then

- a. both bodies must be positively charged
 b. both bodies must be negatively charged
 c. both bodies must be oppositely charged
 d. body A may be neutral

9. If σ = surface charge density, ϵ = electric permittivity, the dimension of $\frac{\sigma}{\epsilon}$ are same as

- a. electric force b. electric field intensity
 c. pressure d. electric charge

10. What is the magnitude of a point charge due to which the electric field 30 cm away has the magnitude 2?

$[1/4 \pi \epsilon_0 = 9 \times 10^9 \text{ Nm}^2/\text{C}^2]$

- a. $2 \times 10^{-11} \text{ C}$ b. $3 \times 10^{-11} \text{ C}$
 c. $5 \times 10^{-11} \text{ C}$ d. $9 \times 10^{-11} \text{ C}$

11. A charged particle of mass m and charge q is released from rest from position $(x, 0, 0)$ in a uniform electric field $E_0 \hat{j}$. The angular momentum of the particle about origin

- a. is zero b. is constant
 c. increases with time d. decreases with time

12. An infinite plane sheet of positive charge has surface charge density σ . A metallic ball of mass m and charge $+Q$ is attached to a thread and is tied to a point A on the sheet PQ . The angle θ made by the string with the plane sheet is in equilibrium is

- a. zero b. $\tan^{-1} \left(\frac{Q\sigma}{4\epsilon_0 mg} \right)$
 c. $\tan^{-1} \left(\frac{Q\sigma}{2\epsilon_0 mg} \right)$ d. $\tan^{-1} \left(\frac{Q\sigma}{\epsilon_0 mg} \right)$

13. A dimensionless body having a physical quantity varies as $1/r^2$, where r is distance from the body. This physical quantity may be

- a. gravitational potential b. electric field
 c. gravitational field d. None of these

14. The electric field inside a conductor

a. must be zero
b. may be non-zero
c. must be non-zero
d. Both (a) and (c) are correct

15. A point charge Q is situated at point B on the ground. A point charge q of mass m is vertically dropped along line AB from a multi-storey building of height h . Find the position of the point charge q when it is in equilibrium

a. $\sqrt{\frac{qQ}{4\pi\epsilon_0 mg}}$
b. $\frac{Q}{h^2}$
c. $\frac{qh}{m}$
d. None of these

16. Two point charges q_1 and q_2 are released from rest in a gravity free hall when distance between them is a . Find the maximum speeds of charged particle. The mass of each charged particle is m .

a. $\frac{q_1 q_2}{4\pi\epsilon_0 a}$
b. $\sqrt{\frac{q_1 q_2}{4\pi\epsilon_0 ma}}$
c. $\sqrt{\frac{2q_1 q_2}{4\pi\epsilon_0 ma}}$
d. None of these

17. Six point charges are arranged at the vertices of a regular hexagon of side length a (shown in figure). Find the magnitude of electric field at the centre of regular hexagon.

a. $\frac{q}{4\pi\epsilon_0 a^2}$
b. zero
c. $\frac{q}{2\pi\epsilon_0 a^2}$
d. None of these

18. A positively charged particle P enters the region between two parallel plates with a velocity u , in a direction parallel to the plates. There is a uniform electric field in the region. P emerges from this region with a velocity v . Taking C as a constant, v will depend on u as

a. $v = Cu$
b. $v = \sqrt{u^2 + Cu}$
c. $v = \sqrt{u^2 + \frac{C}{u}}$
d. $v = \sqrt{u^2 + \frac{C}{u^2}}$

19. A point charge Q is placed at the centre of a circular wire of radius R having charge q . Find the force of electrostatic interaction between point charge and the wire.

a. $\frac{qQ}{4\pi\epsilon_0 R^2}$
b. zero
c. $\frac{q^2}{4\pi\epsilon_0 R}$
d. None of these

20. A small element l is cut from a circular ring of radius a and λ charge per unit length. The net electric field at the centre of ring is

a. zero
b. $\frac{\lambda l}{4\pi\epsilon_0 a^2}$
c. ∞
d. $\frac{\lambda}{4\pi\epsilon_0 l}$

21. A circular ring carries a uniformly distributed positive charge and lies in XY -plane with the centre at origin of coordinate system. If at a point $(0, 0, Z)$ electric field is E , which of the following graphs is correct?

22. In the Q.21 find the separation of the point mass and wall at the equilibrium position of the mass.

a. $L + \frac{qE}{k}$
b. $L - \frac{qE}{k}$
c. $\frac{qE}{k} - L$
d. None of these

23. In the Q.21 find energy stored in spring at the equilibrium position of the point mass.

a. $\frac{q^2 E^2}{2k}$
b. $\frac{1}{2} k E^2$
c. $\frac{q^2 E^2}{k}$
d. None of these

24. A particle of mass m and having a charge q is placed on a smooth horizontal table and is connected to walls through unstressed springs of constant k (shown in figure). A horizontal electric field E parallel to spring is switched On. The maximum speed of the particle is

a. $\frac{qE}{\sqrt{2mk}}$
b. $\frac{qE}{mk}$
c. $\frac{qE}{m}$
d. None of these

25. A point charge is projected along the axis of circular ring of charge Q and radius $10\sqrt{2}$ cm. The distance of the point charge from centre of ring, where acceleration of charged particle is maximum, will be

a. 10 cm
b. 20 cm
c. at infinity
d. None of the above

26. If a charged particle is projected on a rough horizontal surface with speed v_0 . Find the value of dynamic coefficient of friction, if the kinetic energy of the system is constant.
- a. $\frac{qE}{mg}$ b. $\frac{qE}{m}$
 c. $\frac{q}{g}$ d. None of these
27. Two charges of value $2\mu\text{C}$ and $-50\mu\text{C}$ are placed at distance 80 cm apart. Calculate the distance of the point from the smaller charge, where the intensity will be zero.
 a. 20 cm b. 35 cm c. 30 cm d. 25 cm
28. Two charged particles of charge $+2q$ and $+q$ have masses m and $2m$, respectively. They are kept in uniform electric field and allowed to move for the same time. Find the ratio of their kinetic energies.
 a. 1 : 8 b. 16 : 1 c. 2 : 1 d. 3 : 1
29. An oil drop of charge of 2 electrons fall freely with a terminal speed. Calculate the mass of oil drop so, it can move upward with same terminal speed, if electric field of $2 \times 10^3 \text{ V/m}$ is applied.
 a. $3.0 \times 10^{-17} \text{ kg}$ b. $3.2 \times 10^{-17} \text{ kg}$
 c. $2.5 \times 10^{-17} \text{ kg}$ d. $3.3 \times 10^{-17} \text{ kg}$
30. An electron is projected with velocity 10^7 m/s at an angle $\theta (= 30^\circ)$ with horizontal, in a region of uniform electric field of 500 N/C vertically upwards. Find the

maximum distance covered by an electron in vertical direction above its initial level.

- a. 14.2 mm
 b. 15 mm
 c. 12.6 mm
 d. 14.2 cm
31. A pendulum bob of mass m and charge q is suspended by a thread of length l . The pendulum is placed in a region of a uniform electric field E directed vertically upward. If the electrostatic force acting on the sphere is less than that of gravitational force, calculate the period with which the pendulum oscillates (Assume small oscillation).
- a. $T = 2\pi \sqrt{\frac{l}{g + \frac{qE}{m}}}$ b. $T = 2\pi \sqrt{\frac{l}{g - \frac{qE}{m}}}$
 c. $T = \pi \sqrt{\frac{l}{g - \frac{qE}{m}}}$ d. $T = \pi \sqrt{\frac{l}{g + \frac{qE}{m}}}$
32. Identical charges of magnitude Q are placed at $(n-1)$ corners of a regular polygon of n sides each corner of the polygon is at a distance r from the centre. The field at the centre is
- a. $\frac{kQ}{r^2}$ b. $(n-1) \frac{kQ}{r^2}$
 c. $\frac{n}{(n-1)} \cdot \frac{kQ}{r^2}$ d. $\frac{(n-1)}{n} k \frac{Q}{r^2}$

BITSAT Archives

1. A ring shaped conductor with radius a carries a net positive charge q uniformly distributed on it as shown in figure. A point P is situated at a distance x from its centre. Which of following graph shows the correct variation of electric field (E) with distance (x)? [2014]

d. None of these

2. The electrostatic force of repulsion between two positively charged ions carrying equal charge is $3.7 \times 10^{-9} \text{ N}$, when they are separated by a distance of 5 Å. How much electrons are missing from each ion?
 a. 10 b. 8 c. 2 d. 1 [2014]
3. Two equal charges q are kept fixed at a and $+a$ along the x -axis. A particle of mass m and charge $\frac{q}{2}$ is brought to the origin and given a small displacement along the x -axis, then [2012]
 a. the particle executes oscillatory motion
 b. the particle remains stationary
 c. the particle executes, SHM along x -axis
 d. the particle executes SHM along y -axis
4. The magnitude of electric field intensity E , such that an electron placed in it would experience an electrical force equal to its weight is given by [2011]
 a. mge b. $\frac{mg}{e}$ c. $\frac{e}{mg}$ d. $\frac{e^2}{m^2} g$

5. Which one of the following is correct statement? [2009]

- Electric field is always conservative
- Electric field due to varying magnetic field is conservative
- Electric field is conservative due to electrostatic charges while non-conservative due to time varying magnetic field
- Electric field lines are always closed loops

6. A charge of $1 \mu\text{C}$ is divided into two parts such that their charges are in the ratio of 2 : 3. These two charges are kept at a distance 1 m apart in vacuum. Then, the electric force between them (in N) is [2008]

- 0.216
- 0.00216
- 0.0216
- 2.16

7. An electric line of force in the xy -plane is given by equation $x^2 + y^2 = 1$. A particle with unit positive charge, initially at rest at the point $x = 1, y = 0$ in the xy -plane [2007]

- not move at all
- will move along straight line
- will move along the circular line of force
- information is insufficient to draw any conclusion

8. Identify the wrong statement in the following. Coulomb's law correctly described the electric force that [2005]

- binds the electrons of an atom to its nucleus
- binds the protons and neutrons in the nucleus of an atom
- binds atoms together to form molecules
- binds atoms and molecules to form solids

Answer with Solutions

Practice Exercise

1. (b) 2. (b) 3. (a)

4. (a) Condition for equilibrium

$$\frac{kQ^2}{d^2} + \frac{kqQ}{(d/2)^2} = 0 \Rightarrow \frac{kQ}{d^2} (Q + 4q) = 0$$

$$q = \frac{-Q}{4}$$

5. (b) Condition for equilibrium $F_e = F_g$

$$\frac{kq^2}{d^2} = \frac{Gm^2}{d^2}$$

$$\Rightarrow \frac{1}{4\pi\epsilon_0} \frac{q^2}{d^2} = \frac{Gm^2}{d^2}$$

or

$$\frac{q^2}{m^2} = G(4\pi\epsilon_0)$$

$$\frac{q}{m} = \frac{\sqrt{G \times 4\pi\epsilon_0}}{1}$$

$$= \sqrt{\frac{6.67 \times 10^{-17}}{9 \times 10^9}} \approx 10^{-10}$$

6. (b)

7. (d)

8. (d) Attraction may take place between like charged bodies, unlike charged bodies and charged body and neutral body. Hence, (d) is correct.

9. (b)

10. (a) Electric field due to a point charge, $E = \frac{q}{4\pi\epsilon_0 r^2}$

$$\therefore q = E \times 4\pi\epsilon_0 r^2 = 2 \times \frac{1}{9 \times 10^9} \times \left(\frac{30}{100}\right)^2$$

$$\Rightarrow q = 2 \times 10^{-11} \text{ C}$$

11. (b) Angular momentum, $\mathbf{L} = \mathbf{r} \times \mathbf{p} = rp \sin 90^\circ$

$$= rp = rmv = \text{constant}$$

12. (c) By using Lami's theorem,

$$\Rightarrow \tan \theta = \frac{QE}{mg} = \frac{Q\sigma}{2\epsilon_0 mg}$$

$$\theta = \tan^{-1} \left(\frac{Q\sigma}{2\epsilon_0 mg} \right) \quad (\because E = \text{field of plate} = \frac{\sigma}{2\epsilon_0})$$

13. (b)

14. (b)

15. (a) For equilibrium,

$$mg = F_e \text{ or } mg = \frac{qQ}{4\pi\epsilon_0 y^2}$$

$\therefore$

$$y = \sqrt{\left(\frac{qQ}{4\pi\epsilon_0 mg} \right)}$$

16. (b) When separation between charges is infinitely large, potential energy is zero and kinetic energy of system is maximum. According to conservation principle of energy,

$$\frac{1}{2}mv_{\max}^2 + \frac{1}{2}mv_{\max}^2 = \frac{q_1q_2}{4\pi\epsilon_0 a} \text{ or } mv_{\max}^2 = \frac{q_1q_2}{4\pi\epsilon_0 a}$$

$$\therefore v_{\max} = \sqrt{\left(\frac{q_1q_2}{4\pi\epsilon_0 ma}\right)}$$

17. (c) From figure, the resultant electric field is

$$E = 2E_0 = \frac{2q}{4\pi\epsilon_0 a^2} = \frac{q}{2\pi\epsilon_0 a^2}$$

18. (d) $u_x = u, t = \frac{l}{u}$
- $$\Rightarrow a_y = \frac{Eq}{m} = a \Rightarrow v_y = at = \frac{al}{u}$$
- $$\Rightarrow v^2 = u^2 + \frac{a^2 l^2}{u^2} = u^2 + \frac{C}{u^2} \Rightarrow v = \sqrt{u^2 + \frac{C}{u^2}}$$

19. (b)

20. (b) E_{net} = electric field due to ring at centre without cutting portion electric field due to cutting element is

$$E_{\text{net}} = 0 - \frac{q_0}{4\pi\epsilon_0 a^2} = -\frac{\lambda l}{4\pi\epsilon_0 a^2}$$

$$\therefore |E_{\text{net}}| = \frac{\lambda l}{4\pi\epsilon_0 a^2}$$

21. (b) At $Z=0$, $E=0$ and between $Z=0$ and $Z=\infty$ and E grows to a maximum value, which can be found by $\frac{dE}{dt} = 0$. Also, graph (b) should be symmetric, which is (b).

22. (a) At equilibrium position,

$$qE = kx_0 \therefore x_0 = \frac{qE}{k}$$

$$\therefore \text{Separation} = L + \frac{qE}{k}$$

23. (a)

24. (a) The compression in spring at equilibrium = x_0

$$\therefore 2kx_0 = qE \therefore x_0 = \frac{qE}{2k} = A = \text{amplitude}$$

$$\text{Also, } \omega = \sqrt{\frac{k_1 + k_2}{m}} = \sqrt{\frac{2k}{m}}$$

$$\frac{1}{2}mv_{\max}^2 = \frac{1}{2}mA^2\omega^2 \Rightarrow v_{\max} = \frac{qE}{\sqrt{2mk}}$$

25. (a) 26. (a)

27. (a)

$$\therefore E = E_1 - E_2 \text{ or } 0 = E_1 - E_2 \therefore E_1 = E_2$$

$$\text{or } \frac{kq_1}{x^2} = \frac{kq_2}{(0.8 + x)^2}$$

$$\text{or } \frac{2 \times 10^{-6}}{x^2} = \frac{50 \times 10^{-6}}{(0.8 + x)^2}$$

$$\therefore x = 0.2 \text{ m} = 20 \text{ cm}$$

28. (b) Let E = uniform electric field

$$\text{Let } m_1 = m, m_2 = 2m$$

Force on particles,

$$F_1 = ma_1 = 2qE$$

$$\Rightarrow F_2 = 2ma_2 = qE$$

$$a_1 = \frac{2qE}{m} \text{ and } a_2 = \frac{qE}{2m}$$

Final velocities of the particle

$$v_1 = u_1 + a_1 t$$

$$\Rightarrow v_1 = \frac{2qE}{m} t \Rightarrow v_2 = \frac{qE}{2m} t$$

Let K = kinetic energy

$$K_1 = \frac{1}{2}mv_1^2 = \frac{1}{2}m\left(\frac{2qE}{m}t\right)^2 = (2m)\left(\frac{qE}{m}t\right)^2$$

$$\text{Similarly, } K_2 = \frac{1}{2}m\left(\frac{qE}{2m}t\right)^2 \Rightarrow \frac{K_1}{K_2} = \frac{16}{1}$$

$$29. (b) \quad mg = F = 6\pi\eta r v \quad \dots(i)$$

$$qE - mg = 6\pi\eta r v = F \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$qE = 6\pi\eta r v + mg = 2mg$$

$$E = \frac{2mg}{q} = \frac{2mg}{2e} = \frac{mg}{e}$$

$$m = \frac{2 \times 10^3 \times 1.6 \times 10^{-19}}{10} = 3.2 \times 10^{-17} \text{ kg}$$

30. (a)

31. (b) Resultant force vertically downwards ($mg - qE$)

Net acceleration

$$g' = \left(g - \frac{qE}{m}\right)$$

$$T = 2\pi \sqrt{\left(\frac{l}{g'}\right)}$$

$$T = 2\pi \sqrt{\frac{l}{\left(g - \frac{qE}{m}\right)}}$$

32. (a)

BITSAT Archives

1. (c) The net electric field at point P is given by

$$\mathbf{E} = \frac{qx}{4\pi\epsilon_0(x^2 + a^2)^{3/2}} \hat{i}$$

$\therefore$ At the centre of ring $x = 0 \Rightarrow E_0$

If $x \gg a$, $\mathbf{E} = \frac{1}{4\pi\epsilon_0} \frac{q}{x^2}$

and E will be maximum where,

$$\frac{dE}{dx} = 0 \text{ or } x = \pm \frac{a}{\sqrt{2}}$$

and

$$E_{\max} = \frac{1}{4\pi\epsilon_0} \frac{2q}{3\sqrt{3}a^2}$$

2. (c) Here, $F = 3.7 \times 10^{-9} \text{ N}$

Let, $q_1 = q_2 = q$

$$\Rightarrow r = 5 \text{ \AA} = 5 \times 10^{-10} \text{ m}$$

$$\therefore F = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r^2}$$

$$\Rightarrow 3.7 \times 10^{-9} = 9 \times 10^9 \frac{q \times q}{(5 \times 10^{-10})^2}$$

$$q^2 = \frac{3.7 \times 10^{-9} \times 25 \times 10^{-20}}{9 \times 10^9}$$

$$= 10.28 \times 10^{-38}$$

or $q = 3.2 \times 10^{-19} \text{ C}$

Now, $q = ne \therefore n = \frac{q}{e} = \frac{3.2 \times 10^{-19}}{1.6 \times 10^{-19}} = 2$

3. (c) From Coulomb's law,

$$F = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r^2}$$

$$\begin{aligned} F &= \frac{1}{4\pi\epsilon_0} \frac{q \times \frac{q}{2}}{(a+x)^2} - \frac{1}{4\pi\epsilon_0} \frac{q \times \frac{q}{2}}{(a-x)^2} \\ &= \frac{1}{4\pi\epsilon_0} \frac{q^2}{2} \left[\frac{1}{(a+x)^2} - \frac{1}{(a-x)^2} \right] \\ &= \frac{1}{4\pi\epsilon_0} \frac{q^2}{2} \left[-\frac{4ax}{(a^2 - x^2)^2} \right] \end{aligned}$$

When $x \ll a$, then

$$F = -\frac{2q^2}{4\pi\epsilon_0 a^3} x \Rightarrow F \propto -x$$

Hence, SHM is along x -axis.

4. (b) Force on electron

$$|F| = qE = eE = mg \Rightarrow E = \frac{mg}{e}$$

5. (c) Electric field is conservative due to electrostatic charges, while non-conservative due to time varying magnetic field.

6. (b) Ratio of charges = 2 : 3

$$\therefore q_1 = \frac{2}{5} \times 5 \times 1 \mu\text{C} \text{ and } q_2 = \frac{3}{5} \times 1 \mu\text{C}$$

Electrostatic force between the two charges

$$\begin{aligned} F &= \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r^2} \\ &= \frac{9 \times 10^9 \times 2 \times 10^{-6} \times 3 \times 10^{-6}}{5 \times 5 \times (1)^2} \\ &= 2.16 \times 10^{-3} \text{ N} \\ &\approx 0.00216 \text{ N} \end{aligned}$$

7. (c) Charge will move along the circular line of force because $x^2 + y^2 = 1$ is the equation of circle in xy -plane.

8. (b) Coulomb's law is applicable for charged particles, it is not responsible to bind the protons and neutrons in the nucleus of an atom.

22

Gauss's Law and Electric Potential Theory

Electric Flux

The electric flux linked with any surface in an electric field is basically a measure of total number of lines of forces passing normally through the surface. Flux is an imaginary scalar physical quantity.

Electric flux through an elementary area dS is defined as the scalar product of area of field.

i.e. $d\phi = \mathbf{E} \cdot d\mathbf{S} = E dS \cos\theta$

Hence, flux from complete area (S),

$$\phi = \int E dS \cos\theta$$

Outward flux is taken to be positive, while inward flux is taken to be negative.

SI unit of electric flux is (volt $\times$ metre) or $\frac{\text{N-C}}{\text{m}^2}$ and its dimensional formula is $[\text{ML}^3\text{T}^{-3}\text{A}^{-1}]$

Gauss's Law

Gauss's law states that flux is produced by charge. So, total electric flux through a closed surface enclosing a charge $= \frac{Q_{\text{en}}}{\epsilon_0}$, $\phi_{\text{net}} = \frac{1}{\epsilon_0} Q_{\text{en}}$

Gauss's law is the consequence of Coulomb's law. According to Gauss's law,

$$\int \mathbf{E} \cdot d\mathbf{S} = \frac{Q_{\text{en}}}{\epsilon_0}$$

NOTE In figure shown below, E is the net electric field due to both the charges Q_1 and Q_2 but $Q_{en} = Q_1$.

Applications of Gauss's Law

Electric Field due to Infinitely Long Line of Charge

Let us consider a uniformly charged wire of an infinite length having a constant linear charge density, i.e. $\left(\lambda = \frac{\text{Charge}}{\text{Length}}\right)$. We have to calculate electric field at point P

which is at a distance r as shown in figure.

$$\int E dS = \frac{Q}{\epsilon_0} \Rightarrow E \int dS = \frac{Q}{\epsilon_0}$$

$$\Rightarrow E \times 2\pi r l = \frac{Q}{\epsilon_0}$$

$$\Rightarrow E = \frac{Q}{2\pi\epsilon_0 r l} = \frac{\lambda}{2\pi\epsilon_0 r} = \frac{2k\lambda}{r} \quad \left(\because k = \frac{1}{4\pi\epsilon_0}\right)$$

Electric Field due to Charged Circular Ring

Suppose we have a charged circular ring of radius R and charge Q . On its axis, electric field is to be determined at a point x distance away from the centre of the ring.

$$E = \frac{kQx}{(x^2 + R^2)^{3/2}}$$

At centre, $x = 0$, so $E_{\text{centre}} = 0$.

At a point on the axis such that $x \gg R$, $E = \frac{kQ}{x^2}$

If $x = \pm \frac{R}{\sqrt{2}}$, then $E_{\text{max}} = \frac{kQ}{3\sqrt{3} R^2}$

Electric Field due to Charged Conducting Sphere

If a charge on a conducting sphere of radius R is Q and σ is the surface charge density as shown in figure, then electric field in different situations are

(i) **Outside the sphere** If point P lies outside the sphere, then

$$E_{\text{out}} = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{r^2} = \frac{\sigma R^2}{\epsilon_0 r^2} \quad (Q = \sigma \times A)$$

(ii) **At the surface of sphere** At the surface, $r = R$

$$\text{So, } E_S = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{R^2} = \frac{\sigma}{\epsilon_0}$$

(iii) **Inside the sphere** Inside the conducting charge sphere, electric field is zero.

$\therefore$

$$E_{\text{in}} = 0$$

Uniformly Charged Non-conducting Sphere

Suppose a charge Q is uniformly distributed in the volume of a non-conducting sphere of radius R as shown in figure below.

(i) **Outside the sphere** If point P lies outside the sphere, then

$$E_{\text{out}} = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{r^2}$$

If the sphere has a uniform volume charge density,

$$\rho = \frac{Q}{\frac{4}{3}\pi R^3}, \text{ then } E_{\text{out}} = \frac{\rho R^3}{3\epsilon_0 r^2}$$

(ii) **At the surface of sphere**

$$\text{At the surface, } r = R, \text{ so } E_S = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{R^2} = \frac{\rho R}{3\epsilon_0}$$

(iii) **Inside the sphere** At a distance r from the centre,

$$E_{\text{in}} = \frac{1}{4\pi\epsilon_0} \cdot \frac{Qr}{R^3} = \frac{\rho r}{3\epsilon_0} \quad (\text{i.e. } E_{\text{in}} \propto r)$$

Infinite Thin Plane Sheet of Charge

In this case, field is uniform and does not depend on the distance from the plate.

So,
$$E = \frac{\sigma}{2\epsilon_0} \quad (\text{i.e. } E \propto r^0)$$

Electric Field due to Two Thin Infinite Plane Parallel Sheets of Charge

Consider two large uniformly charged parallel sheets A and B having surface charge densities σ_A and σ_B respectively.

At P , $E_P = -(E_A + E_B) = -\frac{1}{2\epsilon_0}(\sigma_A + \sigma_B)$

At Q ,
$$E_Q = (E_A - E_B) = \frac{1}{2\epsilon_0}(\sigma_A - \sigma_B)$$

At R , $E_R = (E_A + E_B) = \frac{1}{2\epsilon_0}(\sigma_A + \sigma_B)$

NOTE Gauss's law is easily applicable to symmetric charge distribution.

Electric Dipole

An electric dipole consists of two equal and opposite charges separated by a small distance.

The dipole moment of a dipole is defined as the product of the magnitude of either charges and the distance between them. Therefore, dipole moment $\mathbf{p} = q(2a)$.

Dipole moment is a vector whose direction is from negative to positive charge. Its SI unit is coulomb-metre, i.e. C-m and has the dimensional formula [LTA].

Electric Field due to a Dipole

- At a point distant r from the centre of a dipole, along its axial line

$$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{2pr}{(r^2 - a^2)^2}$$

(direction of E is the same as that of $\mathbf{p}$)

For a short dipole, i.e. $r \gg a$,

$$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{2p}{r^3}$$

- At a point distant r from the centre of a dipole along its equatorial line

$$E = -\frac{1}{4\pi\epsilon_0} \cdot \frac{p}{(r^2 + a^2)^{3/2}}$$

(direction of E is opposite to that of $\mathbf{p}$)

For a short dipole,

$$E = -\frac{1}{4\pi\epsilon_0} \cdot \frac{p}{r^3} \quad [r \gg a]$$

- At a point distant r from the centre of a short dipole along a line inclined at an angle θ with the dipole axis

$$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{p}{r^3} \sqrt{3 \cos^2 \theta + 1}$$

- E subtends an angle β from $\mathbf{r}$ such that, $\tan \beta = \frac{1}{2} \tan \theta$

Torque on a Dipole in a Uniform Electric Field

When a dipole is placed in an external electric field making an angle θ with the direction of the uniform electric field E , it experiences a torque given by $\tau = qE \times AC$

$$\tau = \mathbf{p} \times \mathbf{E} = pE \sin \theta$$

or

$$qE \times 2d \sin \theta = (q \times 2d) E \sin \theta$$

Work Done

If an electric dipole initially kept in an uniform electric field E making an angle θ_1 is rotated so as to finally subtends an angle θ_2 , then the work done for rotating the dipole is $W = pE(\cos \theta_2 - \cos \theta_1)$

Potential Energy of a Dipole

It is the amount of work done in rotating an electric dipole from a direction perpendicular to electric field to a particular direction. Hence, $U = -pE \cos \theta$ or $U = -\mathbf{p} \cdot \mathbf{E}$.

Obviously, potential energy of an electric dipole is a scalar quantity. It is measured in joule.

Electric Potential

Electric potential at a point in an electric field is defined as the amount of work done in bringing a unit positive charge, without any acceleration from infinity to that point, along any arbitrary path.

Mathematically, if W work is to be done to bring a test charge q_0 from infinity to a point, then the potential of that point is

$$V = \frac{W}{q_0}$$

SI unit of potential is volt, where $1 \text{ V} = \frac{1 \text{ J}}{1 \text{ C}}$. Its dimensional formula is $[\text{ML}^2\text{T}^{-3}\text{A}^{-1}]$.

Electric potential is a state function and does not depend on the path followed.

1. Electric Potential due to a Point Charge

Potential due to a point charge Q at a distance r is given by

$$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{r}$$

- At the centre of the line joining two equal and opposite charges, $V = 0$ but $E \neq 0$.
- At the centre of the line joining two equal and like charges, $E = 0$ but $V \neq 0$.
- If four identical charges q each are placed at the four vertices of a square then the net electric field at the centre of the square is zero, but $V = \frac{\sqrt{2}q}{\pi\epsilon_0 a}$

2. Electric Potential due to a System of Charges

If a number of charges $q_1, q_2, q_3 \dots$ are present in space, then the electric potential at any point will be

$$V = V_1 + V_2 + V_3 + \dots$$

$$= \frac{1}{4\pi\epsilon_0} \left[\frac{q_1}{r_1} + \frac{q_2}{r_2} + \frac{q_3}{r_3} + \dots \right] = \frac{1}{4\pi\epsilon_0} \sum_{i=1}^n \left(\frac{q_i}{r_i} \right)$$

3. Electric Potential due to an Electric Dipole

At any general point,

$$V = \frac{1}{4\pi\epsilon_0} \frac{p \cos \theta}{r^2}$$

On the dipole axis, $\theta = 0^\circ$

and
$$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{p}{r^2}$$

On the equatorial axis, $\theta = 90^\circ$ and $V = 0$

4. Electric Potential due to Some Common Charge Distributions

Potential at a point distant r from an infinitely long wire having linear charge density λ is $V = \frac{\lambda}{2\pi\epsilon_0} \cdot \ln r$

For a charged conducting sphere/shell having total charge Q and radius R , the potential at a point distant r from the centre of the sphere/shell is

(i) $V = \frac{Q}{4\pi\epsilon_0 r}$, for $r > R$

(ii) $V = \frac{1}{4\pi\epsilon_0} \frac{Q}{R}$, for $r = R$

(iii) $V = \frac{Q}{4\pi\epsilon_0 R}$, for $r \leq R$

For a charged non-conducting (dielectric) sphere of radius R , the charge Q is uniformly distributed over the entire volume.

Hence,

(i) $V = \frac{Q}{4\pi\epsilon_0 r}$, for $r > R$

(ii) $V = \frac{Q}{4\pi\epsilon_0 R}$, for $r = R$

(iii) $V = \frac{Q}{4\pi\epsilon_0} \left[\frac{3R^2 - r^2}{2R^3} \right]$, for $r < R$

At the centre of the sphere ($r = 0$)

Electric Potential Energy

The electric potential energy of a system of charges is the work that has been done in bringing those charges from infinity to near each other to form the system. For two point charges q_1 and q_2 separated by distance r_{12} , the potential energy is given by

$$U = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r_{12}}$$

Electric potential energy is a scalar quantity.

Relation between E and V

Because E is force per unit charge and V is work per unit charge. E and V are related in the same way as work and force. If $\Delta V = (V_B - V_A)$ is the increase in potential over a short displacement Δs , $\Delta V = -E\Delta s$

where the negative sign indicates that the work is done against the field. If α is the angle between E and Δs , we have

$$\begin{aligned} \Delta V &= -E(\Delta s)\cos\alpha \\ &= -E\Delta x \end{aligned} \quad (\text{along } E)$$

where, $\Delta x = \Delta s\cos\alpha$ is the component of Δs along E .

Therefore,
$$E = -\frac{\Delta V}{\Delta x}$$

For small changes, above expression may be written as

$$E = -\frac{dV}{dx}$$

Thus, the electric field intensity E is the gradient of potential. This means that the decrease in potential is along the direction of E . The SI unit of E is volt per metre (Vm^{-1}).

Practice Exercise

1. A surface $S = 10\hat{j}$ is kept in an electric field. $E = 2\hat{i} + 4\hat{j} + 7\hat{k}$. How much electric flux will come out through the surface?

- a. 40 units
- b. 50 units
- c. 30 units
- d. 20 units

2. Electric field at point P is given by $\mathbf{E} = r E_0$. The total flux through the given cylinder of radius R and height h is

- a. $E_0\pi R^2 h$
- b. $2E_0\pi R^2 h$
- c. $3E_0\pi R^2 h$
- d. $4E_0\pi R^2 h$

3. A point charge Q is placed at the centre of a hemisphere. Find the electric flux passing through flat surface of hemisphere.

- a. $\frac{Q}{\epsilon_0}$
- b. Zero
- c. $\frac{Q}{2\epsilon_0}$
- d. None of these

4. A point charge Q is placed at the centre of a hemisphere. Find the ratio of electric flux passing through curved surface and plane surface of the hemisphere.

- a. 1 : 1
- b. 1 : 2
- c. 2π : 1
- d. 4π : 1

5. What should be the flux linked with the cube, if a point charge q is placed at one corner of a cube?

- a. $\frac{q}{\epsilon_0}$
- b. $\frac{q}{2\epsilon_0}$
- c. $\frac{q}{3\epsilon_0}$
- d. $\frac{q}{8\epsilon_0}$

6. Find the electric flux passing through the sphere, if an electric dipole is placed at the centre of a sphere.

- a. $\frac{1}{\epsilon_0}$
- b. $\frac{2}{\epsilon_0}$
- c. Zero
- d. None of these

7. A point charge $q = 2 \times 10^{-7} \text{ C}$ is placed at the centre of a spherical cavity of radius 3 cm in a metal piece. Points a and b are situated at distances 1.5 cm and 4.5 cm respectively from the centre of cavity.

The electric field intensities at a and b are

- a. $8 \times 10^6 \text{ N/C}$ and zero
- b. zero and zero
- c. zero and $8.9 \times 10^5 \text{ N/C}$
- d. None of these

8. In the given figure, two point charges q_1 and q_2 are placed at distances a and b from centre of a metallic sphere having charge Q . Find electric field due to the metallic sphere at the point P .

- a. $\frac{1}{4\pi\epsilon_0} \sqrt{\left(\frac{q_1}{a^2}\right)^2 + \left(\frac{q_2}{b^2}\right)^2}$
 b. $\frac{1}{4\pi\epsilon_0} \frac{Q}{R^2}$
 c. $\frac{1}{4\pi\epsilon_0} \sqrt{\left(\frac{Q}{R^2}\right)^2 + \left(\frac{q_1}{a^2} + \frac{q_2}{b^2}\right)^2}$
 d. None of the above
9. Find the minimum surface density of charge on the plate, so that a body of mass 2 kg/m^2 may just be lifted.
- a. $2.84 \times 10^{-5} \text{ C/m}^2$ b. $2.25 \times 10^{-5} \text{ C/m}^2$
 c. $1.86 \times 10^{-5} \text{ C/m}^2$ d. None of these
10. Find the surface density of electric charge at a place on the earth's surface, where the rate of fall of potential is 2.5 V .
- a. $2.0 \times 10^{-9} \text{ C/m}^2$ b. $2.21 \times 10^{-9} \text{ C/m}^2$
 c. $3.36 \times 10^{-9} \text{ C/m}^2$ d. $3.5 \times 10^{-9} \text{ C/m}^2$
11. Four point charges q_1, q_2, q_3 and q_4 are placed at the corners of the squares of side a , as shown in figure. Calculate the potential at the centre of the square.

(Given, $q_1 = 1 \times 10^{-8} \text{ C}$, $q_2 = -2 \times 10^{-8} \text{ C}$,
 $q_3 = 3 \times 10^{-8} \text{ C}$, $q_4 = 2 \times 10^{-8} \text{ C}$ and $a = 1 \text{ m}$)

- a. 507 V b. 607 V c. 550 V d. 650 V
12. Over a thin ring of radius R a charge q is distributed non-uniformly. Calculate the work done of the force field in displacing a point charge q' from centre of the ring to infinity.
- a. $\frac{qq'}{4\pi\epsilon_0 R}$ b. $\frac{qq'}{2\pi\epsilon_0 R}$
 c. $\frac{qq'}{\pi\epsilon_0 R}$ d. None of these
13. Two drops of water each with a charge of $3 \times 10^{-9} \text{ C}$ having surface potential 500 V form a single drop. What is the surface potential of the new drop?
- a. 794 V b. 1000 V
 c. 250 V d. 750 V

14. Calculate the earth's potential. Assume earth has a surface charge density of 1 electron/metre². (Given, the electronic charge $= -1.6 \times 10^{-19} \text{ C}$, earth's radius $= 6.4 \times 10^6 \text{ m}$, $\epsilon_0 = 8.9 \times 10^{-12} \text{ C}^2/\text{Nm}^2$)
- a. -0.115 V b. 0.215 V c. -0.225 V d. 0.185 V
15. An electron is released from rest at one point in uniform field and moves a distance of 10 cm in 10^{-7} s . What is the voltage between the points?
- a. 10 V b. 7 V c. 11.4 V d. 8 V
16. In the figure, the charge appears on the sphere is

- a. q b. $\frac{qd}{r}$ c. $-\frac{qr}{d}$ d. 0
17. At the eight corners of a cube of side 10 cm , equal charges each of value 10 C are placed. Calculate the potential at the centre of the cube.
- a. $83.14 \times 10^{11} \text{ V}$ b. $16.62 \times 10^{11} \text{ V}$
 c. $1.66 \times 10^{11} \text{ V}$ d. $1662.7 \times 10^{11} \text{ V}$
18. Calculate the work required to bring a unit positive charge from infinity to a mid-point between two charges $20 \mu\text{C}$ and $10 \mu\text{C}$ separated by a distance of 50 m .
- a. $10.8 \times 10^4 \text{ J}$ b. $10.8 \times 10^3 \text{ J}$
 c. $108 \times 10^6 \text{ J}$ d. $0.54 \times 10^5 \text{ J}$
19. Two charges $+q$ and $-3q$ are placed at a distance of 1 m apart. Find out the points on the line joining two charges, where electric potential is zero.
- a. 0.25 m , 0.5 m b. 1 cm , 0.50 m
 c. 0.35 cm , 24 cm d. None of these
20. Two points are at distance r_1 and r_2 ($r_1 < r_2$) from a long string having charge per unit length σ . The potential difference between the points is proportional to
- a. σ b. $\log\left(\frac{r_2}{r_1}\right)$ c. $\frac{1}{\sigma}$ d. $\frac{r_2}{r_1}$
21. A semicircular wire of radius a having λ as charge per unit length is shown in the figure. Find the electric potential at the centre of the semicircular wire.

- a. $\frac{\lambda}{\epsilon_0}$ b. $\frac{\lambda}{4\pi\epsilon_0 R}$
 c. $\frac{\lambda}{4\epsilon_0}$ d. None of these

22. If a charged particle starts from rest from one conductor and reaches the other conductor with a velocity of 10^9 cm/s, then calculate the potential difference between the two conductor. The mass of the charge particle is 9×10^{-28} g and the charge is 4.8×10^{-10} esu.

a. 0.94 stat volt b. 1 stat volt
c. 1.2 stat volt d. 0.2 stat volt

23. A charge Q is uniformly distributed over the surface of two conducting concentric spheres of radii R and r ($R > r$). Then, potential at common centre of these spheres is

a. $\frac{kQ(R+r)}{Rr}$ b. $\frac{kQ(R+r)}{(R^2+r^2)}$
c. $\frac{kQ}{\sqrt{R^2+r^2}}$ d. $kQ\left(\frac{1}{R} - \frac{1}{r}\right)$

24. If a charged particle starts from rest from one conductor and reaches the other conductor with a velocity 10^9 cm/s, if the potential difference between the two conductors is 0.94 stat volt, then calculate the charge of the charged particle.

(Given, mass of charged particle = 9×10^{-28} g)

a. 5.8×10^{-10} esu b. 4.8×10^{-10} esu
c. 3.8×10^{-10} esu d. 2.75×10^{-10} esu

25. Calculate the potential of the big drop, if eight charged water drops with a radius of 1 mm and a charge of 10^{-10} C merge into a single drop.

a. 3200 V b. 4000 V c. 3600 V d. 4200 V

26. A charge $q = 2 \mu\text{C}$ is moved by some external force from infinity to a point where electric potential is 10^4 V. Calculate the work done by external force.

a. 1×10^{-2} J b. 2×10^{-2} J
c. 0.2×10^{-2} J d. 12×10^{-2} J

27. Find the electric potential energy of electron-proton system of hydrogen atom. (Given, the radius of electron orbit = $0.53 \text{ \AA}$, electronic charge = 1.6×10^{-19} C)

a. -27.17 eV b. -20.18 eV
c. 36.55 eV d. None of these

28. Three charges Q , $2Q$, $8Q$ are to be placed on a line whose length is R metre. Locate the position where these charges should be placed such that the potential energy of the system is minimum.

a. $\frac{R}{3}$ b. $\frac{2R}{3}$ c. $\frac{3R}{2}$ d. $\frac{4R}{3}$

29. A particle of mass 2 g and charge $1 \mu\text{C}$ is held at rest on a frictionless horizontal surface at a distance of 1 m from a fixed charge 1 mC. If the particle is released, it will be repelled. The speed of the particle when it is at a distance of 10 m from the fixed charge is

a. 100 m/s b. 90 m/s c. 60 m/s d. 45 m/s

30. At the corners of an equilateral triangle of side $a = 1$ m, three point charges are placed (each of 0.1 C). If this system is supplied energy at the rate of 1 kW, then calculate the time required to move one of charges to the mid-point of the line joining the other two.

a. 50 h b. 60 h c. 48 h d. 54 h

31. If Q charge is given to a sphere of radius R , the energy of the system is

a. $\frac{Q^2}{8\pi\epsilon_0 R}$ b. $\frac{Q}{4\pi\epsilon_0 R}$
c. $\frac{Q^2}{15\pi\epsilon_0 R}$ d. None of these

32. Two balls with charges $5 \mu\text{C}$ and $10 \mu\text{C}$ are at a distance of 1 m from each other. In order to reduce the distance between them to 0.5 m, the amount of work to be performed is

a. 45 J b. 0.45×10^{-6} J
c. 1.2×10^{-4} J d. 0.45 J

33. Three small conducting spheres each of radius a and charge q is placed at the corners of an equilateral triangle of side length l . The side length l is considerably larger than dimensions of the spheres. Find the electrical potential energy of system.

a. $\frac{3q^2}{4\pi\epsilon_0} \left(\frac{1}{2a} + \frac{1}{l} \right)$ b. $\frac{3q^2}{4\pi\epsilon_0 l}$
c. $\frac{3q^2}{8\pi\epsilon_0 a}$ d. None of these

34. Due to a charge inside a cube, the electric field is $E_x = 600 x^{1/2}$, $E_y = 0$, $E_z = 0$. The charge inside the cube is

a. $600 \mu\text{C}$ b. $60 \mu\text{C}$
c. $7 \times 10^{-6} \mu\text{C}$ d. $6 \mu\text{C}$

35. What is the electric field intensity at a point at a distance 20 cm on line making an angle of 45° with the axis of the dipole of moment 10 C-m ?

a. $1.77 \times 10^{13} \text{ V/m}$ b. $0.177 \times 10^{13} \text{ V/m}$
c. $17.7 \times 10^{13} \text{ V/m}$ d. $177 \times 10^{13} \text{ V/m}$

36. What is the electric potential at a point distance 100 cm from the centre of an electric dipole of moment $2 \times 10^{-4} \text{ C-m}$ on a line making an angle of 60° ?

a. $7 \times 10^5 \text{ V}$ b. $8 \times 10^5 \text{ V}$
c. $9 \times 10^5 \text{ V}$ d. $10 \times 10^5 \text{ V}$

37. Two point charges $q_1 = -10 \times 10^{-6} \text{ C}$ and $q_2 = 15 \times 10^{-6} \text{ C}$ are 40 cm apart as shown in figure. Find the potential difference between the points P and Q .

a. $-945 \times 10^3 \text{ V}$ b. $-1000 \times 10^3 \text{ V}$
c. $-880 \times 10^3 \text{ V}$ d. None of these

38. An electric dipole made up of a positive and negative charge, each of 1 mC and placed at a distance 2 cm apart. If the dipole is placed in an electric field of 10^5 N/C , then calculate the maximum torque which the field can exert on the dipole, if it is turn from a position $\theta = 0^\circ$ to $\theta = 180^\circ$.

a. $2 \times 10^{-3} \text{ N-m}$ b. $3 \times 10^{-3} \text{ N-m}$
c. $4 \times 10^{-3} \text{ N-m}$ d. $2.8 \times 10^{-3} \text{ N-m}$

39. What work must be done to rotate an electric dipole through an angle θ with the electric field, if an electric dipole of moment p is placed in an uniform electric field E with p parallel to E ?

a. $W = pE(1 - \cos\theta)$ b. $W = pE(1 + \cos\theta)$
c. $E = 2pE(1 - \cos\theta)$ d. None of these

40. Find the force of interaction of two dipoles, if the two dipole moments are parallel to each other and placed at a distance x apart.

a. $\frac{3p_1p_2}{4\pi\epsilon_0x^4}$ b. $\frac{p_1p_2}{4\pi\epsilon_0x^4}$ c. $\frac{p_1p_2}{4\pi\epsilon_0x^4}$ d. $\frac{p_1p_2}{3\pi\epsilon_0x^4}$

41. Electric dipole moment of combination shown in the figure is

a. $qa + qa\sqrt{2} + qa$ b. $2\sqrt{2}qa$
c. $\sqrt{2}qa$ d. $(\sqrt{2} + 1)qa$

BITSAT Archives

1. Electric field in a region is given by $\mathbf{E} = \left(\frac{M}{x^3}\right)\hat{i}$, then

the correct expression for the potential in the region is (assume potential at infinity is zero) [2014]

a. $\frac{M}{2x^2}$ b. Mx^2 c. $\frac{M}{3x^4}$ d. None

2. A charge $(-q)$ and another charge $(+Q)$ are kept at two points A and B respectively, keeping the charge $(+Q)$ fixed at B , the charge $(-q)$ at A is moved to another points C , such that ABC forms an equilateral triangle of side l . The net work done in moving the charge $(-q)$ is [2009]

a. $\frac{1}{4\pi\epsilon_0} \frac{Qq}{l}$ b. $\frac{1}{4\pi\epsilon_0} \frac{Qq}{l^2}$
c. $\frac{1}{4\pi\epsilon_0} Qql$ d. zero

3. Two charges $+q$ and $-q$ are kept apart. Then, at any point on the right bisector of line joining the two charges [2008]

a. the electric field strength is zero
b. the electric potential is zero
c. both electric potential and electric field strength are zero
d. None of the above

4. The work done in carrying a charge q once round a circle of radius r with a charge Q at the centre is [2005]

a. $\frac{qQ}{4\pi\epsilon_0r}$
b. $\frac{qQ}{4\pi\epsilon_0^2r}$
c. $\frac{qQ}{4\pi\epsilon_0r^2}$
d. None of the above

Answer with Solutions

Practice Exercise

1. (a) The electric flux,

$$\begin{aligned}\phi &= \Sigma \mathbf{E} \cdot d\mathbf{S} = \mathbf{E} \cdot \mathbf{S} \\ &= (2\hat{i} + 4\hat{j} + 7\hat{k}) \cdot (10\hat{j}) = 40 \text{ units}\end{aligned}$$

2. (c) Here, $\mathbf{E} = E_0 \mathbf{r}$

$$\mathbf{r} = x\hat{i} + y\hat{j} + z\hat{k}$$

$$\therefore \mathbf{E} = E_0 x\hat{i} + E_0 y\hat{j} + E_0 z\hat{k}$$

ϕ_0 = the electric flux per unit volume

$$= \frac{\partial E_x}{\partial x} + \frac{\partial E_y}{\partial y} + \frac{\partial E_z}{\partial z}$$

$$\phi_0 = E_0 + E_0 + E_0 = 3E_0$$

$$\therefore \text{Net flux} = \phi_0 \times \text{volume} = \phi_0 \times \pi R^2 h = 3E_0 \pi R^2 h$$

3. (c) Total flux passing through whole sphere

$$= \frac{Q}{\epsilon_0} = \text{half flux from curved surface}$$

+ half flux from plane surface

$$\therefore \text{The flux passing through plane surface} = \frac{Q}{2\epsilon_0}$$

4. (a) Net electric flux = $\frac{Q}{\epsilon_0}$

= half flux through curved surface

+ half flux through plane surface

Ratio = 1 : 1

5. (d) The flux linked with each face will be one-eighth of the flux $\frac{q}{\epsilon_0}$.

$$\text{Flux associated with given cube} = \frac{q}{8\epsilon_0}$$

6. (c)

7. (a)

8. (a) The net electric field at P is zero.

$$\therefore \mathbf{E}_P = \mathbf{E}_1 + \mathbf{E}_2 + \mathbf{E}_{\text{sphere}} \text{ or } 0 = \mathbf{E}_1 + \mathbf{E}_2 + \mathbf{E}_{\text{sphere}}$$

$$\therefore \mathbf{E}_{\text{sphere}} = -(\mathbf{E}_1 + \mathbf{E}_2) \therefore E_{\text{sphere}} = \sqrt{E_1^2 + E_2^2}$$

$$= \sqrt{\left(\frac{q_1}{4\pi\epsilon_0 a^2}\right)^2 + \left(\frac{q_2}{4\pi\epsilon_0 b^2}\right)^2} = \frac{1}{4\pi\epsilon_0} \sqrt{\left(\frac{q_1}{a^2}\right)^2 + \left(\frac{q_2}{b^2}\right)^2}$$

9. (c)

10. (b)

11. (a)

12. (a) Work done = qV

where, V = change in potential

V_0 = potential at the centre of the ring

$$V_0 = \frac{1}{4\pi\epsilon_0 R} \int dq = \frac{q}{4\pi\epsilon_0 R}, V_\infty = 0$$

$$W = q'(V_0 - V_\infty) = \frac{qq'}{4\pi\epsilon_0 R}$$

13. (a) Here, $q_1 = 3 \times 10^{-9} \text{ C}$, $V_1 = 500 \text{ V}$

$$V_1 = \frac{q_1}{4\pi\epsilon_0 r_1} \Rightarrow r_1 = \frac{q_1}{4\pi\epsilon_0 V_1} = \frac{3 \times 10^{-9} \times 9 \times 10^9}{500} = \frac{27}{500} \text{ m}$$

Let radius of bigger drop is R .

$$\therefore \frac{4}{3}\pi R^3 = 2 \times \frac{4}{3}\pi r_1^3 \therefore R = r_1 2^{1/3} \therefore V = \frac{2q_1}{4\pi\epsilon_0 R} = 794 \text{ V}$$

14. (a) Let $R = 6.4 \times 10^6 \text{ m}$

σ = surface charge density

Total charge on the surface of earth = q

$$q = 4\pi R^2 \sigma$$

Then, the potential V at a point on the earth's surface is same as if the entire charge q were concentrated at its centre. Thus,

$$V = \frac{1}{4\pi\epsilon_0} \frac{q}{R} = \frac{1}{4\pi\epsilon_0} \frac{4\pi R^2 \sigma}{R} = \frac{R\sigma}{\epsilon_0}$$

$$V = \frac{(6.4 \times 10^6)(-16 \times 10^{-19})}{(8.9 \times 10^{-12})} = -0.115 \text{ V}$$

15. (c) $\therefore s = \frac{1}{2}at^2$

$$\text{or } 10 \times 10^{-2} = \frac{1}{2}a \times (10^{-7})^2$$

$$\therefore a = \frac{10 \times 10^{-2} \times 2}{10^{-14}} = 2 \times 10^{13} \text{ m/s}^2$$

$$\therefore F = ma \text{ or } eE = ma$$

$$\therefore E = \frac{ma}{e} = \frac{9.1 \times 10^{-31} \times 2 \times 10^{13}}{1.6 \times 10^{-19}}$$

But uniform electric field,

$$E = \frac{\text{potential difference}}{\text{distance between points}}$$

$\therefore$ Potential difference, $V = Es$

$$= \frac{9.1 \times 10^{-31} \times 2 \times 10^{13} \times 10 \times 10^{-2}}{1.6 \times 10^{-19}} = 11.4 \text{ V}$$

16. (c)

17. (a) Let V_1 = potential at the centre of the cube due to one charge

$$V_1 = \frac{1}{4\pi\epsilon_0} \frac{q}{x}$$

and

$$x = L \frac{\sqrt{3}}{2}$$

Potential due to 8 charges,

$$\Rightarrow V = 8V_1 \Rightarrow V = 8 \left[\frac{1}{4\pi\epsilon_0} \frac{q}{\frac{\sqrt{3}}{2} \times 10 \times 10^{-2}} \right]$$

$$V = \frac{16q}{4\pi\epsilon_0 \sqrt{3} \times 10 \times 10^{-2}} = 83.14 \times 10^{11} \text{ V}$$

18. (b)

19. (a) Let P is the point on the axis where potential is zero.

$$V_P = \frac{q}{4\pi\epsilon_0 r} - \frac{3q}{4\pi\epsilon_0 (1-r)} = 0 \Rightarrow r = 0.25 \text{ m}$$

$$V_{P'} = \frac{q}{4\pi\epsilon_0 r} - \frac{3q}{4\pi\epsilon_0 (1+r)} = 0 \Rightarrow r = 0.5 \text{ m}$$

20. (b) Here, $-\int_{V_1}^{V_2} dV = \int_{r_1}^{r_2} E dr$

$$\therefore V_1 - V_2 = \int_{r_1}^{r_2} \frac{\sigma}{2\pi\epsilon_0 r} dr \therefore V_1 - V_2 = \frac{\sigma}{2\pi\epsilon_0} \ln \frac{r_2}{r_1}$$

Hence, potential difference is proportional to $\ln \log \frac{r_2}{r_1}$.

21. (c) In the case of circular arc (uniformly or non-uniformly charge), the potential at centre is

$$V = \frac{\Sigma q}{4\pi\epsilon_0 R}$$

Here,

$$\Sigma q = \lambda \pi R \therefore V = \frac{\lambda \pi R}{4\pi\epsilon_0 R} = \frac{\lambda}{4\epsilon_0}$$

22. (a) $QV = \frac{1}{2}mv^2 \therefore V = \frac{1}{2} \frac{mv^2}{Q}$

$$V = \frac{9 \times 10^{-28} \times (10^9)^2}{2 \times 4.8 \times 10^{-10}} = 0.94 \text{ stat volt}$$

23. (b) Let the surface charge density is σ .

$$\therefore Q = q_A + q_B$$

$$\text{or } Q = 4\pi r^2 \sigma + 4\pi R^2 \sigma \therefore \sigma = \frac{Q}{4\pi(r^2 + R^2)}$$

$$\therefore V_C = V_A + V_B \therefore V_C = \frac{q_A}{4\pi\epsilon_0 r} + \frac{q_B}{4\pi\epsilon_0 R}$$

$$\frac{1}{4\pi\epsilon_0} \left[\frac{q_A}{r} + \frac{q_B}{R} \right] = k \left(\frac{4\pi r^2 \sigma}{r} + \frac{4\pi R^2 \sigma}{R} \right) = k(4\pi r \sigma + 4\pi R \sigma)$$

$$= 4\pi k \left[\frac{Qr}{4\pi(R^2 + r^2)} + \frac{QR}{4\pi(r^2 + R^2)} \right] = \frac{kQ(R+r)}{(R^2 + r^2)}$$

(Here, $k = \frac{1}{4\pi\epsilon_0}$)

24. (b)

25. (c) Assume a drop to be perfect sphere of radius r .

$$V = \frac{1}{4\pi\epsilon_0} \frac{q}{r}$$

The charge of n drops,

$$Q_0 = nQ = 8 \times 10^{-10} \text{ C}$$

Let radius of bigger drop = R

$$n \left(\frac{4}{3} \pi r^3 \rho \right) = \frac{4}{3} \pi R^3 \rho \Rightarrow R = r(n)^{1/3} \quad (\because n = 8)$$

$$R = 2 \times 10^{-3} \text{ m}$$

$$\text{Hence, } V = \left(\frac{9 \times 10^9 \times 8 \times 10^{-10}}{2 \times 10^{-3}} \right) = 3600 \text{ V}$$

26. (b) 27. (a)

28. (a) For minimum potential energy, the largest charge should be farthest. Thus, the potential energy,

$$4\pi\epsilon_0 U = \frac{2Q^2}{x} + \frac{8Q^2}{(R-x)} + \frac{16Q^2}{R}$$

For minimum, $\frac{dU}{dx} = 0$

$$4\pi\epsilon_0 \frac{dU}{dx} = -\frac{2Q^2}{x^2} + \frac{8Q^2}{(R-x)^2} + 0 = 0 \Rightarrow x = \frac{R}{3}$$

29. (b) According to conservation principle of energy.

$$U_i + K_i = U_f + K_f$$

$$\frac{Qq}{4\pi\epsilon_0 r_1} + 0 = \frac{Qq}{4\pi\epsilon_0 r_2} + \frac{1}{2}mv^2 \quad \dots(i)$$

Here, $r_1 = 1 \text{ m}$, $r_2 = 10 \text{ m}$,

$$q = 10^{-6} \text{ C}, m = 2 \times 10^{-3} \text{ kg}, Q = 10^{-3} \text{ C}$$

Putting the values in Eq. (i), we get

$$\frac{10^{-3} \times 10^{-6} \times 9 \times 10^9}{1} - \frac{10^{-3} \times 10^{-6} \times 9 \times 10^9}{10} = \frac{1}{2} \times 2 \times 10^{-3} \times v^2$$

$$\Rightarrow v = 90 \text{ m/s}$$

30. (a) U_i = initial potential energy of the system

$$= \frac{1}{4\pi\epsilon_0} \left[\frac{q^2}{a} + \frac{q^2}{a} + \frac{q^2}{a} \right] = \frac{1}{4\pi\epsilon_0} \left(\frac{3q^2}{a} \right)$$

$$= 9 \times 10^9 \left(3 \times \frac{(0.1)^2}{1} \right) = 27 \times 10^7 \text{ J}$$

Let charge at A is moved to mid-point D.

$$U_f = \frac{1}{4\pi\epsilon_0} \left[\frac{2q^2}{(a/2)} + \frac{q^2}{a} \right] = 5 \times \frac{1}{4\pi\epsilon_0} \left(\frac{q^2}{a} \right) = 45 \times 10^7 \text{ J}$$

$$\text{Work done} = U_f - U_i = 18 \times 10^7 \text{ J}$$

$$\text{Also, energy supplied per second} = 1000 \text{ J}$$

$$\text{Time taken} = \frac{18 \times 10^7}{1000} = 18 \times 10^4 \text{ s} = 50 \text{ h}$$

31. (a) 32. (d)

33. (a) $U = U_1 + U_2 + U_3 + U_{12} + U_{13} + U_{23}$

$$U_1 = \text{self potential energy of first sphere} = \frac{q^2}{8\pi\epsilon_0 a} = U_2 = U_3$$

$$U_{12} = \text{interaction energy of first sphere and second sphere}$$

$$= \frac{q^2}{4\pi\epsilon_0 l} = U_{13} = U_{23}$$

$$\therefore U = \frac{3q^2}{4\pi\epsilon_0} \left(\frac{1}{2a} + \frac{1}{l} \right)$$

34. (c) $\phi_{\text{net}} = \frac{Q_{\text{en}}}{\epsilon_0}$, $Q_{\text{en}} = \phi_{\text{net}} \times \epsilon_0$

$$= 600 [(0.2)^{1/2} - (0.1)^{1/2}] (0.1)^2 \times 8.85 \times 10^{-12}$$

$$= 7 \times 10^{-12} \text{ C}$$

35. (a) 36. (c)

37. (a) Potential at P

$$V_P = \frac{1}{4\pi\epsilon_0} \left[\frac{q_2}{r_2} - \frac{q_1}{r_1} \right]$$

$$= 9 \times 10^9 \left(\frac{15 \times 10^{-6}}{0.2} - \frac{10 \times 10^{-6}}{0.2} \right) = 225 \times 10^3 \text{ V}$$

Potential at Q

$$V_Q = \frac{1}{4\pi\epsilon_0} \left[\frac{q_2}{r_2} - \frac{q_1}{r_1} \right] = 9 \times 10^9 \left[\frac{15 \times 10^{-6}}{0.1} - \frac{10 \times 10^{-6}}{0.5} \right]$$

$$= 117 \times 10^4 \text{ V} \therefore V_P - V_Q = -945 \times 10^3 \text{ V}$$

38. (a) $\tau = pE \sin \theta$ and τ is a maximum, when $\theta = 90^\circ$

$$\therefore \tau_{\text{max}} = pE \text{ and } P = (q)(2l) = (1 \times 10^{-6})(0.02)$$

$$E = 10^5 \text{ N/C}$$

$$\tau_{\text{max}} = (1 \times 10^{-6} \times 0.02) \times 10^5 = 2 \times 10^{-3} \text{ N-m}$$

39. (a) The initial potential energy $= U_i = -pE$

$$\text{The final potential energy} = U_f = -pE \cos \theta$$

But $W_{\text{ext}} = \text{change in potential energy.}$

$$W_{\text{ext}} = \Delta U = U_f - U_i$$

$$W_{\text{ext}} = -pE \cos \theta - (-pE)$$

$$W_{\text{ext}} = pE(1 - \cos \theta)$$

40. (a)

41. (b) Here, $p_1 = qa = p_3$

From vector diagram shown in figure,

$$p_x = p_3 + p_2 \cos 45^\circ$$

$$= qa + \sqrt{2}qa \frac{1}{\sqrt{2}} = 2qa$$

$$p_y = p_1 + p_2 \cos 45^\circ = 2qa$$

$$\therefore p = \sqrt{p_x^2 + p_y^2} = 2\sqrt{2}qa$$

$$\Sigma \mathbf{p} = 0$$

BITSAT Archives

1. (a) $V(x, y, z) = - \int_{\infty}^{(x, y, z)} \mathbf{E} \cdot d\mathbf{r}$

$$= - \int_{\infty}^{(x, y, z)} \frac{Mdx}{x^3} = \frac{M}{2x^2}$$

2. (d) Net work done = Final potential energy – Initial potential energy

$$= \frac{Qq}{4\pi\epsilon_0 l} - \frac{Qq}{4\pi\epsilon_0 l} = 0$$

3. (b) At equatorial point,

$$E_e = \frac{1}{4\pi\epsilon_0} \frac{p}{r^3}$$

(directed from + q to – q) and $V_e = 0$.

4. (d) The potential at each point on the circular path will be equal.

So, work done = q × potential difference

$$= q \times 0 = 0$$

23

Electric Capacitor

Capacitor

Capacitor is a device that stores electrical energy. It consists of conductors of any shape and size carrying charges of equal magnitudes and opposite signs and separated by an insulating medium.

Capacity of a Capacitor

Ability to store charge by a conductor is called capacity of the capacitor.

The amount of charge required to raise the potential of the capacitor by one unit (in SI one volt) is called capacitance of the capacitor.

If q = amount of charge given and V = potential of capacitor, then capacitance of the capacitor is given by

$$C = \frac{q}{V}$$

SI unit of capacitance is farad or F, 1 farad = 1 coulomb/volt

Dimensions of capacitance = $[M^{-1}L^{-2}T^4A^2]$

Capacitance is a scalar quantity.

Parallel Plate Capacitor (without Dielectric)

Most commonly used capacitor is parallel plate capacitor, which consists of two charged parallel plates separated by a small distance. Capacity of a parallel plate capacitor with vacuum between the plates is given by

$$C = \frac{\epsilon A}{d} = \frac{\epsilon_0 K A}{d} \text{ farad}$$

or
$$C_{\text{vacuum}} = \frac{\epsilon_0 A}{d} \quad (\because K = 1, \text{ for vacuum})$$

where, K = dielectric constant of the medium between the plates

A = area of plates and d = distance between the plates

- (i) If a dielectric slab fills completely the gap between the plates, then capacitance increases by K times.

i.e. $C' = \frac{K\epsilon_0 A}{d}$

$\Rightarrow C' = KC$

where, K = dielectric constant.

- (ii) If a dielectric slab of thickness t ($t < d$) is inserted between the plates as shown, then E = electric field between the plates, E_i = induced electric field in dielectric. $E' = (E - E_i)$, the reduced value of electric field in the dielectric.

Now, capacitance of the capacitor

$$C' = \frac{Q}{V'}$$

$$\Rightarrow C' = \frac{\epsilon_0 A}{(d - t) + \frac{t}{K}}$$

NOTE When dielectric is inserted between the plates, voltage and electric field reduces by a factor of K between the plates.

- (iii) As dielectric constant of metal is infinite.

Hence, field inside the slab does not exist. Capacitance,

$$C' = \frac{\epsilon_0 A}{(d - t)}, \text{ in case of partial}$$

filling and in case of complete filling, with metallic slab $C' = \infty$, capacitor is said to be short circuited as shown in the figures below.

NOTE (i) The capacity of a spherical capacitor is given below

$$C = \frac{4\pi\epsilon_0 R_1 R_2}{R_2 - R_1}$$

where, R_1 is radius of inner spherical conductor and R_2 is radius of outer spherical conductor.

- (ii) Capacity of an isolated spherical capacitor.

When a smaller conductor is shielded by a conducting shell, then capacity of the combination depends upon radius of shell and is given by $C = 4\pi\epsilon_0 R$

where, R is radius of the shell.

Combination of Capacitors

- (i) Capacitors connected in series

$$\frac{1}{C} = \frac{1}{C_1} + \frac{1}{C_2}$$

- (ii) Capacitors connected in parallel

$$C = C_1 + C_2$$

Energy of a Charged Conductor/Capacitor

When a conductor/capacitor is charged, its potential increases from 0 to V and work is done against repulsion, between charge stored in the conductor and charge coming from the source (battery). This work is stored as electrostatic potential energy. The graph of rise of potential of the capacitor with charge is shown as ($Q \propto V$).

Work done = Area of (Q - V) graph

$$= \frac{1}{2} QV$$

Hence, potential energy, $U = \frac{1}{2} QV$

By using $Q = CV$, we can write

$$U = \frac{1}{2} QV = \frac{1}{2} CV^2 = \frac{Q^2}{2C}$$

The energy is stored in electric field between plates of capacitor, which depends on capacitance, charge and potential difference. This energy is obtained at cost of chemical energy of battery.

Energy Density

The energy stored in a capacitor is not localised on the charges or the plates but is distributed in the field. In case of a parallel plate capacitor, electric field is only between the

plates in a volume ($A \times d$), which is so called **energy density**.

$$\begin{aligned} \text{Hence, energy density} &= \frac{\text{energy}}{\text{volume}} = \frac{\frac{1}{2}CV^2}{Ad} \\ &= \frac{1}{2} \left[\frac{\epsilon_0 A}{d} \right] \frac{V^2}{Ad} \quad \left[\because C = \frac{\epsilon_0 A}{d} \right] \\ &= \frac{1}{2} \epsilon_0 \left(\frac{V}{d} \right)^2 = \frac{1}{2} \epsilon_0 E^2 \end{aligned}$$

Energy density is the property of electric field and above formula is valid in all cases. The unit of energy density is J/m^3 .

Particular Cases of Capacitors

Force between Plates of Capacitor

The two plates of capacitor attract each other, because they are oppositely charged.

$$\text{Electric field due to positive plate, } E = \frac{\sigma}{2\epsilon_0} = \frac{Q}{2\epsilon_0 A}$$

$$\text{Force on negative charge } -Q, F = -QE = -\frac{Q^2}{2\epsilon_0 A}$$

$$\text{Magnitude of force, } F = \frac{Q^2}{2\epsilon_0 A}$$

Capacity of an Isolated Sphere

$$V_{\text{surface}} = \frac{Q}{4\pi\epsilon_0 R}; Q = 4\pi\epsilon_0 R(V)$$

$$\text{So, } C = 4\pi\epsilon_0 R$$

Effect of Dielectric on Charge, Potential Difference, Field and Energy of Capacitor

When a dielectric is introduced between plates, it polarizes and reduces potential difference between plates and so increases its capacity.

If Charge is Held Constant, i.e. Battery is Disconnected After Charging

Charge remains unchanged, $q = q_0$

Capacity increases as $C = KC_0$

PD between the plates decreases as

$$V = \frac{q}{C} = \frac{q_0}{KC_0} = \frac{V_0}{K}$$

Field between the plates decreases as

$$E = \frac{V}{d} = \frac{V_0}{Kd} = \frac{E_0}{K}$$

Energy stored in the capacitor decreases as

$$U = \frac{q^2}{2C} = \frac{q_0^2}{2KC_0} = \frac{U_0}{K}$$

If Potential is Held Constant, i.e. Battery Remains Attached

PD remains constant, i.e. $V = V_0$, as battery is a source of constant potential difference

Capacity increases as,

$$C = KC_0$$

Charge on capacitor increases as

$$q = CV = (KC_0)V = Kq_0$$

Electric field remains unchanged as

$$E = \left[\frac{V}{d} \right] = \frac{V_0}{d} = E_0$$

Energy stored in the capacitor increases as

$$\begin{aligned} U &= \frac{1}{2} CV^2 \\ &= \frac{1}{2} KC_0 V_0^2 \\ &= \frac{1}{2} KU_0 \end{aligned}$$

Practice Exercise

1. In which form of the following, the energy is stored in the capacitor?

a. Charge b. Magnetic field
c. Capacitance d. Electric potential energy

2. A sheet of aluminium foil of negligible thickness is placed between the plates of a capacitor of capacitance C as shown in the figure, the capacitance of capacitor becomes.

a. $2C$ b. C c. $\frac{C}{2}$ d. zero

3. Calculate the ratio of capacitance of two capacitors filled with dielectrics of same dimensions but of different values K and $\frac{K}{4}$

arranged in two ways as shown in Fig. (i) and (ii).

a. 5 : 2 b. 25 : 16
c. 5 : 4 d. 2 : 5

4. A conducting sphere of radius 10 cm is given a charge of $+2 \times 10^{-8} \text{ C}$. What will be its potential?

a. 0.03 kV b. 0.9 kV
c. 1.8 kV d. 3.6 kV

5. If n identical drops of mercury are combined to form a bigger drop then find the capacity of bigger drop, if capacity of each drop of mercury is C .

a. $n^{1/3} C$ b. $n^{2/3} C$
c. $n^{1/4} C$ d. nC

6. Two spherical conductors A_1 and A_2 of radii r_1 and r_2 are placed concentrically in air. The two are connected by a copper wire as shown in figure. Then, the equivalent capacitance of the system is

a. $\frac{4\pi \epsilon_0 K r_1 r_2}{r_2 - r_1}$ b. $4\pi \epsilon_0 (r_2 + r_1)$
c. $4\pi \epsilon_0 r_2$ d. $4\pi \epsilon_0 r_1$

7. Calculate amount of charge flow, when a conducting sphere of radius R and carrying a charge Q , is joined to an uncharged conducting sphere of radius $2R$.

a. $\frac{Q}{4}$ b. $\frac{Q}{3}$ c. $\frac{Q}{2}$ d. $\frac{2Q}{3}$

8. Find the electric field in region II as shown in figure.

a. zero b. $\frac{\sigma}{4\pi \epsilon_0}$
c. $\frac{\sigma}{\epsilon_0}$ d. infinite

9. Two capacitors A and B having capacitances $10 \mu\text{F}$ and $20 \mu\text{F}$ are connected in series with a 12 V battery. The ratio of the charge on A and B is

a. 0.5 : 1 b. 1 : 1
c. 2 : 1 d. 2 : 4

10. A $6 \times 10^{-4} \text{ F}$ parallel plate air capacitor is connected to a 500 V battery. When air is replaced by another dielectric material, $7.5 \times 10^{-4} \text{ C}$ charge flows into the capacitor. The value of the dielectric constant of the material is

a. 1.5 b. 2.0
c. 1.0025 d. 3.5

11. The 90 pF capacitor is connected to a 12 V battery. How many electrons are transferred from one plate to another?

a. 11×10^9 b. 6.7×10^9
c. 4×10^{19} d. 5×10^{19}

12. In the given figure, the capacitor of plate area A is charged upto charge q . Find the ratio of elongation (neglect force of gravity) in spring C and D at equilibrium position.

a. $\frac{k_1}{k_2}$ b. $\frac{k_2}{k_1}$
c. $k_1 k_2$ d. None of these

13. A potential difference of 500 V is applied to a parallel plate condenser. The separation between plates is $2 \times 10^{-3} \text{ m}$. The plates of the condenser are vertical. An electron is projected vertically upwards between the plates with a velocity of 10^5 m/s and it moves undeflected between the plates. The magnetic field acting perpendicular to the electric field has a magnitude of

a. 1.5 Wb/m^2 b. 2.0 Wb/m^2
c. 2.5 Wb/m^2 d. 3.0 Wb/m^2

14. Two capacitors C_1 and C_2 are connected in a circuit as shown in figure. The potential difference ($V_A - V_B$) is

- a. 8 V
b. -8 V
c. 12 V
d. 12 V
15. In the given figure, the equivalent capacity between A and B is

- a. $3C$
b. $\frac{C}{3}$
c. $\frac{3}{2C}$
d. infinity
16. For the circuit, the equivalent capacitance between P and Q is

- a. $6C$
b. $4C$
c. $\frac{3C}{2}$
d. $\frac{6C}{11}$
17. A parallel plate capacitor is connected to a battery of constant emf. Let the electric field at a given point between the plate be E_0 , when there is no medium between the plates. The new electric field at the point, if a medium of dielectric constant A is introduced between them, is

- a. $\frac{E_0}{4}$
b. $\frac{E_0}{2}$
c. E_0
d. $4E_0$
18. Force acting upon a charged particle, kept between the plates of a charged condenser is F . If one of the plates of the condenser is removed, force acting on the same particle will become

- a. 0
b. $\frac{F}{2}$
c. F
d. $2F$

19. A parallel plate capacitor has two layers of dielectrics as shown in figure.

This capacitor is connected across a battery, then the ratio of potential difference across the dielectric layers is

- a. $\frac{4}{3}$
b. $\frac{1}{2}$
c. $\frac{1}{3}$
d. $\frac{3}{2}$

20. A parallel plate capacitor of plate separation d and plate area A is charged to a potential difference V and then the battery is disconnected. To fulfill the space between the plates of the capacitor, a slab of dielectric constant K is inserted. If the magnitude of the charge on each plate, electric field between the plate (after the slab is inserted) and work done on the system in the process of insertion of a slab are Q , E , W respectively, then

- a. $Q = \epsilon_0 \frac{AV}{d}$
b. $W = \epsilon_0 \frac{AV^2}{2d} \left(1 - \frac{1}{K}\right)$
c. $C = \frac{V}{Kd}$
d. All of these

21. A capacitor of capacitance $10 \mu\text{F}$ is charged by connecting through a resistance of 20Ω and battery of 20 V . What is the energy supplied by the battery?

- a. Less than 2 mJ
b. Equal to 2 mJ
c. More than 2 mJ
d. Cannot be predicted
22. A capacitor of capacitance C is charged to a potential difference V_0 . The charged battery is disconnected and the capacitor is connected to a capacitor of unknown capacitance C_x . The potential difference across the combination is V . The value of C_x should be
- a. $\frac{C(V_0 - V)}{V}$
b. $\frac{C(V - V_0)}{V}$
c. $\frac{CV}{V_0}$
d. $\frac{CV_0}{V}$
23. A parallel plate capacitor is made of two dielectric blocks in series. One of the blocks has thickness d_1 and dielectric constant K_1 and the other has thickness d_2 and dielectric constant K_2 as shown in figure. This arrangement can be thought as a dielectric slab of thickness $d (= d_1 + d_2)$ and effective dielectric constant K . Constant K is equal to

- a. $\frac{K_1 d_1 + K_2 d_2}{d_1 + d_2}$
b. $\frac{K_1 d_1 + K_2 d_2}{K_1 + K_2}$
c. $\frac{K_1 K_2 (d_1 + d_2)}{(K_1 d_1 + K_2 d_2)}$
d. $\frac{2K_1 K_2}{K_1 + K_2}$

24. A copper plate of thickness b is placed inside a parallel plate capacitor of plate distance d and area A as shown in figure. The capacitance of capacitor is

- a. $\frac{A\epsilon_0}{d}$
b. $\frac{A\epsilon_0}{b}$
c. $\frac{A\epsilon_0}{d - b}$
d. ∞

25. For the circuit shown below, capacitors A and B have identical geometry, but a material of dielectric constant 3 is present between the plates of B . The potential difference across A and B are respectively

- a. 2.5 V, 7.5 V b. 2 V, 8 V
c. 7.5 V, 2.5 V d. 8 V, 2 V

26. For the network shown we have three identical capacitors. Each of them can withstand a maximum 100 V potential difference. What maximum voltage can be applied across A and B that no capacitor gets spoiled?

- a. 150 V b. 120 V
c. 180 V d. 0.200 V

27. Calculate the work done against the electric force, if the separation of the capacitor of area S is increased from x_1 to x_2 . Assume charge q on the capacitor is constant.

$$\begin{aligned} \text{a. } W &= \frac{q^2}{\epsilon_0 S} (x_2 - x_1) & \text{b. } W &= \frac{q}{\epsilon_0 S} (x_2 - x_1) \\ \text{c. } W &= \frac{q^2}{2\epsilon_0 S} (x_2 - x_1) & \text{d. } W &= \frac{q^2}{4\epsilon_0 S} (x_2 - x_1) \end{aligned}$$

28. Five identical plates are connected across a battery as follows.

If the charge on plate 1 is $+q$, then the charges on the plates 2, 3, 4 and 5 are

- a. $-q, +q, -q, +q$ b. $-2q, +2q, -2q, +q$
c. $-q, +2q, -2q, +q$ d. None of these

29. The equivalent capacitance of the combination of three capacitors each of capacitance C between A and B as shown in figure is

- a. C b. $2C$ c. $C/2$ d. $3C$

BITSAT Archives

1. Three capacitors $X = 1\mu\text{F}$, $Y = 2\mu\text{F}$ and $Z = 3\mu\text{F}$ are connected as shown in figure, then the equivalent capacitance between points A and B is [2014]

- a. $6\mu\text{F}$ b. $12\mu\text{F}$
c. $3\mu\text{F}$ d. None of these
2. A capacitor of capacity $0.1\mu\text{F}$ connected in series to a resistor of $10\text{M}\Omega$ is charged to a certain potential and then made to discharge through resistor. The time in which the potential will take to fall to half its original value is (Given, $\log_{10} 2 = 0.3010$) [2012]
- a. 2 s b. 0.693 s
c. 0.5 s d. 1.0 s
3. The work done in placing a charge of $8 \times 10^{-18}\text{C}$ on a capacitor of capacity $100\mu\text{F}$ is [2011]
- a. $32 \times 10^{-32}\text{J}$ b. $16 \times 10^{-32}\text{J}$
c. $3.1 \times 10^{-26}\text{J}$ d. $4 \times 10^{-10}\text{J}$
4. Two identical air filled parallel plate capacitors are charged to the same potential in the manner shown by closing the switch S . If now the switch S is opened and

the space between the plates is filled with a dielectric of relative permittivity ϵ_r , then [2009]

- a. the potential difference as well as charge on each capacitor goes up by a factor ϵ_r
b. the potential difference as well as the charge on each capacitor goes down by a factor ϵ_r
c. the potential difference across A remains constant and the charge on B remains unchanged
d. the potential difference across B remains constant, while the charge on A remains unchanged
5. Which of the following is discontinuous across a charged conducting surface? [2009]
- a. Electric potential
b. Electric intensity
c. Both electric potential and intensity
d. None of the above
6. Capacitance of a capacitor made by a thin metal foil is $2\mu\text{F}$. If the foil is folded with paper of thickness 0.15 mm, dielectric constant of paper is 2.5 and width of paper is 400 mm, the length of foil will be [2007]
- a. 0.34 m b. 1.33 m c. 13.4 m d. 33.9 m

Answer with Solutions

Practice Exercise

1. (d)

$$2. (b) \frac{1}{C'} = \frac{1}{C_1} + \frac{1}{C_2}$$

$$C_1 = \frac{\epsilon_0 A}{d/2}, C_2 = \frac{\epsilon_0 A}{d/2}$$

$$\therefore \frac{1}{C'} = \frac{d}{\epsilon_0 A} \therefore C' = \frac{\epsilon_0 A}{d} = C$$

$$3. (b) \text{ Here, } C_1 = \frac{\epsilon_0 K_1 A}{2d} + \frac{\epsilon_0 K_2 A}{2d}$$

$$= \frac{\epsilon_0 K A}{2d} + \frac{\epsilon_0 K A}{8d} \quad \left(\begin{array}{l} \text{Given, } K_1 = K \\ \text{and } K_2 = \frac{K}{4} \end{array} \right)$$

$$= \frac{\epsilon_0 K A}{d} \left(\frac{1}{2} + \frac{1}{8} \right) = \frac{\epsilon_0 K A}{d} \left(\frac{4+1}{8} \right)$$

$$\Rightarrow C_1 = \frac{5\epsilon_0 K A}{8d} \quad \dots(i)$$

$$\text{and } C_2 = \frac{\epsilon_0 A}{\frac{d}{2K_1} + \frac{d}{2K_2}} = \frac{\epsilon_0 A}{\frac{d}{2K} + \frac{d}{2\frac{K}{4}}} = \frac{(2K)\epsilon_0 A}{5d} \quad \dots(ii)$$

Dividing Eq. (i) by Eq. (ii), we get

$$\frac{C_1}{C_2} = \frac{\frac{5\epsilon_0 K A}{8d}}{\frac{(2K)\epsilon_0 A}{5d}} = \frac{5 \times 5}{2 \times 8} = \frac{25}{16}$$

4. (c) 5. (a) 6. (c)

7. (d) Capacitance of first sphere, $C_1 = 4\pi \epsilon_0 R$

Capacitance of second sphere

$$C_2 = 4\pi \epsilon_0 (2R) = 2C_1$$

Then, when they are in contact with the common potential between them

$$= V = \frac{Q}{C_1 + C_2}$$

$$\text{Charge on } C_2 = C_2 V = \frac{Q C_2}{C_1 + C_2} = \frac{2}{3} Q$$

8. (c)

9. (b)

10. (c) $q_0 = C_0 V_0$

$$q = C V_0$$

$$\therefore \Delta q = q - q_0 = (C - C_0) V_0$$

$$\text{or } \Delta q = (\epsilon_r C_0 - C_0) V_0 \text{ or } \Delta q = (\epsilon_r - 1) C_0 V_0 \quad \dots(i)$$

$$\text{Here, } \Delta q = 7.5 \times 10^{-4} \text{ C}$$

$$C_0 = 6 \times 10^{-4} \text{ F}$$

$$V_0 = 500 \text{ V}$$

Putting the value in Eq. (i), we get $\epsilon_r = 1.0025$

11. (b)

12. (b)

13. (c) In this case, electric force is balanced by magnetic force.

$$\therefore qE = qvB \therefore E = vB \therefore B = \frac{E}{v} = \frac{V_0}{vd} \quad \left(\because E = \frac{V_0}{d} \right)$$

$$= \frac{500}{2 \times 10^{-3} \times 10^5} = 2.5 \text{ Wb/m}^2$$

14. (b) Consider the diagram below going through the path shown

$$12 - V_A + V_B - 24 + V_D - V_C = 0$$

$$\Rightarrow V_A - V_B = 12 + V_D - V_C - 24 = -12 + \left(\frac{Q}{4\mu\text{F}} \right)$$

$$\Rightarrow \frac{-Q}{2\mu\text{F}} = -12 + \frac{Q}{4\mu\text{F}} \Rightarrow Q \left[\frac{1}{2} + \frac{1}{4} \right] = 12\mu\text{C}$$

$$\Rightarrow Q = \frac{12 \times 8}{6} \mu\text{C} = 16\mu\text{C}$$

$$\Rightarrow V_A - V_B = \frac{-Q}{C_1} = \frac{-16\mu\text{C}}{2\mu\text{F}} = -8 \text{ V}$$

15. (d) From figure, $V_A = V_D = V_E = V_B$

$$V_A - V_B = 0 \quad C = \frac{q}{V_A - V_B} = \frac{q}{0} = \infty$$

16. (d)

$$\therefore \frac{1}{C_{\text{eq}}} = \frac{1}{3C} + \frac{1}{2C} + \frac{1}{C} = \frac{2+3+6}{6C} = \frac{11}{6C} \therefore C_{\text{eq}} = \frac{6C}{11}$$

17. (c)

18. (b)

19. (d) As it is a series combination, so charge on each capacitor is same.

So, $V_1 = \frac{Q}{C_1}$ and $V_2 = \frac{Q}{C_2}$

$$\Rightarrow \frac{V_1}{V_2} = \frac{C_2}{C_1} = \frac{\epsilon_0 K_2 \frac{A}{2d}}{\epsilon_0 K_1 \frac{A}{d}} = \frac{6}{2 \times 2} = \frac{3}{2}$$

20. (b) When battery is disconnected, then charge remains the same.

$$Q = CV = \frac{\epsilon_0 AV}{d}$$

Potential is reduced by factor of K and electric field also.

$$E = \frac{V}{Kd}$$

Energy before dielectric material is introduced

$$U_1 = \frac{1}{2} \frac{Q^2}{C} \Rightarrow U_1 = \frac{1}{2} \frac{\epsilon_0^2 A^2 V^2}{d^2} \cdot \frac{d}{\epsilon_0 KA} = \frac{\epsilon_0 AV^2}{2d} \quad \dots(i)$$

Energy after dielectric introduced

$$U_2 = \frac{1}{2} \frac{Q^2}{C'}$$

$$\text{Here, } C' = \frac{\epsilon_0 KA}{d} \Rightarrow U_2 = \frac{1}{2} \frac{\epsilon_0^2 A^2 V^2}{2d^2} \cdot \frac{d}{\epsilon_0 KA} = \frac{\epsilon_0 AV^2}{2dK} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$U_1 - U_2 = \frac{\epsilon_0 AV^2}{2d} \left(1 - \frac{1}{K} \right)$$

21. (c)

22. (a) The initial charge on first capacitor is $Q = CV_0$

After connection, voltages of both capacitors become same, i.e. V

$$\therefore Q = q_1 + q_2 \text{ or } CV_0 = CV + C_x V$$

$$V = \frac{CV_0}{C + C_x} \therefore C_x = \frac{C(V_0 - V)}{V}$$

BITSAT Archives

1. (a) The equivalent circuit of the following figure is as follow.

$$\therefore C_{eq} = X + Y + Z = 1 + 2 + 3 = 6 \mu F$$

2. (b) By equation of charging,

$$q = q_0(1 - e^{-t/CR})$$

According to question,

$$\frac{q}{q_0} = \frac{1}{2} = 0.50 \therefore 0.50 = 1 - e^{-t/CR}$$

$$e^{-t/CR} = 1 - 0.50 = 0.50 \Rightarrow e^{t/CR} = 2$$

$$\text{or } \frac{t}{CR} = \log_e 2 \text{ or } \frac{t}{CR} = 2.3026 \log_{10} 2$$

$$\text{or } t = CR \times 2.3026 \log_{10} 2$$

$$\text{or } t = 0.1 \times 10^{-6} \times 10 \times 10^6 \times 2.3026 \log_{10} 2$$

23. (c) 24. (d)

25. (c) If C_0 = capacitance with air between plates. Then, $3C_0$ = capacitance with dielectric. As capacitors are in series, equivalent capacitance is given by

$$\frac{1}{C_{eq}} = \frac{1}{C_0} + \frac{1}{3C_0} \Rightarrow C_{eq} = \frac{3}{4} C_0$$

$$\text{Now, } C_{eq} = \frac{Q}{V} \Rightarrow Q = 10 \times \frac{3}{4} C_0$$

Also, charge on each capacitor is same. Charge on each capacitor is $\frac{15}{2} C_0 = Q$

$\therefore$ Potential drop across capacitors is

$$V_A = \frac{Q}{C_A} = \frac{\frac{15}{2} C_0}{C_0} = \frac{15}{2} = 7.5 \text{ V}$$

$$V_B = \frac{Q}{C_B} = \frac{\frac{15}{2} C_0}{3C_0} = \frac{5}{2} = 2.5 \text{ V}$$

26. (a) 27. (c)

28. (b) As plates are identical.

Charge on plate 5 is $+q$.

Charge on plate 3 is $+2q = +q + q$.

Charge on plate 2 is $-2q = -q - q$.

Charge on plate 4 is $-2q = -q - q$.

29. (b) Third capacitor is short-circuited as its both ends are connected to B . Equivalent circuit is

$$\text{or } t = 2.3026 \times 0.3010 \text{ or } t = 0.693 \text{ s}$$

$$3. (a) \text{ Work done, } W = \frac{q^2}{2C} = \frac{(8 \times 10^{-18})^2}{2 \times 100 \times 10^{-6}} = 32 \times 10^{-32} \text{ J}$$

4. (c) When switch S is opened, capacitor A is still connected with battery. Therefore, potential difference across A remains constant. As B is disconnected from battery, charge on B remains fixed.

5. (b) Electric intensity inside the conductor is zero.

$$6. (d) \text{ If length of the foil is } l, \text{ then } C = \frac{K\epsilon_0 (l \times b)}{d}$$

$$\Rightarrow 2 \times 10^{-6} = \frac{2.5 \times 8.85 \times 10^{-12} (l \times 400 \times 10^{-3})}{0.01 \times 10^{-3}}$$

$$\Rightarrow l = 339 \text{ m}$$

24

Current Electricity

Electric Current

The time rate of flow of charge through any cross-section of wire per unit time is called current. So, if Δq charge passes through a cross-section in time Δt , then $i_{av} = \frac{\Delta q}{\Delta t}$ and instantaneous current

$i = \lim_{\Delta t \rightarrow 0} \frac{\Delta q}{\Delta t} = \frac{dq}{dt}$. If rate of flow is uniform, then $i = \frac{q}{t}$. Thus, current is a scalar quantity. Its SI unit is ampere (A).

Current Density

In case of flow of charge through a cross-section, current density is defined as a vector having magnitude equal to current per unit area surrounding that point. Remember area is held normal to the direction of charge flow (or current passes) through that point. Current density at point P is given by

$$\mathbf{J} = \frac{di}{dA} \hat{\mathbf{n}}$$

Current density $\mathbf{J}$ is a vector quantity having SI unit A/m^2 and dimension $[\text{L}^{-2}\text{A}]$.

In case of uniform flow of charge through a cross-section normal to it as $i = nqvA$ so, $\mathbf{J} = \frac{i}{A} \hat{\mathbf{n}} = (nqv) \hat{\mathbf{n}}$.

Current density related with electric field is $\mathbf{J} = \sigma \mathbf{E} = \frac{\mathbf{E}}{\rho}$, where σ = conductivity and ρ = resistivity or specific resistance of substance. The direction of current density $\mathbf{J}$ is same as that of electric field $\mathbf{E}$.

Drift Velocity

Drift velocity is the average uniform velocity acquired by free electrons inside a metal by the application of an electric field which is responsible for current through it. Drift velocity is very small, it is of the order of 10^{-4} m/s as compared to thermal speed ($\approx 10^5$ m/s) of electrons at room temperature.

The current related with drift velocity is $i = neAv_d$.

We can also write $v_d = \frac{i}{neA} = \frac{J}{ne} = \frac{\sigma E}{ne} = \frac{E}{\rho ne} = \frac{V}{\rho lne}$.

where, n = number of electrons per unit volume of the conductor

A = area of cross-section

V = potential difference across the conductor

E = electric field inside the conductor

i = current, J = current density, ρ = specific resistance

σ = conductivity $\left(\sigma = \frac{1}{\rho}\right)$

Ohm's Law

According to Ohm's law, physical conditions (temperature, mechanical strain, etc.) remaining unchanged, the current flowing through a conductor is directly proportional to the potential difference across its ends.

Thus, $I \propto V$ or $V = IR$

where, R is a constant known as the **electrical resistance** of given conductor.

Electrical Resistance

The obstruction offered by any conductor in the path of flow of current is called **electrical resistance** (R). It is equal to the ratio of the potential difference (V) applied across the ends of the conductor and the electric current (I) flowing through it.

$$R = \frac{V}{I}$$

The resistance R_t of a metal conductor is given by

$$R_t = R_0(1 + \alpha t + \beta t^2)$$

where, $\alpha = \frac{R_t - R_0}{R_0 \times t}$

Its unit is ohm (Ω).

In terms of free electron, density n and relaxation time τ , the resistance of a conductor is given by

$$R = \frac{m}{ne^2\tau} \frac{l}{A}$$

where, $\rho = \frac{m}{ne^2\tau}$ is the resistivity of material.

Resistivity is a characteristic of material, i.e. it does not depend upon dimensions of the material. Although, it depends on the temperature.

The SI unit of resistivity is $\Omega\text{-m}$ and its dimensional formula is $[\text{ML}^3\text{T}^{-3}\text{A}^{-2}]$.

V-I Characteristics of Ohmic and Non-ohmic Conductors

Substances obeying Ohm's law are called **ohmic resistors**, e.g. metals and their alloys. V - I graph for an ohmic resistor is an inclined straight line.

Substances which do not obey Ohm's law are called **non-ohmic resistors**. e.g. electrolytes, gases, thermionic tubes, transistors, rectifiers, etc.

V - I graph for them is non-linear.

Colour Code for Resistors

The value of resistance used in electric and electronic circuit vary over a wide range.

Such high resistances used are usually carbon resistances and the values of such resistances are marked on them according to a **colour code**.

Colour	Figure
Black	0
Brown	1
Red	2
Orange	3
Yellow	4
Green	5
Blue	6
Violet	7
Grey	8
White	9

Colour	Tolerance
Gold	5%
Silver	10%
No colour	20%

Series and Parallel Combinations of Resistors

- **Series grouping** In series grouping of resistances, same current I flows through all the resistances.

The potential difference applied across the combination is distributed across various resistors in the direct ratio of their resistances,

i.e. $V = V_1 + V_2 + V_3 + \dots$

and $V_1 : V_2 : V_3 \dots = R_1 : R_2 : R_3 \dots$

Total equivalent resistance in series grouping is equal to the sum of individual resistances. Thus,

$$R_s = R_1 + R_2 + R_3 + \dots$$

- **Parallel grouping** In parallel grouping same potential difference V appears across each resistance.

The current is distributed among various resistors in the inverse ratio of their resistances. Thus,

$$I = I_1 + I_2 + I_3 + \dots$$

and $I_1 : I_2 : I_3 \dots = \frac{1}{R_1} : \frac{1}{R_2} : \frac{1}{R_3}$

Equivalent resistance in parallel grouping R_p is given by

$$\frac{1}{R_p} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \dots$$

Electric Cell

The device which converts chemical energy into electrical energy is known as electric cell.

(a) Electric cell

(b) Schematic diagram of cell

Emf, Terminal Voltage and Internal Resistance of a Cell

The potential difference between the terminals of a cell when it is on an open circuit, i.e. when no current is drawn from it is called its **emf** (E).

The potential difference between the terminals of a cell when it is in a closed circuit, i.e. when a current is drawn from it is called its **terminal voltage** (V).

Every cell has a resistance of its own called its internal resistance (r). The value of r depends upon the nature of electrodes, the nature of the electrolyte, size of electrodes and the distance between them.

Fig. (b) shows a cell of emf E , internal resistance r connected to an external resistance R . Total resistance of the circuit $= R + r$.

The current in the circuit is given by $I = \frac{E}{(R+r)}$

Potential difference across r is $V = Ir$

Potential difference across R is $V = IR$. V is called the terminal voltage and V' is the potential drop across the internal resistance.

Thus,

$$E = V + V' = I(R+r)$$

Terminal voltage is $V = E - Ir$.

Discharging of a Cell

When an external resistance is connected across a cell, a current flows in external circuit, this is also called discharging of the cell then current given by the cell

$$i = \frac{E}{R+r}$$

Potential difference across the resistance R , $V = iR$

Potential drop inside the cell $= ir$

Equation of cell, $E = V + ir$ ($E > V$)

Internal resistance of the cell, $r = \left(\frac{E}{V} - 1 \right) \cdot R$

Power dissipated in external resistance (load)

$$P = Vi = i^2 R = \frac{V^2}{R} = \left(\frac{E}{R+r} \right)^2 \cdot R$$

Power delivered will be maximum when $R = r$.

So,

$$P_{\max} = \frac{E^2}{4r}$$

NOTE During charging of a cell, current flows into positive terminal of the cell and terminal voltage $V = E + ir$

Combination of Cells in Series and in Parallel

A group of cells is called a battery. Two common grouping of cells are

1. Series Grouping

In series grouping, if all the cells are joined so as to supply current in the same direction, then resultant emf

$$E_{\text{eq}} = E_1 + E_2 + E_3 + \dots$$

However, if one or more cells are joined so as to supply current in reverse direction, then emf of that/those cells is taken as negative while calculating the equivalent emf.

The equivalent internal resistance of cell

$$r_{\text{eq}} = r_1 + r_2 + r_3 + \dots$$

If n cells, each of emf E and internal resistance r , are joined in series, then

$$E_{\text{eq}} = nE \text{ and } r_{\text{eq}} = nr$$

2. Parallel Grouping

In parallel grouping, if positive terminals of all cells have been joined at one point and all negative terminals at another point, then

$$\frac{1}{r_{\text{eq}}} = \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3} + \dots$$

The equivalent emf of the parallel grouping is given by

$$\frac{E_{\text{eq}}}{r_{\text{eq}}} = \frac{E_1}{r_1} + \frac{E_2}{r_2} + \frac{E_3}{r_3} + \dots$$

If n cells, each of emf E and internal resistance r , all joined in parallel, then $r_{\text{eq}} = \frac{r}{n}$

But, $E_{\text{eq}} = E$

Electric Energy and Power

The total work done (or energy supplied) by the source of emf in maintaining the electric current in the circuit for a given time is called **electric energy** consumed in the circuit.

The SI unit of electric energy is joule but another unit is watt-hour.

The bigger unit of electric energy is kilowatt-hour (kWh). It is known as **Board of Trade Unit** (BTU).

The electric energy consumed in kWh is given by

$$W = \frac{V \text{ (in volt)} \times I \text{ (in amp)} \times t \text{ (in hour)}}{1000}$$

Whenever the electric current is passed through a conductor, it becomes hot after short time. This indicates that the electric energy is being converted into heat energy. This effect is known as **heating effect** of current or **Joule heating effect**.

$$H = W = I^2 R t \text{ joule} = \frac{I^2 R t}{4.18} \text{ cal}$$

The rate at which work is done by the source of emf in maintaining the effect of current in a circuit is called electric power of the circuit

$$P = VI$$

where, V is the potential difference across the conductor, I is the current flowing through the conductor.

Other expressions for power are given as

$$P = I^2 R \Rightarrow P = \frac{V^2}{R}$$

The SI unit of electric power is watt.

Another important unit is horse power (hp).

1 hp = 746 watt.

Kirchhoff's Laws and their Applications

Sometimes complex electric circuits cannot be reduced to simple series parallel combination.

Kirchhoff's First Law

The algebraic sum of currents meeting at a junction is zero. i.e.

$$\Sigma i = 0$$

$$i_1 + i_2 = i_3 + i_4$$

This law is simply a statement of conservation of charge as if current reaching a junction is equal to the current leaving the junction, charge will be conserved.

Kirchhoff's Second Law

The algebraic sum of the changes in potential in complete traversal of a mesh (closed loop) is zero, i.e. $\Sigma V = 0$
e.g. In the following closed loop

Applying Kirchhoff's second rule to closed mesh $ABFGA$ we have $I_1 R_1 - I_2 R_2 = E_1 - E_2$

Similarly, for the closed mesh $BCDFB$ we have $I_2 R_2 + (I_1 + I_2) R_3 = E_2$.

This law represents **conservation of energy** as if the sum of potential changes around a closed loop is not zero, unlimited energy could be gained by repeatedly carrying a charge around a loop.

Sign Convention for the Applications of Kirchhoff's Law

For the application of Kirchhoff's laws, the following sign conventions are to be considered

- (i) The change in potential in traversing a resistance in the direction of current is $-iR$ while in the opposite direction is $+iR$.

- (ii) The change in potential in traversing an emf source from negative to positive terminal is $+E$ while in the opposite direction is $-E$ irrespective of the direction of current in the circuit.

- (iii) The change in potential in traversing a capacitor from the negative terminal to the positive terminal is $+\frac{q}{C}$ while in opposite direction is $-\frac{q}{C}$.

- (iv) The change in voltage in traversing an inductor in the direction of current is $-L \frac{di}{dt}$ while in opposite direction it is $+L \frac{di}{dt}$.

Wheatstone's Bridge

It is a sensitive arrangement to determine the value of an unknown resistance. The bridge is said to be balanced if on switching the keys K_1 and K_2 there is no deflection in galvanometer. It is possible when $V_B = V_D$. In balanced condition,

$$\frac{P}{Q} = \frac{R}{S}$$

In balanced bridge, Q and R can be interchanged without affecting the balance condition. Similarly, P and S can be interchanged. Moreover, cell and galvanometer may also be **interchanged**. If an electric circuit resembles a balanced Wheatstone's bridge, then resistance of branch BD may be ignored (or removed from the circuit) as no current is flowing through it.

Meter Bridge

A meter bridge is a practical arrangement to realise Wheatstone's bridge.

If by sliding the tapping point a null point is obtained on bridge wire at point B , then in balanced condition

$$\frac{R}{X} = \frac{P}{Q} = \frac{l_1}{l_2} \Rightarrow X = R \frac{l_2}{l_1}$$

Potentiometer

Potentiometer is an instrument which can be used for different electric measurements. It is commonly used to find emf of a given cell and to find internal resistance of a cell.

Here, AB is a long uniform resistance wire (length AB may be ranging from 1 m to 10 m). E_0 is a battery whose emf is known supplying a constant current I for flow through the potentiometer wire. If R be the total resistance of potentiometer wire and L its total length, then potential gradient, i.e. fall in potential per unit length along the potentiometer will be

$$k = \frac{V}{L} = \frac{IR}{L} = \frac{E_0 R}{(R_0 + R) L}$$

where, E_0 = emf of battery,

R_0 = resistance inserted by means of rheostat Rh .

Applications of Potentiometer

The several applications of potentiometer are given below

- **Determination of emf of a cell** If with a cell of emf E on sliding the contact point we obtain zero deflection in galvanometer G when contact point is at J at a length l from the end where positive terminal of cells have been joined, then fall in potential along length l is just balancing the emf of cell. Thus, we have $E = kl$
- **Comparison of emfs of two cells** If with a given potentiometer arrangement we obtain balancing lengths l_1 and l_2 for cells of emfs E_1 and E_2 , then

$$\frac{E_1}{E_2} = \frac{l_1}{l_2}$$

- **Determination of internal resistance of a cell** The arrangement is shown in figure. If the cell E is in open circuit and balancing length is l_1 , then

But if by inserting key K_2 circuit of cell is closed, then potential difference V is balanced by a length l_2 of potentiometer, where $V = kl_2$

⇒ Internal resistance of a cell is given as

$$r = \frac{E - V}{V} R$$

$$= \frac{l_1 - l_2}{l_2} R$$

Variation of Thermo-emf with Temperature

When temperature of hot junction increases by keeping the temperature of cold junction constant, thermo-emf increases and graph is parabolic. At certain temperature emf becomes maximum but thermo electric power is zero.

This temperature is known as neutral temperature (T_n). The neutral temperature is independent of temperature of cold junction. On further increasing, the temperature of hot junction, the thermo-emf decreases and becomes zero. Again further increase in temperature it reverses sign, this temperature is known as temperature of inversion T_i . Seebeck effect is reversible.

$$\therefore T_n - T_c = T_i - T_n$$

$$\Rightarrow T_n = \frac{T_i + T_c}{2}$$

Graph between emf and T can be represented as

where, a, b are constants and E is emf.

Thermoelectric power, P

$$\frac{dE}{dt} = a + 2bt$$

At neutral temperature,

$$\frac{dE}{dt} = 0$$

$$a + 2bT_n = 0$$

$$T_n = -\frac{a}{2b}$$

Inversion temperature,

$$T_i = 2T_n = -\frac{a}{b}$$

Peltier effect The absorption or evolution of heat at a junction of two dissimilar metals, when current is passed through it is known as Peltier effect. It is a reversible phenomenon.

H = Heat energy evolved or absorbed when one coulomb of charge flows across junction

$$\pi = \text{Peltier coefficient} = T \left(\frac{dE}{dt} \right)$$

If Peltier emf at junction under consideration is E volt, then energy absorbed or evolved is Eit

so,

$$\pi it = Eit \text{ or } \pi = E$$

Thomson's effect The absorption or evolution of heat energy along the length of a wire, when current is passed through a wire whose ends are kept at different temperatures.

$$\text{Thomson coefficient, } \sigma = -T \left(\frac{d^2E}{dT^2} \right)$$

Practice Exercise

- Two uniform wires A and B of same metal and have equal masses, the radius of wire A is twice that of wire B . The total resistance of A and B when connected in parallel is
 - $4\ \Omega$, when resistance of wire A is $4.25\ \Omega$
 - $5\ \Omega$, when the resistance of wire A is $4\ \Omega$
 - $4\ \Omega$, when the resistance of wire B is $4.25\ \Omega$
 - $5\ \Omega$, when the resistance of wire B is $4\ \Omega$
- A battery of emf 10 V and internal resistance $0.5\ \Omega$ is connected across a variable resistance R . The value of R for which the power delivered in it is maximum, is given by
 - $2\ \Omega$
 - $0.25\ \Omega$
 - $1\ \Omega$
 - $0.5\ \Omega$
- If R_1 and R_2 are respectively the filament resistances of a 400 W bulb and a 200 W bulb, designed to operate on the same voltage, then
 - $R_1 = 2R_2$
 - $R_2 = 2R_1$
 - $R_2 = 4R_1$
 - $R_1 = 4R_2$
- Two electric bulbs rated P_1 watt V volt and P_2 watt V volt are connected in parallel across V volts mains, then the total power is
 - $P_1 + P_2$
 - $\sqrt{P_1 P_2}$
 - $P_1 P_2 / (P_1 + P_2)$
 - $\frac{P_1 + P_2}{P_1 P_2}$
- In Bohr's model of H_2 atom, the electrons move around the nucleus in a circular orbit of radius $5 \times 10^{-11}\text{ m}$. Its time period is $15 \times 10^{-16}\text{ s}$, the current associated with electron motion is
 - zero
 - $16 \times 10^{-19}\text{ A}$
 - 0.17 A
 - $107 \times 10^{-3}\text{ A}$
- A 5°C rise in temperature is observed in a conductor by passing a current. When the current is doubled, then rise in temperature will be approximately
 - 20°C
 - 16°C
 - 12°C
 - 10°C
- A uniform wire when connected directly across a 220 V line produces heat H per second. If wire is divided into n parts and all parts are connected in parallel across a 200 V line, then the heat produced per second will be
 - H_s
 - nH_s
 - $n^2 H_s$
 - H_s / n^2
- A wire of 50 cm long, 1 mm^2 in cross-section carries a current of 4 A , when connected to a 2 V battery, the resistivity of wire is
 - $2 \times 10^{-7}\ \Omega\text{-m}$
 - $5 \times 10^{-7}\ \Omega\text{-m}$
 - $4 \times 10^{-6}\ \Omega\text{-m}$
 - $1 \times 10^{-6}\ \Omega\text{-m}$
- Three equal resistors connected in series across a source of emf, together dissipated 10 watts of power. What will be the power dissipated if the same resistors are connected in parallel across the same source of emf?
 - 10 W
 - 30 W
 - 90 W
 - $(10/3)\text{ W}$
- Reciprocal of specific resistance is
 - conductive resistance
 - specific conductance
 - conductive reactance
 - plate resistance
- A heating coil is labelled 100 W , 220 V , the coil is cut in half and two pieces are joined in parallel to the same source. The energy now liberated per second is
 - 200 J
 - 400 J
 - 25 J
 - 50 J
- Two resistors of $6\ \Omega$ and $9\ \Omega$ are connected in series to a 120 V source. The power consumed by the $6\ \Omega$ resistor is
 - 384 W
 - 576 W
 - 1500 W
 - 1800 W
- A 100 W , 200 V bulb is connected to a 160 V supply. The power consumption would be
 - 64 W
 - 80 W
 - 100 W
 - 150 W
- The thermistors are usually made of
 - metals with low temperature coefficient of resistivity
 - metals with high temperature coefficient of resistivity
 - metal oxides with high temperature coefficient of resistivity
 - semiconducting materials having low temperature coefficient of resistivity
- Two wires of same material have lengths, L and $2L$ and cross-sectional area $4A$ and A , respectively. The ratio of their resistances would be
 - $1:1$
 - $1:8$
 - $8:1$
 - $1:2$
- Three bulbs A , B and C are connected as shown in figure, B and C are identical, if bulb C is fused, then
 - both A and B will glow more brightly
 - both A and B will glow less brightly than before
 - A will glow less brightly and B more brightly
 - None of the bulbs will glow

18. Three copper wires of length and cross-sectional areas are (L, A) , $(2L, \frac{A}{2})$, $(L/2, 2A)$, resistance is

a. minimum in wire of cross-sectional area $\frac{A}{2}$
 b. minimum in wire of cross-sectional area A
 c. minimum in wire of cross-sectional area $2A$
 d. same in all three cases

19. There is a current of 1.344 A in a copper wire whose area of cross-sectional normal to the length of wire is 1 mm^2 . If the number of free electrons per cm^2 is $8.4 \times 10^{28} \text{ m}^{-3}$, then the drift velocity would be

a. 1 mm/s b. 1 mm/s c. 0.1 mm/s d. 0.01 mm/s

20. In the given figure, the potentiometer wire AB has a resistance of 5Ω and length 10 m. The balancing length AJ for the emf 0.4 V is

a. 8 m
 b. 0.8 m
 c. 4 m
 d. 0.4 m

21. In the following figure, the reading of an ideal voltmeter V is zero. Then, the relation between R , r_1 and r_2 is

a. $R = r_2 - r_1$
 b. $R = r_1 - r_2$
 c. $R = r_1 + r_2$
 d. $R = \frac{r_1 r_2}{r_1 + r_2}$

22. Three equal resistors, each equals to r are connected as shown in figure. Then, the equivalent resistance between points A and B is

a. r b. $3r$ c. $\frac{r}{3}$ d. $\frac{2r}{3}$

23. When a resistance of 2Ω is connected across the terminals of a cell, the current is 0.5 A. When resistance is increased to 5Ω , the current is 0.25 A. The emf of the cell is

a. 1 V b. 1.5 V c. 2 V d. 2.5 V

24. The potential difference between points A and B from the figure is

a. $2/3 \text{ V}$ b. $8/9 \text{ V}$ c. $4/3 \text{ V}$ d. 2 V

25. The 80Ω galvanometer deflects full scale for a potential of 20 mV. A voltmeter deflecting full scale of 5V is to be made using this galvanometer. We must connect

a. a resistance of $19.92 \text{ k}\Omega$ parallel to the galvanometer
 b. a resistance of $19.92 \text{ k}\Omega$ in series with the galvanometer
 c. a resistance of $20 \text{ k}\Omega$ parallel to the galvanometer
 d. a resistance of $20 \text{ k}\Omega$ in series with galvanometer

26. Consider the circuit shown in figure, the current I_3 is equal to

a. 5 A b. 3 A c. -3 A d. $-\frac{5}{6} \text{ A}$

27. Two cells having an internal resistance of 0.2Ω and 0.4Ω are connected in parallel, the voltage across the battery is 1.5 V. If the emf of one cell is 1.2 V, then the emf of second cell is

a. 2.1 V b. 2.7 V c. 3 V d. 4.2 V

28. On a six fold increase in external resistance of a circuit the voltage across the terminals of the battery has increased from 5 V to 10 V. The emf of battery is

a. 15 V b. 18 V c. 12.5 V d. 11 V

29. In figure, AB is a potentiometer wire; length 10 m and resistance 2Ω with open the balancing length is 5.5 m. However, on closing key K the balancing length reduces to 5 m.

The initial resistance of the cell E_1 is

a. 0.01Ω b. 0.1Ω c. 0.2Ω d. 1Ω

30. A battery of emf E and internal resistance r is connected to a variable resistor R as shown in figure. Which one of the following is true?

a. Potential difference across the terminals of the battery is maximum, when $R = r$
 b. Power delivered to the resistor is maximum when $R = r$
 c. Current in the circuit is maximum when $R = r$
 d. Current in the circuit is maximum when $R \gg r$

31. The voltmeter in figure has a resistance of $200\ \Omega$. The reading of voltmeter is

- a. 2 V b. 1 V c. 1.5 V d. 3 V

32. For the circuit, the galvanometer G shows zero deflection. If the batteries A and B have negligible internal resistance, the value of the resistor R will be

- a. $200\ \Omega$ b. $100\ \Omega$ c. $500\ \Omega$ d. $1000\ \Omega$

33. For a potentiometer experiment, the emf of a battery in the primary circuit is 20 V and its internal resistance is $5\ \Omega$. There is a resistance box in series with the battery and the potentiometer wire, whose resistance can be varied from $120\ \Omega$ to $170\ \Omega$. Resistance of the potentiometer wire is $75\ \Omega$. The following potential differences can't be measured using this potentiometer

- a. 5 V b. 6 V c. 7 V d. 8 V

34. A 6 V battery is connected to the terminals of a 3 m long wire of uniform thickness and resistance of $100\ \Omega$. The difference of potential between two points on the wire separated by a distance of 50 cm will be

- a. 2 V b. 3 V c. 1 V d. 15 V

35. A cell has emf of 2.2 V, when connected to a resistance of $5\ \Omega$, the potential difference between the terminals of the cell becomes 2.1 V, the internal resistance for the cell is

- a. $0.12\ \Omega$ b. $0.48\ \Omega$ c. $0.24\ \Omega$ d. $0.50\ \Omega$

36. A uniform wire of $16\ \Omega$ resistance is made into the form of a square. Two opposite corners of square are connected by a wire of resistance $16\ \Omega$. The effective resistance between the other two opposite corners is

- a. $32\ \Omega$ b. $16\ \Omega$ c. $8\ \Omega$ d. $4\ \Omega$

37. For the circuit shown in figure. The point F is grounded. Which of the following is wrong statement?

- a. D is at 5 V
b. E is at zero potential
c. The current in the circuit will be 0.5 A
d. None of the above

38. The figure shows a network of currents. The magnitude of currents is shown here. The magnitude of current I will be

- a. 3 A
b. 13 A
c. 23 A
d. -3 A

39. Two wires having resistance R and $2R$ are connected in parallel, the ratio of heat generated in $2R$ and R is

- a. 1:2 b. 2:1 c. 1:4 d. 4:1

40. If the deflection of galvanometer in Wheatstone circuit is zero, the value of resistance will be

- a. $2\ \Omega$
b. $4\ \Omega$
c. $6\ \Omega$
d. $8\ \Omega$

41. In which property of free electrons causes increase in the resistance of a conductor with rise in temperature?

- a. Number density b. Relaxation time
c. Mass d. None of these

42. In an electroplating experiment, mg of silver is deposited when 4 A of current flows for 2 min. The amount of silver (in g) deposited by 6 A of current for 40 s will be

- a. 4 m b. $m/2$ c. $-m/4$ d. $2m$

43. A, B, C are identical bulbs. How does the brightness of A and B change when the switch S is closed?

- a. The brightness of A increases and that of B decreases
b. The brightness of A does not change and that of B decreases
c. The brightness of both A and B decreases
d. The brightness of A increases and that of B does not change

44. For a thermocouple, T_c , T_n and T_i denote the temperatures of cold junction, the neutral temperature and the temperatures of inversion respectively. Which one of the following relation is correct ?

- a. $T_i = \frac{T_c + T_n}{2}$ b. $T_i = 2T_n - T_c$
c. $T_i = \frac{T_n - T_c}{2}$ d. $T_i = T_n - T_c$

45. If nearly 10^5 C liberate 1g equivalent of aluminium, then the amount of aluminium (equivalent wt. 9) deposited through electrolysis in 20 min current of 50 A will be
 a. 0.6 g b. 10.8 g c. 0.09 g d. 5.4 g
46. For the network shown in figure, points A, B and C are at potentials of 70 V, zero and 10 V respectively

- a. point D is at a potential of 40 V
 b. the currents in the sections AD, DB and DC are in the ratio 4 : 3 : 2
 c. the currents in the sections AD, DB and DC are in the ratio 1 : 2 : 3
 d. the network draws a total power of 100 W
47. When copper voltmeter is connected with a battery of emf 12 V, 2 g of copper is deposited in 30 min. If the same voltmeter is connected across a 6 V battery, then the mass of copper deposited in 45 min would be
 a. 1 g b. 1.5 g c. 2 g d. 2.5 g
48. The emf in a thermoelectric circuit with one junction at 0°C and other at $t^\circ\text{C}$ is given by $E = At - Bt^2$, the neutral temperature is, then
 a. A/B b. $-A/2B$ c. $-B/2A$ d. $A/2B$
49. For the adjoining circuit diagram, the readings of ammeter and voltmeter are 2A and 120 V respectively. If the value of R is $75\ \Omega$, then the voltmeter resistance will be
 a. $100\ \Omega$ b. $150\ \Omega$ c. $300\ \Omega$ d. $75\ \Omega$
50. An electric heater rated as (500 W and 200 V) raises the temperature of 1 kg water from 15°C to its boiling point in 15 min. The heat efficiency of the heater is
 a. 79% b. 97% c. 69% d. 96%
51. The same mass of copper is drawn into two wires 2 mm and 3 mm thick. The two wires are connected in series and current is passed through them. The ratio of heat produced in the two wires is
 a. $\frac{9}{4}$ b. $\frac{3}{2}$ c. $\frac{2}{3}$ d. $\frac{81}{16}$
52. An electric bulb rated 500 W at 100 V is used in a circuit having a 200 V supply. What resistance R must be put in series with the bulbs so that the bulb delivers 500 W?
 a. $20\ \Omega$ b. $40\ \Omega$ c. $10\ \Omega$ d. $5\ \Omega$

53. Two heater coils made of the same material are connected in parallel across the mains, the length and the diameter of one coil is double of the other. Which will produce more heat?
 a. Thinner coil b. Thicker coil
 c. Both produce same heat d. None of these
54. Cell of emf 1 V is connected across a potentiometer, balancing length is 600 cm. What will be the balancing length for 25 V?
 a. 400 cm b. 600 cm c. 1500 cm d. 1200 cm
55. A moving coil galvanometer has a resistance of $9.8\ \Omega$ and gives a full scale deflection when a current of 10mA is passed through it. The value of the shunt required to convert it into a millimeter to measure currents upto 500mA is
 a. $0.02\ \Omega$ b. $0.2\ \Omega$ c. $2\ \Omega$ d. $0.4\ \Omega$
56. The total electrical resistance between the points A and B of the circuit shown, is

- a. $9.23\ \Omega$ b. $15\ \Omega$ c. $30\ \Omega$ d. $100\ \Omega$
57. A wire when connected to 220 V mains supply has power dissipation P_1 . Now, the wire is cut into two equal pieces which are connected in parallel to same supply. Power dissipation in this case is P_2 . Then, $P_1:P_2$ is
 a. 1 b. 2 c. 3 d. 4
58. The resistance of a 50 cm long wire is $10\ \Omega$. The wire is stretched of uniform wire of length 100 cm. The resistance now will be
 a. $15\ \Omega$ b. $30\ \Omega$ c. $20\ \Omega$ d. $40\ \Omega$
59. For the given circuit, the potential difference across P and Q will be nearest to

- a. 9.6 V b. 6.6 V c. 4 V d. 3.2 V
60. A voltmeter having resistance of $1800\ \Omega$ is employed to measure the potential difference across $200\ \Omega$ resistance which is connected to DC power supply of 50V and internal resistance $20\ \Omega$. What is the percentage change in potential difference across $200\ \Omega$ resistance as a result of connecting voltmeter across it?
 a. 1% b. 5% c. 10% d. 20%

61. In an experiment to measure the internal resistance of a cell by potentiometer, it is found that the balance point is at a length of 2 m when the cell is shunted by a $4\ \Omega$ resistance and is at a length of 3 m when the cell is shunted by a $8\ \Omega$ resistance. Then the internal resistance of the cell is, then

a. $12\ \Omega$ b. $8\ \Omega$ c. $16\ \Omega$ d. $1\ \Omega$

62. The V - I graph for a conductor at temperatures T_1 and T_2 are as shown in the figure. The term $T_2 - T_1$ is proportional to

a. $\cos 2\theta$ b. $\sin 2\theta$
c. $\cot 2\theta$ d. $\tan 2\theta$

63. The reading of ammeter shown in figure is

a. 6.56 A
b. 3.28 A
c. 2.18 A
d. 1.09 A

BITSAT Archives

1. Ohm's law says [2014]

a. $V = IR$
b. $V/I = \text{constant}$
c. Both a and b are correct
d. Both a and b are incorrect

2. A current 4.0 A exist in a wire of cross-sectional area $2.0\ \text{mm}^2$. If each cubic metre of the wire contains 12.0×10^{28} free electrons, then the drift speed is [2014]

a. $2 \times 10^{-8}\ \text{m/s}$ b. $0.5 \times 10^{-3}\ \text{m/s}$
c. $1.04 \times 10^{-4}\ \text{m/s}$ d. None of these

3. What will be the value of current i in the circuit shown? [2014]

a. 0.67 A b. 1 A
c. 0.32 A d. None of these

4. In the given circuit (as shown in figure), each capacitor has a capacity of $3\ \mu\text{F}$. What will be the net charge on each capacitor? [2013]

a. $48\ \mu\text{C}$ b. $24\ \mu\text{C}$
c. $12\ \mu\text{C}$ d. None of these

5. Three bulbs X, Y and Z are connected as shown in figure. The bulbs Y and Z are identical. If bulb Z gets fused, then [2013]

a. Both X and Y will glow more brightly
b. Both X and Y will glow less brightly
c. X will glow less brightly and Y will glow more brightly
d. X will glow more brightly and Y will glow less brightly

6. In the circuit shown, the value of i in ampere is [2012]

a. 1 b. 0.60 c. 0.4 d. 1.5

7. In the circuit shown below, the ammeter reading is zero. Then, the value of the resistance R is [2012]

a. $50\ \Omega$ b. $100\ \Omega$ c. $200\ \Omega$ d. $400\ \Omega$

8. A steady current flow in a metallic conductor of non-uniform cross-section. The quantity/quantities remaining constant along the whole length of the conductor is/are [2011]

a. current, electric field and drift speed
b. drift speed only
c. current and drift speed
d. current only

9. Two bulbs which consume powers P_1 and P_2 are connected in series. The power consumed by the combination is [2010]

a. $P_1 + P_2$ b. $\sqrt{P_1 P_2}$ c. $\frac{P_1 P_2}{P_1 + P_2}$ d. $\frac{2P_1 P_2}{P_1 + P_2}$

10. Three conductors draw respectively currents of 1 A, 2 A and 4 A when connected in turn across a battery. If they are connected in series across the same battery, the current drawn will be [2010]

a. $\frac{2}{7}$ A b. $\frac{3}{7}$ A c. $\frac{4}{7}$ A d. $\frac{5}{7}$ A

11. 24 identical cells, each of internal resistance 0.5Ω , are arranged in a parallel combination of n rows, each row containing m cells in series. The combination is connected across a resistor of 3Ω . In order to send maximum current through the resistor, we should have [2010]

a. $m = 12, n = 2$ b. $m = 8, n = 3$
c. $m = 2, n = 12$ d. $m = 3, n = 8$

12. A wire is stretched as to change its diameter by 0.25%. The percentage change in resistance is [2009]

a. 4.0% b. 2.0% c. 1.0% d. 0.5%

13. If in the circuit in figure, the internal resistance of the battery is 15Ω and V_P and V_Q are potential at P and Q respectively. What is the potential difference between the points P and Q ? [2009]

a. Zero b. 4 V ($V_P > V_Q$)
c. 4 V ($V_Q > V_P$) d. 2.5 V ($V_Q > V_P$)

14. When the potential difference applied across a solid conductor is increased, the rate of flow of electrons [2009]

a. remains same b. decreases
c. increases d. decreases sharply

15. A box with two terminals is connected in series with a 2V battery, an ammeter and a switch. When the switch is closed the needle of the ammeter moves quickly across the scale and drops back to zero. The box contains [2009]

a. 20Ω resistor b. a strip of copper
c. a diode d. a short length of fuse wire

16. A current of 2 A flows in an electric circuit as shown in figure. The potential difference ($V_R - V_S$), in volts (V_R and V_S are potentials at R and S respectively) is [2008]

a. -4 b. +2 c. +4 d. -2

17. When a battery connected across a resistor of 16Ω , the voltage across the resistor is 12 V. When the same battery is connected across a resistor of 10Ω , voltage across it is 11 V. The internal resistance of the battery (in ohm) is [2008]

a. $\frac{10}{7}$ b. $\frac{20}{7}$ c. $\frac{25}{7}$ d. $\frac{30}{7}$

18. If a rod has resistance 4Ω and if rod is turned as half circle, then the resistance along diameter is [2007]

a. 156Ω b. 2.44Ω c. 4Ω d. 2Ω

19. In the circuit, the potential difference across PQ will be nearest to [2007]

a. 9.6 V b. 6.6 V c. 4.8 V d. 3.2 V

20. Each resistance shown in figure is 2Ω . The equivalent resistance between A and B is [2006]

a. 2Ω b. 4Ω
c. 8Ω d. 1Ω

21. A cell of constant emf first connected to a resistance R_1 and then connected to resistance R_2 . If power delivered in both cases is same, then the internal resistance of the cell is [2006]

a. $\sqrt{R_1 R_2}$ b. $\sqrt{\frac{R_1}{R_2}}$ c. $\frac{R_1 - R_2}{2}$ d. $\frac{R_1 + R_2}{2}$

22. Ampere - hour is the unit of [2006]

a. quantity of charge b. potential
c. energy d. current

23. A 5.0 A current is set up in an external circuit by a 6.0 V storage battery for 6.0 min. The chemical energy of the battery is reduced by [2005]

a. 1.08×10^4 J b. 1.08×10^{-4} J
c. 1.8×10^4 J d. 1.8×10^{-4} J

24. The current in a simple series circuit is 5.0 A. When an additional resistance of 2.0Ω is inserted, the current drops to 4.0 A. The original resistance of the circuit in ohms was [2005]

a. 1.25 b. 8 c. 10 d. 20

25. Two resistances are connected in two gaps of a Meter bridge. The balance point is 20 cm from the zero end. A resistance of 15Ω is connected in series with the smaller of the two. The null point shifts to 40 cm. The value of the smaller resistance in ohms is [2005]

a. 3 b. 6 c. 9 d. 12

26. By using only two resistance coils - singly, in series or in parallel one should be able to obtain resistance of 3, 4, 12, and 16 Ω . The separate resistances of the coil are [2005]

a. 3 and 4 b. 4 and 12 c. 12 and 16 d. 16 and 3

Answer with Solutions

Practice Exercise

1. (a) $r_A = 2r_B$

$$\rho_A = \rho_B \quad (\text{specific resistance})$$

In parallel, $\frac{1}{R} = \frac{1}{R_A} + \frac{1}{R_B} \quad \dots(i)$

$$A_A l_A = A_B l_B \Rightarrow \pi r_A^2 l_A = \pi r_B^2 l_B$$

$$\frac{l_A}{l_B} = \frac{1}{4} \text{ and } \frac{A_A}{A_B} = 4 \Rightarrow \frac{R_A}{R_B} = \frac{\rho \frac{l_A}{A_A}}{\rho \frac{l_B}{A_B}}$$

$$\frac{R_A}{R_B} = \frac{l_A}{l_B} \times \frac{A_B}{A_A} = \frac{1}{4} \times \frac{1}{4} = \frac{1}{16}$$

$$16R_A = R_B \quad \dots(ii)$$

$$\frac{1}{R} = \frac{1}{R_A} + \frac{1}{R_B}$$

$$= \frac{1}{R_A} + \frac{1}{16R_A} = \frac{16+1}{16R_A} = \frac{17}{16 \times R_A} \Rightarrow R = \frac{16R_A}{17}$$

If $R_A = 4.25 \Omega \Rightarrow R = \frac{16 \times 4.25}{17} = \frac{68}{17}$

$\therefore R = 4 \Omega$

2. (d) For maximum power,

$\therefore R = 0.5 \Omega$

3. (b) 4. (a)

5. (d) $r = 5 \times 10^{-11} \text{ m}$, $t = 15 \times 10^{-16} \text{ s}$

$$i = \frac{q}{t} = \frac{16 \times 10^{-19}}{15 \times 10^{-16}} \Rightarrow i = 1.07 \times 10^{-3} \text{ A}$$

6. (a)

7. (c) $V = 200 \text{ V}$

$$H = i^2 R t \quad (\because i = V / r)$$

$$H_s = \frac{V^2}{n R_{\text{eq}}} t$$

In parallel, equivalent resistance of n parts is

$$R_{\text{eq}} = \frac{r}{n}$$

where, r is the resistance of each part.

$$H = \frac{V^2}{(r/n)} t = \frac{n V^2}{r} t$$

$\therefore H = n^2 H_s$

8. (d) 9. (c) 10. (b) 11. (b)

12. (a) $V = 120 \text{ V}$

$$V = V_1 + V_2 \quad \dots(i)$$

$$V_1 = i R_1$$

$$V_2 = i R_2 \Rightarrow \frac{V_1}{R_1} = \frac{V_2}{R_2}$$

From Eq. (i), $V = V_1 + V_2 = V_1 + \frac{R_2}{R_1} V_1$

$$V = V_1 \left[\frac{R_1 + R_2}{R_1} \right] \Rightarrow V_1 = \frac{120 \times 6}{15} = 48 \text{ V}$$

Power in 6Ω , $P_1 = \frac{V_1^2}{R_1} = \frac{48 \times 48}{6} \Rightarrow P_1 = 384 \text{ W}$

13. (a) $P = V^2 / R = 160 \times \frac{160}{400} = 64 \text{ W}$

14. (c) 15. (b)

16. (c) Bulbs B and C are connected in parallel. Suppose, voltage across A and B is same. If bulb C is fused, bulb B will work

$$P_B = \frac{V^2}{R_B} \Rightarrow P_A = \frac{V^2}{R_A}$$

$$R = \frac{R_B R_C}{R_B + R_C}$$

$\therefore R_B < R_A \therefore P_B > P_A$

17. (a)

18. (c) $l_1 = L$, $A_1 = A$

$$l_2 = 2L$$

$$\frac{R_1}{R_2} = \frac{l_1}{l_2} \times \frac{A_2}{A_1} \Rightarrow R_3 < R_1 < R_2$$

19. (c)

20. (a)

21. (b) $I = \frac{2E}{r_1 + r_2 + R}$

$$V_1 = E - I r_1 = 0$$

$$\Rightarrow I = E / r_1$$

$$E = \frac{2E r_1}{r_1 + r_2 + R}$$

$$\Rightarrow r_1 + r_2 + R = 2r_1$$

22. (c)

23. (b) $E = i(R + r)$

$$E = 15 \text{ V}$$

24. (a) By Kirchhoff's voltage law, for branch $ABCEA$

$$15 I_1 = 2 \Rightarrow I_1 = \frac{2}{15} \text{ A}$$

For branch $ADCEA$,

$$15 I_2 = 2 \Rightarrow I_2 = \frac{2}{15} \text{ A}$$

$$V_{AD} = I_2 R = \frac{2}{15} \times 5 = \frac{2}{3} \text{ V}$$

25. (b)

26. (d) For I_1 , by Kirchhoff's voltage law

$$28 I_1 = -6 - 8 \Rightarrow I_1 = \frac{-14}{28} = -\frac{1}{2}$$

Here, I_1 is -ve means opposite in direction as assumed.

$$\therefore I_3 = -(I_1 + I_2) = -\left(\frac{1}{2} + \frac{1}{3}\right)$$

$$I_3 = -\left(\frac{5}{6}\right) \text{ A}$$

27. (a) $r_1 = 0.2 \Omega$, $r_2 = 0.4 \Omega$

$$V = IR$$

$$R = \frac{r_1 r_2}{r_1 + r_2}, I = I_1 + I_2 \Rightarrow V = \frac{r_1 r_2}{r_1 + r_2} (I_1 + I_2)$$

$$I_1 = E_1 / r_1 \text{ and } I_2 = E_2 / r_2$$

$$V = \left(\frac{E_1}{r_1} + \frac{E_2}{r_2}\right) \frac{r_1 r_2}{r_1 + r_2} = \frac{(E_2 r_1 + E_1 r_2)}{r_1 r_2} \left(\frac{r_1 r_2}{r_1 + r_2}\right)$$

$$V = \frac{E_2 r_1 + E_1 r_2}{r_1 + r_2} \Rightarrow 15 = \frac{E_2 \times 0.2 + 1.2 \times 0.4}{0.6}$$

$$0.9 = 0.2 E_2 + 0.48 \Rightarrow \frac{0.42}{0.2} = E_2 \Rightarrow E_2 = 2.1 \text{ V}$$

28. (c) $\frac{E-V}{V} R = r \Rightarrow \frac{E-5}{5} R = r \dots(i)$

$$\frac{E-10}{10} 6R = r \dots(ii)$$

Equating Eqs. (i) and (ii), we get

$$\frac{E-5}{5} R = \frac{E-10}{10} 6R \Rightarrow E-5 = 3E-30$$

$$2E = 25 \Rightarrow E = 12.5 \text{ V}$$

29. (b) $I_{AB} = 10 \text{ m}$, $R_{AB} = 2 \Omega$, $R_{AJ} = 1 \Omega$

$$E_1 = \rho L \quad (\text{When key is open})$$

$$E_1 = \rho \times 5.5 \Rightarrow V_1 = 5 \text{ p}$$

$$\frac{E-V}{V} R = r \Rightarrow \frac{5.5 \text{ p} - 5 \text{ p}}{5 \text{ p}} \times 1 = r \Rightarrow \frac{0.5}{5} \times 1 = r$$

$$r = 0.1 \Omega$$

30. (c) 31. (c)

32. (b) The galvanometer shows zero deflection, i.e. current through XY is zero

As a result potential drop across R is 2 V. Circuit can be redrawn as

$$I = \frac{12}{500 + R}$$

Voltage across R ,

$$V = IR \Rightarrow 2 = \frac{12}{500 + R} \times R$$

$$\text{or } 1000 + 2R = 12R \text{ or } R = 100 \Omega$$

33. (d) Maximum external resistance put across the potentiometer battery is $(170 + 75) \Omega$.

As external resistance $= r = 5 \Omega$

So, current in potentiometer wire

$$= I = \frac{E}{(R + r)} = \frac{20}{250} = 0.08 \text{ A}$$

$$\text{Potential drop occurs across wire of potentiometer} = IR \\ = 0.08 \times 75 = 6 \text{ V}$$

Also, minimum resistance $= 120 + 75 \Omega$

$$\therefore I = \frac{20}{200} = 0.1 \text{ A}$$

$$\text{Potential drop} = IR = 0.1 \times 75 = 7.5 \text{ V}$$

So, upto 7 V it can be measured with the help of potentiometer.

34. (c)

35. (c) $E = 2.2 \text{ V}$, $R = 5 \Omega$, $V = 2.1 \text{ V}$,

$$E = iR + ir \Rightarrow \frac{E-V}{V} R = r$$

$$\frac{2.2-2.1}{2.1} \times 5 = r \Rightarrow \frac{0.1}{2.1} \times 5 = r$$

$$r = 0.24 \Omega$$

36. (d)

37. (a) Effective emf of circuit $= 10 - 3 = 7 \text{ V}$

Total resistance of circuit $= 2 + 5 + 3 + 4 = 14 \Omega$

Current $I = 7/14 = 0.5 \text{ A}$

Potential difference between A and $D = 0.5 \times 10 = 5 \text{ A}$

Potential at $D = 10 - 5 = 5 \text{ V}$

Potential at $E = 5 - 3 = 2 \text{ V}$

Hence, E cannot be at zero potential, as there is a potential drop at E .

38. (c) $\sum I = 0$ (at a junction)

$$(7 + 3) + (8 + 5) + I = 0$$

$$I = -23 \text{ A} \Rightarrow |I| = 23 \text{ A}$$

39. (b) In parallel circuit potential across each resistor is same.

$$\therefore P_1 = \text{power across } R = \frac{V^2}{R}$$

$$P_2 = \text{power across } 2R = \frac{V^2}{2R}$$

$$\frac{P_1}{P_2} = 2:1$$

40. (c)

41. (b)

42. (b) $m = z \times 4 \times 2$

$$m' = \frac{z \times 6 \times 40}{60}$$

$$\frac{m}{m'} = \frac{8z \times 60}{240z} = 2 \Rightarrow m' = \frac{m}{2}$$

43. (a) $\therefore$ Illumination of A is more than previous.

44. (b) $T_i - T_n = T_n - T_c$

$$2T_n = T_i + T_c \Rightarrow T_i = 2T_n - T_c$$

45. (d) $m = zit$

$$m = \frac{9}{10^5} \times 50 \times 20 \times 60 = \frac{54}{10} \Rightarrow m = 5.4 \text{ g}$$

46. (a) Consider the current distributions in the circuit as shown below

$$\text{By KVL, } V_A - I_1 10 - I_2 20 - V_B = 0$$

$$\Rightarrow I_1 10 + I_2 20 = 70 \quad \dots(i)$$

$$V_A - I_1 10 - I_3 30 - V_C = 0$$

$$\Rightarrow I_1 10 + I_3 30 = 60 \quad \dots(ii)$$

$$\text{Also, } I_3 = I_1 - I_2$$

So, Eq. (ii) becomes

$$I_1 10 + 30(I_1 - I_2) = 60$$

$$I_1 40 - 30 I_2 = 60 \quad \dots(iii)$$

Solving Eqs. (i) and (iii), we get

$$I_2 = 2 \text{ A, } I_1 = 3 \text{ A, } I_3 = 1 \text{ A}$$

Potential drop across branch AD,

$$V_A - V_D = I_1 \times 10 \Rightarrow 70 - V_D = 30 \Rightarrow V_D = 40 \text{ V}$$

47. (b) $m = zit$

$$m = 15 \text{ g}$$

48. (d)

49. (c) $V_{AB} = (I - I_g) R = I_g \cdot G$

where, $G = \text{voltmeter}$
(resistance)

$$V_{AB} = 120, I = 2, R = 75$$

$$\Rightarrow 120 = (2 - I_g) 75 \Rightarrow I_g = 0.4 \text{ A}$$

$$\text{Now, } V_{AB} = I_g G \Rightarrow G = \frac{120}{0.4} = 300 \Omega$$

50. (a) Heat absorbed by water $= ms\Delta T$

$$\text{Heat supplied by heater} = VIt = Pt$$

$$\therefore \text{Efficiency} = \frac{ms\Delta T}{Pt} \times 100$$

By putting given value, efficiency $\approx 79\%$

51. (d) $m = A \cdot l \cdot x = \pi \frac{d^2}{4} l \cdot x$, $x = \text{Density}$

$$\Rightarrow d_1^2 l_1 = d_2^2 l_2 \quad (\text{as mass is same})$$

In series, current will be same.

$$\text{So, } \frac{H_1}{H_2} = \frac{i^2 R_1}{i^2 R_2} = \frac{\rho \left(\frac{l_1}{A_1} \right)}{\rho \left(\frac{l_2}{A_2} \right)} = \frac{l_1 A_2}{l_2 A_1} = \left(\frac{d_2^2}{d_1^2} \right) \pi \frac{d_2^2}{4}$$

$$= \frac{d_2^4}{d_1^4} = \left(\frac{3}{2} \right)^4 = \frac{81}{16}$$

52. (a) 53. (b)

54. (c) For a potentiometer

$$\frac{E_1}{l_1} = \frac{E_2}{l_2} = 1500 \text{ cm}$$

55. (b)

56. (a) In branch, (1) resistors are in series.

$$R_1 = 10 + 10 + 10 = 30 \Omega$$

In branch (3), 20 and 20 are in series

$$\therefore R_3 = 20 + 20 = 40 \Omega$$

The equivalent circuit of (1), (2) and (3) branches are in parallel.

$$\therefore \frac{1}{R_{eq}} = \frac{1}{30} + \frac{1}{20} + \frac{1}{40} = \frac{4 + 6 + 3}{120} = \frac{13}{120}$$

$$E_{eq} = \frac{120}{13} = 9.23 \Omega$$

57. (d)

58. (d) When length of wire is stretched, its area and length changes in such a way that volume always remains same.

Wire A has resistance R , length l , radius r

Wire A when stretched resistance $= R'$, length $= l'$, radius $= r_1$

$\therefore$ Volume of original wire = volume of stretched wire

$$V = V'$$

$$Al = A' l' \Rightarrow \pi r^2 l = \pi r_1^2 l'$$

$$\frac{l}{l'} = \frac{r_1^2}{r^2} = \frac{50}{100} = \frac{1}{2}$$

$$R = \rho \cdot \frac{l}{A}, R' = \rho \cdot \frac{l'}{A'}$$

$$\frac{R}{R'} = \frac{l/A}{l'/A'} = \frac{l}{l'} \times \frac{A'}{A} = \frac{l}{l'} \times \frac{r_1^2}{r^2} = \frac{50}{100} \times \frac{50}{100} = \frac{1}{4}$$

$$R' = 4R = 4 \times 10 = 40 \Omega$$

59. (d)

60. (a) $V_1 = E - Ir = 50 - \frac{50}{220} \times 20 = 50 - 4.5 = 45.5 \text{ V}$

$$\text{Now, } V_2 = 50 - \frac{50}{200} \times 20 = 45$$

% change in potential difference

$$= \frac{(45.5 - 45)}{50} \times 100 = 1\%$$

61. (b) As, $\left(\frac{l-2}{2} \right) 4 = \left(\frac{l-3}{3} \right) 8 \Rightarrow l = 6$

$$\text{Therefore, } r = \left(\frac{l-2}{2} \right) 4 = 8 \Omega$$

62. (c) $R_1 = \tan \theta = R_0 (1 + \alpha T_1)$

$$\text{and } R_2 = \cot \theta = R_0 (1 + \alpha T_2)$$

$$\cot \theta - \tan \theta = R_0 (1 + \alpha T_2) - R_0 (1 + \alpha T_1) = R_0 \alpha (T_2 - T_1)$$

$$\text{or } T_2 - T_1 = \frac{1}{\alpha R_0} (\cot \theta - \tan \theta)$$

$$= \frac{1}{\alpha R_0} (\cot \theta - \tan \theta)$$

$$= \frac{1}{\alpha R_0} \left(\frac{\cos \theta}{\sin \theta} - \frac{\sin \theta}{\cos \theta} \right)$$

$$= \frac{2 \cos 2\theta}{\alpha R_0 \sin \theta} = \frac{2 \cos 2\theta}{\alpha R_0 \sin 2\theta}$$

$$\Rightarrow = \frac{2}{\alpha R_0} \cot 2\theta$$

63. (c) The equivalent circuit of the given circuit will be reduced to as shown in figure.

$$\begin{aligned}\text{Total resistance of the circuit} &= \frac{2 \times 4}{2 + 4} + 0.8 \\ &= \frac{8}{6} + 0.8 = \frac{12.8}{6} \Omega\end{aligned}$$

$$\text{Main current in the circuit} = \frac{14}{(12.8/6)} = \frac{84}{12.8} \text{ A}$$

$$\text{Reading of ammeter} = \frac{84}{12.8} \times \frac{2}{6} = 2.18 \text{ A}$$

BITSAT Archives

1. (c) Ohm's law says $\frac{V}{I} = R = \text{constant}$

2. (c) The current density in the wire is

$$J = \frac{i}{A} = \frac{4}{2 \times 10^{-6}} = 2 \times 10^6 \text{ Am}^{-2}$$

The drift speed is

$$\begin{aligned}v &= \frac{J}{nc} = \frac{2 \times 10^6}{12 \times 10^{28} \times 1.6 \times 10^{-19}} \\ &= \frac{10^6}{6 \times 1.6 \times 10^9} = 1.04 \times 10^{-4} \text{ m/s}\end{aligned}$$

3. (a) $V_A - V_D = -6i - 5i + 10 - 4i$

Here, $V_A = V_D$

Since, points A and D are centred.

$$\begin{aligned}-6i - 5i + 10 - 4i &= 0 \\ \Rightarrow 15i &= 10 \Rightarrow i = \frac{10}{15} = 0.67 \text{ A}\end{aligned}$$

4. (c) Net resistance between ABCD is

$$\begin{aligned}R &= 4 + 1 = 5 \Omega \\ \therefore \text{Current } I &= \frac{V}{R} = \frac{10}{5} = 2 \text{ A}\end{aligned}$$

Potential difference across A and B

$$= I \times 4 = 2 \times 4 = 8 \text{ V}$$

$\therefore$ Two capacitors of $3 \mu\text{F}$ each are in series

$\therefore$ Potential difference across each capacitor

$$= \frac{8}{2} = 4 \text{ V}$$

Charge on each capacitor, $q = CV = 3 \times 4 = 12 \mu\text{C}$

5. (c) If bulb Z is fused, the current stops flowing through Z. The effective resistance of the circuit due to bulbs X and Y in series becomes more as compared to before. Due to which, the current in the circuit decrease.

$$\therefore \text{brightness} \propto (\text{current})^2$$

So, the brightness of bulb X decreases,

Now, bulb Y gets more current than before fusing the bulb, Z.

$\therefore$ Brightness of bulb Y will increase.

6. (c) We can simplify the network as shown in figure.

So, net resistance,

$$R = 2.4 + 1.6 = 4.0 \Omega$$

Therefore, current from the battery

$$i = \frac{V}{R} = \frac{4}{4} = 1 \text{ A}$$

Now, from the circuit (b),

$$4I' = 6I \Rightarrow I' = \frac{3}{2}I$$

But,

$$i = I + I' = I + \frac{3}{2}I = \frac{5}{2}I$$

$$\therefore 1 = \frac{5}{2}I$$

$$\Rightarrow I = \frac{2}{5} = 0.4 \text{ A}$$

7. (b) Given circuit is shown in figure

In loop (1),

$$12 - 500i_1 - Ri_1 = 0$$

$$\Rightarrow 12 = i_1(500 + R) \quad \dots(i)$$

In loop (2),

$$12 - 500i_1 - 2 = 0 \Rightarrow 10 = 500i_1$$

$$\text{or } i_1 = \frac{1}{50} \text{ A} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$12 \times \frac{1}{i_1} = (500 + R)$$

$$\Rightarrow 12 \times 50 = 500 + R \Rightarrow R = 100 \Omega$$

8. (d) In a metallic conductor of non-uniform cross-section, only the current remains constant along the entire length of the conductor.

9. (a) For a series circuit,

$$\begin{aligned} R_s &= R_1 + R_2 \\ \Rightarrow i^2 R_s &= i^2 R_1 + i^2 R_2 \Rightarrow P_s = P_1 + P_2 \end{aligned}$$

10. (c) Let the potential of the battery be V

$$R_1 = \frac{V}{1}, R_2 = \frac{V}{2}, R_3 = \frac{V}{4}$$

On connecting in series

$$\begin{aligned} R_s &= R_1 + R_2 + R_3 \\ \Rightarrow R_s &= V \left(1 + \frac{1}{2} + \frac{1}{4} \right) \Rightarrow R_s = \frac{7}{4} V \end{aligned}$$

$\therefore$ By definition

$$I = \frac{V}{R_s} \Rightarrow I = \frac{4}{7} \text{ A}$$

11. (a) $N = 24 = mn$

For current to be maximum

$$\begin{aligned} R_{\text{internal}} &= R_{\text{external}} \\ \Rightarrow \frac{mr}{n} &= 3 \Rightarrow \frac{m}{n} (0.5) = 3 \Rightarrow \frac{m}{n} = 6 \end{aligned}$$

$\Rightarrow m = 6n$, substituting the values, we get

$$24 = 6n^2$$

$$\Rightarrow n = 2 \Rightarrow m = 12$$

12. (c)

13. (d) Effective resistance of circuit = $\frac{5 \times 5}{5 + 5} + 15 = 4 \Omega$

Total current in circuit,

$$I = \frac{20}{4} = 5 \text{ A}$$

Current in arm APB or $AQB = \frac{1}{2} = 2.5 \text{ A}$

$$V_A - V_P = 3 \times 2.5 = 7.5 \text{ V}$$

$$V_A - V_Q = 2 \times 2.5 = 5 \text{ V}$$

$$\begin{aligned} V_P - V_Q &= (V_A - V_Q) - (V_A - V_P) \\ &= 5.0 - 7.5 = -2.5 \text{ V} \end{aligned}$$

14. (c) When potential difference applied across a conductor increases, the current flowing through the conductor increases. Therefore, drift velocity of the electrons increases as

$$I \propto v_d$$

15. (d) When a box contains fuse wire, a strong current flows through fuse when circuit is closed. Due to which a very strong heating effect takes place, resisting the breakage of fuse wire.

16. (c) Current through each arm

$$PQR \text{ and } PSQ = 1 \text{ A}$$

$$V_P - V_R = 3 \text{ V}$$

$$V_P - V_S = 7 \text{ V}$$

From Eqs. (i) and (ii), we get

$$V_R - V_S = +4 \text{ V}$$

17. (b) Here, $V < E$

$$\therefore E = V + Ir \quad \dots(i)$$

For first case,

$$E = 12 + \frac{12}{16} r$$

For second case,

$$E = 11 + \frac{11}{10} r \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$12 + \frac{12}{16} r = 11 + \frac{11}{10} r \Rightarrow r = \frac{20}{7} \Omega$$

18. (c)

19. (d) Potential difference across PQ , i.e. potential difference across the resistance of 20Ω , which is $V = i \times 20$ and

$$\begin{aligned} i &= \frac{48}{(100 + 100 + 80 + 20)} \\ &= 0.16 \text{ A} \end{aligned}$$

$$\therefore V = 0.16 \times 20 = 3.2 \text{ V}$$

20. (a) Given circuit is a balanced Wheatstone bridge. So, diagonal resistance of 2Ω will be ineffective.

Equivalent resistance of upper arms

$$= 2 + 2 = 4 \Omega$$

Equivalent resistance of lower arms

$$= 2 + 2 = 4 \Omega$$

$$R_{AB} = \frac{4 \times 4}{4 + 4} = 2 \Omega$$

21. (a) Current given by cell

$$I = \frac{E}{R + r}$$

Power delivered in first case

$$P_1 = I^2 R_1 = \left(\frac{E}{R_1 + r} \right)^2 R_1$$

Power delivered in second case

$$P_2 = I^2 R_2 = \left(\frac{E}{R_2 + r} \right)^2 R_2$$

Power delivered is same in the both cases.

$$\left(\frac{E}{R_1 + r} \right)^2 R_1 = \left(\frac{E}{R_2 + r} \right)^2 R_2$$

$$\frac{R_1}{(R_1 + r)^2} = \frac{R_2}{(R_2 + r)^2}$$

$$R_1 (R_2^2 + r^2 + 2R_2 r) = R_2 (R_1^2 + r^2 + 2R_1 r)$$

$$R_1 R_2^2 + R_1 r^2 + 2R_1 R_2 r = R_2 R_1^2 + R_2 r^2 + 2R_1 R_2 r$$

$$R_1 R_2^2 - R_2 R_1^2 = R_2 r^2 - R_1 r^2$$

$$R_1 R_2 (R_2 - R_1) = r^2 (R_2 - R_1)$$

$$r = \sqrt{R_1 R_2}$$

22. (a) $I = \frac{q}{t}$

$$q = I \times t$$

23. (a) Chemical energy reduced

$$= V I t = 6 \times 5 \times 6 \times 60$$

$$= 10800 = 1.08 \times 10^4 \text{ J}$$

24. (b) Let the original resistance is $R \Omega$

$$V = I R$$

$$V = 5 \times R \times = 5 R \quad \dots(i)$$

When 2Ω resistance is inserted, then total resistance

$$= (R + 2) \Omega$$

$$\therefore V = I' (R + 2) = 4 (R + 2) \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$5 R = 4 (R + 2)$$

$$\therefore R = 8 \Omega$$

25. (c) Let S be the large and R be the smaller resistance.

From formula for meter bridge

$$S = \left(\frac{100 - l}{l} \right) R = \frac{100 - 20}{20} R = 4 R$$

$$\text{Again, } S = \left(\frac{100 - l}{l} \right) (R + 15)$$

$$= \frac{100 - 40}{40} (R + 15)$$

$$= \frac{3}{2} (R + 15)$$

$$\therefore 4 R = \frac{3}{2} (R + 15)$$

$$\Rightarrow \frac{8R}{3} - R = 15$$

$$\Rightarrow \frac{5R}{3} = 15$$

$$\Rightarrow R = 9 \Omega$$

26. (b) If we take $R_1 = 4 \Omega$, $R_2 = 12 \Omega$, then in series resistance

$$R_s = R_1 + R_2 = 4 + 12 = 16 \Omega$$

$$\text{In parallel, resistance, } R_p = \frac{4 \times 12}{4 + 12} = 3 \Omega$$

$$\text{So, } R_s = 4 \Omega$$

$$\text{and } R_p = 12 \Omega$$

25

Magnetic Field

Concept of Magnetic Field

In 1820, Oersted observed that a compass needle suffers a deflection when brought near a current carrying wire. This means that electric current (electric charge in motion) gives rise to magnetism.

Biot-Savart's Law

Biot-Savart's law gives the magnitude of magnetic field at any point due to a current carrying conductor. This law is although for an infinitesimally small conductor, yet it can be used for long conductors. According to Biot-Savart's law, magnetic field $d\mathbf{B}$ at any point P due to a current element $i d\mathbf{l}$ is

$$d\mathbf{B} = \frac{\mu_0}{4\pi} \cdot \frac{i(d\mathbf{l} \times \hat{\mathbf{r}})}{r^2} = \frac{\mu_0}{4\pi} \cdot \frac{i(d\mathbf{l} \times \mathbf{r})}{r^3}$$
$$d\mathbf{B} = \frac{\mu_0}{4\pi} \cdot \frac{idl \sin \theta}{r^2} \text{ or } d\mathbf{B} = k \frac{idl \sin \theta}{r^2} \quad \left(\because \frac{\mu_0}{4\pi} = k \right)$$

As a moving charge is equivalent to a current, then

$$i d\mathbf{l} = \frac{q}{dt} d\mathbf{l} = q \frac{d\mathbf{l}}{dt} = q\mathbf{v}$$

So, in terms of charge and its velocity, $d\mathbf{B} = \frac{\mu_0}{4\pi} q \frac{(\mathbf{v} \times \mathbf{r})}{r^3}$

Total field can be found by summing *via* integration.

i.e.
$$B = \int d\mathbf{B} = \frac{\mu_0 i}{4\pi} \cdot \int \frac{dl \sin \theta}{r^2}$$

where, μ_0 = absolute permeability of air or vacuum.

It has exact value of $4\pi \times 10^{-7} \text{ Wb/A} \cdot \text{m}$ or $1.26 \times 10^{-6} \text{ T} \cdot \text{m/A}$.

Its other units are H/m and N/A^2 .

Applications of Biot-Savart's Law

Let us consider few applications of Biot-Savart's law

1. Magnetic Field due to a Circular Current Carrying Loop

If a coil of radius r carries a current i , then magnetic field on its axis at a distance x from its centre is given by

$$B_{\text{axis}} = \frac{\mu_0}{4\pi} \cdot \frac{2\pi N i r^2}{(x^2 + r^2)^{3/2}}$$

where, N = number of turns in the coil.

2. Magnetic Field due to a Current Carrying Circular Arc

Magnetic field at centre O of a circular arc as given by Biot-Savart's law is

If magnetic field at the centre of circular coil is denoted by B_0 , then

$$B_0 = \frac{\mu_0}{4\pi} \cdot \frac{2\pi i}{r}$$

Magnetic field at the centre of arc which is making an angle θ at the centre is $B_{\text{arc}} = \left(\frac{B_0}{2\pi}\right) \cdot \theta$.

3. Magnetic Field in Concentric Circular Loops

(a) For coplanar and concentric loops, magnetic field is either in same or in different directions.

If currents are in same direction, then magnetic field

$$B_1 = \frac{\mu_0}{4\pi} \times 2\pi i \left(\frac{1}{r_1} + \frac{1}{r_2} \right)$$

If currents are in opposite directions, then magnetic field

$$B_2 = \frac{\mu_0}{4\pi} \times 2\pi i \left(\frac{1}{r_1} - \frac{1}{r_2} \right)$$

(b) For non-coplanar and concentric coils, magnetic field is resultant of fields of both the coils. If planes of coils are perpendicular to each other, then magnetic field at common centre is

$$B = \sqrt{B_1^2 + B_2^2} = \frac{\mu_0}{2r} \sqrt{i_1^2 + i_2^2}$$

Also, the direction of B with direction of B_1 is $\tan \theta = \frac{B_2}{B_1}$.

Ampere's Circuital Law

According to Ampere's circuital law, the line integral of the magnetic field B around any closed path is equal to μ_0 times the net current I threading through the area enclosed by the closed path. Mathematically,

$$\oint \mathbf{B} \cdot d\mathbf{l} = \mu_0 \Sigma I$$

Now, consider the diagram shown

Here, $\Sigma I = i_1 + i_2 - i_3$

Hence, $\oint \mathbf{B} \cdot d\mathbf{l} = \mu_0 \cdot (i_1 + i_2 - i_3)$

Applications of Ampere's Circuital law

The following are the few important applications of Ampere's circuital law given as below:

1. Magnetic Field due to a Current Carrying Straight Wire

The magnetic field due to a current carrying wire of finite length at a point P situated at a normal distance r is given from Ampere's circuital law, $\int B \cdot dl = \mu_0 \Sigma I$

$$B = \frac{\mu_0 I}{4\pi r} (\sin \phi_1 + \sin \phi_2)$$

If point P lies symmetrically on the perpendicular bisector of wire XY , then $\phi_1 = \phi_2 = \phi$ (say) and hence

$$B = \frac{\mu_0 I}{4\pi r} \cdot 2 \sin \phi = \frac{\mu_0 I \sin \phi}{2\pi r}$$

For a wire of infinite length, $\phi_1 = \phi_2 = 90^\circ$ and hence

$$B = \frac{\mu_0 I}{2\pi r}$$

2. Magnetic Field due to a Thick (Cylindrical) Wire

Let us consider a thick cylindrical wire of radius R and infinite length, which carries a current I . Then, magnetic field at a point outside the wire $B = \frac{\mu_0 I}{2\pi r}$, where r is the distance of given point from centre of wire and $r > R$.

Magnetic field at a point inside the wire at a distance r from centre of wire ($r < R$) is given by

$$B = \frac{\mu_0 I}{2\pi} \cdot \frac{r}{R^2}$$

Magnetic field inside a hollow current carrying conductor is zero.

3. Magnetic Field due to a Solenoid

For a solenoid coil of infinite length at a point on its axial line, the magnetic field is given as $B = \mu_0 n I$

where, n is the number of turns per unit length.

At the end of solenoid, $B = \frac{1}{2} \mu_0 n I$

At the end field is half of at the centre this is called end effect.

Toroidal Solenoids

For a toroid (i.e. a ring shaped closed solenoid), magnetic field at any point within the core of toroid is $B = \mu_0 n I$,

where, $n = \frac{N}{2\pi R}$ and R = radius of toroid.

Motion of a Charged Particle in a Uniform Magnetic Field

If a particle carrying a positive charge q and moving with velocity v enters a magnetic field B , then it experiences a force F which is given by the expression

$$F = q(\mathbf{v} \times \mathbf{B}) \text{ or } F = qvB \sin \theta$$

The force F is always perpendicular to both the velocity v and the field B .

Trajectory (path) of the charged particle depends on the angle between v and B .

Case I $\mathbf{v} \parallel \mathbf{B}$, $\theta = 0^\circ$

Then, force on charged particle

$$F = q(\mathbf{v} \times \mathbf{B}) = 0$$

So, path of particle is a straight line and it passes undeflected through the region of magnetic field.

Case II $\mathbf{v} \perp \mathbf{B}$, $\theta = 90^\circ$

Force is maximum $|F| = Bqv$ and it provides centripetal force and path of the particle is a circle as given below.

$$\text{So, } \frac{mv^2}{r} = Bqv \Rightarrow \frac{v}{r} = \omega = \frac{Bq}{m}$$

$$\Rightarrow T = \text{Time period of rotation} = \frac{2\pi}{\omega} = \frac{2\pi m}{Bq}$$

$$\text{and } f = \text{frequency of rotation} = \frac{1}{T} = \frac{Bq}{2\pi m}$$

which is independent of radius of path and velocity of charged particle.

Case III $\mathbf{v}$ is at some angle except 90° with $\mathbf{B}$.

If velocity is at some angle θ with direction of B , then due to parallel component $v \cos \theta$, charged particle moves parallel to the direction of field B .

Also, due to perpendicular component $v \sin \theta$, it moves in a circular path. So, path of particle is spiral in shape.

For the particle, T = time period = $2\pi m / Bq$

$$\text{and } \text{pitch} = \frac{2\pi m}{Bq} \times v \cos \theta$$

Cyclotron

It is a device used to accelerate positively charged particles e.g. proton, deuteron, α -particle and other heavy ions to high energy of 100 MeV or more.

Time taken by charged particle to describe a semi-circular path in the dee is given by

$$t = \frac{\pi r}{v} = \frac{\pi m}{qB}$$

If T is time period of oscillating charged particle, then

$$T = 2t = \frac{2\pi m}{qB}$$

The cyclotron frequency, D_2

$$v = \frac{1}{T} = \frac{Bq}{2\pi m}$$

Maximum energy gained by the charged particle, $E_{\max} = \left(\frac{B^2 r_0^2 q^2}{2m} \right)$

where, r_0 = maximum radius of the circular path followed by the positive ion.

Magnetic Force on a Current Carrying Conductor

If a current carrying conductor is placed in a magnetic field B , then a small current element $I d\mathbf{l}$ experiences a force given by

$$d\mathbf{F}_m = I d\mathbf{l} \times \mathbf{B}$$

and the total force experienced by whole current carrying conductor will be

$$\mathbf{F}_m = \int d\mathbf{F}_m = \int I(d\mathbf{l} \times \mathbf{B})$$

The direction of force when current element $I d\mathbf{l}$ and B are perpendicular to each other can also be determined by applying Fleming's left hand rule or right hand thumb rule.

Force on a Straight Wire

If a current carrying straight conductor (length l) is placed in a uniform magnetic field B such that it makes an angle θ with the direction of field, then force experienced by it is $F = B i l \sin \theta$.

(i) If $\theta = 0^\circ$, then $F = 0$

(ii) If $\theta = 90^\circ$, then $F_{\max} = B i l$

(iii) In general, $F = i(l \times B)$ or $|F| = B i l \sin \theta$

Force between Two Parallel Current Carrying Conductors

When two long straight conductors carrying currents i_1 and i_2 are placed parallel at distance of a from each other, then a mutual force of attraction acts between them which is given by

$$F_{12} = F_{21} = F = \frac{\mu_0}{4\pi} \cdot \frac{2i_1 i_2}{a} \times l$$

where, l is the length of that portion of the conductor on which force is to be calculated.

Hence, force per unit length

$$\frac{F}{l} = \frac{\mu_0}{4\pi} \cdot \frac{2i_1 i_2}{a} \text{ N/m}$$

Torque Experienced by a Current Carrying Loop in a Uniform Magnetic Field

In the given figure, when a current carrying coil (loop) having N turns and area A , is placed in a uniform field B , in such a way that the normal ($\hat{n}$) to the coil makes an angle θ with the direction of B , then the coil experiences a torque given by

$$\tau = N B i A \sin \theta$$

$$PQ = RS = a \Rightarrow QR = SP = b \text{ or } \tau = \mathbf{M} \times \mathbf{B}$$

where, $M = N i A$ called magnetic moment of the loop.

Case I τ is zero, when $\theta = 0$, i.e. when the plane of the coil is perpendicular to the field.

Case II τ is maximum, when $\theta = 90^\circ$, i.e. the plane of the coil is parallel to the field. $\tau_{\max} = N B i A$.

The above expression is valid for any shape of coil.

Work Done

If the coil is to be rotated through an angle θ from its equilibrium position ($\theta = 0^\circ$), then required work done, $W = M B (1 - \cos \theta)$. It is maximum when $\theta = 180^\circ$

$$W_{\max} = 2 M B$$

Moving Coil Galvanometer (MCG)

In a moving coil galvanometer, the coil is suspended between the pole pieces of a strong horse-shoe magnet. The pole pieces are made cylindrical and a soft iron cylindrical core is placed within the coil without touching it. This makes the field radial. In such a field, the plane of the coil always remains parallel to the field. When current will pass through this coil, then torque will be experienced by this coil.

Moving coil galvanometer

$$F = NBil \Rightarrow \tau_{\text{def}} = NBiA$$

Suppose, N = number of turns in the coil,

A = area of the coil,

B = magnetic field induction of radial magnetic field in which the coil is suspended.

As the coil deflects, a restoring torque is set up in the suspension fibre. If α is the angle of twist, then the restoring torque is

$$\tau_{\text{rest}} = C\alpha$$

where, C is the torsional constant of the fibre.

When the coil is in equilibrium, then $NBiA = C\alpha$

$$i = \frac{C}{NBA} \alpha \Rightarrow i = k\alpha$$

where, $k = \frac{C}{NBA}$ is the galvanometer constant. This linear relationship between i and α makes the moving coil galvanometer useful for current measurement and detection.

- (i) **Current sensitivity (S_i)** The current sensitivity of a galvanometer is defined as the deflection produced in the galvanometer per unit current flowing through it.

$$S_i = \frac{\alpha}{i} \Rightarrow S_i = \frac{NBA}{C}$$

Thus, in order to increase the sensitivity of a moving coil galvanometer, N , B and A should be increased and C should be decreased.

Quartz fibres can also be used for suspension of the coil because they have large tensile strength and very low value of k .

- (ii) **Voltage sensitivity (S_V)** Voltage sensitivity of a galvanometer is defined as the deflection produced in the galvanometer per unit potential difference applied to it.

$$S_V = \frac{\alpha}{V} = \frac{\alpha}{iR} = \frac{S_i}{R} \Rightarrow S_V = \frac{NBA}{RC}$$

Conversion of Galvanometer into Ammeter

An ammeter is made by connecting a low resistance S in parallel with a moving coil galvanometer G . S is known as shunt.

Ammeter

Then, from circuit

$$i_g \times G = (i - i_g) \times S$$

$$\Rightarrow S = \frac{i_g}{i - i_g} G$$

So, $S \ll G$, only a small fraction of current goes through the galvanometer.

Conversion of Galvanometer into Voltmeter

A voltmeter is made by connecting a resistor of high resistance R in series with a moving coil galvanometer G .

From the circuit

Voltmeter

$$i_g = \frac{V}{G + R}$$

$$\Rightarrow G + R = \frac{V}{i_g}$$

$$R = \frac{V}{i_g} - G$$

Practice Exercise

1. For the arrangement as shown in the figure, the magnetic induction at the centre is

- a. $\frac{3\mu_0 I}{4a}$ b. $\frac{\mu_0 I}{4\pi a} (1 + \pi)$ c. $\frac{\mu_0 I}{4\pi a}$ d. $\frac{3\mu_0 I}{8a}$

2. If the resistance of the upper half of a rigid loop is twice that of the lower half, the magnitude of magnetic induction at the centre is equal to

- a. zero b. $\frac{\mu_0 I}{4a}$
c. $\frac{\mu_0 I}{12a}$ d. None of these

3. The earth's magnetic field at a certain point is 0.70 gauss. This field is to be annulled by the magnetic field at the centre of a circular conducting loop 5.0 cm in radius. The required current is about
a. 0.66 A b. 5.6 A c. 0.28 A d. 2.8 A

4. Three circular concentric wires of radii a , $2a$ and $3a$ are carrying currents $3I$, $2I$ and I in same manner. Find the magnetic field at the common centre.

- a. $\frac{13\mu_0 I}{6a}$ b. $\frac{\mu_0 I}{6a}$
c. $\frac{\mu_0 I}{a}$ d. None of these

5. A charge $q (> 0)$ moves towards the centre of a circular loop of radius R along its axis. The magnitude of B along the periphery of the loop is

- a. zero b. $\frac{\mu_0}{4\pi} \frac{qvR}{\sqrt{(R^2 + x^2)^3}}$
c. $\frac{qvR}{\sqrt{R^2 + x^2}}$ d. None of these

6. A current carrying loop is free to turn in a uniform magnetic field. The loop will then come into equilibrium when its plane is inclined at

- a. 0° to the direction of the field
b. 45° to the direction of the field
c. 90° to the direction of the field
d. 135° to the direction of the field

7. In the given figure, the loop is fixed but straight wire can move. The straight wire will

- a. remain stationary
b. move towards the loop
c. move away from the loop
d. rotates about the axis

8. The dimensions of $\frac{1}{\sqrt{\mu_0 \epsilon_0}}$ are same as

- a. $\frac{E}{B}$ b. $\frac{B}{E}$
c. $\frac{E^2}{B^2}$ d. $\sqrt{\left(\frac{E}{B}\right)}$

9. A charged particle is moving in a uniform magnetic field and losses 4% of its KE. The radius of curvature of its path changes by

- a. 2%
b. 4%
c. 10%
d. None of the above

10. A charged particle of mass m and charge q , a uniform magnetic field B acting into the plane. The plane is frictional having coefficient of friction μ . The speed of charged particle just before entering into the region is v_0 .

The radius of curvature of the path after the time $\frac{v_0}{2\mu g}$ is

- a. $\frac{mv_0}{qB}$ b. $\frac{mv_0}{2qB}$
c. $\frac{mv_0}{4qB}$ d. None of these

11. A γ -ray photon is passing near a nucleus and breaks into an electron and positron. The region contains a uniform magnetic field B perpendicular to the plane of motion. Find the time after which they again converted into γ -ray. The force of electrostatic interaction and gravitational interaction may be neglected

- a. $\frac{2\pi m}{eB}$ b. $\frac{\pi m}{2eB}$
c. $\frac{4\pi m}{eB}$ d. None of these

12. If a charged particle of charge $5\mu\text{C}$ and mass 5 g is moving with constant speed 5 m/s in a uniform magnetic field B on a curve $x^2 + y^2 = 25$, where x and y are in metre. The value of magnetic field will be

- a. 1 tesla
b. 1 kilo tesla along z -axis
c. 5 kilo tesla along the x -axis
d. 1 kilo tesla along any line in the x - y plane

13. A charged particle of mass m and charge q is accelerated through a potential difference of V volt. It enters a region of uniform magnetic field which is directed perpendicular to the direction of motion of the particle. The particle will move on a circular path of radius given by

a. $\sqrt{\left(\frac{Vm}{qB^2}\right)}$ b. $\frac{2Vm}{qB^2}$
 c. $\sqrt{\left(\frac{2Vm}{q}\right)\left(\frac{1}{B}\right)}$ d. $\sqrt{\left(\frac{Vm}{q}\right)\left(\frac{1}{B}\right)}$

14. A circular flexible loop of wire of radius r carrying a current I is placed in a uniform magnetic field B . If B is doubled, then tension in the loop

- a. remains unchanged b. is doubled
 c. is halved d. becomes 4 times

15. A non-relativistic proton beam passes without deviation through the region of space where there are uniform transverse mutually perpendicular electric and magnetic fields with $E = 120$ kV/m and $B = 50$ mT. Then the beam strikes a grounded target. Find the force with which the beam acts on the target if the beam current is equal to $I = 0.80$ mA.

- a. $80 \mu\text{N}$ b. $25 \mu\text{N}$ c. $20 \mu\text{N}$ d. $35 \mu\text{N}$

16. An α -particle and a proton are both simultaneously projected into a region of constant magnetic field, perpendicular to the direction of the field but in opposite directions. After 10^{-8} s, it is found that the velocity of α -particle has changed in the direction by 45° . The angle between the velocity vectors of the α -particle and the proton is

- a. 90° b. 45° c. $45^\circ + 90^\circ$ d. $\frac{(45^\circ + 90^\circ)}{2}$

17. Four wires each of length 2 m are bent into four loops P, Q, R and S and then suspended into uniform magnetic field. Some current is passed in each loop. Which statement is correct?

- a. Couple on loop P will be the highest
 b. Couple on loop Q will be the highest
 c. Couple on loop R will be the highest
 d. Couple on loop S will be the highest

18. The magnetic moment of the current carrying loop shown in the figure is equal to

a. $\frac{I(b^2 + 2ab)\theta}{2}$
 b. $Iab\theta$
 c. $\frac{I(a^2 + ba)\theta}{2}$
 d. None of the above

19. The magnitude of magnetic moment of the current loop in the figure is

- a. Ia^2
 b. $\sqrt{2}Ia^2$
 c. zero
 d. None of the above

20. A length l of a wire is bent to form a circular coil of some turns. A current I is then established in the coil and it is placed in a uniform magnetic field B . The maximum torque that acts on the coil is

- a. IBl^2 b. $4\pi IBl^2$ c. $\frac{Il^2B}{4\pi}$ d. zero

21. The ratio of the energy required to set up in a cube of side 10 cm, a uniform magnetic field of 4 Wb/m^2 and a uniform electric field of 10^6 V/m is

- a. 1.44×10^7 b. 1.44×10^{-5} c. 1.44×10^6 d. 1.44×10^3

22. A magnetic field $4 \times 10^{-3} \text{ kT}$ exerts a force $(4\hat{i} + 3\hat{j}) \times 10^{-10} \text{ N}$ on a particle having a charge 10^{-9} C and going on the x - y plane. The velocity of the particle is

- a. $-75\hat{i} + 100\hat{j}$ b. $-100\hat{i} + 75\hat{j}$
 c. $25\hat{i} + 2\hat{j}$ d. $2\hat{i} + 25\hat{j}$

23. A uniform magnetic field $B = B_0\hat{j}$ exists in space. A particle of mass m and charge q is projected towards X -axis with speed v from a point $(a, 0, 0)$. The maximum value of v for which the particle does not hit the Y - Z plane is

- a. $\frac{Bqa}{m}$ b. $\frac{Bqa}{2m}$ c. $\frac{Bq}{am}$ d. $\frac{Bq}{2am}$

24. Through two parallel wires A and B , 10 A and 2 A of currents are passed respectively in opposite directions. If the wire A is infinitely long the length of the wire B is 2 m, then force on the conductor B , which is situated at 10 cm distance from A , will be

- a. $8 \times 10^{-7} \text{ N}$ b. $8 \times 10^{-5} \text{ N}$
 c. $4 \times 10^{-7} \text{ N}$ d. $4 \times 10^{-5} \text{ N}$

25. Two parallel long wires A and B carry currents I_1 and I_2 ($I_2 < I_1$). When I_1 and I_2 are in the same direction, the magnetic field at a point mid-way between the wires is $10 \mu\text{T}$. If I_2 is reversed, the field becomes $30 \mu\text{T}$. The ratio I_1/I_2 is

- a. 1 b. 3
 c. 2 d. 4

26. A circular coil of 100 turns and effective diameter 20 cm carries a current of 0.5 A. It is to be turned in a magnetic field $B = 2 \text{ T}$ from a position in which θ equals zero to one in which θ equals 180° . The work required in this process is

- a. π joule b. 2π joule
 c. 4π joule d. 8π joule

27. Two long parallel wires are placed on a smooth horizontal table. They have equal and opposite charges. Work required to increase separation between wires from a to $2a$ if magnitude of charge per unit length on them is λ , will be
- a. $\frac{\lambda^2 \ln 2}{4\pi\epsilon_0}$ b. $\frac{\lambda^2}{\pi\epsilon_0} \ln 2$ c. $\frac{\lambda^2}{4\pi\epsilon_0 a}$ d. $\frac{\lambda^2}{2\pi\epsilon_0} \ln 2$

28. Two long straight parallel conductors are separated by a distance of 5 cm and carrying current 20 A. What work per unit length of a conductor must be done to increase the separation between conductors to 10 cm, if the current flows in the same direction?
- a. $8 \times 10^{-5} \log_e 2$ b. $\log_e 2$
c. $10^{-7} \log_e 2$ d. None of these

BITSAT Archives

1. A narrow beam of protons and deuterons, each having the same momentum, enters a region of uniform magnetic field directed perpendicular to their direction of momentum. The ratio of the radii of the circular paths described by them is [2014]
a. 1:2 b. 1:1 c. 2:1 d. 1:3
2. A solenoid of length 1.0 m has a radius of 1 cm and has a total of 1000 turns wound on it. It carries a current of 5 A. If an electron was to move with a speed of 10^4 ms^{-1} along the axis of this current carrying solenoid, then force experienced by this electron is [2014]
a. 2 N b. 1.2 N
c. zero d. 2.5 N
3. Magnetic field [2014]
a. can increase the speed of charged particle
b. can accelerate a charged particle
c. Both a and b are correct
d. Both a and b are incorrect
4. A square coil of side 10 cm has 20 turns and carries a current of 12 A. The coil is suspended vertically and the normal to the plane of the coil, makes an angle θ with the direction of a uniform horizontal magnetic field of 0.80 T. If the torque, experienced by the coil, equals 0.96 N-m, the value of θ is [2014]
a. 0° b. $\frac{\pi}{2}$ rad c. $\frac{\pi}{3}$ rad d. $\frac{\pi}{6}$ rad

5. For the circuit (figure), the current is to be measured. The ammeter shown is a galvanometer with a resistance $R_G = 60.00 \Omega$ converted to an ammeter by a shunt resistance $r_S = 0.02 \Omega$. The value of the current is [2014]
a. 0.79 A b. 0.29 A
c. 0.99 A d. 0.8 A

6. A square shaped current loop of side length L and carrying current I lies in a uniform magnetic field B acting perpendicular to the plane of square loop and directed inward. The net magnetic force acting on current loop is [2013]
a. IBL b. $4IBL$ c. zero d. $2IBL$

7. Two parallel conductors carry current in opposite directions as shown in figure. One conductor carries a current of 10.0 A. Point C is a distance $\frac{d}{2}$ to the right of the 10.0 A current. If $d = 18 \text{ cm}$ and I is adjusted so that the magnetic field at C is zero, the value of the current I is [2013]
a. 10.0 A b. 30.0 A
c. 8.0 A d. 18.0 A

8. Two long, parallel conductors carry currents in the same direction, as shown in figure. Conductor A carries a current of 100 A and is held firmly in position. Conductor B carries a current I_B and is allowed to slide freely up and down (parallel to A) between a set of non-conducting guides. The mass per unit length of conductor B is 0.1 g/cm and the distance between the two conductors is 5 cm. If system of conductors is in equilibrium, the value of current I_B is [2013]
a. 250 A b. 240 A c. 220 A d. 230 A

9. A straight wire of mass 200 g and length 1.5 m carries a current of 2 A. It is suspended in mid-air by a uniform horizontal magnetic field B . The magnitude of B (in tesla) is (assume, $g = 9.8 \text{ ms}^{-2}$) [2012]
a. 2 b. 1.5 c. 0.55 d. 0.65
10. The intensity of the magnetic induction field at the centre of a single turn circular coil of radius 5 cm carrying current of 0.9 A is [2012]
a. $36\pi \times 10^{-7} \text{ T}$ b. $9\pi \times 10^{-7} \text{ T}$
c. $36\pi \times 10^{-6} \text{ T}$ d. $9\pi \times 10^{-6} \text{ T}$
11. The maximum current that can be measured by a galvanometer of resistance 40Ω is 10 mA. It is converted into a voltmeter that can read upto 50 V. The resistance to be connected in series with the galvanometer (in ohms) is [2012]
a. 2010 b. 4050
c. 5040 d. 4960

12. A galvanometer of resistance 100Ω gives full scale deflection with 0.01 A current. How much resistance should be connected in parallel to convert it into an ammeter of range 10 A ? [2011]
 a. 0.100Ω b. 1.00Ω c. 10.00Ω d. 100.00Ω
13. A galvanometer of 50Ω resistance has 25 divisions. A current of $4 \times 10^{-4}\text{ A}$ gives a deflection of one division. To convert this galvanometer into a voltmeter having a range of 25 V , it should be connected with a resistance of [2011]
 a. 2500Ω as a shunt b. 2950Ω as a shunt
 c. 2550Ω in series d. 2450Ω in series
14. The cyclotron frequency of an electron gyrating in a magnetic field of 1 T is approximately [2011, 2007]
 a. 28 MHz b. 280 MHz c. 2.8 GHz d. 28 GHz
15. A current carrying circular coil is bent so as to convert it into a double loop, both the loops being concentric and are carrying current in the same direction. If B is the initial magnetic field at the centre, the final magnetic field at the centre will be [2010]
 a. zero b. B c. $2B$ d. $4B$
16. In order to increase the current sensitivity of moving coil galvanometers, the [2010]
 a. number of turns of the coil should be increased
 b. the strength of the magnetic field should be increased
 c. area of coil should be increased
 d. All of the above
17. In an ammeter 10% of main current is passing through the galvanometer. If the resistance of the galvanometer is G , then the shunt resistance, in ohms is [2005]
 a. $9G$ b. $\frac{G}{9}$ c. $90G$ d. $\frac{G}{90}$
18. Due to magnetic field of earth, charged particles coming from outer space. [2009]
 a. required greater kinetic energy to reach the equator than the poles
 b. required lesser kinetic energy to reach the equator than the poles
 c. can never reach the equator
 d. can never reach the poles
19. In a galvanometer, 5% of the total current in the circuit passes through it. If the resistance of the galvanometer is G , the shunt resistance S connected to galvanometer is [2008]
 a. $19G$ b. $\frac{G}{19}$ c. $20G$ d. $\frac{G}{20}$
20. Two concentric coils of 10 turns each are placed in the same plane. Their radii are 20 cm and 40 cm and carry 0.2 A and 0.3 A current respectively in opposite directions. The magnetic induction (in tesla) at the centre is [2008]
 a. $\frac{3}{4}\mu_0$ b. $\frac{5}{4}\mu_0$ c. $\frac{7}{4}\mu_0$ d. $\frac{9}{4}\mu_0$
21. A current carrying small loop behaves like a small magnet. If A be its area and M its magnetic moment, the current in the loop will be [2007]
 a. M/A b. A/M
 c. MA d. AM^2
22. A magnet of magnetic moment 20 CGS units is freely suspended in a uniform magnetic field of intensity 0.3 CGS unit. The amount of work done in deflecting it by an angle of 30° in CGS unit is [2007]
 a. 6 b. $3\sqrt{3}$
 c. $3(2 - \sqrt{3})$ d. 3
23. In a magnetic field of 0.05 T area of coil changes from 101 cm^2 to 100 cm^2 without changing the resistance which is 2Ω . The amount of charge that flow during this period is [2006]
 a. $25 \times 10^{-6}\text{ C}$
 b. $2 \times 10^{-6}\text{ C}$
 c. 10^{-6} C
 d. $8 \times 10^{-6}\text{ C}$
24. An electric field of 1500 V/m and a magnetic field of 0.40 Wb/m^2 act on a moving electron. The minimum uniform speed along a straight line, the electron could have is [2005]
 a. $16 \times 10^{15}\text{ m/s}$
 b. $6 \times 10^{-16}\text{ m/s}$
 c. $3.75 \times 10^3\text{ m/s}$
 d. $3.75 \times 10^2\text{ m/s}$

Answer with Solutions

Practice Exercise

1. (d)

2. (c) $\because I_1 R_1 = I_2 R_2$

$$\frac{I_1}{I_2} = \frac{R_2}{R_1} = \frac{R_2}{2R_2} = \frac{1}{2}$$

$$\therefore I_2 = 2I_1$$

$$\text{and } I = I_1 + I_2 = I_1 + 2I_1 = 3I_1$$

$$\therefore I_1 = \frac{I}{3} \text{ and } I_2 = \frac{2}{3}I$$

$\therefore$ Magnetic field at the centre of coil

$$= \frac{\mu_0 I_1}{4\pi a} \times \pi - \frac{\mu_0 I_2}{4\pi a} \times \pi$$

$$\therefore B = \frac{\mu_0 \pi}{4\pi a} (I_1 - I_2) = \frac{\mu_0}{4a} \left(\frac{I}{3} - \frac{2}{3}I \right) = \frac{\mu_0}{4a} \left(-\frac{I}{3} \right) = -\frac{\mu_0 I}{12a} = \frac{\mu_0 I}{12a}$$

3. (b)

4. (a) $B = B_1 + B_2 + B_3$

$$= \frac{\mu_0 (3I)}{2a} + \frac{\mu_0 (2I)}{2(2a)} + \frac{\mu_0 I}{2(3a)}$$

$$= \frac{3\mu_0 I}{2a} + \frac{\mu_0 I}{2a} + \frac{\mu_0 I}{6a}$$

$$= \frac{9\mu_0 I}{6a} + \frac{3\mu_0 I}{6a} + \frac{\mu_0 I}{6a} = \frac{13\mu_0 I}{6a}$$

5. (d) $\mathbf{B} = \frac{\mu_0}{4\pi} q \frac{\mathbf{v} \times \mathbf{r}}{r^3}$

$$B = \frac{\mu_0 q v r \sin \theta}{4\pi (R^2 + x^2)^{\frac{3}{2}}}$$

$$B = \frac{\mu_0 q}{4\pi} \frac{vR}{(R^2 + x^2)^{\frac{3}{2}}} [\because r \sin \theta = R]$$

6. (a)

7. (b)

8. (a)

9. (a) $r = \frac{mv}{qB}$

$$KE = K = \frac{1}{2} mv^2$$

$$\therefore mv = \sqrt{2Km}$$

$$\therefore r = \frac{mv}{qB} = \frac{\sqrt{2Km}}{qB} \text{ or } r \propto \sqrt{K}$$

or $r = eK^{\frac{1}{2}}$, where e is a constant.

$$\text{or } \frac{dr}{dr} = e \frac{dK^{\frac{1}{2}}}{dK} = \frac{e}{2} \frac{ec}{\sqrt{K}} \text{ or } \frac{ec}{2\sqrt{K}} \frac{dK}{dr} = \sqrt{K}$$

$$\text{or } e \frac{\Delta K}{\Delta r} = 2\sqrt{K} \text{ or } \frac{\Delta r}{r} = \frac{c\Delta K}{2\sqrt{K}c\sqrt{K}} = \frac{\Delta K}{2K}$$

$$\text{or } \frac{\Delta r}{r} \times 100 = \frac{\Delta K}{2K} \times 100 = 2\% \quad \left[\because \frac{\Delta K}{K} \times 100 = 4\% \right]$$

10. (b) Here, centripetal acceleration is provided by magnetic force but tangential acceleration is provided by force of friction

$$\frac{mv^2}{r} = qvB$$

$$\therefore r = \frac{mv}{qB}$$

$$\text{Tangential acceleration} = a = \frac{-\mu mg}{m}$$

$$v = -\mu g \left(\frac{v_0}{2\mu g} \right) = \frac{v_0}{2}$$

$$\therefore r = \frac{mv}{qB} = \frac{mv_0}{2qB}$$

11. (a) Both positron and electron are moving on circular paths.

$$\therefore T = \frac{2\pi m}{eB}$$

12. (b)

13. (c)

14. (b)

15. (c) Since, proton moves with constant velocity. So, magnetic force on the proton is balanced by electric force.

$$\therefore qE = qvB \text{ or } E = vB$$

$$\text{The force on the target is } F = \frac{\Delta p}{\Delta t} = \frac{m v n}{\Delta t}$$

where, n = number of protons striking the target in time dt .

m = mass of proton

v = speed of each proton before striking the target

$$I = \frac{ne}{\Delta t} \Rightarrow \frac{n}{\Delta t} = \frac{I}{e}$$

$$\therefore F = \frac{m v I}{e} = \frac{m I \left[\frac{E}{B} \right]}{e}$$

$$F = \frac{1.6 \times 10^{-27} \times 120 \times 1000 \times 0.8 \times 10^{-3}}{50 \times 10^{-3} \times 1.6 \times 10^{-19}}$$

$$= 20 \times 10^{-6} \text{ N} = 20 \mu\text{N}$$

$$16. (c) \omega_\alpha = \frac{(2e)B}{4m} = \frac{1}{2} \frac{eB}{m}$$

$$\omega_p = \frac{eB}{m}$$

$$\theta_\alpha = 45^\circ$$

$\theta_p = 90^\circ$ from their original directions.

17. (d) Concept Couple = $I(\mathbf{A} \times \mathbf{B})$

More area means more couple.

$\therefore$ For a given perimeter, circle has maximum area.

18. (a) Magnetic moment

$$M = IA = I(A_2 - A_1)$$

$$= I \left\{ \frac{(a+b)^2}{2} \theta - \frac{a^2}{2} \theta \right\} = \frac{I(b^2 + 2ab)\theta}{2}$$

19. (b)

20. (c) $\tau = NIAB = N\pi r^2 B$

But, $N \times 2\pi r = l$

$$\therefore r = \frac{l}{2\pi N}$$

$$\therefore \tau = N\pi \left(\frac{l}{2\pi N} \right)^2 B = N\pi \frac{l^2}{4\pi^2 N^2} B = \frac{l^2 B}{4\pi N}$$

$$\therefore \tau_{\max} = \frac{l^2 B}{4\pi} \quad [N_{\min} = 1]$$

21. (c) $U_E = \frac{1}{2} \epsilon_0 E^2 \times \text{volume}$

$$U_B = \frac{B^2}{2\mu_0} \times \text{volume}$$

$$\therefore \frac{U_B}{U_E} = \left(\frac{B}{E} \right)^2 \frac{1}{\mu_0 \epsilon_0} = \left(\frac{4}{10^6} \right)^2 (3 \times 10^8)^2$$

$$= \frac{16}{10^{12}} \times 9 \times 10^{16} = 144 \times 10^4 = 1.44 \times 10^6$$

22. (a) From Lorentz force,

$$F = q(v \times B)$$

Given, $F = (4\hat{i} + 3\hat{j}) \times 10^{-10} \text{ N}, q = 10^{-9} \text{ C}$

$$B = 4 \times 10^{-3} \hat{k} \text{ T}$$

$$\therefore (4\hat{i} + 3\hat{j}) \times 10^{-10} = 10^{-9} (a\hat{i} + b\hat{j}) \times (4 \times 10^{-3}) \hat{k}$$

Solving, we get

$$a = -75, b = 100 \Rightarrow v = -75\hat{i} + 100\hat{j}$$

23. (a) 24. (b)

25. (c) $\frac{\mu_0}{4\pi} \frac{2I_1}{r} - \frac{\mu_0}{4\pi} \frac{2I_2}{r} = 10 \mu\text{T}$

$$\frac{\mu_0 2I_1}{4\pi r} + \frac{\mu_0 2I_2}{4\pi r} = 30 \mu\text{T}$$

On solving, $I_1 = 20 \text{ A}$ and $I_2 = 10 \text{ A}$

So, $I_1 / I_2 = 2$

26. (b)

27. (d) $W = \int_a^{2a} \frac{\lambda \cdot \lambda dr}{2\pi\epsilon_0 r} = \frac{\lambda^2}{2\pi\epsilon_0} \ln 2$

28. (a) The force per unit length is

$$F_0 = \frac{\mu_0 I_1 I_2}{2\pi r}$$

$$\begin{aligned} \therefore W &= \int F dr = \frac{\mu_0 I_1 I_2}{2\pi} \int_{5 \times 10^{-2}}^{10 \times 10^{-2}} \frac{dr}{r} \\ &= \frac{\mu_0 I_1 I_2}{2\pi} \ln 2 = 2 \times 10^{-7} \times 20 \times 20 \ln 2 \\ &= 8 \times 10^{-5} \ln 2 = 8 \times 10^{-5} \log_e 2 \end{aligned}$$

BITSAT Archives

1. (b) Since, the radius of circular path of a charged particle in magnetic field is $r = \frac{mv}{qB} = \frac{p}{qB}$

Now, the radius of circular path of charged particle of given momentum p and magnetic field B is given by $r \propto \frac{1}{q}$

But charge on both charged particles, protons and deuterons, is same. Therefore,

$$\frac{r_p}{r_D} = \frac{q_D}{q_p} = \frac{1}{1}$$

2. (c) Here, $L = 1 \text{ m}, N = 1000$

The number of turns per unit length

$$n = N/L = 1000 \text{ turn/m}$$

Magnetic field inside the solenoid

$$B = \mu_0 n I = \mu_0 \times 1000 \times 5 = 2\pi \times 10^{-3} \text{ T}$$

The direction of magnetic field is along the solenoid.

For electron, $q = -e, v = 10^4 \text{ ms}^{-1}$

Magnetic Lorentz force, $F = -evB \sin 0^\circ = 0$ as the angle between B and v is 0° .

3. (b) Magnetic field can accelerate a charged particle by changing the direction of its velocity but it cannot change the speed of charged particle as magnetic force always acts perpendicular to the velocity of charged particle.

4. (d) Area of coil, $A = \text{side}^2 = (0.1)^2 = 0.01 \text{ m}^2$,

Number of turns, $N = 20$, current, $I = 12 \text{ A}$,

Normal to the coil make an angle θ with the direction of B , magnetic field, $B = 0.80 \text{ T}$

Torque, experienced by the coil, $\tau = 0.96 \text{ N-m}$

Since, total torque on the coil, $\tau = (NIA)B \sin \theta$

Substituting the values in above formula, we get

$$0.96 \text{ N-m} = 20 \times 12 \text{ A} \times 0.01 \text{ m}^2 \times 0.80 \text{ T} \times \sin \theta$$

$$\sin \theta = \frac{0.96}{192} = \frac{1}{2}$$

$$\theta = \frac{\pi}{6} \text{ rad}$$

5. (c) $R_G = 60.00 \Omega$; shunt resistance, $r_s = 0.02 \Omega$

Total resistance in the circuit is $R_G + 3 = 63 \Omega$.

Hence, $I = 3 / 63 = 0.048 \text{ A}$

Resistance of the galvanometer converted to an ammeter is,

$$\frac{R_G r_s}{R_G + r_s} = \frac{60 \Omega \times 0.02 \Omega}{(60 + 0.02) \Omega} = 0.02 \Omega$$

Total resistance in the circuit $= 0.02 + 3 = 3.02 \Omega$

Hence, $I = 3 / 3.02 = 0.99 \text{ A}$

6. (c) Let the current be flowing in anti-clockwise direction as shown in figure.

Now, magnetic force on $AD = F_1 = ILB$ inwards

(by Fleming's left hand rule)

Similarly, magnetic force on

$BC = F_2 = ILB$ inwards

Since, two forces are equal in magnitude and opposite in direction, therefore, they cancel out each other.

Also, magnetic force on $CD = F_3 = ILB$ inwards

(by Fleming's left hand rule)

Similarly, magnetic force on $AB = F_4 = ILB$ inwards.

Again, two forces are equal in magnitude and opposite in direction, therefore, they cancel out each other.

7. (b) The magnetic field at C due to first conductor is

$$B_1 = \frac{\mu_0}{2\pi} \frac{I}{3d/2} \quad (\text{since, point } C \text{ is separated by } d + \frac{d}{2} = \frac{3d}{2})$$

from 1st conductor). The direction of field is perpendicular to the plane of paper and directed outwards.

The magnetic field at C due to second conductor is

$$B_2 = \frac{\mu_0}{2\pi} \frac{10}{d/2} \quad (\text{since, point } C \text{ is separated by } \frac{d}{2} \text{ from 2nd}$$

conductor)

The direction of field is perpendicular to the plane of paper and directed inwards.

Since, direction of B_1 and B_2 at point C is in opposite direction and the magnetic field at C is zero, therefore,

$$B_1 = B_2$$

$$\frac{\mu_0}{2\pi} \frac{I}{3d/2} = \frac{\mu_0}{2\pi} \frac{10}{d/2}$$

On solving $I = 30.0 \text{ A}$

8. (a) When system of conductors is in equilibrium. The magnetic force of attraction per unit length between conductors = weight of conductor B per unit length.

$$\frac{\mu_0}{2\pi} \frac{I_A \times I_B}{d} = \frac{mg}{L} = \left(\frac{m}{L}\right)g$$

$$\frac{\mu_0}{2\pi} \frac{I_A \times I_B}{d} = \left(\frac{m}{L}\right)g$$

$$2 \times 10^{-7} \times \frac{100 \times I_B}{0.05} = (0.01 \text{ kg/m}) \times 10$$

On solving, we get $I_B = 250 \text{ A}$

9. (d) Magnetic force on straight wire

$$F = BIl \sin \theta = BIl \sin 90^\circ = BIl$$

For equilibrium of wire in mid-air,

$$F = mg$$

$$Bil = mg$$

$$\therefore B = \frac{mg}{il} = \frac{200 \times 10^{-3} \times 9.8}{2 \times 15} = 0.65 \text{ T}$$

10. (a) The intensity of magnetic induction field

$$B = \frac{\mu_0 i}{2r} = \frac{4\pi \times 10^{-7} \times 0.9}{2 \times 5 \times 10^{-2}}$$

$$B = 36\pi \times 10^{-7} \text{ T}$$

11. (d) To convert a galvanometer into voltmeter, the necessary value of resistance to be connected in series with the galvanometer is

$$R = \frac{V}{I_g} - G = \frac{50}{10 \times 10^{-3}} - 40 = 5000 - 40 = 4960 \Omega$$

12. (a) Shunt is given by

$$S = \frac{I_g \times R_g}{I - I_g} = \frac{0.01 \times 100}{10 - 0.01} = \frac{0.01 \times 100}{9.99} = 0.100 \Omega$$

13. (d) Here, $I_g = 25 \times 4 \times 10^{-4} \text{ A} = 10^{-2} \text{ A}$

To convert the galvanometer into a voltmeter, we must join a series resistance of

$$R = \frac{V}{I_g} - G = \frac{25}{10^{-2}} - 50 = 2500 - 50 = 2450 \Omega$$

14. (d) Cyclotron of frequency, $\nu = \frac{Bq}{2\pi m} = \frac{1 \times 1.6 \times 10^{-19}}{2\pi \times 9.1 \times 10^{-31}}$
 $= 2.8 \times 10^{10} \text{ Hz} = 28 \text{ GHz}$

15. (d) $B_{\text{initial}} = \frac{\mu_0 i}{2r}$

$$B_{\text{final}} = \frac{\mu_0 i}{2\left(\frac{r}{2}\right)} + \frac{\mu_0 i}{2\left(\frac{r}{2}\right)} \Rightarrow B_{\text{final}} = \frac{2\mu_0 i}{r} = 4B_{\text{initial}}$$

16. (d) Current sensitivity of the galvanometer can be increased by all three factors.

17. (b) Shunt resistance $S = \frac{I_g G}{I - I_g} = \frac{0.1 G}{1 - 0.1} = \frac{G}{9}$

18. (c) Due to magnetic force the charged particles get deviated. For positively, charged particles, due to east-west asymmetry of particles, more particles get deviated towards east, then towards west, but since they are deviated, hardly any charged particle will reach equator.

19. (b) Shunt of an ammeter,

$$S = \frac{I_g \times G}{I - I_g} = \frac{5 \times G}{100 - 5} = \frac{G}{19}$$

20. (b) Two coils carry currents in opposite directions, hence net magnetic field at centre will be difference of the two fields.

$$\text{i.e. } B_{\text{net}} = \frac{\mu_0}{4\pi} \cdot 2\pi N \left[\frac{i_1}{r_1} - \frac{i_2}{r_2} \right] = \frac{10\mu_0}{2} \left[\frac{0.2}{0.2} - \frac{0.3}{0.4} \right] = \frac{5}{4} \mu_0$$

21. (a) $M = iA \Rightarrow i = \frac{M}{A}$

22. (c) Work done, $W = MB_{\mu} (1 - \cos \theta)$

$$= 20 \times 0.3 (1 - \cos 30^\circ) = 6 \left(1 - \frac{\sqrt{3}}{2} \right) = 3(2 - \sqrt{3})$$

23. (a) $B = 0.5 \text{ T}$, $A_1 = 101 \text{ cm}^2 = 101 \times 10^{-4} \text{ m}^2$
 $A_2 = 100 \text{ cm}^2 = 100 \times 10^{-4} \text{ m}^2$
 $R = 2 \Omega$

Amount of charge flowing is

$$q = \frac{B\Delta A}{R} = \frac{0.50 \times (101 \times 10^{-4} - 100 \times 10^{-4})}{2}$$

$$= \frac{0.05 \times 1 \times 10^{-4}}{2} = 2.5 \times 10^{-6} \text{ C}$$

24. (c) Here, $E = 1500 \text{ V/m}$, $B = 0.4 \text{ Wb/m}^2$

Minimum speed of electron along the straight line, $v = \frac{E}{B}$

$$= \frac{1500}{0.4} = 3750 = 3.75 \times 10^3 \text{ m/s}$$

26

Magnetostatics

Current Loop as a Magnetic Dipole

A current loop is equivalent to a magnetic dipole. If $A(= \pi a^2)$ be the area of the loop, then the magnitude of its dipole moment is

$$p_m = iA = i\pi a^2$$

where, a is radius of coil and i is current flowing through it.

$$\therefore i = \frac{p_m}{\pi a^2} \quad \dots(i)$$

Magnetic field at the centre of a circular current loop is given by

$$B = \frac{\mu_0 i}{2a} \quad \dots(ii)$$

Putting the value of i from Eq. (i) in Eq. (ii), we get

$$B = \frac{\mu_0}{2\pi} \frac{p_m}{a^3}$$

This is the expression for the magnetic field at the centre of the current loop in terms of its dipole moment. Instead of a circular loop, if there is a circular coil having n turns, its dipole moment would be $p_m = niA = ni\pi a^2$.

Torque on a Magnetic Dipole Placed in a Uniform Magnetic Field

In the given figure, a magnetic dipole is placed in a uniform magnetic field B represented by equidistant parallel lines.

Now, torque exerted on magnetic dipole by magnetic field is

$$\begin{aligned} \Rightarrow \quad \tau_m &= \mathbf{m} \times \mathbf{B} \\ \text{Here,} \quad \tau_m &= \text{magnetic torque} \\ \Rightarrow \quad \tau_m &= mB \sin \theta \end{aligned}$$

where, $\mathbf{B}$ = magnetic field, $\mathbf{m}$ = magnetic moment of the bar magnet, θ = the angle between $\mathbf{m}$ and $\mathbf{B}$.

So, torque is zero when $\theta = 0^\circ$ or 180° and it is maximum when $\theta = 90^\circ$.

Magnetic Dipole Moment of a Revolving Electron

A revolving electron constitutes a current,

i.e.

$$i = \frac{e}{T}$$

As, T = time period of revolution, $T = \frac{2\pi}{\omega}$,

where, ω = electron's orbital angular speed

$$\therefore i = \text{equivalent current} = \frac{e\omega}{2\pi} = \frac{ev}{2\pi r} \quad (\because v = r\omega)$$

So, magnetic moment associated with this circulating current

$$\mu_l = i\pi r^2 = \frac{evr}{2} = \frac{e}{2m_e}(m_e vr)$$

where, r = radius of an orbit = $\frac{e}{2m_e} \cdot l$,

where, l = angular momentum ($\because l = m_e vr$)

and vector form $\mu_l = \frac{-e}{2m_e} l$

or the angular momentum vector and magnetic dipole moment vectors are opposite in direction.

The ratio $\left| \frac{\mu_l}{l} \right| = \frac{e}{2m_e}$ is called **gyromagnetic ratio**. Its value is 8.8×10^{10} C/kg.

According to Bohr's postulate, $|l| = \frac{nh}{2\pi}$

$$\therefore \mu_l = \frac{nh e}{4\pi m_e}$$

$$\begin{aligned} \text{and } \mu_l (\text{minimum}) &= \frac{e}{4\pi m_e} \cdot h \\ &= 9.27 \times 10^{-24} \text{ A-m}^2 \quad (\because n = 1) \end{aligned}$$

This value is called **Bohr's magneton**.

Potential Energy of a Magnetic Dipole in a Uniform Magnetic Field

When we rotate a dipole with the help of external torque, we have to do some external work.

$$\therefore W_{\text{ext}} = \Delta U \quad \dots(i)$$

$$\Rightarrow W_{\text{ext}} = \int dW = \int \tau d\theta$$

$$= \int_{\theta_1}^{\theta_2} mB \sin\theta d\theta$$

$$W_{\text{ext}} = -mB(\cos\theta_2 - \cos\theta_1) \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$-mB(\cos\theta_2 - \cos\theta_1) = \Delta U \quad \dots(iii)$$

Let at $\theta = 90^\circ$, $U = 0$

So, if $\theta_1 = 90^\circ$, $\theta_2 = \theta$

and $U_i = 0$, then

$$W_{\text{ext}} = -mB(\cos\theta_2) = U_f$$

$$\Rightarrow U = -mB\cos\theta = -\mathbf{m} \cdot \mathbf{B}$$

Magnetic Dipole Moment Associated with Charged Rotating Bodies

As a charged rotating body constitutes an equivalent current. So, they have a magnetic dipole moment associated with them. For geometrically symmetric charged bodies, magnetic moment is given by

Charged rotating bodies

$$\mathbf{m} = \frac{qL}{2m} = \frac{ql\omega}{2m} \quad (\because L = I\omega)$$

where,

L = angular momentum,

I = moment of inertia,

ω = angular velocity,

m = mass of rotating body

Bar Magnet

A bar magnet may be viewed as a combination of two magnetic poles, north pole and south pole, separated by some distance. The distance is known as the magnetic length of the given bar magnet.

If a bar magnet is broken, the fragments are independent magnetic dipoles and not isolated magnetic poles.

Magnetic Field due to a Bar Magnet

A bar magnet has a magnetic field around it. Magnetic field is mathematically measured by a vector term $\mathbf{B}$, whose SI unit is 1 tesla (1 T).

The magnetic field in free space, at a point at a distance r from the given bar magnet (or magnetic dipole)

(i) **Along its axial line**

$$\mathbf{B} = \frac{\mu_0}{4\pi} \frac{2Mr}{(r^2 - l^2)^2}$$

and the direction of $\mathbf{B}$ is the same as the direction of $\mathbf{M}$. For a short dipole (or for a far away point on the axis) when $r \gg l$, the above relation is simplified as

$$\mathbf{B} = \frac{\mu_0}{4\pi} \frac{2\mathbf{M}}{r^3}$$

(ii) **Along the equatorial line** of a magnetic dipole, the magnetic field $\mathbf{B}$ in free space is given by

$$\mathbf{B} = \frac{\mu_0}{4\pi} \frac{\mathbf{M}}{(r^2 + l^2)^{3/2}}$$

If $r \gg l$, the relation is modified as $\mathbf{B} = \frac{\mu_0}{4\pi} \frac{\mathbf{M}}{r^3}$

However, along the equatorial line, the direction of $\mathbf{B}$ is opposite to that of $\mathbf{M}$.

In general, in a direction making an angle θ with the magnetic axis, the magnetic field is given by

$$\mathbf{B} = \frac{\mu_0}{4\pi} \frac{\mathbf{M}}{r^3} \sqrt{(3 \cos^2 \theta + 1)}$$

In these relations, μ_0 is a constant having a value of $4\pi \times 10^{-7} \text{ T mA}^{-1}$ and it is known as the **magnetic permeability of free space**.

For solenoid $\mathbf{B} = \mu_0 n i$, where n is number of turns of solenoid and i is the current flowing through it.

NOTE Time period of oscillations of a bar magnet in a uniform magnetic field.

$$T = 2\pi \sqrt{\frac{I}{mB}}$$

Earth's Magnetic Field and Magnetic Elements

Earth's magnetic field on the earth's surface is around 0.4 gauss and its value shows variations with time. At present, magnetic south pole is located at northern Canada 70.5° N latitude and 96° W longitude. North magnetic is at 70.5° S and 84° E at Arctic. The magnetic poles are around 2000 km apart.

Magnetic equator intersects the geographic equator at 6° W longitude and 174° E latitude. Earth's field reverses itself in a span of around one million years. Declination shows a yearly variation. As per the most established theory, it is due to the rotation of the earth whereby various charged ions present in the molten state in the core of the earth rotate and constitute a current.

Magnetic equator divides the earth into two hemispheres. The hemisphere containing south polarity of the earth's magnetism is called **northern hemisphere**. While the other hemisphere containing north polarity of the earth's magnetism is called the **southern hemisphere**. Direction of the earth's magnetic field is from S (geographical south) to N (geographical north).

The magnitude and direction of the magnetic field of the earth at a place are completely given by certain quantities known as **magnetic elements**.

Three magnetic elements of the earth are

(i) **Magnetic declination (ϕ)** It is the angle between geographic and the magnetic meridian planes.

Declination at a place is expressed at ϕ° E or ϕ° W depending upon whether the north pole of the compass needle lies to the east or to the west of the geographical axis.

(ii) **Angle of inclination or magnetic dip (θ)** It is the angle between the direction of intensity of total magnetic field of the earth and a horizontal line in the magnetic meridian. If λ is magnetic latitude at a place, then angle of dip θ at the place is given by $\tan \theta = 2 \tan \lambda$.

(iii) **Horizontal component of the earth's magnetic field (B_H)** Earth's magnetic field is horizontal only at the magnetic equator.

At any other place, the total intensity can be resolved into horizontal component (B_H) and vertical component (B_V).

Also, $B_H = B \cos \theta$ and $B_V = B \sin \theta$

So, $B = \sqrt{B_H^2 + B_V^2}$ and $\tan \theta = \frac{B_V}{B_H}$

$$\Rightarrow \theta = \tan^{-1} \left(\frac{B_V}{B_H} \right)$$

At equator, $\theta = 0 \Rightarrow B_H = B, B_V = 0$, while at poles $\theta = 90^\circ$

$\Rightarrow B_H = 0, B_V = B$

Important Terms Used in Magnetism

1. Magnetic Induction or Magnetic Flux Density (B)

Whenever a piece of magnetic substance is placed in an external magnetising field, the substance becomes magnetised. If B_0 is the magnetic field in free space, then on placing the given magnetic substance at that place, the magnetic field changes from B_0 to B , where $B = \mu_r B_0$

$\oint \mathbf{B} \cdot d\mathbf{S}$ is magnetic flux which is equal to $\mu_0 \mathbf{m}_{\text{inside}}$, where $\mathbf{m}_{\text{inside}}$ is the net pole strength inside a closed surface.

For a dipole, Gauss's law for magnetism is $\oint \mathbf{B} \cdot d\mathbf{S} = 0$ for a closed surface.

2. Magnetic Permeability (μ)

It is the degree or extent to which the magnetic lines of induction may pass through a given distance.

Magnetic permeability of free space μ_0 has a value of $4\pi \times 10^{-7} \text{ TmA}^{-1}$. However, for a material substance, **absolute permeability (μ)** has a value different than μ_0 .

For any magnetic substance $\frac{\mu}{\mu_0} = \frac{B}{B_0} = \mu_r = \text{relative magnetic permeability of that substance.}$

Relative magnetic permeability μ_r is a unitless and dimensionless term. For magnetic substance like iron, $\mu_r > 1000$

Relative permeability of a diamagnetic substance is less than 1 ($\mu_r < 1$), but it can never be negative. Thus, $0 \leq \mu_r < 1$, for a diamagnetic material.

3. Intensity of Magnetisation (I)

Intensity of magnetisation of a substance is defined as the magnetic moment induced in the substance per unit volume, when placed in the magnetising field.

Thus,

$$I = \frac{M}{V}$$

It is a vector quantity and its SI unit is Am^{-1} .

4. Intensity of Magnetising Field or Magnetic Intensity (H)

It is a measure of the capability of external magnetising field to magnetise the given substance and is mathematically defined as

$$H = \frac{B_0}{\mu_0} \text{ or } H = \frac{B}{\mu} \text{ or } H = \frac{B}{\mu_0} - I$$

Magnetic intensity H is a vector quantity and its SI unit is Am^{-1} .

5. Magnetic Susceptibility (χ_m)

Magnetic susceptibility of a substance is the ratio of the intensity of magnetisation I induced in the substance to the magnetic intensity H . Thus, $\chi_m = \frac{I}{H}$, it is a scalar term and

has no unit or dimension.

Relation (i) $\mathbf{B}I = \mu_0(\mathbf{H} + \mathbf{I})$ and (ii) $\mu_r = 1 + \chi_m$

Magnetic Behaviour of Materials

Diamagnetic Materials

These are materials which show a very small decrease in magnetic flux when placed in a strong magnetising field. Hydrogen, water, copper, zinc, antimony, bismuth, etc. are the examples of diamagnetic materials.

Paramagnetic Materials

These are those materials which show a small increase in the magnetic flux when placed in a magnetising field.

Oxygen, air, platinum, aluminium, etc., are examples of paramagnetic materials.

Ferromagnetic Materials

These are those materials which are strongly attracted by a magnetic field and can themselves be magnetised even in a weak magnetising field. Iron, steel, nickel and cobalt are ferromagnetic materials.

Curie's Law and Curie Temperature

Curie's Law

According to Curie's law, the magnetic susceptibility of paramagnetic substances is inversely proportional to absolute temperature,

$$\text{i.e.} \quad \chi \propto \frac{1}{T}$$

Here, T = absolute temperature.

On increasing temperature, magnetic susceptibility of paramagnetic substances decreases or *vice-versa*.

Curie Temperature or Curie Point

The magnetic susceptibility of these substances decreases on increasing the temperature and above a particular temperature, a ferromagnetic substance behaves like a paramagnetic substance.

This particular temperature is called the Curie temperature of the substance.

e.g. The Curie temperature of iron is 770°C . It follows that at a temperature below 770°C , the iron is ferromagnetic and at a temperature above 770°C , the iron is paramagnetic.

Similarly, the Curie temperature of nickel is 369°C and that of cobalt is 1150°C .

Curie-Weiss Law

At temperature above Curie point, the magnetic susceptibility of ferromagnetic substances is inversely proportional to $(T - T_C)$, i.e.

$$\chi \propto \frac{1}{T - T_C} \text{ or } \chi = \frac{C}{T - T_C}$$

Here, T_C = Curie temperature.

Hysteresis Curve

A great deal of information can be learned about the magnetic properties of a material by studying its hysteresis loop. A hysteresis loop shows the relationship between the induced magnetic flux density (B) and the magnetising force (H). It is often referred as B - H loop.

A ferromagnetic material can be easily magnetised by placing it in an external magnetising field H .

Initially as H is increased, the intensity of magnetisation I developed in the material increases non-linearly along the curve OA and reaches a maximum, known as saturated magnetism. Now on reducing H , I follows the path AB . Point B corresponds to $H = 0$ but I has a finite positive value. This value of I is called **remance** or **retentivity** or **residual magnetisation**.

If direction of H is reversed and is gradually increased, H curve is along BC . Point C represents the situation when I is finally reduced to zero. The reversed value of I , represented by OC , is known as the **coercivity** of the material.

On increasing H in the reverse direction further, graph CD is obtained. Now, if H is taken back from its negative saturation value to its original positive saturation value a similar I - H curve represented by $DEFA$ is traced.

The whole graph $ABCDEFA$ is a closed loop and known as **hysteresis loop**.

Vibration Magnetometer

- (a) If small magnet is placed in magnetic meridian and it vibrates in horizontal plane, then

$$T = 2\pi \sqrt{\frac{I}{MH}}$$

$$\text{where,} \quad I = M \left(\frac{l^2 + b^2}{12} \right)$$

Its breadth is negligible,

$$I = \frac{M_0 l^2}{12}$$

- (b) If magnet is placed parallel to magnetic meridian and oscillates in vertical plane, then

$$T = 2\pi \sqrt{\left(\frac{I}{MBe} \right)}$$

- (c) If magnet is placed perpendicular to magnetic meridian and oscillates in vertical plane

$$T = 2\pi \sqrt{\left(\frac{I}{MV} \right)}$$

- (d) Comparison of magnetic moment by sum and difference method.

$$\frac{M_1}{M_2} = \frac{T_1^2 + T_2^2}{T_1^2 - T_2^2}$$

Practice Exercise

- Calculate the force acting between two small magnets, placed in end on position 0.1 m apart from their centres. (Given, magnetic moment of each magnet is 5 Am^2).
a. 0.6 N b. 0.8 N c. 0.15 N d. 0.2 N
- Two similar equal magnetic poles when separated by a distance of 1 m, they repel with a force of 10^{-3} N . The pole strength is
a. 10 Am b. 20 Am c. 50 Am d. 100 Am
- Three similar magnetic south poles each of strength 10 Am are placed at the corners of an equilateral triangle of side 20 cm. Find the magnetic force on one of the pole.
a. $0.25 \times 10^{-3} \text{ N}$ b. 10^{-3} N
c. $10 \times 10^{-3} \text{ N}$ d. None of these
- Six similar magnetic poles are placed on six corners of a regular hexagon of side 10 cm. A south pole of strength 10 Am is placed at the centre of hexagon. Find the magnetic force on the south pole.
a. Zero b. $4\pi \times 10^{-4} \text{ N}$
c. 10 N d. None of these
- A magnetic wire of dipole moment $4\pi \text{ Am}^2$ is bent in the form of semicircle. The new magnetic moment is
a. $4\pi \text{ Am}^2$ b. $8\pi \text{ Am}^2$
c. 4 Am^2 d. None of these
- Current I is flowing in a conducting wire of length l . It is bent in the form of a circular coil of single turn. Its magnetic moment will be
a. $\frac{Il}{4\pi}$ b. $\frac{I^2l}{4\pi}$ c. $\frac{Il^2}{4\pi}$ d. $\frac{I^2l^2}{4\pi}$
- The magnetic induction inside a solenoid is $6.5 \times 10^{-4} \text{ T}$. When it is filled with iron medium, then the induction becomes 1.4 T. The relative permeability of iron will be
a. 1578 b. 2355
c. 1836 d. 2154
- If a magnetising field of 1600 A/m produces a magnetic flux of $14 \times 10^{-5} \text{ Wb}$ in an iron bar of cross-sectional area 0.2 cm^2 . Then,
a. magnetic permeability of iron rod is around 1000
b. magnetic susceptibility is very larger than unity
c. magnetic susceptibility is 340
d. None of the above
- Two dissimilar poles of strength $x \text{ mWb}$ and 2 mWb are separated by a distance 12 cm. If the null point is at a distance of 4 cm from 2 mWb , then calculate x .
a. 5 mWb b. 6 mWb c. 7 mWb d. 8 mWb

- Two small magnets of each of magnetic moment M_0 is placed parallel to each other (shown in figure). The magnetic field at point O is
a. zero b. $4 \times 10^{-4} \text{ N}$
c. $2 \times 10^{-4} \text{ N}$ d. None of these

- Two short magnets of magnetic moment 2 Am^2 and 5 Am^2 are placed along two lines drawn at right angle to each other on the sheet of paper as shown in the figure. What is the magnetic field at the point of intersection of their axis?
a. $2.15 \times 10^{-5} \text{ T}$ b. $215 \times 10^{-5} \text{ T}$
c. $2.15 \times 10^{-3} \text{ T}$ d. $21.5 \times 10^{-5} \text{ T}$

- Calculate the magnetic induction at P, for the arrangement shown in the figure, when two similar short magnets of magnetic moment M are joined at the middle. So that, they are mutually perpendicular.
a. $\frac{\mu_0}{4\pi} \frac{M\sqrt{3}}{d^3}$ b. $\frac{\mu_0}{4\pi} \frac{2M}{d^3}$ c. $\frac{\mu_0 M\sqrt{5}}{4\pi d^3}$ d. $\frac{\mu_0 2M}{4\pi d^3}$

- A small magnet of dipole moment M is kept on the arm of a deflection magnetometer set in tan A position at a distance of 0.2 m. If the deflection is 60° , find the value of P ($B_H = 0.4 \times 10^{-4} \text{ T}$).
a. 2.77 Am^2 b. 8 Am^2
c. 0.2 Am^2 d. None of these
- A short bar magnet of magnetic dipole moment $m = 0.32 \text{ JT}^{-1}$ is placed in a uniform external magnetic field of 0.15 T. If bar is free to rotate in the field, then
a. when m is anti-parallel to B , $U = 4.8 \times 10^{-2} \text{ J}$
b. when m is perpendicular to B , $U = 0$
c. when m is perpendicular to B , $U = 4.8 \times 10^{-2} \text{ J}$
d. None of the above

15. A magnet of dipole moment 2 Am^2 is deflected through 30° from magnetic meridian. The required deflecting torque is ($B_H = 0.4 \times 10^{-4} \text{ T}$)
- $0.4 \times 10^{-4} \text{ Nm}$
 - 0.4 Nm
 - $0.2 \times 10^{-4} \text{ Nm}$
 - None of these
16. If the areas under the I - H hysteresis loop and B - H hysteresis loop are denoted by A_1 and A_2 , then
- $A_2 = \mu_0 A_1$
 - $A_2 = A_1$
 - $A_2 = \frac{A_1}{\mu_0}$
 - $A_2 = \mu_0^2 A_1$
17. Consider the plane S formed by the dipole axis and the axis of the earth. Let P be point on the magnetic equator and in S . Let Q be the point of intersection of the geographical and magnetic equators. The declination and dip angles at P and Q are
- 0° and 11.3°
 - 0° and 0°
 - 11.3° and 6.5°
 - 11.3° and 11.3°
18. A magnet of length 14 cm and magnetic moment M , is broken into two parts of length 6 cm and 8 cm respectively. They are put at right angles to each other, with opposite poles together. The magnetic moment of the combination is
- $M/10$
 - M
 - $M/1.4$
 - $2.8 M$
19. A uniform magnetic needle of strength of each pole is 98.1 amp. cm, is suspended from its centre by a thread. When a mass of 50 mg is loaded to its upper end, the needle becomes horizontal, then the vertical component of earth's magnetic induction is ($g = 981 \text{ cm/s}^2$)
- 0.50 gauss
 - 0.25 gauss
 - 0.05 gauss
 - 0.005 gauss
20. M and $M/\sqrt{3}$ are the magnetic dipole moments of the two magnets, which are joined to form a cross figure. Find the inclination of the system with the field, if their combination is suspended freely in a uniform external magnetic field B .
- 
- $\theta = 30^\circ$
 - $\theta = 45^\circ$
 - $\theta = 60^\circ$
 - $\theta = 15^\circ$
21. Calculate the couple acting on a magnet of length 10 cm and pole strength 15 Am, kept in a field of $B = 2 \times 10^{-5} \text{ T}$ at an angle of 30° .
- $1.5 \times 10^{-5} \text{ Nm}$
 - $1.5 \times 10^{-3} \text{ Nm}$
 - $1.5 \times 10^{-2} \text{ Nm}$
 - $1.5 \times 10^{-6} \text{ Nm}$
22. A bar magnet of magnetic moment 2.5 J/T , is placed in magnetic field 0.2 T. What work is done in turning the magnet from parallel to anti-parallel position relative to field direction?
- 1 J
 - 2 J
 - 3 J
 - 4 J

23. Two like poles of strength m_1 and m_2 are far distance apart. Calculate the energy required to bring them r_0 distance apart.
- $\frac{\mu_0 m_1 m_2}{4\pi r_0}$
 - $\frac{\mu_0 m_1 m_2}{8\pi r_0}$
 - $\frac{\mu_0 m_1 m_2}{16\pi r_0}$
 - None of these
24. Calculate the work done in deflecting a small magnet of magnetic moment 10 Am^2 through 180° from a uniform magnetic field of strength $0.4 \times 10^{-4} \text{ T}$.
- $8 \times 10^{-4} \text{ J}$
 - Zero
 - $4 \times 10^{-4} \text{ J}$
 - None of these
25. At a place the values of B_H and B_V are $0.4 \times 10^{-4} \text{ T}$ and $0.3 \times 10^{-4} \text{ T}$ respectively. The resultant earth's magnetic field is
- $0.5 \times 10^{-4} \text{ T}$
 - 10^{-4} T
 - $2 \times 10^{-4} \text{ T}$
 - None of these
26. In previous problem, the angle of dip is
- $\tan^{-1}(0.75)$
 - $\tan^{-1}(0.5)$
 - $\tan^{-1}(0.8)$
 - None of these
27. Calculate the real angle of dip, if a magnet is suspended at an angle of 30° to the magnetic meridian, the dip needle makes an angle of 45° with horizontal.
- $\tan^{-1}\left(\frac{\sqrt{3}}{2}\right)$
 - $\tan^{-1}(\sqrt{3})$
 - $\tan^{-1}\left(\frac{\sqrt{3}}{\sqrt{2}}\right)$
 - $\tan^{-1}\left(\frac{2}{\sqrt{3}}\right)$
28. A magnet is cut in three equal parts by cutting it perpendicular to its length. The time period of original magnet is T_0 in a uniform magnetic field B . Then, the time period of each part in the same magnetic field is
- $\frac{T_0}{2}$
 - $\frac{T_0}{3}$
 - $\frac{T_0}{4}$
 - None of these
29. A magnet is cut in four equal parts by cutting it parallel to its length. What will be the time period of each part, if the time period of original magnet in the same field is T_0 ?
- $\frac{T_0}{\sqrt{2}}$
 - $\frac{T_0}{2}$
 - $\frac{T_0}{4}$
 - $4 T_0$
30. The current on the winding of a toroid is 2 A. It has 400 turns and mean circumferential length is 40 cm. With the help of search coil and charge measuring instrument the magnetic field is found to be 1 T. The susceptibility is
- 100
 - 290
 - 398
 - 397
31. The magnetic needle of a tangent galvanometer is deflected at an angle 30° with respect to the magnet. The horizontal component of the earth's magnetic field is $0.34 \times 10^{-4} \text{ T}$ along the plane of the coil. The magnetic intensity is
- $1.96 \times 10^{-4} \text{ T}$
 - $1.96 \times 10^4 \text{ T}$
 - $1.96 \times 10^{-5} \text{ T}$
 - $1.96 \times 10^5 \text{ T}$

32. Calculate the angle of dip, if a dip needle oscillating in a vertical plane makes 40 oscillations per minute in a magnetic meridian and 30 oscillations per minute in a vertical plane at right angle to the magnetic meridian.
 a. $\theta = \sin^{-1}(0.5625)$ b. $\theta = \sin^{-1}(0.325)$
 c. $\theta = \sin^{-1}(0.425)$ d. $\theta = \sin^{-1}(0.235)$
33. Inside a long solenoid wound with 300 turns/m, an iron rod is placed. An iron rod is 0.2 m long, 10 mm in diameter and of permeability 10^3 . Calculate the magnetic moment of the rod, if 0.5 A of current is passed through the rod.
 a. 2.356 SI units b. 1.335 SI units
 c. 3.664 SI units d. 1.664 SI units
34. An iron rod is subjected to cycles of magnetisation at the rate of 50 Hz. Given the density of the rod is $8 \times 10^3 \text{ kg/m}^3$ and specific heat is $0.11 \times 10^{-3} \text{ cal/kg}^\circ\text{C}$. Find the rise in temperature per minute. If the area enclosed by the B - H loop corresponds to energy of 10^{-2} J . Assume there is no radiation losses.
 a. 78°C b. 88°C
 c. 8.1°C d. None of these

BITSAT Archives

1. The susceptibility of a magnetism at 300 K is 1.2×10^{-5} . The temperature at which the susceptibility increases to 1.8×10^{-5} is [2014]
 a. 150 K b. 200 K c. 250 K d. 20 K
2. Magnetic moment of bar magnet is M . The work done to turn the magnet by 90° of magnet in direction of magnetic field B will be [2012]
 a. zero b. $\frac{1}{2} MB$ c. $2 MB$ d. MB
3. If $\mathbf{M}$ is magnetic moment and $\mathbf{B}$ is the magnetic field, then the torque is given by [2011]
 a. $\mathbf{M} \cdot \mathbf{B}$ b. $\frac{|\mathbf{M}|}{|\mathbf{B}|}$ c. $\mathbf{M} \times \mathbf{B}$ d. $|\mathbf{M}||\mathbf{B}|$
4. At the magnetic north pole of the earth, the value of horizontal component of earth's magnetic field and angle of dip are, respectively [2009]
 a. zero, maximum b. maximum, minimum
 c. maximum, maximum d. minimum, minimum
5. With a standard rectangular bar magnet the time period of a vibration magnetometer is 4 s. The bar magnet is cut parallel to its length into four equal pieces. The time period of vibration magnetometer when one piece is used (in second) (bar magnet breadth is small) is [2008]
 a. 16 b. 8 c. 4 d. 2
6. The magnetised wire of moment M and length l is bent in the form of semicircle of radius r . Then, its magnetic moment is [2008]
 a. $\frac{2M}{\pi}$ b. $2M$ c. $\frac{M}{\pi}$ d. zero
7. Susceptibility of ferromagnetic substance is [2006]
 a. > 1 b. < 1 c. zero d. 1
8. Among the following properties describing diamagnetism, identify the property that is wrongly stated. [2005]
 a. Diamagnetic material do not have permanent magnetic moment
 b. Diamagnetism is explained in terms of electromagnetic induction
 c. Diamagnetic materials have a small positive susceptibility
 d. The magnetic moment of individual electrons neutralise each other

Answer with Solutions

Practice Exercise

1. (c) 2. (d) 3. (a)
4. (a) From force diagram shown in figure, the net magnetic force is zero. In general, if similar poles are placed on the corners of a regular polygon. Then, the net magnetic force on a pole placed at centre is zero.

5. (c) Here,

$$\begin{aligned} M_i &= 4\pi \\ mL &= 4\pi \\ m &= \frac{4\pi}{L} \end{aligned}$$

The new distance between poles is

$$\begin{aligned} L_1 &= 2r = 2 \frac{L}{2\pi} = \frac{L}{\pi} \\ \therefore M_f &= mL_1 = \frac{mL}{\pi} = \frac{4\pi}{\pi} \\ &= 4 \text{ Am}^2 \end{aligned}$$

6. (b) Length of a conducting wire, $2\pi r = l$, $r = \frac{l}{2\pi}$,

$$\text{Area of coil, } \alpha = \pi r^2 = \frac{\pi \cdot l^2}{4\pi^2} = \frac{l^2}{4\pi}$$

$$\text{So, } m = IA = \frac{l^2}{4\pi}$$

7. (d) $B_{\text{air}} = \mu_0 nI$, $B_{\text{medium}} = \mu_0 \mu_r nI = \mu_r B_0$

$$1.4 = \mu_r \times 6.5 \times 10^{-4}$$

$$\therefore \mu_r = \frac{1.4}{6.5 \times 10^{-4}} = 2154$$

8. (c) Magnetic field, $B = \frac{\phi}{A} = 0.7 \text{ Wb/m}^2$,

$$\mu = \frac{B}{H} = \frac{0.7}{1600} = 4.3 \times 10^{-4} \text{ N/A}^2$$

$$\mu = \mu_0(1 + \chi_m)$$

$$\Rightarrow \chi_m = 340$$

9. (d) $\sqrt{\left(\frac{4}{x^2}\right)} = \frac{4}{4+12} = \frac{4}{16}$

$$\frac{4}{x^2} = \frac{1}{16}$$

$$x = 8 \text{ mWb}$$

10. (a) $B_1 = \frac{\mu_0 M_0}{4\pi r^3}$

$$B_2 = \frac{\mu_0 M_0}{4\pi r^3}$$

$$\therefore B = B_1 - B_2 = 0$$

11. (a) Magnetic field due to magnet (1),

$$B_1 = \frac{\mu_0}{4\pi} \frac{2M_1}{r_1^3} = \frac{10^{-7} \times 2 \times 2}{(0.3)^3} = 1.48 \times 10^{-5} \text{ T}$$

Magnetic field due to magnet (2),

$$B_2 = \frac{\mu_0}{4\pi} \left(\frac{2M_2}{r_2^3} \right) = \frac{10^{-7} \times 2 \times 5}{(0.4)^3} = 1.56 \times 10^{-5} \text{ T}$$

$\therefore$ Net field at P,

$$B = \sqrt{B_1^2 + B_2^2} = 2.15 \times 10^{-5} \text{ T}$$

12. (c)

13. (a) $\therefore B = B_H \tan \theta$

$$\text{or } \frac{\mu_0}{4\pi} \frac{2M}{r^3} = 0.4 \times 10^{-4} \tan 60^\circ$$

$$\therefore \frac{\mu_0 M}{2\pi(0.2)^3} = 0.4 \times 10^{-4} \tan 60^\circ$$

$$M = \frac{0.4 \times 4\pi \times (0.2)^3 \times 10^{-4} \times \sqrt{3}}{2 \times \mu_0}$$

$$= \frac{0.00277 \times 10^{-4}}{10^{-7}}$$

$$\therefore M = 2.77 \text{ Am}^2$$

14. (a)

15. (a)

16. (a) As, $B = \mu_0(H + I)$

$$\Rightarrow dB = \mu_0 dH + \mu_0 dI$$

$$\text{or } \oint H dB = \mu_0 \oint H dH + \mu_0 \oint H dI$$

$$\oint H dH = 0$$

$$\oint H dB = \mu_0 \oint H \cdot dI$$

Area of the B - H loop $= \mu_0 \times$ area of I - H loop

$$\text{i.e. } A_2 = \mu_0 A_1$$

17. (a) P is in the plane S , needle is in north, so the declination is zero.

P is also on the magnetic equator, so the angle of dip $= 0$, because the value of angle of dip at equator is zero Q is also on the magnetic equator, thus the angle of dip is zero. As earth tilted on its axis by 11.3° , thus the declination at Q is 11.3° .

18. (c) Pole strength of the original magnet, $m = \frac{M}{14}$

Effective distance between the poles $= AB$

$$= \sqrt{6^2 + 8^2}$$

$$= 10 \text{ cm}$$

$\therefore$ Magnetic moment of the combination

$$M' = m \cdot 2l = \frac{M}{14} \times 10 = \frac{M}{14}$$

19. (b)

Taking moment about O ,

$$Mgl = mB_v L + mB_v L$$

$$Mg = 2mB_v$$

$$\frac{50}{1000} \times 981 = 2 \times 98.1 \times B_v$$

$$B_v = 0.25 \text{ gauss}$$

20. (c) Torque (τ) acting on magnet (1),

$$\tau_1 = MB \sin \theta$$

$$\text{Similarly, } \tau_2 = \sqrt{3} MB \sin \theta$$

$$\therefore \theta = 60^\circ$$

But for equilibrium, $\tau_1 = \tau_2$

$$\therefore MB \sin \theta = \sqrt{3} MB \cos \theta$$

$$\tan \theta = \sqrt{3} = \tan 60^\circ$$

$$\therefore \theta = 60^\circ$$

21. (a) $C = MB \sin \theta$

$$= (m \times 2l) \times 2 \times 10^{-5} \sin 30^\circ$$

$$= 15 \times 10 \times 10^{-2} \times 2 \times 10^{-5} \times \frac{1}{2}$$

$$= 1.5 \times 10^{-5} \text{ Nm}$$

22. (a) 23. (a) 24. (a) 25. (a) 26. (a) 27. (a)

28. (b) In the case of vertical cutting, $T_1 = \frac{\text{Original time period}}{n}$

$$T_1 = \frac{T_0}{3} \text{ (Here, } n = \text{number of equal parts)}$$

29. (a) For each part, $l_1 = \frac{l}{4}$

and $M_1 = \frac{M}{2}$

$$\therefore T = 2\pi \sqrt{\left(\frac{l}{MB}\right)}$$

and $T_1 = 2\pi \sqrt{\left(\frac{l_1}{M_1 B}\right)} = 2\pi \sqrt{\left(\frac{l \times 2}{4M \times B}\right)}$

$$\therefore \frac{T_1}{T} = \frac{1}{\sqrt{2}}$$

$$\therefore T_1 = \frac{T}{\sqrt{2}} = \frac{T_0}{\sqrt{2}}$$

30. (d) As, $n = \frac{400}{2\pi R} = \frac{400}{40 \times 10^{-2}} = 1000$

$$\mu = ni = 1000 \times 2 = 2000$$

$$\Rightarrow \mu_0 \mu_r = \frac{1}{2000} = 5 \times 10^{-4}$$

$$\Rightarrow \mu_r = \frac{5 \times 10^{-4}}{\mu_0} = \frac{5 \times 10^{-4}}{4\pi \times 10^{-7}} = 398$$

$$\Rightarrow \chi = \mu_r - 1 = 397$$

31. (c) 32. (a) 33. (a)

34. (c) Energy loss per unit volume per cycle
= area of hysteresis loop
Energy loss per second per unit volume
= $10^{-2} \times 50 \text{ J}$

Also, heat produced Q in one minute per volume

$$Q = 10^{-2} \times 50 \times 60 \text{ J} = \frac{30}{4.2} \text{ cal}$$

Let θ = rise in temperature

$$\therefore 8 \times 10^3 \times 0.11 \times 10^{-3} \times \theta = \frac{30}{4.2}$$

$$\theta = \frac{30}{4.2 \times 8 \times 0.11} = 8.1^\circ \text{C}$$

BITSAT Archives

1. (b) $\chi = \frac{C}{T}$

$$\Rightarrow \frac{\chi_1}{\chi_2} = \frac{T_2}{T_1} \Rightarrow \frac{1.2 \times 10^{-5}}{1.8 \times 10^{-5}} = \frac{T_2}{300}$$

$$\Rightarrow T_2 = \frac{12}{18} \times 300 = 200 \text{ K}$$

2. (d) Work done, $W = MB(1 - \cos \theta)$

$$\theta = 90^\circ$$

$$\therefore W = MB$$

3. (c) Torque, $\tau = \mathbf{M} \times \mathbf{B}$

4. (a) At the magnetic north pole, the magnetic needle will point vertically. There is no component of earth's magnetic field in the horizontal direction and the angle of dip (the angle that the resultant magnetic field at the place makes with the horizontal) is 90° .

$$H = 0, \quad \delta = 90^\circ \text{ (maximum)}$$

5. (c) Time period of magnet, $T = 2\pi \sqrt{\frac{I}{MB}}$

When magnet is cut parallel to its length into four equal pieces.

Then,

New magnetic moment, $M' = \frac{M}{4}$

Moment of inertia, $I' = \frac{I}{4}$

$$\therefore \text{New time period, } T' = 2\pi \sqrt{\frac{I'}{M'B}}$$

$$\Rightarrow \text{New time period, } T = T' = 4 \text{ s}$$

6. (a) On bending a wire its pole strength remains unchanged, whereas its magnetic moment changes.
New magnetic moment,

$$M' = m(2r) = m \left(\frac{2l}{\pi} \right) = \frac{2M}{\pi}$$

7. (a) Susceptibility of the ferromagnetic substance is always greater than 1.

8. (c) Diamagnetic materials have negative susceptibility.
Thus, (c) is wrongly stated.

27

Electromagnetic Induction (EMI)

Electromagnetic Induction

Electromagnetic induction is the phenomenon due to which an induced emf is set up in a conductor or in an electric circuit, on changing the magnetic flux linked with it.

Magnetic Flux

The total number of magnetic lines of force passing normally through an area placed in a magnetic field is equal to the **magnetic flux** linked with that area.

Net flux through the surface, $\phi = \int \mathbf{B} \cdot d\mathbf{A} = BA \cos \theta$

where, ϕ = magnetic flux passing through the surface

B = magnetic field at the surface and θ = angle between $\mathbf{B}$ and $d\mathbf{A}$

$d\mathbf{A}$ = a vector perpendicular to the surface and has a magnitude equal to the area dA

For N turns coil, $\phi = NBA \cos \theta$

Magnetic flux is a scalar quantity. Its SI unit is weber (Wb) and CGS unit is maxwell or gauss $\times \text{cm}^2$.

$1 \text{ Wb} = 10^8 \text{ maxwell}$. It is also expressed in tesla $\times \text{m}^2$.

Its dimensional formula is $[\phi] = [\text{ML}^2\text{T}^{-2}\text{A}^{-1}]$.

Faraday's Laws of Electromagnetic Induction

Faraday had introduced two laws of electromagnetic induction which are as follows

Faraday's First Law

This law states that, whenever the number of magnetic lines of forces (magnetic flux) passing through a circuit changes (or a moving conductor cuts the magnetic flux), an emf is produced in the circuit (or emf induces across the ends of the conductor) called **induced emf**. The induced emf persists only as long as the flux is changing.

Faraday's Second Law

This law states that, induced emf in the circuit is equal to the rate of change of magnetic flux linked with the circuit

i.e.
$$e = -\frac{d\phi}{dt}$$

where, e = induced emf, $\frac{-d\phi}{dt}$ = change in magnetic flux.

For N turns,
$$e = -\frac{Nd\phi}{dt}$$

Here, negative sign indicates that induced emf opposes the change of flux in the circuit.

Lenz's Law

This law gives the direction of induced emf/induced current. According to this law, the direction of induced emf or induced current in a circuit is such as to oppose the cause that produced it. This law is another form of **law of conservation of energy**.

e.g. If a magnet approaches a coil as shown, then an anti-clockwise current is induced in the coil and the coil opposes approaching magnet. So, some work has to be done to move magnet towards the coil and this work appears in the form of electrical energy.

Motional Emf

Let a conducting rod of length l be moving with a uniform velocity v perpendicular to a uniform magnetic field B , an induced emf is set up. The magnitude of the induced emf will be $|e| = Blv$.

If the rod is moving such that it makes an angle θ with the direction of the magnetic field, then $|e| = Blv \sin \theta$. Hence, for the motion parallel to B , the induced emf is zero.

When a conducting rod moves horizontally, then an induced emf is set up between its ends due to the vertical component of the earth's magnetic field. However, at the magnetic equator, induced emf will be zero because $B_V = 0$.

Motional Emf in a Loop

If a conducting rod moves on two parallel conducting rails then an emf is induced whose magnitude is $|e| = Blv$ and the direction is given by the Fleming's right hand rule.

Induced current, $|I| = \frac{|e|}{R} = \frac{Blv}{R}$

Rotational Emf

Let a conducting rod of length l rotate about an axis passing through one of its ends (that end may be fixed), with an angular velocity ω in a plane perpendicular to the magnetic field B , then an induced emf is set up between the ends of the rod, whose magnitude is given by

$$|e| = \frac{1}{2} Bl^2 \omega$$

Self-Induction

Whenever the electric current passing through a coil or circuit changes, the magnetic flux linked with it will also change. As a result of this, in accordance with Faraday's laws of electromagnetic induction, an emf is induced in the coil or in the circuit which opposes the change that causes it.

This phenomenon is called **self-induction** and the emf induced is called **back emf**, current so produced in the coil is called induced current.

If no magnetic materials are present near the coil, then number of flux linkages with the coil is proportional to the current i , i.e. $N\phi \propto i$ or $N\phi = Li$ (N is the number of turns in coil and $N\phi$ = total flux linkage), where $L = \frac{N\phi}{i}$, coefficient of self-induction. If $i = 1$ A, $N = 1$ then, $L = \phi$ i.e. the coefficient of self-induction of a coil is equal to the flux linked with the coil when the current in it is 1 A and number of turns is one.

By Faraday's second law, induced emf, $e = -N \frac{d\phi}{dt}$, which

gives $e = -L \frac{di}{dt}$

Then, the voltage (V) induced across the inductor,

$$V = |e| = \frac{di}{dt} \times L$$

Its SI unit is $\frac{\text{weber}}{\text{amp}}$.

But its practical unit is henry (H). Its dimensional formula is $[L] = [ML^2T^{-2}A^{-2}]$.

Inductance of a Solenoid

Let us find the inductance of a uniformly wound solenoid having N turns and length l . Assume that l is much longer than the radius of the windings and that the core of the solenoid is air. We can assume that the interior magnetic field due to a current i is uniform and given by equation,

$$B = \mu_0 ni = \mu_0 \left(\frac{N}{l} \right) i$$

where, $n = \frac{N}{l}$ is the number of turns per unit length.

The magnetic flux through each turn is,

$$\phi_B = BS = \mu_0 \frac{NS}{l} i$$

Here, S is the cross-sectional area of the solenoid. Now,

$$L = \frac{N\phi_B}{i} = \frac{N}{i} \left(\frac{\mu_0 NSi}{l} \right) = \frac{\mu_0 N^2 S}{l}$$

$$\therefore L = \frac{\mu_0 N^2 S}{l}$$

This result shows that L depends on dimensions (S, l) and is proportional to the square of the number of turns.

$$L \propto N^2$$

Because $N = nl$, we can also express the result in the form,

$$L = \mu_0 \frac{(nl)^2}{l} S = \mu_0 n^2 Sl = \mu_0 n^2 V \text{ or } L = \mu_0 n^2 V$$

Here, $V = Sl$ is the volume of the solenoid.

Energy Stored in an Inductor

The energy of a capacitor is stored in the form of electric field between its plates. Similarly, an inductor has the capability of storing energy in the form of magnetic field.

An increasing current in an inductor causes an emf between its terminals.

The work done per unit time is power.

$$P = \frac{dW}{dt} = -ei = -Li \frac{di}{dt}$$

$$\text{From, } dW = -dU \text{ or } \frac{dW}{dt} = -\frac{dU}{dt}$$

$$\text{we have, } \frac{dU}{dt} = Li \frac{di}{dt} \text{ or } dU = Li di$$

The total energy U supplied while the current increases from zero to a final value i is,

$$U = L \int_0^i di = \frac{1}{2} Li^2 \therefore U = \frac{1}{2} Li^2$$

Mutual Induction

Whenever the current passing through a coil or circuit changes, the magnetic flux linked with a neighbouring coil or circuit will also change. Hence, an emf will be induced in the neighbouring coil or circuit.

This phenomenon is called **mutual induction**.

In case of mutual inductance for two coils situated close to each other, total flux linked with the secondary coil due to current in the primary coil is

$$N_2 \phi_2$$

$$\text{and } N_2 \phi_2 \propto i_1 \Rightarrow N_2 \phi_2 = M i_1$$

where, N_1 is the number of turns in primary coil; N_2 is the number of turns in secondary coil; ϕ_2 is the flux linked with each turn of secondary coil; i_1 is the current flowing through primary coil; M is the coefficient of mutual induction or mutual inductance.

$$\text{Emf induced in secondary coil, } e_2 = -N_2 \frac{d\phi_2}{dt}; e_2 = -M \frac{di_1}{dt}$$

If $\frac{di_1}{dt} = 1 \text{ A/s}$, then $|e_2| = M$. Hence, coefficient of mutual

induction is equal to the emf induced in the secondary coil when rate of change of current in primary coil is unity.

Mutual Inductance between Two Coils

- (i) If two coils (1 and 2) also called primary and secondary coils are placed close to each other (maximum coupling), then mutual inductance between them

$$M = \frac{B_1 N_2 A_2}{i_1}$$

where, N_1 and N_2 = number of turns in primary and secondary coils respectively, ϕ_2 = flux linked with each turn of secondary coil, $N_2 \phi_2$ = total flux linkage with secondary coils, M = mutual inductance between two coils.

- (ii) If the coils are two concentric coplanar circular coils, then mutual inductance between them

$$M = \frac{\pi \mu_0 N_1 N_2 r^2}{2R}$$

$$\Rightarrow M \propto \frac{r^2}{R}$$

- (iii) For **two solenoids** tightly wound to each other as shown.

Magnetic field inside the primary solenoid,

$$B_1 = \mu_0 n_1 i_1 \quad \left(n_1 = \frac{N_1}{l} \right)$$

$$\text{Thus, } M = \frac{\mu_0 N_1 N_2 A}{l}$$

where, A = area of each solenoid,
 l = length of each solenoid

Combination of Inductors

If two coils of self-inductances L_1 and L_2 are placed quite far apart and are arranged in series, then their equivalent inductance

$$L_s = L_1 + L_2$$

However, if the coils are placed quite close to each other, so as to mutually affect each other, then

$$L_s = L_1 + L_2 \pm 2M$$

Here, M has been written with $\pm$ sign depending on the fact whether currents in the two coils are flowing in same sense or opposite sense.

If two coils of self-inductances L_1 and L_2 are connected in parallel, then equivalent inductance L_p is given by

$$\frac{1}{L_p} = \frac{1}{L_1} + \frac{1}{L_2} \Rightarrow L_p = \frac{L_1 L_2}{L_1 + L_2}$$

In a parallel arrangement, effect of mutual inductance may be omitted because value of k in this arrangement is quite small.

Growth and Decay of Current in an Inductance Resistance Circuit

Consider a circuit containing a resistance R and inductance L , a two-way key and a battery of emf E connected in series as shown in figure. We consider the following cases

- (a) When the switch is connected to position b , the rise of current in R - L circuit takes place.

The growth of the current in the circuit is given by

$$i = i_0(1 - e^{-t/\tau})$$

where, $i_0 = \frac{E}{R}$ and $\tau = \frac{L}{R}$ = time constant of the circuit.

$$\therefore i = \frac{E}{R} \left[1 - \exp\left(-\frac{R}{L}t\right) \right]$$

In case of growth of current, when $t = \lambda$, then $i = 0.632i_0$

- (b) When the switch S is connected to position a , decay of the current in R - L circuit takes place. The current in this case is given by

$$i = i_0 \exp\left(-\frac{t}{\tau}\right) = i_0 \exp\left(-\frac{t}{\tau}\right)$$

In case of decay of current, when $t = \lambda$, then $i = 0.368i_0$

The growth and decay of the current is shown in figure.

Practice Exercise

- The magnetic flux ϕ (in weber) in a closed circuit of resistance 10Ω varies with time t (in second) according to equation $\phi = 6t^2 - 5t + 1$. The magnitude of induced current at $t = 0.25$ s
 a. 1.2 A b. 0.8 A c. 0.6 A d. 0.2 A
- A metallic circular loop of radius r is placed in uniform magnetic field B acting perpendicular to the plane of the loop. A naughty boy pulls diametrically opposite corner so that after sometime, the loop changes into an ellipse of major and minor radius a and b . If total resistance of loop is R and it remains constant during the pulling. Find average charge flowing through loop during pulling.
 a. $\frac{B(\pi ab)}{R}$ b. $\frac{B(\pi ab - \pi r^2)}{R}$
 c. $\frac{B\pi r^2}{R}$ d. $\frac{B\pi br}{R}$
- Three resistances of magnitude R each are connected in the form of an equilateral triangle of side a . The combination is placed in a magnetic field $B = B_0 e^{-\lambda t}$ perpendicular to the plane. The induced current in the circuit is given by
 a. $\left(\frac{a^2 \lambda}{2\sqrt{3}R} B_0\right) e^{-\lambda t}$ b. $\left(\frac{a^2 \lambda}{4(\sqrt{3})R} B_0\right) e^{-\lambda t}$
 c. $\left(\frac{a^2 B_0}{\lambda 4\sqrt{3}R}\right) e^{-\lambda t}$ d. $\left(\frac{a^2 B_0 R}{\lambda 4\sqrt{3}}\right) e^{-\lambda t}$

4. A helicopter rises vertically with a speed of 10 ms^{-1} . If helicopter has a length of 10 m and the horizontal component of the earth's magnetic field is $1.5 \times 10^{-3} \text{ Wbm}^{-2}$, the emf induced between the tip of the nose and the tail of the helicopter, is
 a. 0.15 V b. 125 V c. 130 V d. 5 V
5. An air-cored solenoid with length 30 cm, area of cross-section 25 cm^2 and number of turns 500, carries a current of 2.5 A. The current is suddenly switched off in a brief time of 10^{-3} s . How much is the average back emf induced across the ends of the open switch in the circuit? Ignore the variation in magnetic field near the ends of the solenoid.
 a. 6.5 V b. 7.4 V c. 8.2 V d. 9.3 V
6. A fan blade of length $2a$ rotates with frequency f cycle per second perpendicular to magnetic field B . Then, potential difference between centre and end of blade is
 a. $\pi B a^2 f$ b. $4\pi B a f$ c. $4\pi a^2 B f$ d. $2\pi a B f$
7. A metal rod AB of length l is rotated with a constant angular velocity ω about an axis passing through O and normal to its length. Potential difference between ends of rod in absence of external magnetic field (where, e = electric charge)
 a. zero b. $\frac{m\omega^2 l^2}{4e}$ c. $\frac{m\omega^2 l^2}{2e}$ d. $\frac{m\omega^2 l^2}{8e}$
8. A wire is sliding as shown in the figure. The angle between the acceleration and velocity of the wire is

 a. 30° b. 40°
 c. 120° d. 90°
9. A fan blade of length $1/\sqrt{\pi}$ metre rotates with frequency 5 cycle per second perpendicular to a magnetic field 10 tesla. What is potential difference between the centre and the end of blade?
 a. -50 V b. +50 V
 c. -2.0 V d. +0.02 V
10. A coil has an area of 0.05 m^2 and has 800 turns. After placing the coil in a magnetic field of strength $4 \times 10^{-5} \text{ Wbm}^{-2}$, perpendicular to the field, the coil is rotated by 90° in 0.1 s. The value of average emf induced is
 a. zero b. 0.016 V
 c. 0.01 V d. 0.032 V

11. In the figure shown, a coil of single turn is wound on a sphere of radius r and mass m . The plane of the coil is parallel to the inclined plane and lies in the equatorial plane of the sphere. If sphere is in rotational equilibrium, the value of B is (current in the coil is I)

 a. $\frac{mg}{\pi I r}$ b. $\frac{mg \sin \theta}{\pi I}$
 c. $\frac{mgr \sin \theta}{\pi I}$ d. None of these

12. The loop $ABCD$ is moving with velocity ' v ' towards right. The magnetic field is 4 T. The loop is connected to a resistance of 8Ω . If steady current of 2 A flows in the loop then value of v if loop has a resistance of 4Ω , (Given, $AB = 30 \text{ cm}$, $AD = 30 \text{ cm}$) is

- a. $\frac{50}{3} \text{ m/s}$ b. 20 m/s
 c. 10 m/s d. $\frac{100}{3} \text{ m/s}$
13. Calculate the self-inductance of the air cored solenoid of length 80 cm and has 500 turns and its circular cross-section has diameter of 2 cm.
 a. $150.6 \mu\text{H}$ b. $162.2 \mu\text{H}$
 c. $123.3 \mu\text{H}$ d. $102.5 \mu\text{H}$
14. The inductance per unit length of a double tape line as shown in the figure.

- a. $\frac{\mu_0 h}{b}$ b. $\frac{b}{\mu_0 h}$
 c. $\frac{\mu_0 b}{h}$ d. $\frac{hb}{\mu_0}$
15. What is the mutual inductance of coil and solenoid if a solenoid of length 0.50 m and with 5000 turns of wire has a radius 4 cm and a coil of 700 turns is wound on the middle part of the solenoid?
 a. 44.17 mH b. 48.98 mH
 c. 34.34 mH d. 36.73 mH

16. When the current changes from $+2\text{ A}$ to -2 A in 0.05 s , an emf of 8 V is induced in a coil. The coefficient of self-induction of the coil is
- 0.1 H
 - 0.2 H
 - 0.4 H
 - 0.8 H
17. A closed circuit consists of a source of emf E and an inductor coil of inductance L , connected in series. The active resistance of whole circuit is R . At the moment $t = 0$, inductance of coil abruptly decreased to L/n . Then, current in the circuit immediately after, is
- zero
 - E/R
 - $\frac{nE}{R}$
 - $\frac{E}{nR}$
18. Three pure inductors each of 2 H are connected as shown in the figure. The equivalent inductance of the circuit is

- $8\text{ H}/6$
 - 6 H
 - 2 H
 - None of these
19. The sum and the difference of self-inductances of two coils are 13 H and 5 H respectively. The maximum mutual inductances of two coils is
- 6 H
 - 5 H
 - $\sqrt{65}\text{ H}$
 - 18 H
20. In the figure, the steady state current through the inductor will be

- zero
 - 1 A
 - 1.25 A
 - Cannot be determined
21. Determine the value of time constant for the given circuit.

- $\frac{L}{R_1 + r + R_2}$
- $\frac{L}{(R_1 + r)}$
- $\frac{L(R_1 + R_2 + r)}{(R_1 + r)R_2}$
- None of these

22. The time constant for the given circuit is

- 4 s
 - $1/4\text{ s}$
 - 2 s
 - $1/2\text{ s}$
23. With usual notations, the energy dissipation in an ideal inductor is given by
- LI
 - $\frac{1}{2}LI$
 - $\frac{1}{2}LI^2$
 - None of the above
24. A non-conducting ring of radius r has charge per unit length λ . A magnetic field perpendicular to plane of the ring changes at rate dB/dt . Torque experienced by the ring is

- $\lambda\pi r^3 \frac{dB}{dt}$
 - $\lambda 2\pi r^3 \frac{dB}{dt}$
 - $\lambda^2(2\pi r)^2 r \frac{dB}{dt}$
 - zero
25. Figure shows a uniform magnetic field B confined to a cylindrical volume of radius R . If B is increasing at constant rate of 0.01 T/s . Instantaneous acceleration experienced by electron at $r = 10\text{ cm}$ ($< R$) as shown in the figure.
- $8.79 \times 10^{-12}\text{ m/s}^2$
 - $8.79 \times 10^{-11}\text{ m/s}^2$
 - $8.79 \times 10^{-10}\text{ m/s}^2$
 - $8.79 \times 10^{-9}\text{ m/s}^2$
26. Find the energy stored in the magnetic field if current of 5 A produces a magnetic flux of $2 \times 10^{-3}\text{ Wb}$ through a coil of 500 turns.
- 2.5 J
 - 0.25 J
 - 250 J
 - 1.5 J
27. The inductance of a coil in which a current of 0.1 A increasing at the rate of 0.5 A/s represents a power flow of $\frac{1}{2}\text{ watt}$, is
- 2 H
 - 8 H
 - 20 H
 - 10 H

BITSAT Archives

1. Lenz's law of electromagnetic induction corresponds to the [2011]
 - a. law of conservation of charge
 - b. law of conservation of energy
 - c. law of conservation of momentum
 - d. law of conservation of angular momentum
2. A toroidal solenoid with an air core has an average radius of 15 cm, area of cross-section 12 cm^2 and 1200 turns. Ignoring the field variation across the cross-section of the toroid the self-inductance of the toroid is [2011]
 - a. 4.6 mH
 - b. 6.9 mH
 - c. 2.3 mH
 - d. 9.2 mH
3. A coil of inductance L is carrying a steady current I . What is the nature of its stored energy? [2011]
 - a. Magnetic
 - b. Electrical
 - c. Both magnetic and electrical
 - d. Heat
4. If emf induced in a coil is 2 V by changing the current in it from 8 A to 6 A in $2 \times 10^{-3} \text{ s}$. Then, the coefficient of self-induction is [2006]
 - a. $2 \times 10^{-3} \text{ H}$
 - b. 10^{-3} H
 - c. $0.5 \times 10^{-3} \text{ H}$
 - d. $4 \times 10^{-3} \text{ H}$
5. If in a triode valve amplification factor is 20 and plate resistance is $10 \text{ k}\Omega$, then its mutual conductance is [2006]
 - a. 2 milli mho
 - b. 20 milli mho
 - c. (1/2) milli mho
 - d. 200 milli mho
6. The induction coil works on the principle of [2005]
 - a. self-induction
 - b. mutual induction
 - c. Ampere's rule
 - d. Fleming's right hand rule

Answer with Solutions

Practice Exercise

1. (d)
2. (b)

3. (b) $\phi = BA = B_0 e^{-\lambda t} \frac{\sqrt{3}}{4} a^2$

$$e = -\frac{d\phi}{dt} = -\frac{\sqrt{3}}{4} a^2 B_0 \frac{d}{dt} (e^{-\lambda t})$$

$$= -\frac{\sqrt{3}}{4} a^2 B_0 (-\lambda) e^{-\lambda t} = \frac{\sqrt{3}}{4} a^2 B_0 \lambda e^{-\lambda t}$$

$$\therefore I = \frac{e}{3R} = \frac{\sqrt{3}}{12R} a^2 B_0 \lambda e^{-\lambda t} = \left(\frac{a^2 \lambda B_0}{4\sqrt{3}R} \right) e^{-\lambda t}$$

4. (a)

5. (a) Given, length of solenoid $l = 30 \text{ cm} = 30 \times 10^{-2} \text{ m}$

Area of cross-section $A = 25 \text{ cm}^2 = 25 \times 10^{-4} \text{ m}^2$

Number of turns, $N = 500$

Current, $I_1 = 21.5 \text{ A}$, $I_2 = 0$

Brief time $dt = 10^{-3} \text{ s}$

Induced emf in the solenoid

$$e = \frac{d\phi}{dt} = \frac{d}{dt} (BA) \quad [\because \phi = BA]$$

Magnetic field induction B at a point well inside the long solenoid carrying current I is

$$B = \mu_0 n I \quad \left(\text{where, } n = \text{number of turns per unit length} = \frac{N}{l} \right)$$

$$e = NA \frac{dB}{dt} = A \frac{d}{dt} \left(\mu_0 \frac{N}{l} I \right) = A \frac{\mu_0 N}{l} \cdot \frac{dI}{dt}$$

$$e = 500 \times 25 \times 10^{-4} \times 4 \times 3.14 \times 10^{-7} \times \frac{500}{30 \times 10^{-2}} \times \frac{2.5}{10^{-3}}$$

$$= 6.5 \text{ V}$$

6. (a)

7. (b) $eV = m\omega^2 x \Rightarrow V = \frac{m\omega^2 x}{e}$

$$dV = \frac{m\omega^2}{e} dx \Rightarrow V = \frac{m\omega^2}{e} \int_{1/4}^{3/4} x dx = \frac{m\omega^2 l^2}{4e}$$

8. (c) The magnetic force on the wire is perpendicular to wire. (shown in the figure)

$$\therefore \text{Angle} = 30^\circ + 90^\circ = 120^\circ$$

9. (a) $\int_{V_0}^{V_D} de = - \int_0^a B x \omega dx$

$$V_D - V_0 = - \frac{1}{2} B a^2 \omega$$

$$= - \frac{1}{2} \times 10 \times 5 \times 2\pi \times \frac{1}{\pi} = -50 \text{ V}$$

10. (b)

11. (a) Torque due to magnetic force = torque due to gravitational force

or $MB \sin (180 - \theta) = mgr \sin \theta$

or $MB \sin \theta = mgr \sin \theta$

$$\therefore B = \frac{mgr}{M} = \frac{mgr}{\pi r^2} = \frac{mg}{\pi r}$$

12. (d)
- $e = BAD \sin 37^\circ v = 4 \times 0.3 \sin 37^\circ v$

$$I = \frac{4 \times 0.3 \times 0.6 v}{(4 + 8)} = 2 \Rightarrow v = \frac{24 \times 10}{4 \times 0.6 \times 3} = \frac{100}{3} \text{ m/s}$$

13. (c)

14. (a) Neglecting end effects of magnetic field, we have

$$B = \frac{\mu_0 I}{b}$$

Flux ϕ per unit length of the plates is

$$\frac{\mu_0 I}{b} \times h \times l = \frac{\mu_0 h l}{b}$$

$$\text{Also, } \phi = LI \Rightarrow L = \frac{\mu_0 h}{b}$$

15. (a) Flux linked with coil

$$\phi_2 = N_2 B I A = \frac{\mu_0 N_1 N_2 \pi r^2 I}{l} \text{ also } \phi = M I$$

Comparing the equations,

$$M = \frac{\mu_0 N_1 N_2 \pi r^2}{l}$$

$$M = \frac{4 \times 3.14 \times 10^{-7} \times 5000 \times 700 \times 3.14 \times (4 \times 10^{-2})^2}{0.5}$$

$$M = 44.17 \text{ mH}$$

16. (a)
- $e = L \frac{\Delta I}{\Delta t}$

$$\therefore L = \frac{e}{\frac{\Delta I}{\Delta t}} = \frac{8}{\frac{0.05}{0.05}} = \frac{8 \times 0.05}{4} = 0.1 \text{ H}$$

17. (c) Due to change in inductance, magnetic flux remains constant.

But, $\phi = LI = \text{constant}$

$$\text{Here, } L_2 = \frac{L_1}{n} \text{ and } I_1 = \frac{E}{R} \therefore I_2 = \frac{L_1 I_1}{L_2} = \frac{nE}{R}$$

18. (a)

19. (a)
- $L_1 + L_2 = 13$

$$L_1 - L_2 = 5$$

Adding Eqs. (i) and (ii), we get

$$2L_1 = 18 \therefore L_1 = 9 \text{ H}$$

$$\therefore L_2 = L_1 - 5 = 9 - 5 = 4 \text{ H} \therefore M = K \sqrt{L_1 L_2}$$

$$\therefore M_{\max} = K_{\max} \sqrt{9 \times 4} = 1 \times \sqrt{36} = 6 \text{ H} \quad [\because K_{\max} = 1]$$

20. (c)

$$21. (c) \text{ Here, } R_{\text{eq}} = \frac{(R_1 + r)R_2}{R_1 + r + R_2} \therefore \tau = \frac{L}{R} = \frac{L(R_1 + R_2 + r)}{(R_1 + r)R_2}$$

22. (b)

23. (d)

$$24. (a) e = \frac{d\phi}{dt} = \pi r^2 \frac{dB}{dt} \Rightarrow E(2\pi r) = \pi r^2 \frac{dB}{dt}$$

$$E = \frac{1}{2} r \frac{dB}{dt} \Rightarrow dF = \lambda dSE$$

$$\Rightarrow d\tau = r \lambda dSE \Rightarrow \tau = \lambda r E \int dS = \lambda r E 2\pi r$$

$$= 2\pi r^2 \lambda \frac{1}{2} r \frac{dB}{dt} = \pi r^3 \lambda \frac{dB}{dt}$$

$$25. (b) E(2\pi r) = \pi r^2 \frac{dB}{dt} \Rightarrow E = \frac{1}{2} r \frac{dB}{dt}$$

$$a = \frac{eE}{m_e} = \frac{\frac{e}{2} r \left(\frac{dB}{dt} \right)}{m_e} = \frac{1.6 \times 10^{-19} \times \frac{1}{2} \times 0.1 \times 0.01}{9.1 \times 10^{-31}}$$

$$= 8.79 \times 10^{-11} \text{ m/s}^2$$

26. (a)

27. (d)

BITSAT Archives

1. (b) Lenz's law of electromagnetic induction corresponds to the law of conservation of energy.

2. (c) For a solenoid,

$$B = \mu_0 n I$$

$$\therefore n = \frac{N}{2\pi r}$$

$$\therefore B = \frac{\mu_0 N I}{2\pi r}$$

Flux linked with the solenoid

$$\phi = NBA$$

$$\phi = \frac{\mu_0 N^2 I A}{2\pi r} = \frac{4\pi \times 10^{-7} \times (1200)^2 \times 12 \times 10^{-4}}{2\pi \times 15 \times 10^{-2}}$$

$$L = 2.3 \times 10^{-3} \text{ H}$$

$$= 2.3 \text{ mH}$$

3. (a) Energy is stored in an inductor in the form of magnetic potential energy.

4. (a) Induced emf,
- $e = 2 \text{ V}$

$$i_1 = 8 \text{ A, } i_2 = 6 \text{ A} \Rightarrow \Delta t = 2 \times 10^{-3}$$

Coefficient of self-induction

$$L = \frac{e}{\Delta i / \Delta t} = \frac{-2}{(6 - 8) / 2 \times 10^{-3}} = \frac{-2 \times 2 \times 10^{-3}}{-2} = 2 \times 10^{-3} \text{ H}$$

5. (a) Amplification factor
- $\mu = 20$

$$\text{Plate resistance } R_p = 10 \text{ k}\Omega = 10 \times 10^{-3} \Omega$$

$$\therefore \text{Mutual conductance } g_m = \frac{\mu}{R_p}$$

$$= \frac{20}{10 \times 10^3}$$

$$= 2 \times 10^{-3} \text{ mho or 2 milli mho}$$

6. (b) The induction coil works on the principle of mutual induction.

Alternating Current and EM Wave

Alternating Current

An **alternating current** is the current (or voltage) whose magnitude keeps on changing continuously with time, between zero and a maximum value and the direction also reverses periodically.

Alternating current or voltage varying as sine function can be written as

$$i = i_0 \sin \omega t = i_0 \sin 2\pi \nu t = i_0 \sin \frac{2\pi}{T} t$$

and $V = V_0 \sin \omega t = V_0 \sin 2\pi \nu t = V_0 \sin \frac{2\pi}{T} t$

where, i and V = instantaneous values of current and voltage,

i_0 and V_0 = peak values of current and voltage respectively.

ω = angular frequency in rad/s, ν = Frequency (in Hz) and T = time period.

Mean Square Value ($\bar{V}^2$ or $\bar{i}^2$)

The average of square of instantaneous values in one cycle, is called mean square value. It is always positive for one complete cycle.

e.g.
$$\bar{V}^2 = \frac{1}{T} \int_0^T V^2 dt = \frac{V_0^2}{2} \text{ or } \bar{i}^2 = \frac{i_0^2}{2}$$

Root Mean Square (rms) Value

Root mean square of voltage or current in an AC circuit for one complete cycle is called rms value. It is denoted by V_{rms} or i_{rms} .

$$i_{\text{rms}} = \sqrt{\frac{i_1^2 + i_2^2 + \dots}{n}} = \sqrt{i^2} = \sqrt{\frac{\int_0^T i^2 dt}{\int_0^T dt}} = \frac{i_0}{\sqrt{2}}$$

$$= 0.707 i_0 = 70.7\% \text{ of } i_0$$

Similarly, $V_{\text{rms}} = V_0 / \sqrt{2} = 0.707 V_0 = 70.7\% \text{ of } V_0$

The rms value of alternating current is also called **virtual value** or **effective value**.

Mean or Average Value (i_{av} or V_{av})

The average of instantaneous values of current or voltage in one cycle is called its mean value. The average value of alternating quantity for one complete cycle is zero.

The average value of AC over half cycle ($t = 0$ to $T/2$) is

$$i_{\text{av}} = \frac{\int_0^{T/2} i dt}{\int_0^{T/2} dt} = \frac{2i_0}{\pi} = 0.637 i_0 = 63.7\% \text{ of } i_0$$

Similarly, $V_{\text{av}} = \frac{2V_0}{\pi} = 0.637 V_0 = 63.7\% \text{ of } V_0$

AC Circuit Elements

The circuits consist of resistor, capacitor and inductor are called pure resistive, pure inductive and pure capacitive circuits. These circuits with their respective phasor diagram are given below.

1. Pure Resistive Circuit

Let an alternating voltage $V = V_0 \sin \omega t$ be applied across a pure resistance R . Then,

$$\text{Current, } I = \frac{V}{R} \text{ or } I_{\text{rms}} = \frac{V_{\text{rms}}}{R}$$

Current and voltage are in the same phase, i.e. current is given by $I = I_0 \sin \omega t$.

2. Pure Inductive Circuit

Let an alternating voltage $V = V_0 \sin \omega t$ be applied across a pure inductance L . Then, the average power

$$= V_{\text{rms}} I_{\text{rms}} \cos \frac{\pi}{2} = 0$$

Such a current, for which average power as well as power factor is zero, is called as **wattless current**.

The inductance offers some opposition to the flow of AC. It is known as inductive reactance $X_L = 2\pi v L = L\omega$. Thus, a

pure inductance does not oppose the flow of DC ($\omega = 0$) but opposes the flow of AC.

$$\text{Current flowing, } I = \frac{V}{X_L}$$

The current decreases with an increase in frequency.

The current lags behind the voltage by $\frac{\pi}{2}$ (or voltage leads the current by $\frac{\pi}{2}$) and is thus given by

$$I = I_0 \sin \left(\omega t - \frac{\pi}{2} \right)$$

3. Pure Capacitive Circuit

Let an alternating voltage $V = V_0 \sin \omega t$ be applied across a pure capacitance C . Then,

The capacitance offers some opposition to the flow of DC current but allows AC to pass through it. The opposition offered is known as the **capacitive reactance**.

$$X_C = \frac{1}{C\omega} \Omega$$

$$= \frac{1}{C \times 2\pi v} \Omega$$

$$\text{Current flowing, } I = \frac{V}{X_C}$$

For DC circuit, frequency $v = 0$ and hence, $X_L = 0$ but $X_C = \infty$

The current increases with an increase in frequency.

The current leads the voltage by $\frac{\pi}{2}$ (or voltage lags behind the current by $\frac{\pi}{2}$) and is thus given by $I = I_0 \sin\left(\omega t + \frac{\pi}{2}\right)$

Out of the three elements in an AC circuit, the resistor is called the **active element** because it always opposes the flow of current under all conditions.

Series AC Circuits

Some of the series AC circuits are given below

1. Series L-R Circuit

The potential difference across a resistance in AC is in phase with current and it leads in phase by 90° with current across the inductor.

For $E = E_0 \sin \omega t$
 $I = \frac{E_0}{Z} \sin(\omega t - \phi)$

where, $Z = \sqrt{R^2 + (\omega L)^2}$

and $\tan \phi = \frac{\omega L}{R}$

$$V = \sqrt{V_R^2 + V_L^2}$$

where, V_R = voltage across resistor R .

V_L = voltage across inductor L .

Current lags behind the voltage by ϕ .

2. Series R-C Circuit

Potential difference across a capacitor in AC lags in phase by 90° with the current in the circuit.

For $E = E_0 \sin \omega t$,
 $I = \frac{E_0}{Z} \sin(\omega t + \phi)$

where, $Z = \sqrt{R^2 + \left(\frac{1}{\omega C}\right)^2}$

and $\tan \phi = \frac{-1/\omega C}{R}$

Current leads the voltage by ϕ .

$$V^2 = V_R^2 + V_C^2 \Rightarrow V = \sqrt{V_R^2 + V_C^2}$$

3. Series L-C Circuit

For $E = E_0 \sin \omega t$, $I = \frac{E_0}{Z} \sin(\omega t - \phi)$

where,

$$Z = X_L - X_C$$

and $\tan \phi = \frac{X_L - X_C}{0} = \infty$

For $X_L > X_C$, $\phi = \frac{\pi}{2}$ and for $X_L < X_C$, $\phi = -\frac{\pi}{2}$

If $X_L = X_C$ i.e. at $\omega = \frac{1}{\sqrt{LC}}$, $Z = 0$ and I_0 becomes infinity.

This condition is termed as the resonant condition and this frequency is termed as natural frequency of the circuit.

4. L-C-R Series Circuit

As shown in the figure, inductance L , capacitance C and resistance R are connected together in series and supplied with an alternating voltage. In such an arrangement, the same circuit current flows through all the components of the circuit and V_R , V_L and V_C indicate the voltages across the resistor, inductor and capacitor. Fig. (b) shows the circuit conditions when the inductive reactance (X_L) is greater than the capacitive reactance (X_C).

In this case, since both L and C carry the same current and X_L is greater than X_C , it follows that V_L must be greater than

$$V_C, (V_L = I_S X_L \text{ and } V_C = I_S X_C)$$

Remember that V_C and V_L are in anti-phase to each other due to their 90° leading and lagging relationship with the circuit current I_S . As V_L and V_C directly oppose each other, a resulting voltage is created, which will be the difference between V_C and V_L . This is called the **reactive voltage**.

Phasors for V_L and V_C are in anti-phase. So, the circuit in which V_L is greater than V_C , behaves like an inductive circuit.

The phasors for $(V_L - V_C)$, V_R and V_S in the figure form right angled triangle, a number of properties and values in the circuit can be calculated using Pythagoras theorem or some basic trigonometry. Like

$$V_S^2 = (V_L - V_C)^2 + V_R^2 \quad \text{or} \quad V_S = \sqrt{(V_L - V_C)^2 + V_R^2}$$

Total circuit impedance (Z), $Z = \sqrt{(X_L - X_C)^2 + R^2}$

The phase angle between $(V_L - V_C)$ and V_R can be found using trigonometry

$$\therefore \tan \phi = \frac{(V_L - V_C)}{V_R} \Rightarrow \phi = \tan^{-1} \frac{(V_L - V_C)}{V_R}$$

Also, Ohm's law states that R (or X) = $\frac{V}{I}$

If $(V_L - V_C)$ and V_R are each divided by the current I_S . This allows the phase angle θ to be found using the resistances and reactances.

$$\phi = \tan^{-1} \left(\frac{X_L - X_C}{R} \right)$$

At Resonance (Series Resonant Circuit)

- $X_L = X_C \Rightarrow Z_{\min} = R$, i.e. circuit behaves as resistive circuit.
- $V_L = V_C \Rightarrow V = V_R$, i.e. whole applied voltage appeared across the resistance.
- Phase difference, $\phi = 0^\circ \Rightarrow$ Power factor = $\cos \phi = 1$
- Power consumption, $P = V_{\text{rms}} i_{\text{rms}} = \frac{1}{2} V_0 i_0$
- Current amplitude in the circuit is maximum and it is given by $i_0 = \frac{V_0}{R}$
- This circuit is used for voltage amplification and as selector circuits in wireless telegraphy.

Resonant Frequency (Natural Frequency)

At resonance $X_L = X_C \Rightarrow \omega_0 L = \frac{1}{\omega_0 C}$

$$\Rightarrow \omega_0 = \frac{1}{\sqrt{LC}} \text{ rad/s}$$

$$\Rightarrow \nu_0 = \frac{1}{2\pi\sqrt{LC}} \text{ Hz (or cps)}$$

Resonant frequency doesn't depend upon the resistance of the circuit.

Half power frequencies and band width The frequencies at which the power in the circuit is half of the maximum power (the power at resonance), are called half power frequencies.

- (i) The current in the circuit at

Half Power Frequencies (HPF) is $\frac{1}{\sqrt{2}}$ or 0.707 or 70.7% of maximum current (current at resonance).

- (ii) There are two half power frequencies, which are related as

$$\omega_0 = \sqrt{\omega_1 \omega_2}$$

Quality Factor

At resonance, $I_0 = \frac{E_0}{R}$

and

$$V_L = I_0 X_L = V_C = I_0 X_C$$

i.e.

$$V_L = \frac{\omega L}{R} \times E_0 = \frac{1}{\omega RC} \times E_0 = Q E_0$$

where,

$$Q = \frac{\omega L}{R}$$

or $\frac{1}{\omega RC}$ is termed as the **Quality factor of the circuit**. It determines the sharpness of resonance. Higher the value of Q , sharper is the resonance.

Parallel Resonant Circuit

Figure shows a parallel resonant circuit in which resistor R and inductor L have been connected in series and this combination is connected in parallel with the capacitor C .

To this combination, an alternating source of $V = V_0 \sin \omega t$ is applied.

From the figure,

$$i = i_L + i_C$$

or

$$\begin{aligned} \frac{V}{Z} &= \frac{V}{R + j\omega L} + \frac{V}{-j/\omega C} \\ &= \frac{V}{R + j\omega L} - \frac{\omega CV}{j} \end{aligned}$$

$$= \frac{V}{R + j\omega L} + j(\omega C)V$$

$$\therefore \frac{1}{Z} = \frac{1}{R + j\omega L} + j\omega C$$

$\frac{1}{Z}$ is known as admittance (Y). Thus,

$$Y = \frac{1}{Z} = \frac{R - j\omega L}{R^2 + \omega^2 L^2} + j\omega C$$

$$\therefore Y = \frac{\sqrt{R^2 + (\omega CR^2 + \omega^3 L^2 C - \omega L)^2}}{R^2 + \omega^2 L^2}$$

The admittance will be minimum when

$$\omega CR^2 + \omega^3 L^2 C - \omega L = 0$$

$$\text{or } \omega = \sqrt{\frac{1}{LC} - \frac{R^2}{L^2}}$$

$$\therefore f = \frac{\omega}{2\pi} = \frac{1}{2\pi} \sqrt{\frac{1}{LC} - \frac{R^2}{L^2}}$$

is known as resonance frequency. At resonance frequency admittance is minimum and impedance is maximum.

Thus, the parallel circuit does not allow this frequency from the source to pass in the circuit. Due to this reason, the circuit with such a frequency is known as rejector circuit.

We have dynamic resistance

$$Z_{\max} = \frac{1}{Y_{\max}} = \frac{L}{CR}$$

$$\therefore \text{Peak current through the supply} = \frac{V_0}{L/CR} = \frac{V_0 CR}{L}$$

$$\text{The peak current through capacitor} = \frac{V_0}{1/\omega C} = V_0 \omega C$$

$$\text{Hence, } Q\text{-factor} = \frac{V_0 \omega C}{V_0 CR/L} = \frac{\omega L}{R}$$

This is basically the measure of current magnification.

Power in an AC Circuit

Let a voltage $V = V_0 \sin \omega t$ be applied across an AC and consequently a current $I = I_0 \sin(\omega t - \phi)$ flows through the circuit. Then,

(i) **Instantaneous power** = $V I$

= $V_0 I_0 \sin \omega t \sin(\omega t - \phi)$, and its value varies with time.

Here, ϕ is known as **phase difference** between V and I .

(ii) **Average power** over a full cycle of AC is

$$P_{\text{av}} = V_{\text{rms}} I_{\text{rms}} \cos \phi = \frac{1}{2} V_0 I_0 \cos \phi$$

The term $V_{\text{rms}} I_{\text{rms}}$ is known as the apparent or virtual power but $V_{\text{rms}} I_{\text{rms}} \cos \phi$ is called the **true power**.

(iii) The term $\cos \phi$ is known as the **power factor** of the given circuit. Thus, $\cos \phi = \frac{R}{Z}$ = power factor

$$= \frac{\text{true power}}{\text{apparent power}}$$

(iv) For a pure resistive circuit, V and I are in phase ($\phi = 0^\circ$) hence, $\cos \phi = 1$ and average power = $V_{\text{rms}} I_{\text{rms}}$. For a pure inductive or a pure capacitive circuit, current and voltage differ in phase by $\frac{\pi}{2}$ (i.e. $\phi = \frac{\pi}{2}$).

Wattless Current

Average power is given by $P_{\text{av}} = E_{\text{rms}} I_{\text{rms}} \cos \phi$

The phase difference between E_{rms} and I_{rms} is ϕ . We can resolve I_{rms} into two components

$$I_{\text{rms}} \cos \phi \text{ and } I_{\text{rms}} \sin \phi$$

Here, the component $I_{\text{rms}} \cos \phi$ contributes towards power dissipation and the component $I_{\text{rms}} \sin \phi$ does not contribute towards power dissipation. Therefore, it is called **wattless current**.

Choke Coil

Let us consider a choke coil (used in tube lights) of large inductance, L and low resistance R . The power factor for such a coil is given by

$$\cos \phi = \frac{R}{\sqrt{R^2 + \omega^2 L^2}} \approx \frac{R}{\omega L} \text{ (as } R \ll \omega L \text{)}$$

As $R \ll \omega L$, $\cos \phi$ is very small. Thus, the power absorbed by the coil $V_{\text{rms}} i_{\text{rms}} \cos \phi$ is very small. On account of its large impedance $Z = \sqrt{R^2 + \omega^2 L^2}$, the current passing through the coil is very small. Such a coil is used in AC circuits for the purpose of adjusting current to any required value without waste of energy. The only loss of energy is due to hysteresis in the iron core, which is much less than the loss of energy in the resistance that can also reduce the current if placed instead of the choke coil.

AC Generator

An electrical machine used to convert mechanical energy into electrical energy is known as AC generator/alternator. It works on the **principle of electromagnetic induction**, i.e. when a coil is rotated in uniform magnetic field, an induced emf is produced in it.

Induced emf,
$$e = -\frac{Nd\phi}{dt} = NBA\omega \sin \omega t = e_0 \sin \omega t$$

where,
$$e_0 = NBA\omega$$

Current in the coil,
$$i = \frac{e}{R} = \frac{e_0}{R} \sin \omega t = i_0 \sin \omega t$$

where, R = Resistance of the circuit.

$$\theta = 0^\circ \quad \theta = 90^\circ \quad \theta = 180^\circ \quad \theta = 270^\circ \quad \theta = 360^\circ$$

Output of a single loop of AC generator for one cycle of rotation

Transformer

It is a device which raises or lowers the voltage in AC circuits through mutual induction. It works on the basic **principle of mutual induction** i.e. The alternating current passing through the primary coil creates a continuously changing flux through the core. This changing flux induces an alternating emf in the secondary coil.

Transformer is of two types

Step-up transformer	Step-down transformer
This transformer is used to increase voltage and decrease current.	This transformer is used to decrease voltage and increase current.
$V_S > V_P$	$V_S < V_P$
$N_S > N_P$	$N_S < N_P$
$E_S > E_P$	$E_S < E_P$
$i_S < i_P$	$i_S > i_P$
$R_S > R_P$	$R_S < R_P$
$t_S > t_P$	$t_S < t_P$
$k > 1$	$k < 1$

where, N_P and N_S = Number of turns in primary and secondary coil

V_P and V_S = Applied (input) voltage to primary and secondary (load voltage) coil

e_P and e_S = Induced emf in primary and secondary coil

ϕ = Flux linked with primary as well as secondary coil

i_P and i_S = Current in primary and secondary coil (or load current)

R_P and R_S = Resistance of primary and secondary coil

t_P and t_S = Thickness of turn in primary and secondary coil

As in an ideal transformer, there is no loss of power i.e. $P_{out} = P_{in}$ and $e = V$

So, $V_S i_S = V_P i_P$ and $V_P \approx e_P, V_S \approx e_S$

According to Faraday's law,

$$e_S = -N_S \frac{d\phi}{dt}, e_P = -N_P \frac{d\phi}{dt}$$

Hence,
$$\frac{e_S}{e_P} = \frac{N_S}{N_P} = \frac{V_S}{V_P} = \frac{i_P}{i_S} = k;$$

where, k = transformation ratio

Efficiency of transformer (η) Efficiency is defined as the ratio of output power and input power

$$(\eta\%) = \frac{P_{out}}{P_{in}} \times 100$$

i.e.

$$= \frac{V_S i_S}{V_P i_P} \times 100$$

Electromagnetic Waves

Electromagnetic waves are those waves in which electric and magnetic fields vary sinusoidally in space and with time. The electric and magnetic fields are mutually perpendicular to each other and each field is perpendicular to the direction of propagation of the wave.

Characteristics of EM Waves

Maxwell's theory predicted that electromagnetic waves of all frequencies (and hence all wavelengths) propagate in vacuum, with a speed given by $c = \frac{1}{\sqrt{\mu_0 \epsilon_0}}$

where, μ_0 is the magnetic permeability and ϵ_0 is the electric permittivity of vacuum. Now, for the vacuum, $\mu_0 = 4\pi \times 10^{-7} \text{ TmA}^{-1}$ and $\epsilon_0 = 8.85 \times 10^{-12} \text{ C}^2\text{N}^{-1}\text{m}^{-2}$. Substituting these values in the above relation, we have

$$c = \frac{1}{[(4\pi \times 10^{-7})(8.85 \times 10^{-12})]^{1/2}} \simeq 3.0 \times 10^8 \text{ ms}^{-1}$$

Maxwell's Displacement Current

If the plates of a charged capacitor are joined through a conductor, then the charge arises due to the flow of electrons and thus conduction current flows in the conductor.

Maxwell proposed that as the charge on the plates of the capacitor decreases, the electric field between the plates also decreases with time and the time varying electric field produces magnetic field which signifies that there must be some current flowing between the plates. Maxwell termed this as displacement current (i_d) given as

$$i_d = \epsilon_0 \frac{d\phi_E}{dt}$$

where, ϕ_E = electric flux,

ϵ_0 = permittivity of the free space

Maxwell's Equations

Maxwell in 1862, gave the basic laws of electricity and magnetism in the form of four fundamental equations. In the absence of any dielectric and magnetic material, which are known as Maxwell's equations. It is based on experimental observations followed by all electromagnetic phenomena, may be stated in the integral form as below

1. Gauss's law for electrostatics

- (i) This law gives the total electric flux in terms of charge enclosed by the closed surface.
- (ii) This law states that the electric lines of force start from positive charge and end at negative charge i.e. the electric lines of force do not form a continuous closed path.

$$\text{Mathematically, } \oint_s \mathbf{E} \cdot d\mathbf{S} = \frac{q}{\epsilon_0}$$

2. Gauss's law for magnetism

- (i) This law shows that the number of magnetic lines of force entering a closed surface is equal to the number of magnetic lines of force leaving that closed surface.
- (ii) This law tells that the magnetic lines of force form a continuous closed path.
- (iii) This law also predicts that the isolated magnetic monopole does not exist.

$$\text{Mathematically, } \oint_s \mathbf{B} \cdot d\mathbf{S} = 0$$

3. Faraday's law of electromagnetic induction

- (i) This law gives a relation between electric field and a changing magnetic flux.
- (ii) This law tells that the changing magnetic field is the source of electric field.

$$\text{Mathematically, } \oint \mathbf{E} \cdot d\mathbf{l} = - \frac{d\phi_B}{dt}$$

4. Ampere-Maxwell's law

- (i) This law states that the magnetic field can be produced by a conduction current as well as by displacement current.
- (ii) This law also states that the conduction current and displacement current together have a property of continuity.
- (iii) At an instant, in a circuit, the conduction current is equal to the displacement current.

$$\text{Mathematically, } \oint \mathbf{E} \cdot d\mathbf{l} = \mu_0 \left(i_c + \epsilon_0 \frac{d\phi_E}{dt} \right)$$

These equations are collectively called Maxwell's equations.

Results from Maxwell's Equations

- (i) The average of energy density associated with electromagnetic wave is found to be

$$u_{av} = \frac{1}{2} \epsilon_0 E_0^2 = \text{Electric field energy density}$$

$$u_{av} = \frac{1}{2\mu_0} B_0^2 = \text{Magnetic field energy density}$$

- (ii) Intensity is defined as energy crossing through unit area in unit time.

$$\begin{aligned} \therefore I &= u_{av} c \\ &= \frac{1}{2} \epsilon_0 c E_0^2 \\ I &= \frac{1}{2\mu_0} c B_0^2 \end{aligned}$$

Practice Exercise

1. An AC source of voltage $V = 100 \sin 100\pi t$ is connected to a resistor of resistance 20Ω . The rms value of current through resistor is

a. 10 A
b. $\frac{10}{\sqrt{2}}$ A
c. $\frac{5}{\sqrt{2}}$ A
d. None of these

2. In (Q. No. 1), average value of current for long time is

a. zero
b. $\frac{5}{\sqrt{2}}$ A
c. 10 A
d. None of these

3. In (Q. No. 1), the average value for half cycle is

a. $\frac{10}{\pi}$ A
b. $\frac{5}{\pi}$ A
c. zero
d. None of these

4. In (Q. No. 1), total charge transferred through resistor in long time is

a. zero
b. $\frac{2I_0}{\pi}$
c. $\frac{I_0}{25\pi}$
d. None of these

5. In (Q. No. 1), total charge transferred in $1/100$ second is

a. $\frac{1}{10\pi}$ C
b. $\frac{1}{5\pi}$ C
c. zero
d. None of these

6. In (Q. No. 1), total heat generated in one cycle is

a. $\sqrt{2}$ J
b. 5 J
c. $4\sqrt{2}$ J
d. zero

7. In (Q. No. 1), power factor is

a. 1
b. 0
c. $1/2$
d. None of these

8. A metallic square loop ABCD is moving in its own plane with velocity v in a uniform magnetic field perpendicular to its plane as shown in the figure. An electric field is induced

a. in AD, but not in BC
b. in BC, but not in AD
c. neither in AD nor in BC
d. in both AD and BC

9. A circular coil is placed in a uniform magnetic field such that its plane is perpendicular to field. The radius of coil changes with time as shown in the figure. Then, which of the following graph represent the induced electromotive force in the coil with time?

10. A uniform but time-varying magnetic field $B(t)$ exists in a circular region of radius a and is directed into the plane of the paper as shown. The magnitude of the induced electric field at point P at a distance r from the centre of the circular region

a. is zero
b. decreases as $1/r$
c. increases as r
d. decreases as $1/r^2$

11. Calculate the peak and rms value of current in AC circuit. The current is represented by the equation $i = 5 \sin \left(300t - \frac{\pi}{4} \right)$, where t is in seconds and i in ampere.

a. 5 A, 3.535 A
b. 5 A, 5.53 A
c. 3 A, 3.53 A
d. 6.25 A, 5.33 A

12. The average value for half cycle in a 200 V AC source is

a. 180 V
b. 200 V
c. 220 V
d. None

13. Two alternating currents are given by

$$I_1 = I_0 \sin \omega t \text{ and } I_2 = I_0 \cos (\omega t + \phi)$$

The ratio of rms value is

a. 1 : 1
b. 1 : ϕ
c. 1 : 2
d. None of these

14. A current $I = 3 + 8 \sin 100t$ is passing through a resistor of resistance 10Ω . The effective value of current is

a. 5 A
b. 10 A
c. $4\sqrt{2}$ A
d. $3\sqrt{2}$ A

15. An alternative voltage

$$V = 30 \sin 50t + 40 \cos 50t$$

is applied to a resistor of resistance 10Ω . The rms value of current through resistor is

a. $\frac{5}{\sqrt{2}}$ A
b. $\frac{10}{\sqrt{2}}$ A
c. $\frac{7}{\sqrt{2}}$ A
d. 7 A

16. An alternating voltage $V = 140 \sin 50t$ is applied to a resistor of resistance 10Ω . This voltage produces ΔH heat in the resistor in time Δt . To produce the same heat in the same time, required DC current is
 a. 14 A b. about 20 A
 c. about 10 A d. None of these
17. An AC voltage is represented by $e = 220 \sin(100\pi)t$ volt and is applied over a resistance of 110 ohm . Calculate the heat produced in 7 min.
 a. $11 \times 10^3 \text{ cal}$ b. $22 \times 10^3 \text{ cal}$
 c. $33 \times 10^3 \text{ cal}$ d. $25 \times 10^3 \text{ cal}$
18. The reactance of a capacitor connected with DC voltage is
 a. zero b. ∞
 c. 1Ω d. None of these
19. The reactance of an inductor connected with DC voltage is
 a. zero b. ∞
 c. 1Ω d. None of these
20. An AC voltage $e = e_0 \sin 50t - e_0 \cos 100\pi t$ is connected in series with a resistor and capacitor. The steady state current through circuit is found to be $I = I_0 \sin(50\pi t + \phi) + I_0' \cos(100\pi t + \phi_2)$
 Then, the ratio of $\frac{I_0}{I_0'}$ is
 a. greater than 1 b. equal to 1
 c. less than 1 d. None of these
21. An alternating voltage $V = V_0 \sin \omega t$ is connected to a capacitor of capacity C_0 through an AC ammeter of zero resistance. The reading of ammeter is
 a. $\frac{V_0}{\sqrt{2}}$ b. $\frac{V_0}{\omega C \sqrt{2}}$
 c. $\frac{V_0 \omega C}{\sqrt{2}}$ d. None of these
22. Calculate the maximum current in the circuit, if a capacitor of capacitance $1 \mu\text{F}$ is charged to a potential of 2 V and is connected in parallel to an inductor of inductance 10^{-3} H .
 a. $\sqrt{4000} \text{ mA}$ b. $\sqrt{2000} \text{ mA}$ c. $\sqrt{1000} \text{ mA}$ d. $\sqrt{5000} \text{ mA}$
23. In a circuit consisting of inductor (L), capacitor (C) and resistor (R) are in series, if $\omega L < \frac{1}{\omega C}$, then the emf
 a. leads the current b. lags behind the current
 c. is in phase with current d. is zero
24. Find the resonant frequency of a series circuit consist of an inductance $200 \mu\text{H}$, a capacitance of $0.0005 \mu\text{F}$ and a resistance of 10Ω .
 a. 480 kHz b. 503 kHz c. 406 kHz d. 607 kHz
25. Find the frequency of voltage for an AC circuit. The equation of alternating voltage is $V = 200 \sin 314 t$.
 a. 50 Hz b. 60 Hz c. 55 Hz d. 65 Hz
26. An AC circuit with $f = 1000 \text{ Hz}$ consists of a coil of 200 mH and negligible resistance. Calculate the voltage across the coil, if the effective current of 5 mA is flowing.
 a. 7.64 V (rms) b. 7.452 V (rms)
 c. 6.28 V (rms) d. 74.62 V (rms)
27. Find the average power per unit area at distance of 2 m from a small bulb, if the bulb emits 20 W of electromagnetic radiation uniformly in all directions.
 a. 0.69 W/m^2 b. 0.56 W/m^2
 c. 0.78 W/m^2 d. 0.39 W/m^2
28. If a circuit made up of a resistance 1Ω and inductance 0.01 H , an alternating emf of 200 volt at 50 Hz is connected, then find the phase difference between the current and the emf in the circuit.
 a. $\tan^{-1}(\pi)$ b. $\tan^{-1}\left(\frac{\pi}{2}\right)$ c. $\tan^{-1}\left(\frac{\pi}{4}\right)$ d. $\tan^{-1}\left(\frac{\pi}{3}\right)$
29. Choose the correct option. If speed of gamma rays, X-rays and microwaves are v_g, v_x and v_m .
 a. $v_g < v_x < v_m$ b. $v_g > v_x > v_m$
 c. $v_g > v_x < v_m$ d. $v_g = v_x = v_m$
30. A condenser of capacitance of $2.4 \mu\text{F}$, is used in a transmitter to transmit at λ wavelength. If the inductor of 10^{-8} H is used for resonant circuit, then value of λ is
 a. 292 m b. 400 m c. 334 m d. 446 m
31. If a dry cell of emf = 1.5 V is connected across the primary of a step-up transformer of turn ratio 3 : 5, then calculate the voltage developed across the secondary.
 a. 30 V b. 5 V
 c. zero d. None of these
32. If at a certain instant, the magnetic induction of the electromagnetic wave in vacuum is $6.7 \times 10^{-12} \text{ T}$, then the magnitude of electric field intensity will be
 a. $2 \times 10^{-3} \text{ N/C}$ b. $3 \times 10^{-3} \text{ N/C}$
 c. $4 \times 10^{-3} \text{ N/C}$ d. $1 \times 10^{-3} \text{ N/C}$
33. Find the energy of photon of electromagnetic radiation of wavelength $200 \text{ \AA}$.
 a. $1.76 \times 10^{-18} \text{ J}$ b. $0.99 \times 10^{-18} \text{ J}$
 c. $0.54 \times 10^{-18} \text{ J}$ d. $0.63 \times 10^{-18} \text{ J}$
34. Find the speed of light in air, if an electromagnetic wave is travelling in air whose dielectric constant is $k = 1.006$.
 a. $3 \times 10^8 \text{ m/s}$ b. $3.88 \times 10^8 \text{ m/s}$
 c. $2.5 \times 10^8 \text{ m/s}$ d. $4.6 \times 10^8 \text{ m/s}$
35. An object is placed at some distance from a radio station. If the interval between transmission and reception of pulses is $2.66 \times 10^{-2} \text{ s}$, then find the distance.
 a. 4000 km b. 2000 km c. 3000 km d. 2500 km

36. Calculate the wavelength of a radio wave of frequency of 1 MHz.

a. 400 m b. 300 m c. 350 m d. 200 m

37. The electric field in an electromagnetic wave is given by $E = (100 \text{ N/C}) \sin \omega \left(t - \frac{x}{C} \right)$.

If the energy contained in a cylinder of cross-section 10 cm^2 and length 50 cm along the X -axis is $4.4 \times 10^{-8} \text{ J/m}^3$, then find the intensity of the wave.

a. 12.4 W/m^3
b. 13.2 W/m^3
c. 15.7 W/m^3
d. 11.9 W/m^3

38. A radio wave of intensity I is reflected by a surface. Find intensity (I), if pressure exerted on the surface is $2 \times 10^{-8} \text{ N/m}^2$.

a. 3 N/m^2 b. 4 N/m^2 c. 6 N/m^2 d. 7 N/m^2

39. A TV tower has a height of 100 m . Find the area covered by the TV broadcast, if radius of the earth is 6400 km .

a. $380 \times 10^7 \text{ m}^2$ b. $402 \times 10^7 \text{ m}^2$
c. $595 \times 10^7 \text{ m}^2$ d. $440 \times 10^7 \text{ m}^2$

40. An electromagnetic wave with pointing vector 5 W/m^2 is absorbed by a surface of some area. If the force on the surface is 10^{-7} N , then area is

a. 6 m^2 b. 3 m^2 c. 60 m^2 d. 4 m^2

BITSAT Archives

1. Voltage V and current i in AC circuit are given by

$$V = 50 \sin(50t) \text{ volt}, i = 50 \sin\left(50t + \frac{\pi}{3}\right) \text{ mA}$$

The power dissipated in the circuit is

a. 5.0 W b. 2.5 W
c. 1.25 W d. zero

2. The produced rays in sonography are

a. microwaves b. infrared waves
c. sound waves d. ultrasound

3. The ratio of secondary and primary turns of step-up transformer is $4 : 1$. If a current of 4 A is applied to the primary, the induced current in secondary will be

a. 8 A b. 2 A
c. 1 A d. 0.5 A

4. The impedance of a circuit consists of 3Ω resistance and 4Ω reactance. The power factor of the circuit is

a. 0.4 b. 0.6
c. 0.8 d. 1.0

5. The time taken by the current to rise to 0.63 of its maximum value in a DC circuit containing inductance (L) and resistance (R) depends on

a. L only b. R only
c. $\frac{L}{R}$ d. LR

6. Figure represents two bulbs B_1 and B_2 , resistor R and inductor L . When the switch S is turned off, then

a. both B_1 and B_2 die out promptly
b. both B_1 and B_2 die out with some delay
c. B_1 dies out promptly but B_2 with some delay
d. B_2 dies out promptly but B_1 with some delay

7. An AC source is connected in parallel with an L - C - R circuit as shown. Let I_S , I_L , I_C and I_R denote the currents through and V_S , V_L , V_C and V_R the voltages across the corresponding components. Then,

a. $I_S = I_L + I_C + I_R$
b. $V_S = V_L + V_C + V_R$
c. $(I_L, I_C, I_R) < I_S$
d. I_L, I_C may be greater than I_S

8. The number of turns in primary and secondary coils of a transformer is 50 and 200 , respectively. If the current in the primary coil is 4 A , then current in the secondary coil is

a. 1 A b. 2 A c. 4 A d. 5 A

9. An inductor of 2 H and a resistance of 10Ω are connected in series with a battery of 5 V . The initial rate of change of current is

a. 0.5 A/s b. 2.0 A/s c. 2.5 A/s d. 0.25 A/s

10. The transformation ratio in the step-up transformer is

a. 1 b. greater than one c. less than one d. the ratio greater or less than depends on the other factors

11. In a step-up transformer, if ratio of turns of primary to secondary is $1 : 10$ and primary voltage is 230 V . If the load current is 2 A , then the current in primary is

a. 20 A b. 10 A c. 2 A d. 1 A

12. The square root of the product of inductance and capacitance has the dimension of

a. length b. mass
c. time d. no dimension

Answer with Solutions

Practice Exercise

1. (c) $I_0 = \frac{V_0}{R} = \frac{100}{20} = 5 \text{ A} \quad \therefore I_{\text{rms}} = \frac{I_0}{\sqrt{2}} = \frac{5}{\sqrt{2}} \text{ A}$

2. (a) $I = \frac{V}{R} = \frac{100}{20} \sin 100\pi t = 5 \sin 100\pi t$

$\therefore \bar{I} = \frac{5 \int_0^T \sin 100\pi t \, dt}{\int_0^T dt} = 0$

3. (a) $I_{\text{av}} = \frac{2I_0}{\pi} = \frac{2 \times 5}{\pi} = \frac{10}{\pi} \text{ A}$

4. (a) $q = \int_0^{t=1/50} I \, dt = \int_0^{t=1/50} 100 \sin 100\pi t \, dt = 0$

5. (a) When $t \leq \frac{T}{2}$, i.e. $t \leq \frac{1}{100} \text{ s}$

Then, $q = I_{\text{av}} t = \frac{2I_0}{\pi} t = \frac{10}{\pi} \times \frac{1}{100} = \frac{1}{10\pi}$

6. (b) $\Delta H = I_{\text{rms}}^2 RT = \left(\frac{5}{\sqrt{2}}\right)^2 \times 20 \times \frac{1}{50} = 5 \text{ J}$

7. (a) $\cos \phi = \frac{R}{Z} = \frac{R}{\sqrt{R^2 + (X_L - X_C)^2}} = \frac{R}{\sqrt{R^2 + 0}} = 1$

$\Rightarrow \cos \phi = 1$

8. (d) In both AD and BC, because the electrons and positive ions will be separated by magnetic force in these two arms.

9. (b) Flux linked with the circular coil, $\phi = BA$

$\frac{d\phi}{dt} = B\pi 2r \frac{dr}{dt} \quad \therefore \frac{d\phi}{dt} \propto \frac{dr}{dt}$

Emf of coil $\propto \frac{dr}{dt}$ and $e \propto r$

In 1 and 3 regions, $r = \text{constant} \Rightarrow \text{emf} = 0$

In 2 region, $\frac{dr}{dt} = \text{constant}$

Emf induced is increasing at constant rate, because r is increasing.

10. (b) Using, $\oint \mathbf{E} \cdot d\mathbf{l} = -\frac{d\phi}{dt}$

$\Rightarrow E(2\pi r) = \text{constant} \Rightarrow E \propto \frac{1}{r}$

11. (a)

12. (a) $V_{\text{rms}} = \frac{V_0}{\sqrt{2}} \quad \therefore V_0 = \sqrt{2} V_{\text{rms}}$

$\therefore V_{\text{av}} = \frac{2V_0}{\pi} = \frac{2}{\pi} \sqrt{2} V_{\text{rms}} = \frac{2\sqrt{2} \times 200}{\pi} = 180 \text{ V}$

13. (a) $I_{\text{rms}1} = \frac{I_{01}}{\sqrt{2}} = \frac{I_0}{\sqrt{2}}, I_{\text{rms}2} = \frac{I_{02}}{\sqrt{2}} = \frac{I_0}{\sqrt{2}}$

$\therefore \text{Ratio} = 1:1$

14. (a) $I_{\text{effective}}^2 = I_{\text{rms}}^2 \frac{\int_0^T I^2 \, dt}{\int_0^T dt}$

After solving, $I_{\text{effective}} = I_{\text{rms}} = 5 \text{ A}$

15. (a) $I = \frac{V}{R} = \frac{30}{10} \sin 50t + \frac{40}{10} \cos 50t$

or $I = 3 \sin 50t + 4 \cos 50t$

or $I = 3 \sin 50t + 4 \sin \left(50t + \frac{\pi}{2}\right)$

$\therefore I_{\text{rms}} = \frac{I_0}{\sqrt{2}} = \frac{5}{\sqrt{2}} \text{ A}$

16. (c)

17. (b) $H = \frac{I_{\text{rms}}^2 RT}{J} \text{ cal}$

$= \frac{(\sqrt{2})^2 \times 110 \times 7 \times 60}{4.2} \left(\because I_{\text{rms}} = \frac{I_0}{\sqrt{2}} = \frac{220/110}{\sqrt{2}} = \sqrt{2} \right)$
 $= 22 \times 10^3 \text{ cal}$

18. (b) For DC source, frequency is zero.

$\therefore X_C = \frac{1}{\omega C} = \frac{1}{0} \times C = \infty$

19. (a) $X_L = \omega L = 0 \times L = 0$

20. (c) $I_0 = \frac{E_0}{\sqrt{R^2 + X_C^2}} = \frac{E_0}{\sqrt{R^2 + \left(\frac{1}{50C}\right)^2}}$

Similarly, $I'_0 = \frac{E_0}{\sqrt{R^2 + \left(\frac{1}{100C}\right)^2}} \quad \text{Hence, } I_0 < I'_0$

21. (c)

22. (a) Charge on capacitor $q_0 = CV, \quad q_0 = 2 \times 10^{-6} \text{ C}$

Here, $q = q_0 \sin \omega t$

For maximum current $= I_0 = \frac{dq}{dt} = \omega q_0$

But $\omega = \frac{1}{\sqrt{LC}} = (10^9)^{1/2}, I_0 = (10^9)^{1/2} (2 \times 10^{-6})$

$= \sqrt{10} \times 10^4 \times 2 \times 10^{-6} = 2\sqrt{10} \times 10^{-2} \text{ A} = \sqrt{4000} \text{ mA}$

23. (a) When $\omega L < \frac{1}{\omega C}$, emf leads the current by $\frac{\pi}{2}$.

24. (b)

25. (a) Comparing $V = 200 \sin 314t$ with the standard equation $V = V_0 \sin \omega t$, we get $\omega = 314 \text{ s}^{-1}$

Linear frequency, $f = \frac{\omega}{2\pi} = \frac{314}{2 \times 3.14} = 50 \text{ Hz}$

26. (c) Inductive reactance,
- $X_L = L\omega = 2\pi fL$

$$\text{also, } \frac{E}{I} = L\omega = X_L \quad \text{or } E = IX_L \Rightarrow E = \frac{5}{1000} \times 1256$$

$$E = 6.28 \text{ volt (rms)}$$

27. (d)
- $I = \frac{P}{4\pi r^2}, \quad I = \frac{20}{4\pi(2)^2} = 0.39 \text{ W/m}^2$

28. (a)
- $\tan \phi = \left(\frac{X_L}{R}\right)$

$$\text{and } X_L = \omega L = (2\pi fL) = (2\pi)(50)(0.01) = \pi \Omega$$

$$\text{also } R = 1 \Omega \Rightarrow \phi = \tan^{-1}(\pi)$$

29. (d)

30. (a) Frequency
- $= n = \frac{c}{\lambda} = \frac{3 \times 10^8}{\lambda}$

$$\text{also, resonant frequency } = n = \frac{1}{2\pi\sqrt{LC}}$$

$$\text{or } LC = \frac{1}{4\pi^2 n^2} \quad \text{or } C = \frac{\lambda^2}{4\pi^2 c^2 L}$$

$$\text{or } \lambda = \sqrt{4\pi^2 c^2 L C}$$

$$\text{or } \lambda = \sqrt{4\pi^2 \times (3 \times 10^8)^2 \times 2.4 \times 10^{-6} \times 10^{-8}} \Rightarrow \lambda = 292 \text{ m}$$

31. (c) Transformer is an AC device, it does not work on DC, so, output voltage is zero.

32. (a)

33. (b)
- $E = \frac{hc}{\lambda} = \frac{6.62 \times 10^{-34} \times 3 \times 10^8}{2000 \times 10^{-10}} = 0.0099 \times 10^{-16}$
-
- $E = 0.99 \times 10^{-18} \text{ J}$

34. (a)
- $v = \frac{1}{\sqrt{\mu_0 k \epsilon_0}} \Rightarrow \frac{c}{\sqrt{k}}$
-
- $v = \frac{c}{\sqrt{k}} = \frac{3 \times 10^8}{\sqrt{1.006}} \Rightarrow v \approx 3 \times 10^8 \text{ m/s}$

35. (a)
- $2x = ct$

$$x = \frac{ct}{2} = \frac{3 \times 10^8 \times 2.66 \times 10^{-2}}{2} \Rightarrow x \approx 4000 \text{ km}$$

36. (b)

37. (b)
- $I = \frac{1}{2} \epsilon E_0^2 c = (4.4 \times 10^{-8}) \times (3 \times 10^8) = 13.2 \text{ W/m}^2$

38. (a)

39. (b) Area
- $= \pi r^2 = \pi = ((2hR)^{1/2})^2$

$$\text{Area} = 2\pi Rh = 2 \times \pi \times 6400 \times 10^3 \times 100 = 402 \times 10^7 \text{ m}^2$$

40. (a) We know,
- $P = \frac{I}{c} = \frac{5}{3 \times 10^8}$

$$\text{and } F = P \times A \Rightarrow A = \frac{F}{P}$$

$$A = \frac{10^{-7}}{5} \times 3 \times 10^8 \Rightarrow A = 6 \text{ m}^2$$

BITSAT Archives

1. (c) Given,
- $V = 50 \sin(50 t) \text{ V}$

$$\text{Maximum voltage, } V_0 = 50 \text{ V, } i = 50 \sin\left(50 t + \frac{\pi}{3}\right) \text{ mA}$$

$$\text{Maximum current, } i_0 = 50 \text{ mA} = 50 \times 10^{-3} \text{ A}$$

$$\begin{aligned} \text{Power dissipated, } P &= \frac{i_0}{\sqrt{2}} \times \frac{V_0}{\sqrt{2}} \\ &= \frac{50 \times 50 \times 10^{-3}}{2} \\ &= \frac{2500 \times 10^{-3}}{2} = 1.25 \text{ W} \end{aligned}$$

2. (d) The produced rays in sonography are ultra sound.

3. (c)
- $\frac{I_S}{I_P} = \frac{N_P}{N_S} = \frac{1}{4} \Rightarrow I_S = \frac{1}{4} \times 4 = 1 \text{ A}$

4. (b)
- $\tan \phi = \frac{X}{R} = \frac{4}{3}$

$$\text{Power factor} = \cos \phi = \frac{3}{5} = 0.6$$

5. (c) It depends upon its time constant,
- $\tau = \frac{L}{R}$
- .

6. (c) Bulb
- B_1
- dies out promptly, but bulb
- B_2
- dies out with some delay. This is because of self-induced emf across
- L
- , during decay.

7. (d) In parallel resonant circuit, current through
- L
- and
- C
- may be greater than the source current, i.e.
- I_L, I_C
- may be greater than
- I_S
- .

8. (a) In a transformer,

$$\therefore \frac{N_P}{N_S} = \frac{I_S}{I_P} = \frac{50}{200} = \frac{I_S}{4} \Rightarrow I_S = 1 \text{ A}$$

9. (c)
- $i = i_0 \left(1 - e^{-\frac{Rt}{L}}\right)$

$$\Rightarrow \frac{di}{dt} = \frac{d}{dt} i_0 - \frac{d}{dt} \left(i_0 e^{-\frac{Rt}{L}}\right) = 0 + \frac{i_0 R}{L} e^{-\frac{Rt}{L}}$$

$$\text{Initially, } t = 0$$

$$\Rightarrow \frac{di}{dt} = \frac{i_0 \times R}{L} = \frac{E}{L} = \frac{5}{2} = 2.5 \text{ A/s}$$

10. (b) Transformation ratio,
- $k = \frac{N_S}{N_P} = \frac{V_S}{V_P}$

For step-up transformer,

$$N_S > N_P, \text{ i.e., } V_S > V_P, \text{ hence, } k > 1.$$

11. (a)
- $\frac{N_P}{N_S} = \frac{1}{10}$

$$V_P = 230 \text{ V, } I_S = 2 \text{ A,}$$

$$\frac{I_P}{I_S} = \frac{N_S}{N_P} \Rightarrow \frac{I_P}{2} = \frac{10}{1} \Rightarrow I_P = 20 \text{ A}$$

12. (c) We know
- $f = \frac{1}{2\pi\sqrt{LC}}$
- or
- $\sqrt{LC} = \frac{1}{2\pi f} = \text{time}$

Thus, $\sqrt{LC}$ has the dimension of time.

Cathode Ray, Photoelectric Effect of Light and X-Rays

Cathode Rays

It consists of fast moving electrons. If discharge tube is operating at voltage V , then

$$E_k = eV = \frac{1}{2}mv^2$$

Dual Nature of Radiation

The concept of wave nature of matter arose from the dual character of the radiation which sometimes behaves as a wave and sometimes as a particle.

In the phenomena where light interacts with itself, such as dispersion, interference, diffraction and polarisation, the wave nature of light dominates. In the phenomena where the light interacts with matter, such as in Photoelectric effect, Compton effect, Raman effect, the nature of particle of light dominates.

Matter waves travel as a wave packet with decreasing amplitude on either side of the present position.

de-Broglie Wavelength Relation

According to de-Broglie, a wave is associated with energy moving particle. These waves are called de-Broglie waves or matter waves.

(i) In the n th orbit, we have

$$L = mvr = \frac{nh}{2\pi} \Rightarrow \lambda = \frac{h}{mv} = \frac{2\pi r}{n}$$

- (ii) Number of waves in n th orbit is $N = \frac{2\pi r}{\lambda} = n$

Thus, the number of de-Broglie waves in n th orbit is n .

Expression for the wavelength associated with charged particles accelerated through a potential difference V

(i) Electron, $\lambda_e = \frac{12.27}{\sqrt{V}} \text{ \AA}$

(ii) Proton, $\lambda_p = \frac{0.286}{\sqrt{V}} \text{ \AA}$

(iii) Deuteron, $\lambda_d = \frac{0.202}{\sqrt{V}} \text{ \AA}$

(iv) α -particle, $\lambda_\alpha = \frac{0.101}{\sqrt{V}} \text{ \AA}$

- (v) The de-Broglie wavelength of a particle of mass m and moving with velocity v is given by

$$\lambda = \frac{h}{mv}$$

- (vi) If m_0 be the rest mass of the particle, then

$$\lambda = \frac{h[1 - v^2/c^2]^{1/2}}{m_0 v}$$

- (vii) The de-Broglie wavelength of a particle of mass m and kinetic energy K is given by

$$\lambda = \frac{h}{\sqrt{2mK}}$$

- (viii) If a particle of mass m carrying charge q_0 is accelerated through a potential V , then its de-Broglie wavelength is given by

$$\lambda = \frac{h}{\sqrt{2mq_0V}}$$

- (ix) The de-Broglie wavelength of a gas molecule of mass m at temperature T (in kelvin) is given by

$$\lambda = \frac{h}{\sqrt{3mkT}}$$

Here, k is Boltzmann constant.

Photoelectric Effect

For emission of electrons from a metal surface, a minimum amount of energy (E) is required to overcome the potential barrier (W_0 : work function) provided by the metal. When energy is provided in the form of electromagnetic waves of photons, then emitted electrons are called photoelectrons and this effect is called **photoelectric effect**. As photon energy ($E = h\nu$) is proportional to its frequency, a minimum frequency is required so that photon has energy greater than or equal to work function. This minimum frequency is called **threshold frequency** (ν_0).

For photoemission to take place, either of the following conditions must be satisfied

$$E \geq W_0 \text{ or } \nu \geq \nu_0 \text{ or } \lambda \leq \lambda_0$$

where, ν_0 = threshold frequency, λ_0 = threshold wavelength.

Dependence of Photocurrent on Intensity

On keeping the frequency of incident radiation and anode potential fixed, if the intensity of incident light is increased, then the photoelectric current increases.

i.e. photocurrent (i) $\propto$ intensity (I)

Dependence of Stopping Potential on Intensity

The stopping potential does not change for a given metal and given frequency of radiation, if we change the intensity of incident light.

Dependence of Stopping Potential on Frequency

Greater is the frequency of incident radiation, more is the magnitude of stopping potential.

Einstein's Photoelectric Equation

According to Einstein, photoelectric effect is the result of one to one elastic collision between photon and electron in which photon is completely absorbed. So, if an electron in a metal absorbs a photon of energy $E (= h\nu)$, then it uses the energy in the following ways

- (i) Some energy (say W) is used in shifting the electron from interior to surface.
- (ii) Some energy (say W_0) is used in removing electron from metal's surface.
- (iii) Rest energy will appear as kinetic energy (K) of the emitted photoelectrons. Hence, $W + W_0 + K = h\nu$

For the electrons emitting from surface $W = 0$, so kinetic energy of these emitted electrons will be maximum.

Hence, $h\nu = W_0 + K_{\max}$

So, Einstein's photoelectric equation is given by

$$\Rightarrow K_{\max} = h\nu - W_0$$

where, W_0 is a work function.

If V_0 is stopping potential,

$$\text{then } eV_0 = K_{\max} = h\nu - W_0.$$

Graph between $K_{\max}$ and f

Let us plot a graph between maximum kinetic energy ($K_{\max}$) of photoelectrons and frequency (ν) of incident light.

The equation between $K_{\max}$ and ν is $K_{\max} = h\nu - W$

Comparing it with $y = mx + c$, the graph between $K_{\max}$ and f is a straight line with positive slope and negative intercept.

Graph between $K_{\max}$ and f

From the graph, we observe that

- (i) If $K_{\max} = 0$, then $\nu = \nu_0$
- (ii) Slope of the straight line is h , a universal constant, i.e. if graph is plotted for two different metals 1 and 2, then slope of both the lines is same.
- (iii) The negative intercept of the line is W (the work function) which is characteristic of a metal, i.e. intercepts for two different metals will be different.

If $W_2 > W_1$, then $(\nu_0)_2 > (\nu_0)_1$ as $W = h\nu_0$, where $\nu_0 =$ threshold frequency

Graph between V_0 and ν

Let us plot a graph between the stopping potential (V_0) and the incident frequency (ν). The equation between them is

$$eV_0 = h\nu - W$$

or

$$V_0 = \left(\frac{h}{e}\right)\nu - \left(\frac{W}{e}\right)$$

Again comparing with $y = mx + c$, the graph between V_0 and ν is a straight line with **positive slope** $\frac{h}{e}$ (a universal constant) and **negative intercept** $\frac{W}{e}$ (which depends on the metal). The corresponding graph is shown as below:

Graph between V_0 and ν

Particle Nature of Light– The Photon

According to Einstein's quantum theory, light propagates in the bundles (packets or quanta) of energy. Each bundle is called a photon which possesses energy.

- (i) **Energy of photon** Energy of each photon is given by

$$E = h\nu = \frac{hc}{\lambda}$$

where, c = speed of light

h = Planck's constant = 6.6×10^{-34} J-s

Energy of photon in electron-volt

$$E(\text{eV}) = \frac{hc}{e\lambda} = \frac{12375}{\lambda(\text{\AA})} \Rightarrow E(\text{eV}) \approx \frac{12400}{\lambda(\text{\AA})}$$

- (ii) **Mass of photon** Actual rest mass of the photon is zero. But its effective mass is given as

$$E = mc^2 = h\nu \Rightarrow m = \frac{E}{c^2} = \frac{h\nu}{c^2} \Rightarrow m = \frac{h}{c\lambda}$$

This mass is also known as **dynamic mass of the photon**.

- (iii) **Momentum of the photon** Momentum,

$$p = m \times c = \frac{E}{c} = \frac{h\nu}{c} \Rightarrow p = \frac{h}{\lambda}$$

- (iv) **Number of emitted photons** The number of photons emitted per second from a source of monochromatic radiation of wavelength λ and power P is given as

$$n = \frac{P}{E}$$

$$= \frac{P}{h\nu}$$

$$\Rightarrow n = \frac{P\lambda}{hc}$$

where, E = energy of each photon.

Bragg's Equations

For normal incidence, $b \sin \phi = n\lambda$

For glancing incidence, $2d \sin \theta = n\lambda$

Also, $\phi + 2\theta = 180^\circ$

Compton Effect

- (a) Compton shift in wavelength

$$\Delta\lambda = \frac{h}{m_0c} (1 - \cos \theta)$$

(Here, $\frac{h}{m_0c} = 0.024 \text{ \AA}$, θ is angle of scattering.)

- (b) KE of recoil electron, $E_k = \frac{hc}{\lambda} - \frac{hc}{\lambda_0}$

- (c) Direction of recoil electron, $\tan \theta = \frac{\lambda \sin \theta}{\lambda_0 - \lambda \cos \theta}$

Mosley Law

Frequency ν of characteristic X-rays spectrum

$$\sqrt{\nu} = n(z - \sigma)$$

where, a and σ are constants and screening constant for K_α line, $\sigma = 1$, Screening constant for L_α line, $\sigma = 7.4$.

Practice Exercise

- In an oil drop experiment, the following charges (in arbitrary units) were found on a series of oil droplets: 2.30×10^{-15} , 6.90×10^{-15} , 1.38×10^{-14} , 5.75×10^{-15} , 1.955×10^{-14} . The charge on electron (in the same unit) should be
 - 2.30×10^{-15}
 - 1.15×10^{-15}
 - 1.38×10^{-14}
 - 1.955×10^{-14}
- In Wilson cloud chamber experiment, two particles were found to show equal deviation but in opposite directions. The names positron and negatron were given to these particles by Anderson. Negatron should be
 - neutron
 - neutrino
 - electron
 - proton
- An α -particle when accelerated through a potential of V volt has a wavelength λ associated with it, but if a proton in order to have same wavelength λ by what potential difference it must be accelerated?
 - 8 V
 - 6 V
 - 4 V
 - 12 V
- The cathode ray particles originate in a discharge tube from the
 - cathode
 - anode
 - source of high voltage
 - residual gas
- Three particles having charges in the ratio of 2:3:5, produce the same point on the photographic film in Thomson's experiment. Their masses are in the ratio of
 - 2:3:5
 - 5:3:2
 - 15:10:6
 - 3:5:2
- If the velocity of an electron is doubled, its de-Broglie frequency will be
 - half
 - remain same
 - doubled
 - become four times
- An electron is at rest. Its wavelength is
 - 1
 - infinity
 - $\frac{h}{m_e}$
 - it has no wave character
- If the de-Broglie wavelength of a proton is 10^{-13} m , the electric potential through which it must have been accelerated is
 - $4.07 \times 10^4 \text{ V}$
 - $8.2 \times 10^4 \text{ V}$
 - $8.2 \times 10^3 \text{ V}$
 - $4.07 \times 10^5 \text{ V}$
- A moving electron has numerical relation $\lambda = h$. Then,
 - $m_e = \frac{1}{v_e}$
 - $v_e = \frac{1}{m_e}$
 - both a and b
 - None of these
- The de-Broglie wavelength of a bus moving with speed v is λ . Some passengers left the bus at a stoppage. Now, when the bus moves with twice its initial speed, its kinetic energy is found to be twice its initial value. What will be the de-Broglie wavelength, now?
 - λ
 - 2λ
 - $\lambda/2$
 - $\lambda/4$

11. An electron of mass m and charge q is accelerated from rest in a uniform electric field of strength E . The velocity acquired by it as it travels a distance l is
 a. $\sqrt{2Eq/lm}$ b. $\sqrt{2Eq/ml}$ c. $\sqrt{2Em/ql}$ d. $\sqrt{Eq/ml}$
12. Protons of an electromagnetic radiation has an energy 11 keV each. To which region of electromagnetic spectrum does it belong?
 a. X-ray region b. Ultra violet region
 c. Infrared region d. Visible region
13. Two photons of same frequencies moving in same medium have
 a. same linear momenta and wavelengths
 b. same linear momenta and same speeds
 c. same energies and same linear moment
 d. None of the above
14. The voltage applied to an electron microscope to produce electrons of wavelength $0.50 \text{ \AA}$ is
 a. 602 V b. 50 V c. 138 V d. 812 V
15. A certain molecule has an energy level diagram for its vibrational energy in which two levels are 0.014 eV apart. Find the wavelength of the emitted line for the molecule as it falls from one of these levels to the other
 a. $8.9 \times 10^{-5} \text{ m}$ b. $1.2 \times 10^{-6} \text{ m}$
 c. 173.6 m d. $4.6 \times 10^{-7} \text{ m}$
16. How many photons are emitted by a laser source of $5 \times 10^{-3} \text{ W}$ operating at 632.2 nm in 2 second ($h = 6.63 \times 10^{-34} \text{ Js}$)?
 a. 3.2×10^{16} b. 1.6×10^{16}
 c. 4×10^{16} d. None of these
17. Only a fraction of the electrical energy supplied to a tungsten light bulb is converted into visible light. If a 100 W light bulb converts 20% of the electrical energy into visible light ($\lambda = 662.6 \text{ nm}$), then the number of photons emitted by the bulb per second is
 a. 6.67×10^{19} b. 2×10^{28} c. 6×10^{36} d. 6.30×10^{19}
18. Calculate the number of photons emitted by a 60 W bulb per second, if 10% of the electrical energy supplied to an incandescent light bulb is radiated as visible light.
 a. 1.8×10^{19} b. 1.8×10^{16} c. 1.8×10^{11} d. 1.8×10^{21}
19. The momentum of a photon having energy equal to the rest energy of an electron is
 a. zero b. $2.73 \times 10^{-22} \text{ kg ms}^{-1}$
 c. $1.99 \times 10^{-24} \text{ kg ms}^{-1}$ d. infinite
20. A perfectly reflecting solid hemisphere of radius R is placed in the path of a parallel beam of light of large aperture. If the beam carries an intensity I , find the force exerted by the beam on the hemisphere.
 a. $\frac{2\pi R^2 I}{c}$ b. $\frac{\pi R^2 I}{c}$
 c. $\frac{4\pi R^2 I}{c}$ d. None of these
21. An electron (mass m) with an initial velocity $\mathbf{v} = v_0 \hat{i}$ ($v_0 > 0$) is in an electric field $\mathbf{E} = -E_0 \hat{i}$ ($E_0 = \text{constant} > 0$). Its de-Broglie wavelength at time t is given by
 a. $\frac{\lambda_0}{\left(1 + \frac{eE_0 t}{m v_0}\right)}$ b. $\lambda_0 \left(1 + \frac{eE_0 t}{m v_0}\right)$
 c. λ_0 d. $\lambda_0 t$
22. A ruby laser produces radiations of wavelengths 662.6 nm in pulses whose duration are 10^{-9} s . If the laser produces 0.39 J of energy per pulse, how many photons are produced in each pulse?
 a. 1.3×10^9
 b. 1.3×10^{18}
 c. 1.3×10^{27}
 d. 3.9×10^{18}
23. At one time, the metre was defined as 1650763.73 wavelengths of the orange light emitted by a light source containing Kr^{86} atoms. What is the corresponding photon energy of this radiation?
 a. $3.28 \times 10^{-19} \text{ J/quanta}$ b. $1.204 \times 10^{-31} \text{ J/quanta}$
 c. $1.09 \times 10^{-27} \text{ J/quanta}$ d. $4.01 \times 10^{-40} \text{ J/quanta}$
24. From the figure describing photoelectric effect, we may infer correctly that

- a. Na and Al both have the same threshold frequency
 b. Maximum kinetic energy for both the metals depend linearly on the frequency
 c. The stopping potentials are different for Na and Al for the same change in frequency
 d. Al is a better photosensitive material than Na
25. The stopping potential for the photoelectrons emitted from a metal surface of work function 1.7 eV is 10.4 eV . Identify the energy levels corresponding to the transitions in hydrogen atom which will result in emission of wavelength equal to that of incident radiation for the above photoelectric effect.

- a. $n = 3$ to 1 b. $n = 3$ to 2
 c. $n = 2$ to 1 d. $n = 4$ to 1

26. The work function of a certain metal is 2.3 eV. If light of wave number $2 \times 10^6 \text{ m}^{-1}$ falls on it, the kinetic energies of fastest and slowest ejected electron will be respectively.
 a. 2.48 eV, 0.18 eV b. 0.18 eV, zero
 c. 2.30 eV, 0.18 eV d. 0.18 eV, 0.18 eV
27. When the electromagnetic radiations of frequencies $4 \times 10^{15} \text{ Hz}$ and $6 \times 10^{15} \text{ Hz}$ fall on the same metal, in different experiments, the ratio of maximum kinetic energy of electrons liberated is 1:3. The threshold frequency for the metal is
 a. $2 \times 10^{15} \text{ Hz}$ b. $1 \times 10^{15} \text{ Hz}$
 c. $3 \times 10^{15} \text{ Hz}$ d. $1.67 \times 10^{15} \text{ Hz}$
28. A surface is irradiated with ultraviolet radiation of wavelength $0.2 \mu\text{m}$. If the maximum velocity of electron liberated from the surface is $8.8 \times 10^5 \text{ m/s}$, then find the work function of the surface.
 a. 3 eV b. 4 eV c. 5 eV d. 6 eV
29. Choose the correct option for the graph between the frequency of incident light and the stopping potential.
 a. It is a parabola b. It is a straight line
 c. It is a hyperbola d. It is a circle
30. Specific heat of water is $4.2 \text{ J/g } ^\circ\text{C}$. If light of frequency $3 \times 10^9 \text{ Hz}$ is used to heat 400 g of water from 20°C to 40°C , the number of moles of photons needed will be
 a. 1.69×10^{29} b. 1.69×10^{28} c. 2.80×10^4 d. 2.80×10^5
31. 10^{-3} W of $5000 \text{ \AA}$ light is directed on a photoelectric cell. If the current in the cell is $0.16 \mu\text{A}$, then the percentage of incident photons which produce photoelectrons, is
 a. 0.4% b. 0.04% c. 20% d. 10%
32. The potential energy of a particle of mass m is given by

$$U(x) = \begin{cases} E_0; & 0 \leq x < 1 \\ 0; & x > 1 \end{cases}$$
 λ_1 and λ_2 are the de-Broglie wavelengths of the particle, when $0 \leq x < 1$ and $x > 1$ respectively. If the total energy of particle is $2E_0$, then the ratio $\frac{\lambda_1}{\lambda_2}$ will be
 a. 2 b. 1 c. $\sqrt{2}$ d. $1/\sqrt{2}$
33. A radiation is incident on a metal surface of work function 2.3 eV. The wavelength of incident radiation is 600 nm, then the number of photoelectrons is
 a. zero b. $> 10^4$
 c. $= 10^4$ d. None of these
34. At its closest approach, the distance between the mars and the earth is found to be 60 million km. When the planets are at this closest distance, how long would it take to send a radio message from a space probe of mars to earth?
 a. 5 s b. 200 s c. 0.2 s d. 500 s
35. Ultraviolet beam of wavelength 280 nm is incident on lithium surface of work function 2.5 eV. The maximum velocity of electron emitted from metal surface is
 a. $8.2 \times 10^5 \text{ m/s}$ b. 10^6 m/s
 c. $7 \times 10^5 \text{ m/s}$ d. None of these
36. In previous problem, the stopping potential is
 a. 1.9 V b. 10 V c. 3 V d. None
37. Threshold frequency for photoelectric effect from a metal surface of work function 4.5 eV is
 a. $1.1 \times 10^9 \text{ Hz}$ b. 540 Hz
 c. $1.1 \times 10^{15} \text{ Hz}$ d. None of these
38. If n_r and n_b are the number of photons of red and blue light respectively with same energy, then
 a. $n_r > n_b$
 b. $n_r < n_b$
 c. $n_r = n_b$
 d. no relation between n_r and n_b
39. The number of photoelectrons emitted per unit time depends on ($\nu > \nu_0$)
 a. threshold frequency
 b. frequency of the incident radiation
 c. intensity of the incident radiation
 d. density of the metal irradiated
40. An X-ray tube is operating at 15 kV. The lower limit of the wavelength of X-rays produced is
 a. $0.82 \times 10^{-7} \text{ m}$
 b. $0.82 \times 10^{-8} \text{ m}$
 c. $0.83 \times 10^{-10} \text{ m}$
 d. $0.82 \times 10^{-13} \text{ m}$
41. Ultraviolet light of wavelength 66.26 nm and intensity 2 W/m^2 falls on potassium surface by which photoelectrons are ejected out. If only 0.1% of the incident photons produce photoelectrons, and surface area of metal surface is 4 m^2 , how many electrons are emitted per second?
 a. 2.67×10^{15}
 b. 3×10^{15}
 c. 3.33×10^7
 d. 4.17×10^{16}
42. The stopping potentials are V_1 and V_2 . Calculate the $(V_1 - V_2)$, if the λ_1 and λ_2 are wavelength of incident lights, respectively.
 a. $\frac{hc}{e} \left(\frac{1}{\lambda_1} - \frac{1}{\lambda_2} \right)$
 b. $\frac{hc}{e} \left(\frac{1}{\lambda_1} + \frac{1}{\lambda_1} \right)$
 c. $\frac{e}{hc} \left(\frac{1}{\lambda_1} + \frac{1}{\lambda_2} \right)$
 d. $\frac{e}{hc} \left(\frac{1}{\lambda_1} - \frac{1}{\lambda_2} \right)$

43. Calculate the work function of the metal, if the kinetic energies of the photoelectrons are E_1 and E_2 , with wavelengths of incident light λ_1 and λ_2
- $\frac{E_1\lambda_1 - E_2\lambda_2}{\lambda_2 - \lambda_1}$
 - $\frac{E_1E_2}{\lambda_1 - \lambda_2}$
 - $\frac{(E_1 - E_2)\lambda_1\lambda_2}{(\lambda_1 - \lambda_2)}$
 - $\frac{\lambda_1\lambda_2E_1}{(\lambda_1 - \lambda_2)E_2}$
44. What is the energy of photon of wavelength 24800 Å?
- 0.5 eV
 - 0.9 eV
 - 1.1 eV
 - 0.75 eV
45. For a certain metal v is five times of v_0 and the maximum velocity of coming out photons is 8×10^6 m/s. If $v = 2v_0$, then maximum velocity of photoelectrons will be
- 4×10^6 m/s
 - 6×10^6 m/s
 - 2×10^6 m/s
 - 1×10^6 m/s
46. A red bulb and violet bulb of equal power emits n_R and n_V number of photons in a given time, then
- $n_R = n_V$
 - $n_R > n_V$
 - $n_R < n_V$
 - $n_R \geq n_V$
47. When a surface 1 cm thick is illuminated with light of wavelength λ , the stopping potential is V_0 , but when the same surface is illuminated by light of wavelength 3λ , the stopping potential is $\frac{V_0}{6}$. Find the threshold wavelength for metallic surface.
- 4λ
 - 5λ
 - 3λ
 - 2λ
48. Photoelectric effect show
- wave-like behaviour of light
 - particle-like behaviour of light
 - both wave-like and particle-like behaviour of light
 - neither wave-like nor particle-like behaviour of light

BITSAT Archives

1. Graph of stopping potential for most energetic emitted photoelectron (V_s) with frequency of incident radiation on metal is given below. [2014]

The value of $\frac{AB}{BC}$, in graph is

- (h = Planck's constant, e = electronic charge)
- h
 - e
 - $\frac{h}{e}$
 - $\frac{e}{h}$
2. The number of photoelectrons in a photoelectric effect experiment depends on the [2013]
- frequency of light
 - intensity of light
 - Both **a** and **b** are correct
 - Both **a** and **b** are incorrect
3. A and B are two metals with threshold frequencies 1.8×10^{14} Hz and 2.2×10^{14} Hz. Two identical photons of energy 0.825 eV each are incident on them. Then, photoelectrons are emitted by (Taking, $h = 6.6 \times 10^{-34}$ J-s) [2012]
- B alone
 - A alone
 - Neither A nor B
 - Both A and B
4. Energy conversion in a photoelectric cell takes place from [2011]
- chemical to electrical
 - magnetic to electrical
 - optical to electrical
 - mechanical to electrical
5. Of the following, the one which has the largest de-Broglie wavelength for the same speed is [2010]
- electron
 - proton
 - α -particle
 - oxygen atom
6. The energy that should be added to an electron to reduce its de-Broglie wavelength from 1 nm to 0.5 nm is [2005]
- four times the initial energy
 - equal to the initial energy
 - twice the initial energy
 - thrice the initial energy

Answer with Solutions

Practice Exercise

1. (b) 2. (c)

3. (a) $\lambda_p = \lambda_\alpha$

$$\frac{h}{\sqrt{2m_p Q_p V_p}} = \frac{h}{\sqrt{2m_\alpha Q_\alpha V_\alpha}}$$

$$\therefore m_p Q_p V_p = m_\alpha Q_\alpha V_\alpha$$

$$\therefore V_p = \left(\frac{m_\alpha}{m_p}\right) \left(\frac{Q_\alpha}{Q_p}\right) V_\alpha$$

$$V_p = (4)(2) V_\alpha \Rightarrow V_p = 8 \text{ V}$$

4. (a) 5. (a) 6. (c) 7. (d) 8. (b)

9. (c) $\lambda = \frac{h}{m_e v_e}$

$$\therefore m_e v_e = 1 \quad [\because \lambda = h \text{ (given)}]$$

$$\therefore m_e = \frac{1}{v_e}$$

10. (a) Momentum,

$$p = mv = \frac{\frac{1}{2}mv \times v}{\frac{1}{2} \times v} = \frac{2\text{KE}}{v}$$

If KE as well as speed are doubled, momentum p remains unchanged.

$$\therefore \lambda = \frac{h}{p}$$

Hence, de-Broglie wavelength will be unchanged.

11. (a) As, $v^2 = u^2 + 2as$,

$$\text{So, } v^2 = 0 + 2 \frac{qEl}{m} \text{ or } v = \sqrt{\frac{2qEl}{m}}$$

12. (b) 13. (d)

14. (a) de-Broglie wavelength is $\lambda = \frac{h}{mv} = \frac{h}{\sqrt{2mE}}$

But

$$E = eV$$

$$\lambda = \frac{h}{\sqrt{2meV}} \Rightarrow V = \frac{h^2}{2me\lambda^2}$$

$$V = \frac{(6.62 \times 10^{-34})^2}{(0.5 \times 10^{-10})^2 \times 2 \times 9.1 \times 10^{-31} \times 1.6 \times 10^{-19}}$$

$$\Rightarrow V = 60198 \text{ V} \approx 602 \text{ V}$$

15. (a)

16. (a) Energy of each photon

$$E_0 = \frac{hc}{\lambda} = \frac{6.63 \times 10^{-34} \times 3 \times 10^8}{632.2 \times 10^{-9}} = 3.15 \times 10^{-19} \text{ J}$$

Total energy = $E = Pt$

$$\therefore nE_0 = Pt$$

$$\therefore n = \frac{Pt}{E_0} = \frac{5 \times 10^{-3} \times 2}{3.15 \times 10^{-19}} = 3.2 \times 10^{16}$$

17. (a) 18. (a)

19. (b) For photon, $p = \frac{h}{\lambda} = \frac{E}{c}$

But from questions,

$$E = \text{rest energy of electron} = m_0 c^2$$

$$\therefore p = \frac{m_0 c^2}{c} = m_0 c = (9.109 \times 10^{-31} \text{ kg}) \times (3 \times 10^8 \text{ ms}^{-1})$$

$$= 2.7327 \times 10^{-22} \text{ kg ms}^{-1} = 2.73 \times 10^{-22} \text{ kg m/s}$$

20. (b) Effected area = πR^2

$$\text{Pressure} = \frac{I}{c}, \quad \text{where, } c \text{ is speed of light}$$

$$\therefore \text{Force} = \frac{\pi R^2 I}{c}$$

21. (a) Acceleration, $a = \frac{eE_0}{m}$

Final velocity after t second,

$$v = v_0 + \frac{eE_0}{m} t \quad (\text{From, } v = u + at)$$

$$\therefore \text{de-Broglie wavelength, } \lambda = \frac{h}{mv} = \frac{h}{m \left(v_0 + \frac{eE_0 t}{m} \right)}$$

$$= \frac{h}{mv_0 \left(1 + \frac{eE_0 t}{mv_0} \right)} = \frac{\lambda_0}{\left(1 + \frac{eE_0 t}{mv_0} \right)}$$

22. (b)

23. (a) Given, $\bar{\nu} = 1650763.73 \text{ m}^{-1}$

$$\text{Now, } E = hc\bar{\nu}$$

$$= (6.626 \times 10^{-34}) \times (3 \times 10^8) \times 1650763.73$$

$$= 3.28 \times 10^{-19} \text{ J/quanta}$$

24. (b)

25. (a) If incident radiation has wavelength λ , then

$$eV_0 = \frac{hc}{\lambda} - \phi_0 \text{ or } \frac{hc}{\lambda} = 10.4 + 1.7 = 12.1 \text{ eV}$$

$$\text{or } \lambda = \frac{1240 \text{ eV} \cdot \text{nm}}{12.1 \text{ eV}}$$

and for an excited H_2 atom, energy levels are

$$E_g = E_i - E_f = -1.51 - (-13.6) = 12.1 \text{ eV}$$

So, energy of transition from $n = 3$ to $n = 1$ corresponds to energy of incident photons.

26. (b)

27. (c) $h\nu = h\nu_0 + \text{KE}_{\text{max}}$

For first experiment,

$$h \times 4 \times 10^{15} = h\nu_0 + x$$

For second experiment,

$$h \times 6 \times 10^{15} = h\nu_0 + 3x$$

From Eqs. (i) and (ii), we get $\nu_0 = 3 \times 10^{15}$ Hz

$$\begin{aligned} 28. (d) \text{ We know that } E &= h\nu = \frac{hc}{\lambda} \\ E &= \frac{6.6 \times 10^{-34} \times 3 \times 10^8}{0.2 \times 10^{-6}} \\ &= \frac{1.98 \times 10^{-25}}{0.2 \times 10^{-6}} = 9.9 \times 10^{-19} \text{ J} \end{aligned}$$

$$\text{Also, } E - W_0 = \frac{1}{2}mv^2$$

$$9.9 \times 10^{-19} - W_0 = \frac{1}{2} \times 9.1 \times 10^{-31} (8.8 \times 10^5)^2$$

$$\therefore W_0 = 9.9 \times 10^{-19} - 3.52 \times 10^{-19}$$

$$W_0 = 6.38 \approx 6 \text{ eV}$$

$$29. (b) h\nu = h\nu_0 + \frac{1}{2}(mv^2)_{\max}$$

$$\text{But, } \left(\frac{1}{2}mv^2\right)_{\max} = eV_s \therefore V_s = \frac{h\nu}{e} - \frac{h}{e}\nu_0$$

Hence, it is a straight line.

30. (d)

$$31. (b) \text{ Current, } I = \frac{q}{t} = \frac{Ne}{t} = n_e e$$

$$\text{where, } n_e = \text{number of electrons per second} \\ e = 1.6 \times 10^{-19} \text{ C}$$

As, each electron is emitted due to absorption of a photon,

$\therefore n_e = n_2 = \text{number of photons absorbed per second}$

$$\Rightarrow n_r = \frac{I}{e} = \frac{0.16 \times 10^{-6}}{1.6 \times 10^{-19}} \text{ per sec} = 10^{12} \text{ photons/s}$$

And power of source,

$$P = n_1 E, n_1 = \text{number of photons emitted per second}$$

$$\Rightarrow n_1 = \frac{P}{E}$$

$$\text{where, } E = \frac{hc}{\lambda} = \frac{12400}{5000} \text{ eV}$$

$$\Rightarrow E = 2.48 \text{ eV} = 2.48 \times 1.6 \times 10^{-19} \text{ J} = 3.968 \times 10^{-19} \text{ J}$$

$$\Rightarrow n_1 = \frac{P}{E} = 2.52 \times 10^{15} \text{ photons/s}$$

$$\therefore \% \text{ of photons absorbed} = \frac{n_2}{n_1} \times 100$$

$$= \frac{10^{12} \times 100}{2.52 \times 10^{15}} = 0.03968\% \approx 0.04\%$$

$$32. (c) \text{ KE} = \begin{cases} 2E_0 - E_0 = E_0, & \text{for } 0 \leq x \leq 1 \\ 2E_0, & \text{for } x > 1 \end{cases}$$

$$\therefore \lambda_1 = \frac{h}{\sqrt{2mE_0}} \text{ and } \lambda_2 = \frac{h}{\sqrt{4mE_0}} \Rightarrow \frac{\lambda_1}{\lambda_2} = \sqrt{2}$$

33. (a)

34. (b)

... (i)

... (ii)

$$\begin{aligned} 35. (a) \frac{hc}{\lambda} &= \phi + \frac{1}{2}mv_{\max}^2 \\ \therefore v_{\max} &= \sqrt{\frac{2\left(\frac{hc}{\lambda} - \phi\right)}{m}} = \sqrt{\frac{2\left(\frac{1242 \text{ eV}}{280} - 2.5 \text{ eV}\right)}{9.1 \times 10^{-31}}} \\ &= \sqrt{\left(\frac{2 \times 1.9 \times 1.6 \times 10^{-19}}{9.1 \times 10^{-31}}\right)} = 8.2 \times 10^5 \text{ m/s} \end{aligned}$$

36. (a)

37. (c)

$$38. (a) \xrightarrow{\text{VIBGYOR}} E = n \cdot \frac{hc}{\lambda}$$

From equation,

$$\text{or } n_r \cdot \frac{hc}{\lambda_r} = n_b \cdot \frac{hc}{\lambda_b} \text{ or } \frac{n_r}{n_b} = \frac{\lambda_r}{\lambda_b} \therefore \frac{\lambda_r}{\lambda_b} > 1 \quad (\text{Given})$$

$$\text{Hence, } \frac{n_r}{n_b} > 1 \text{ or } n_r > n_b$$

39. (c)

40. (c)

41. (a) Number of photons falling on metal surface,

$$\begin{aligned} n_p &= \frac{\text{intensity} \times \text{area}}{\text{energy per quanta}} \\ &= \frac{(2 \text{ Js}^{-1} \text{ m}) \times (4 \text{ m}^2)}{\left\{ \frac{(6.626 \times 10^{-34} \text{ Js}) \times (3 \times 10^8 \text{ ms}^{-1})}{(66.26 \times 10^{-9} \text{ m})} \right\}} \\ &= 2.67 \times 10^{18} \text{ per sec} \end{aligned}$$

From equation, $n_e = 0.1\%$ of n_p

$$= \frac{0.1}{100} \times 2.67 \times 10^{18} = 2.67 \times 10^{15} \text{ per sec}$$

$$42. (a) eV_1 = \frac{hc}{\lambda_1} \text{ and } eV_2 = \frac{hc}{\lambda_2} \Rightarrow (V_1 - V_2) = \frac{hc}{e} \left(\frac{1}{\lambda_1} - \frac{1}{\lambda_2} \right)$$

$$43. (a) \text{ We know that } E_1 = \frac{hc}{\lambda_1} - W \quad \dots (i)$$

$$E_2 = \frac{hc}{\lambda_2} - W \quad \dots (ii)$$

From Eqs. (i) and (ii), we get

$$\therefore \frac{E_1 + W}{E_2 + W} = \frac{\lambda_2}{\lambda_1} \text{ or } W = \frac{E_1 \lambda_1 - E_2 \lambda_2}{(\lambda_2 - \lambda_1)}$$

44. (a)

$$45. (a) \frac{1}{2}m(8 \times 10^6)^2 = h(5\nu_0 - \nu_0) \quad \dots (i)$$

$$\text{and } \frac{1}{2}mv^2 = h(2\nu_0 - \nu_0) \quad \dots (ii)$$

Dividing Eq. (ii) by Eq. (i), we get

$$\frac{(8 \times 10^6)^2}{v^2} = \frac{4\nu_0}{\nu_0} \Rightarrow v^2 = \frac{(8 \times 10^6)^2}{4}$$

$$v = \frac{8 \times 10^6}{2} \Rightarrow v = 4 \times 10^6 \text{ m/s}$$

$$46. (b) \text{ We know that, } E = \frac{hc}{\lambda}$$

Let, power = P

then, energy in time t

$$nE = Pt \text{ and } n = \frac{Pt}{E} = \frac{Pt\lambda}{hc}$$

$$\therefore n_R = \frac{Pt\lambda_R}{hc} \quad \dots(i)$$

$$n_V = \frac{Pt\lambda_V}{hc} \quad \dots(ii)$$

Dividing Eq. (i) by Eq. (ii), we get

$$\frac{n_R}{n_V} = \frac{\lambda_R}{\lambda_V}$$

We know, $\lambda_R > \lambda_V$

$$\therefore n_R > n_V$$

$$47. (b) eV_0 = hc \left[\frac{1}{\lambda} - \frac{1}{\lambda_0} \right] \quad \dots(i)$$

$$\frac{eV_0}{6} = hc \left[\frac{1}{3\lambda} - \frac{1}{\lambda_0} \right] \quad \dots(ii)$$

Dividing Eq. (i) by Eq. (ii), we get

$$6 = \frac{\left(\frac{1}{\lambda} - \frac{1}{\lambda_0} \right)}{\left(\frac{1}{3\lambda} - \frac{1}{\lambda_0} \right)}$$

$$\frac{6}{3\lambda} - \frac{6}{\lambda_0} = \frac{1}{\lambda} - \frac{1}{\lambda_0}$$

$$\frac{1}{\lambda} = \frac{5}{\lambda_0}$$

$$\lambda = \frac{\lambda_0}{5}$$

$$\lambda_0 = 5\lambda$$

or
48. (b)

BITSAT Archives

1. (c) By Einstein's photoelectric equation

$$KE_{\max} = eV_s = h\nu - h\nu_0$$

$$\Rightarrow V_s = \left(\frac{h}{e} \right) \nu - \frac{h\nu_0}{e}$$

Graph of V_s with ν is straight line whose slope = $\frac{h}{e}$

$$\text{Slope of graph} = \frac{AB}{BC} \Rightarrow \frac{AB}{BC} = \frac{h}{e}$$

2. (b) Number of photoelectrons depends on the intensity of light only.

3. (b) Threshold energy of A is

$$\begin{aligned} E_A &= h\nu_A \\ &= 6.6 \times 10^{-34} \times 1.8 \times 10^{14} \\ &= 11.88 \times 10^{-20} \text{ J} \\ &= \frac{11.88 \times 10^{-20}}{1.6 \times 10^{-19}} \text{ eV} \\ &= 0.74 \text{ eV} \end{aligned}$$

Similarly, $E_B = 0.91 \text{ eV}$

Since, the incident photons have energy greater than E_A but less than E_B .

So, photoelectrons will be emitted from metal A only.

4. (c) In a photoelectric cell, optical energy is being transformed into electrical energy because light photons are being absorbed and photoelectric current is being produced.

5. (a) $\lambda = \frac{h}{mv}$

So, electron is the lightest particle of these four. So, λ_e is maximum.

6. (d) de-Broglie wavelength,

$$\lambda = \frac{h}{\sqrt{2mE}}$$

$$\frac{\lambda_1}{\lambda_2} = \sqrt{\frac{E_2}{E_1}}$$

$$\Rightarrow \frac{1 \times 10^{-9}}{0.5 \times 10^{-9}} = \sqrt{\frac{E_2}{E_1}}$$

$$\Rightarrow 2 = \sqrt{\frac{E_2}{E_1}}$$

$$\Rightarrow \frac{E_2}{E_1} = 4$$

$$\therefore E_2 = 4E_1$$

$$\therefore \text{Energy to be added} = E_2 - E_1 = 4E_1 - E_1 = 3E_1$$

30

Atomic Structure

Theory of Atom

Atom is the smallest particle of an element which contains all properties of element. Molecule is a single atom or a group of atoms joined by chemical bonds. It is the smallest unit of a chemical compound that can have an independent existence. Nuclei refers to a nucleus of an atom having a given number of nucleons. It is a general term referring to all known isotopes, both stable and unstable of the chemical elements. Thus, O^{16} and O^{17} are different nuclides.

Rutherford's Atomic Model

Rutherford and his two associates, H Geiger and E Marsden performed classical α -particle scattering experiment in order to investigate the structure of the atom.

In this experiment, a beam of 5.5 MeV of α -particles emitted from a ${}^{214}_{33}\text{Bi}$, a radioactive source was made to fall at thin metal foil made of gold.

α -Particle Scattering Experiment

Set up for Rutherford's α -particle scattering experiment is

The scattered α -particles were observed through a rotatable detector consisting of zinc sulphide screen and a microscope. It produces bright light flash which can be seen by microscope.

Main Observations

- (i) Most of the α -particles pass through the foil straight away (undeflected).
- (ii) Some of them are deflected through small angles.
- (iii) Few α -particles (1 in 1000) are deflected through the angle more than 90° .

- (iv) Some α -particles (very few) returned back, i.e. deflected by 180° .
 (v) The number of α -particles scattered at an angle θ by a target is given by

$$N_\theta = \frac{N_0 n t (2Ze^2)^2}{4(4\pi\epsilon_0)^2 r^2 (mv_0^2)^2} \times \frac{1}{\sin^4\left(\frac{\theta}{2}\right)}$$

where, N_0 = total number of α -particles that strike the unit area of the scattered, n = number of target atoms per m^3 , t = thickness of target, Ze = charge on the target nucleus, $2e$ = charge on α -particle, r = distance of screen from the target and v_0 = velocity of α -particle at nearest distance of approach.

The number of α -particles scattered per unit area, N_θ at scattering angle θ varies inversely as $\sin^4 \frac{\theta}{2}$.

i.e.
$$N_\theta \propto \frac{1}{\sin^4(\theta/2)}$$

- (vi) In an atom, there is maximum empty space and the electrons revolve around the nucleus in the same way as the planets revolve around the sun. Taking electrostatic force as only force of attraction on electrons,

$$\frac{mv^2}{r} = \frac{kZe \cdot e}{r^2}$$

where, Z = number of protons of target nucleus

- (vii) **Distance of closest approach** (Nuclear dimension) The minimum distance from the nucleus upto which the α -particle approaches is called the distance of closest approach (r_0).

From figure,

$$r_0 = \frac{1}{4\pi\epsilon_0} \cdot \frac{2Ze^2}{E}$$

where, $E = \frac{1}{2}mv^2 = \text{KE of } \alpha\text{-particle}$

- (viii) **Impact parameter** The perpendicular distance of the velocity vector (v) of the α -particle from the centre of the nucleus when it is far away from the nucleus is known as impact parameter. It is given as in the figure.

From figure,
$$b = \frac{Ze^2 \cot\left(\frac{\theta}{2}\right)}{4\pi\epsilon_0 \times \frac{1}{2}mv^2}$$

$$\Rightarrow b \propto \cot\left(\frac{\theta}{2}\right)$$

- (ix) If t is the thickness of the foil and N is the number of α -particles scattered in a particular direction

(θ = constant), then it was observed that $\frac{N}{t} = \text{constant}$

$$\Rightarrow \frac{N_1}{N_2} = \frac{t_1}{t_2}$$

Bohr's Model

Bohr added the following postulates to the Rutherford's model of the atom

- The electrons revolve around the nucleus only in certain permitted orbits, in which the angular momentum of the electron is an integral multiple of $h/2\pi$, where h is the Planck's constant.
- The electrons do not radiate energy while revolving in the permitted orbits.
i.e. the permitted orbits are stationary, non-radiating orbits.
- The energy is radiated only when the electron jumps from an outer permitted orbit to some inner permitted orbit. (Absorption of energy makes the electron jump from inner orbit to outer orbit).
- If energy of the electron in n th and m th orbits be E_n and E_m respectively, then while the electron jumps from n th to m th orbit the radiation frequency ν is emitted, such that $E_n - E_m = h\nu$

This is called the **Bohr's frequency equation**.

- Radius of the orbit of electron in a hydrogen atom in its stable state, corresponding to $n = 1$, is called Bohr's radius. The value of Bohr's radius is $r_0 = 0.529 \text{ \AA} \approx 0.53 \text{ \AA}$.
- The time period of an electron in orbital motion in the Bohr's orbit is given by

$$T = \frac{2\pi r}{v} = \frac{2\pi \times 0.53 \text{ \AA}}{\frac{c}{137}} = 1.52 \times 10^{-16} \text{ s}$$

and the frequency of revolution is

$$f = \frac{1}{T} = 6.5757 \times 10^{15} \text{ cps}$$

Some Characteristics of an Atom

- (i) The **orbital radius** of the electron is

$$r_n = 4\pi\epsilon_0 \frac{n^2 h^2}{4\pi^2 m e^2}$$

(ii) The **orbital velocity** of electron is

$$v_n = \frac{1}{4\pi\epsilon_0} \frac{2\pi e^2}{nh}$$

(iii) The **orbital frequency** is given by

$$f = \frac{1}{T} = \frac{v}{2\pi r} = \frac{me^4}{4\epsilon_0^2 n^3 h^3}$$

(iv) The **total energy** of the orbital electron is

$$E = -\left(\frac{1}{4\pi\epsilon_0}\right)^2 \left[\frac{2\pi me^4}{h^2}\right] \left[\frac{1}{n^2}\right]$$

$$\text{KE} = \frac{me^4}{8n^2 h^2 \epsilon_0^2} \text{ or } \text{PE} = -\frac{me^4}{4n^2 h^2 \epsilon_0^2}$$

(v) The **velocity of the orbital electron** may be written as

$$v_n = \frac{1}{4\pi\epsilon_0} \left[\frac{2\pi e^2}{h}\right] \left(\frac{1}{n}\right) = \frac{c}{n} \left[\frac{1}{4\pi\epsilon_0} \cdot \frac{2\pi e^2}{ch}\right] = \frac{c}{n} \alpha$$

Here, $\frac{1}{4\pi\epsilon_0} \frac{2\pi e^2}{ch} = \alpha$ is called fine structure constant.

It is a dimensionless quantity.

The value of α comes out to be $\frac{1}{137} = 0.0073$.

(vi) The kinetic, potential and total energies of the electron varies with r (the radius of the orbit) as follows

$$\text{KE} = \frac{1}{2} \left[\frac{1}{4\pi\epsilon_0} \frac{e^2}{r} \right], \text{PE} = -\frac{1}{4\pi\epsilon_0} \frac{e^2}{r}$$

$$\text{and } E = -\frac{1}{2} \left[\frac{1}{4\pi\epsilon_0} \frac{e^2}{r} \right]$$

Therefore, they are related to each other as follows

$$\text{KE} = -E \text{ and } \text{PE} = 2E$$

(vii) For a hydrogen atom,

$$r_n \propto n^2, v_n \propto \frac{1}{n} \text{ and } |E| \propto \frac{1}{n^2}$$

The difference in angular momentum associated with the electron in the two successive orbits of hydrogen atom is $\Delta L = (n+1) \frac{h}{2\pi} - \frac{nh}{2\pi} = \frac{h}{2\pi}$.

Hydrogen Spectrum

Hydrogen spectrum consists of spectral lines classified as five spectral series of hydrogen atom. Out of these five, Lyman series lies in the ultraviolet region of spectrum, Balmer series lies in the visible region and the remaining three series, lie in the infrared region of spectrum.

Total number of emission spectral lines from some excited state n , to another energy $n_2 (< n_1)$ is given by

$$\frac{(n_1 - n_2)(n_1 - n_2 + 1)}{2}$$

e.g. Total number of lines from $n_1 = n$ to $n_2 = 1$ are $\frac{n(n-1)}{2}$.

The five spectral series of hydrogen atom are given as below

1. Lyman Series

Spectral lines of Lyman series correspond to the transition of electron from higher energy levels (orbits) $n_i = 2, 3, 4, \dots$ to ground energy level (1st orbit) $n_f = 1$.

For Lyman series, $\frac{1}{\lambda} = \bar{\nu} = R \left[\frac{1}{(1)^2} - \frac{1}{n^2} \right]$, where $n = 2, 3, 4, \dots$

It is found that a term $Rch = 13.6 \text{ eV} = 2.17 \times 10^{-18} \text{ J}$. The term Rch is known as Rydberg's energy.

2. Balmer Series

Electronic transitions from $n_i = 3, 4, 5, \dots$ to $n_f = 2$, give rise to spectral lines of Balmer series.

Thus, for a Balmer series line

$$\frac{1}{\lambda} = \bar{\nu} = R \left[\frac{1}{(2)^2} - \frac{1}{n^2} \right], \text{ where } n = 3, 4, 5, \dots$$

3. Paschen Series

Spectral lines of this series lie in the infrared region and correspond to electronic transition from $n_i = 4, 5, 6, \dots$ to $n_f = 3$.

Thus, $\frac{1}{\lambda} = \bar{\nu} = R \left[\frac{1}{(3)^2} - \frac{1}{n^2} \right]$, where $n = 4, 5, 6, \dots$

4. Brackett Series

It lies in the infrared region and corresponds to transition from

$$n_i = 5, 6, 7, \dots \text{ to } n_f = 4.$$

Thus, for Brackett series

$$\frac{1}{\lambda} = \bar{\nu} = R \left[\frac{1}{(4)^2} - \frac{1}{n^2} \right], \text{ where } n = 5, 6, 7, \dots$$

5. Pfund Series

It lies in the far infrared region of spectrum and corresponds to electronic transitions from higher orbits $n_i = 6, 7, 8, \dots$ to orbit having $n_f = 5$. Thus, we have

$$\frac{1}{\lambda} = \bar{\nu} = R \left[\frac{1}{(5)^2} - \frac{1}{n^2} \right], \text{ where } n = 6, 7, 8, \dots$$

- Radius of the n th orbit in hydrogen atom is the $r_n = 0.53 n^2 \text{ \AA}$.
- If elements with $n > 4$ were not allowed to exist, then total number of elements would be

$$2 \times [1^2 + 2^2 + 3^2 + 4^2] = 60$$

Ionisation Energy and Potential

Ionisation energy of an atom is defined as the energy required to ionise it, i.e. to make the electron jump from its present orbit to infinity.

Thus, ionisation energy of hydrogen atom in the ground state

$$= E_{\infty} - E_1 = 0 - (-13.6 \text{ eV}) = +13.6 \text{ eV}$$

The potential through which an electron is to be accelerated so that it acquires energy equal to the ionisation energy is called the **ionisation potential**.

Therefore, ionisation potential of hydrogen atom in its ground state is 13.6V.

Excitation Energy and Potential

Excitation energy is the energy required to excite an electron from a lower energy level to a higher energy level. The potential through which an electron is accelerated so as to gain requisite ionisation energy is called the **ionisation potential**.

Thus, first excitation energy of hydrogen atom

$$\begin{aligned} &= E_2 - E_1 = -3.4 - (-13.6) \text{ eV} \\ &= +10.2 \text{ eV} \end{aligned}$$

Similarly, second excitation energy of hydrogen atom

$$\begin{aligned} &= E_3 - E_1 = -1.51 - (-13.6) \\ &= 12.09 \text{ eV} \end{aligned}$$

Practice Exercise

1. α -particles are projected towards the nuclei of the following metals with the same kinetic energy. Towards which metal, the distance of closest approach is minimum?
 - a. Cu ($Z = 29$)
 - b. Ag ($Z = 47$)
 - c. Au ($Z = 79$)
 - d. Pd ($Z = 46$)
2. An α -particle accelerated through V volt is fired towards a nucleus. Its distance of closest approach is r . If a proton accelerated through the same potential is fired towards the same nucleus, then distance of closest approach of proton will be
 - a. r
 - b. $2r$
 - c. $r/2$
 - d. $r/4$
3. The distance of closest approach of an α -particle fired towards a nucleus with momentum p is r . What will be the distance of closest approach when the momentum of α -particle is $2p$?
 - a. $2r$
 - b. $4r$
 - c. $r/2$
 - d. $r/4$
4. Which of the following is incorrect regarding Rutherford's atomic model?
 - a. Atom contains nucleus
 - b. Size of nucleus is very small in comparison to that of atom
 - c. Nucleus contains about 90% mass of the atom
 - d. Electrons revolve around the nucleus with a uniform speed
5. In Rutherford's experiment, the number of α -particles scattered through an angle of 90° is 28 per minute. Then, the number of particles scattered through an angle of 60° per minute by the same nucleus is
 - a. 28 per minute
 - b. 112 per minute
 - c. 12.5 per minute
 - d. 7 per minute
6. Find the equivalent current due to motion of electron in first orbit of H-atom.
 - a. $0.7 \times 10^{-3} \text{ A}$
 - b. $9 \times 10^{-3} \text{ A}$
 - c. 10^{-3} A
 - d. None of these

7. If the radius of first Bohr's orbit is x , then de-Broglie wavelength of electron in 3rd orbit is nearly
 a. $2\pi x$ b. $6\pi x$
 c. $9x$ d. $x/3$
8. How many times larger is the spacing between the energy levels with $n = 3$ and $n = 4$, then the spacing between the energy levels with $n = 8$ and $n = 9$ for a hydrogen like atom or ion?
 a. 0.71 b. 0.41
 c. 2.43 d. 14.82
9. The circumference of the second orbit of an atom or ion having single electron, is 4×10^{-9} m. The de-Broglie wavelength of electron revolving in this orbit should be
 a. 2×10^{-9} m b. 4×10^{-9} m
 c. 8×10^{-9} m d. 1×10^{-9} m
10. In each of the following atoms or ions, electronic transition from $n = 4$ to $n = 1$ take place. The frequency of the radiation emitted out will be minimum for
 a. hydrogen atom
 b. deuterium atom
 c. He^+ ion
 d. Li^{2+} ion
11. If an electron is revolving around the hydrogen nucleus at a distance of 0.1 nm, what should be its speed?
 a. 2.188×10^6 m/s b. 1.094×10^6 m/s
 c. 4.376×10^6 m/s d. 1.59×10^6 m/s
12. The angular speed of an electron revolving around the H-nucleus is proportional to
 a. $1/r$ b. $1/r^{3/2}$
 c. $1/r^2$ d. $r^{3/2}$
13. Calculate the angular momentum of the electron in third orbit of hydrogen atom, if the angular momentum in the second orbit of hydrogen atom is L .
 a. L b. $3L$
 c. $\frac{3}{2}L$ d. $\frac{2}{3}L$
14. If an electron is moving around a nucleus of charge $2e$ in a circular orbit of radius 10^{-10} m, then calculate the initial frequency of light emitted by the electron.
 a. 4.2×10^{15} Hz b. 0.36×10^{15} Hz
 c. 3.6×10^{15} Hz d. 4.2×10^{15} Hz
15. An electron of hydrogen atom is revolving in third Bohr's orbit ($n = 3$). How many revolutions will it undergo before making a transition to the second orbit ($n = 2$). Assume the average life time of an excited state of the hydrogen atom is of the order of 10^{-8} s. (Given, Bohr radius = 5.3×10^{-12} m)
 a. 2.5×10^6 revolutions b. 3.5×10^6 revolutions
 c. 4.5×10^6 revolutions d. 1.5×10^6 revolutions
16. If $\left(\frac{0.51 \times 10^{-10}}{4}\right)$ metre is the radius of smallest electron orbit in hydrogen like atom, then this atom is
 a. hydrogen atom b. He^+
 c. Li^{2+} d. Be^{3+}
17. How many different wavelengths may be observed in the spectrum from a hydrogen sample, if the atoms are excited to third excited state?
 a. 3 b. 4 c. 5 d. 6
18. Find the maximum number of photons emitted by an H-atom, if atom is excited to states with principal quantum number four.
 a. 4 b. 3 c. 2 d. 1
19. In (Q. 18) problem, the minimum number of photons emitted by the H-atom is
 a. 1 b. 2 c. 3 d. 4
20. The kinetic energy of an electron in hydrogen atom is 3.40 eV. The minimum energy required to ionise the hydrogen atom is
 a. -3.40 eV b. 6.40 eV c. -6.80 eV d. 3.40 eV
21. Two H-atoms in the ground state collide inelastically. The maximum amount by which their combined kinetic energy is reduced is
 a. 10.20 eV b. 20.40 eV c. 13.6 eV d. 27.2 eV
22. Calculate the ratio of the frequencies of the long wavelength limits of the Balmer and Lyman series of hydrogen.
 a. 27 : 5 b. 5 : 27 c. 4 : 1 d. 1 : 4
23. For a certain atom, there are energy levels A, B, C corresponds to energy values $E_A < E_B < E_C$. Choose the correct option if $\lambda_1, \lambda_2, \lambda_3$ are the wavelength of radiations corresponding to the transition from C to B , B to A and C to A respectively.
 a. $\lambda_3 = \lambda_1 + \lambda_2$ b. $\lambda_3 = \frac{\lambda_1 \lambda_2}{\lambda_1 + \lambda_2}$
 c. $\lambda_1 + \lambda_2 + \lambda_3 = 0$ d. $3\lambda_2 = \lambda_3 + 2\lambda_2$
24. Calculate the energy required to excite an electron in hydrogen atom from the ground state to the next higher state, if the ionisation energy for the hydrogen atom is 13.6 eV.
 a. 3.4 eV b. 10.2 eV c. 12.1 eV d. 1.3 eV
25. Find the wavelength of the emitted radiation, if electron in hydrogen atom jumps from the third orbit to second orbit.
 a. $\lambda = \frac{36}{5R}$ b. $\lambda = \frac{5R}{36}$ c. $\lambda = \frac{5}{R}$ d. $\lambda = \frac{R}{6}$
26. Any radiation in the ultraviolet region of hydrogen spectrum is able to eject photoelectrons from a metal. What should be the maximum value of threshold frequency for the metal?
 a. 3.288×10^{15} Hz b. 2.466×10^{15} Hz
 c. 4.594×10^{14} Hz d. 8.220×10^{14} Hz

27. Balmer gives an equation for wavelength of visible radiation of H-spectrum as $\lambda = \frac{kn^2}{n^2 - 4}$. The value of k in terms of Rydberg constant R is
 a. R b. $4R$ c. $R/4$ d. $4/R$
28. When an electron jumps from higher orbit to the second orbit in He^+ ion, the radiation emitted out will be in ($R = 1.09 \times 10^7 \text{ m}^{-1}$)
 a. ultraviolet region b. visible region
 c. infrared region d. X-ray region
29. Deuterium atoms in the ground state are radiated by photons of energy 12.8 eV. What will be the energy of induced radiation of longest wavelength? Ionisation energy of deuterium is 14.4 eV.
 a. 12.8 eV b. 10.8 eV c. 1.6 eV d. 2.00 eV
30. Calculate the ionisation energy of Li^{2+} atom in ground state.
 a. $13.6 \times 9 \text{ eV}$ b. 13.6 J
 c. 13.6 erg d. 13.6×10^{-19}
31. The first excitation potential of a given atom is 10.2 V, then the ionisation potential is
 a. 10.2 V b. 13.6 V c. 30.6 V d. 20.4 V
32. For a single ionised helium atom, the longest wavelength in ground state will absorb
 a. 912 Å b. 304 Å
 c. 606 Å d. 1216 Å
33. If an electron drops from 4th orbit to 2nd orbit in an H-atom, then
 a. it gains 2.55 eV of potential energy
 b. it gains 2.55 eV of total energy
 c. it emits a 2.55 eV electron
 d. it emits a 2.55 eV photon
34. 29 electrons are removed from Zn-atom ($Z = 30$) by certain means. The minimum energy needed to remove the 30th electron, will be
 a. 12.24 keV b. 408 eV
 c. 0.45 eV d. 765 eV
35. An electron of kinetic energy E_0 is scattered by an atomic hydrogen sample in ground state. Find the minimum value of E_0 , so that a photon of wavelength 656.3 nm may be emitted by H-atom.
 a. 12.09 eV b. 13.6 eV
 c. 14.6 eV d. None of these
36. A H-atom moving with speed v makes a head on collision with a H-atom in rest. Both atoms are in ground state. Find the minimum value of velocity v for which one of atom may excite.
 a. $6.25 \times 10^4 \text{ m/s}$ b. $8 \times 10^4 \text{ m/s}$
 c. $7.25 \times 10^4 \text{ m/s}$ d. $13.6 \times 10^4 \text{ m/s}$
37. A photon of energy 15 eV collides with H-atom. Due to this collision, H-atom gets ionised. The maximum kinetic energy of emitted electron is
 a. 1.4 eV b. 5 eV
 c. 15 eV d. 13.6 eV
38. Find the minimum frequency of light which can ionise a hydrogen atom.
 a. $3.28 \times 10^{15} \text{ Hz}$ b. $5 \times 10^{15} \text{ Hz}$
 c. 91.1 Hz d. None of these
39. In the case of Compton effect, which of the following is applicable?
 a. Energy conservation b. Momentum conservation
 c. Charge conservation d. All of these
40. The number of orbitals in 3rd orbit are
 a. 3 b. 10
 c. 18 d. None of these

BITSAT Archives

1. In hydrogen atom, an electron jumps from bigger orbit to smaller orbit, so that radius of smaller orbit is one-fourth of radius of bigger orbit. If speed of electron in bigger orbit was v , then speed in smaller orbit is
 a. $\frac{v}{4}$ b. $\frac{v}{2}$ [2014]
 c. v d. $2v$
2. In hydrogen atom, if $\lambda_1, \lambda_2, \lambda_3$ are shortest wavelengths in Lyman, Balmer and Paschen series respectively, then $\lambda_1 : \lambda_2 : \lambda_3$ equals [2013]
 a. 1 : 4 : 9 b. 9 : 4 : 1
 c. 1 : 2 : 3 d. 3 : 2 : 1
3. If λ is the wavelength of hydrogen atom from the transition $n = 3$ to $n = 1$, then what is the wavelength for doubly ionised lithium ion for same transition?
 a. $\frac{\lambda}{3}$ b. 3λ [2006]
 c. $\frac{\lambda}{9}$ d. 9λ
4. In Bohr's atom model, [2005]
 a. the nucleus is of infinite mass and is at rest
 b. electrons in a quantised orbit will not radiate energy
 c. mass of electron remains constant
 d. All of the above

Answer with Solutions

Practice Exercise

1. (a) For distance of closest approach,
(KE) _{α} = PE at distance of closest approach

$$\text{or} \quad \text{KE} = \frac{1}{4\pi\epsilon_0} \cdot \frac{q_1 q_2}{r}$$

where, q_1 = charge of α -particle
 q_2 = charge of nucleus

$$\therefore r = \frac{1}{4\pi\epsilon_0} \cdot \frac{q_1 q_2}{\text{KE}} \Rightarrow r \propto q_2$$

Smaller q_2 (= Ze), smaller will be radius of closest approach (r).

2. (a) $\text{KE} = \text{PE}$
or $q_1 V = \frac{1}{4\pi\epsilon_0} \cdot \frac{q_1 q_2}{r}$

or $r = \frac{1}{4\pi\epsilon_0} \cdot \frac{q_2}{V} = \text{constant in this problem}$

3. (d) $\text{KE} = \text{PE}$
or $\frac{p^2}{2m} = \frac{1}{4\pi\epsilon_0} \cdot \frac{q_1 q_2}{r} \Rightarrow r \propto \frac{1}{p^2}$

Hence, momentum of α -particle will be the closest approach of $r/4$.

4. (c)

5. (b) According to Rutherford's scattering formula, if the α -particle scattered at angle θ is directly proportional to $\frac{1}{\sin^4(\theta/2)}$,

Then, $N_\theta = \frac{K}{\sin^4(\theta/2)}$

When $\theta = 90^\circ$, $N_\theta = 28 \text{ min}^{-1}$

$\Rightarrow 28 = \frac{K}{\sin^4(45^\circ)} = 4K \Rightarrow K = 7$

Thus, $N_\theta = \frac{7}{\sin^4(\theta/2)}$

Hence, the number of α -particles scattered at an angle of 60° per minute is $N'_\theta = \frac{7}{\sin^4 30^\circ} = \frac{7}{(1/2)^4} = 7 \times 16 = 112$

6. (a) $I = \frac{e}{T} = \frac{e}{2\pi/\omega} = \frac{e\omega}{2\pi} = \frac{ev}{2\pi r}$

Here, $v = \frac{e^2}{2\epsilon_0 h} = \frac{(1.6 \times 10^{-19})^2}{2 \times 8.85 \times 10^{-12} \times 6.63 \times 10^{-34}} = 2.18 \times 10^6 \text{ m/s}$

$r = n^2 r_0 = (1)^2 \times 0.53 \text{ \AA} = 0.53 \times 10^{-10}$
 $\therefore I = \frac{1.6 \times 10^{-19} \times 2.18 \times 10^6}{3 \times 3.14 \times 0.53 \times 10^{-10}} = 0.7 \times 10^{-3} \text{ A}$

7. (b) $r_3 = r_1 \times n^2 = x \times 3^2 = 9x$

$\therefore 2\pi r = n\lambda$

$\therefore \lambda = \frac{2\pi r}{n} = \frac{2\pi \times 9x}{3} = 6\pi x$

8. (b) $\frac{r_4 - r_3}{r_9 - r_8} = \frac{r_1 \times 4^2 - r_1 \times 3^2}{r_1 \times 9^2 - r_1 \times 8^2} = \frac{16 - 9}{81 - 64} = 0.41$

9. (a)

10. (a)

11. (d)

12. (b) We know that,

$\therefore \frac{1}{4\pi\epsilon_0} \cdot \frac{Ze^2}{r^2} = \frac{mv^2}{r}$

$\therefore v = \sqrt{\left(\frac{1}{4\pi\epsilon_0} \cdot \frac{Ze^2}{mr}\right)} = \frac{k}{\sqrt{r}}$

(Let $k = \frac{Ze^2}{4\pi\epsilon_0 m}$)

Angular speed, $\omega = \frac{v}{r} = \frac{k}{\sqrt{r} \cdot r} = \frac{k}{r^{3/2}}$

13. (c)

14. (c) We know that,

$\frac{mv^2}{r} = \frac{2e^2}{4\pi\epsilon_0 r^2}$ or $v = \left(\frac{2e^2}{4\pi\epsilon_0 mr}\right)^{1/2}$

Also, frequency $= f = \frac{v}{2\pi r} = \left(\frac{2e^2}{4\pi\epsilon_0 mr}\right)^{1/2} \times \frac{1}{2\pi r}$

$\therefore f = \frac{(1.414)(9 \times 10^9)^{1/2} \times 1.6 \times 10^{-19}}{(9.1 \times 10^{-31})^{1/2} \times 2\pi(10^{-10})^{3/2}} \approx 3.6 \times 10^{15} \text{ Hz}$

15. (a) Number of revolutions made in one second $= \frac{v_3}{2\pi r_3}$

(for $n = 3$)

$= \frac{(0.73) \times 10^6}{2 \times \pi \times 47.7 \times 10^{-11}} = 2437 \times 10^{11}$

Number of revolutions taken in 10^{-8} s
 $= 2437 \times 10^{-8} \times 10^{11} \approx 2.5 \times 10^6 \text{ revolutions.}$

16. (d)

17. (d) $N = \frac{n(n-1)}{2}$

For third excited state, $n = 4$

$\therefore N = \frac{4(4-1)}{2} = 6$

18. (b) For maximum number,

$N = n - 1 = 4 - 1 = 3$

19. (a) When transition takes place from $n = 4$ to $n = 1$. One photon will be emitted.

20. (d) Given, KE = 3.40 eV

So, total energy = -3.40 eV

When H-atom is ionised, its minimum total energy will become zero.

So, ionisation energy = $0 - (-3.40) = 3.40$ eV

21. (a) 22. (a)

$$23. (b) \quad E_B - E_A = \frac{hc}{\lambda^2} \Rightarrow E_C - E_B = \frac{hc}{\lambda_2}$$

$$\text{or} \quad \frac{1}{\lambda_3} = \frac{1}{\lambda_1} + \frac{1}{\lambda_2} \Rightarrow \lambda_3 = \frac{\lambda_1 \lambda_2}{\lambda_1 + \lambda_2}$$

24. (b) 25. (a)

26. (b) For minimum frequency in Lyman series of H-atom, transition $n = 2$ to $n = 1$ takes place.

Now, $h\nu = \Delta E = E_2 - E_1$

$$\text{or} \quad h\nu = \left[\left(-\frac{13.6}{2^2} \right) - \left(-\frac{13.6}{1^2} \right) \right] \text{eV}$$

$$\nu = \frac{10.2 \times 1.6 \times 10^{-19}}{6.63 \times 10^{-34}}$$

$$\therefore \nu = 2.466 \times 10^{15} \text{ Hz}$$

If the threshold frequency of metal is ν or less, photoelectron will come out.

27. (d)

28. (b)

29. (d)

30. (a)

31. (b)

32. (b)

$$\lambda = \frac{912}{Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)}$$

$$\lambda = \frac{912}{3} = 304 \text{ Å}$$

33. (d)

34. (a)

35. (a)

36. (a) For $v_{\min}$, collision should be completely inelastic.

According to energy conservation principle,

$$\frac{1}{2} m v_{\min}^2 = \frac{1}{2} m v^2 + \frac{1}{2} m v^2 + \Delta E \quad \dots(i)$$

According to momentum conservation principle,

$$m v_{\min} = m v + m v$$

$$\therefore v = \frac{v_{\min}}{2} \quad \dots(ii)$$

After solving Eqs. (i) and (ii), we get

$$\frac{1}{2} m v_{\min}^2 = 2 \Delta E$$

$$\therefore v_{\min} = \sqrt{\left(\frac{4 \Delta E}{m} \right)}$$

Here, ΔE = minimum excitation energy = 10.2 eV

$$m = 1.67 \times 10^{-27} \text{ kg}$$

$$\therefore v_{\min} = \sqrt{\left(\frac{4 \times 10.2 \times 1.6 \times 10^{-19}}{1.67 \times 10^{-27}} \right)} = 6.25 \times 10^4 \text{ m/s}$$

37. (a)

38. (a)

39. (b)

40. (d)

1. (d) Radius of n th orbit, $r_n \propto n^2$

$$\frac{r_{n \text{ big}}}{r_{n \text{ small}}} = \frac{n_{\text{big}}^2}{n_{\text{small}}^2} = \frac{4}{1} \quad (\text{given})$$

$$\Rightarrow \frac{n_{\text{big}}}{n_{\text{small}}} = 2$$

$$\Rightarrow \frac{n_{\text{small}}}{n_{\text{big}}} = \frac{1}{2}$$

Velocity of electron in n th orbit

$$v_n \propto \frac{1}{n}$$

$$\frac{v_{n \text{ big}}}{v_{n \text{ small}}} = \frac{n_{\text{small}}}{n_{\text{big}}} = \frac{1}{2}$$

$$\Rightarrow v_{n \text{ small}} = 2(v_{n \text{ big}}) = 2v$$

2. (a) For hydrogen atom, $\frac{1}{\lambda} = R \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$, $n_2 > n_1$

For Lyman series, $n_1 = 1, n_2 = \infty$

$$\Rightarrow \frac{1}{\lambda_1} = R$$

For Balmer series, $n_1 = 2, n_2 = \infty$

$$\Rightarrow \frac{1}{\lambda_2} = \frac{R}{4}$$

For Paschen series, $n_1 = 3, n_2 = \infty$

$$\Rightarrow \frac{1}{\lambda_3} = \frac{R}{9}$$

$$\text{So, } \lambda_1 = \frac{1}{R}, \lambda_2 = \frac{4}{R}, \lambda_3 = \frac{9}{R}$$

$$\lambda_1 : \lambda_2 : \lambda_3 = 1 : 4 : 9$$

3. (c) For wavelength, $\frac{1}{\lambda} = R Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$

Here, transition is same

$$\text{So, } \lambda \propto \frac{1}{Z^2}$$

$$\frac{\lambda_{\text{H}}}{\lambda_{\text{Li}}} = \frac{(Z_{\text{Li}})^2}{(Z_{\text{H}})^2} = \frac{(3)^2}{(1)^2} = 9$$

$$\Rightarrow \lambda_{\text{Li}} = \frac{\lambda_{\text{H}}}{9} = \frac{\lambda}{9}$$

4. (d)

31

Nucleus

Nucleus

In every atom the positive charge and mass is densely concentrated at the centre of the atom forming its nucleus. Nuclear radius is of the order of 10^{-15} m. In nucleus the number of protons is equal to the atomic number of that element and the remaining particles to fulfill the mass number are the neutrons i.e. number of protons = atomic number Z (say) and number of neutrons.

Composition and Size of Nucleus

As mass of an atom is very small, hence we define a new unit of mass, called as 1 atomic mass unit (1u), which is $\frac{1}{12}$ th the mass of one atom of carbon-12.

$$1 \text{ u} = 1.660539 \times 10^{-27} \text{ kg} \simeq 1.66 \times 10^{-27} \text{ kg} = 931.5 \text{ MeV}$$

A nucleus has a structure of its own. It consists of protons and neutrons. Electrons cannot exist inside the nucleus. A proton is a positively charged particle having mass (m_p) of 1.007276 u and charge (+e) = $+1.602 \times 10^{-19}$ C.

Number of protons Z inside the nucleus of an atom is exactly equal to the number of electrons revolving around the nucleus of that atom. This number is called the atomic number. A neutron is a neutral particle having mass $m_n = 1.008665$ u. The number of neutrons in the nucleus of an atom is called the **neutron number** N . The sum of the number of protons and neutrons is called the mass number A . Thus, $A = N + Z$.

Properties of Nucleus

The nucleus properties are described below

- **Nucleus size**
 - (a) Size of the nucleus is of the order of fermi (1 fermi = 10^{-15} m)
 - (b) The radius of the nucleus is given by $R = R_0 A^{1/3}$
where, $R_0 = 1.3$ fermi and A is the mass number.
 - (c) The size of the atom is of the order of 10^{-10} m.

- **Volume** The volume of nucleus is

$$V = \frac{4}{3} \pi R^3 = \frac{4}{3} \pi (R_0 A^{1/3})^3$$

- **Density**

$$\begin{aligned} \text{(a) Density} &= \frac{\text{Mass of nucleus}}{\text{Volume of the nucleus}} = \frac{Am_p}{\frac{4}{3} \pi (R_0 A^{1/3})^3} \\ &= \frac{m_p}{\frac{4}{3} \pi R_0^3} \end{aligned}$$

where, $m_p = 1.6 \times 10^{-27}$ kg = mass of proton and $R_0 = 1.3$ fermi.

- (b) Density of nuclear matter is of the order of 10^{17} kg/m³.
- (c) Density of nuclear matter is independent of the mass number.

Isotopes, Isobars and Isotones

Isotopes

Isotopes of an element are nuclides having same atomic number Z but different mass number A (or different neutron number N). Isotopes of an element have identical electronic configuration and hence, identical chemical properties. ${}^1_1\text{H}$, ${}^2_1\text{H}$, ${}^3_1\text{H}$ and ${}^{11}_6\text{C}$, ${}^{12}_6\text{C}$, ${}^{14}_6\text{C}$, etc., are isotopes.

Isobars

Nuclides having same mass number A but different atomic number Z are called isobars. Isobars have different chemical properties. In isobars number of protons Z as well as number of neutrons N differ but total nucleon (or mass) number $A = N + Z$ is the same. ${}^3_1\text{H}$, ${}^3_2\text{He}$ and ${}^{14}_6\text{C}$, ${}^{14}_7\text{N}$ are isobars.

Isotones

Nuclides with different atomic number Z and different mass number A but same neutron number are called isotones.

Thus, for isotones $N = (A - Z)$ is constant. ${}^3_1\text{H}$, ${}^4_2\text{He}$ and ${}^{198}_{80}\text{Hg}$, ${}^{197}_{79}\text{Au}$ are examples of isotones.

Radioactivity

The phenomenon of spontaneous emission of radiations by heavy elements, is called radioactivity.

An unstable nucleus undergoes a decay to form a stable nucleus. Three types of decay occurs in nature, which are defined as follows.

1. α -decay

An α -particle is a helium nucleus. Alpha (α) emission occurs principally with nuclei that are too large to be stable. When a nucleus emits an α -particle, its N and Z values each decrease by two and A decreases by four.

Few examples of α -decay are

In general, the decay can be written as

where, X = parent nucleus, Y = daughter nuclues

2. β -decay

A beta minus particle (β^-) is like an electron. Emission of β^- involves transformation of a neutron into a proton, an electron and a third particle called an anti-neutrino ($\bar{\nu}$).

β -decay is spontaneous process with a half-life of about few days.

β^- -decay usually occurs with nuclides for which the neutron to proton ratio (N/Z ratio) is too large for stability.

In β^+ -decay, a proton changes into a neutron with the emission of a positron (and a neutrino) $p \rightarrow n + e^+ + \nu$

β^+ -decay usually occurs with nuclides for which the neutron to proton ratio (N/Z ratio) is too small for stability.

3. γ -decay

When a nucleus is placed in an excited state, either by bombardment with high-energy particles or by a radioactive transformation, it can decay to the ground state by emission of one or more photons called gamma rays or gamma ray photon, with typically energies of 10 keV to 5 MeV. This process is called γ -decay.

In general, the decay can be written as

All the known conservative laws are obeyed in γ -decay.

Radioactivity Decay Law

According to Rutherford and Soddy, law for radioactive decay is as follows.

At any instant, the rate of decay of radioactive atoms is proportional to the number of atoms present at that instant.

$$\text{i.e.} \quad -\frac{dN}{dt} \propto N$$

$$\Rightarrow \quad \frac{dN}{dt} = -\lambda N$$

$$\text{So,} \quad N = N_0 e^{-\lambda t}$$

Activity

It is defined as the rate of disintegration (or count rate) of the radioactive substance (or the number of atoms of any material decaying per second)

$$\text{i.e.} \quad R = -\frac{dN}{dt} = \lambda N = \lambda N_0 e^{-\lambda t}$$

$$R = R_0 e^{-\lambda t}$$

where, R_0 = activity at $t = 0$, R = activity after time t .

Units of Activity The SI unit of decay rate is becquerel (Bq) but curie (Ci) and rutherford (Rd) are often used in practice.

1 becquerel = 1 disintegration/s, 1 rutherford = 10^6 dis/s,

1 curie = 3.7×10^{11} dis/s.

Half-life ($T_{1/2}$)

Time interval in which the mass of a radioactive substance or the number of its atom reduces to half of its initial value, is called the half-life of the substance.

$$\text{i.e. if } N = \frac{N_0}{2}, \text{ then } t = T_{1/2}$$

$$\text{Hence from,} \quad N = N_0 e^{-\lambda t}$$

$$\text{We have,} \quad \frac{N_0}{2} = N_0 e^{-\lambda(T_{1/2})} \Rightarrow T_{1/2} = \frac{\log_e 2}{\lambda}$$

$$T_{1/2} = \frac{0.693}{\lambda}$$

After n half-lives, number of undecayed atoms

$$\text{i.e.} \quad N = N_0 \left(\frac{1}{2}\right)^n = N_0 \left(\frac{1}{2}\right)^{t/T_{1/2}}$$

Mean (or average) Life (τ)

The time for which a radioactive material remains active, is defined as mean (average) life of that material. It is defined as the sum of lives of all atoms divided by the total number of atoms.

$$\text{i.e.} \quad \tau = \frac{\text{sum of the lives of all the atoms}}{\text{total number of atoms}} = \frac{1}{\lambda}$$

(The average or mean life is the reciprocal of the decay constant)

$$\text{Also, from} \quad T_{1/2} = \frac{0.693}{\lambda}$$

$$\Rightarrow \quad \frac{1}{\lambda} = \tau = \frac{1}{0.693} \cdot (T_{1/2})$$

$$= 1.44 (T_{1/2})$$

Thus, mean life is about 44% more than that of half-life, which gives us $\tau > T_{1/2}$.

Mass Defect and Binding Energy

• The difference in mass of a nucleus and its constituent nucleons is called the mass defect of that nucleus. Thus, mass defect, $\Delta M = Zm_p + (A - Z)m_n - M$ where, M is the mass of a given nucleus.

• **Packing fraction** of an atom is the difference between mass of nucleus and its mass number per nucleon. Thus, packing fraction = $\frac{M - A}{A}$

• The energy equivalent of the mass defect of a nucleus is called its **binding energy**.

Thus, binding energy $\Delta E_b = \Delta M c^2$

$$= [Zm_p + (A - Z)m_n - M]c^2$$

If masses are expressed in atomic mass units,

$$\text{then} \quad \Delta E_b = \Delta M \times 931.5 \text{ MeV}$$

$$= [Zm_p + (A - Z)m_n - M] \times 931.5 \text{ MeV}$$

• Binding energy per nucleon (ΔE_{bn}) is the average energy needed to separate a nucleus into its individual nucleons.

$$\text{Thus, } \Delta E_{bn} = \frac{\Delta E_b}{A}$$

Nuclear Fission and Fusion

Nuclear Fission

The process of a splitting of a heavy nucleus into two lighter nuclei of comparable masses (after bombardment with a energetic particle) with liberation of energy, is called **nuclear fission**.

Fission reaction of U^{235} is

The energy released in U^{235} fission is about 200 MeV or 0.8 MeV per nucleon.

Nuclear Fusion

In nuclear fusion, two or more lighter nuclei combine to form a single heavy nucleus. The mass of single nucleus so formed is less than the sum of the masses of parent nuclei. This difference in mass results in the release of tremendous amount of energy.

For fusion, high pressure ($\approx 10^6$ atm) and high temperature (of the order of 10^7 K to 10^8 K) is required and so the reaction is called **thermonuclear fusion**.

Practice Exercise

- The radius of Na^{23} nucleus is
 a. $3.125 \times 10^{-15} \text{ m}$ b. $23 \times 10^{-15} \text{ m}$
 c. $11 \times 10^{-15} \text{ m}$ d. $11 \times 10^{-15} \text{ m}$
- A heavy nucleus (mass number = A) splits into two new nuclei, whose mass numbers are in the ratio 3 : 2. The ratio of radii of these new nuclei is
 a. 3 : 2 b. 2 : 3 c. $3^{1/3} : 2^{1/3}$ d. $2^{1/3} : 3^{1/3}$
- Find the rest mass energy of electron.
 a. 0.8 MeV b. 1.66 amu
 c. 0.5119 MeV d. None of these
- Find the mass of electron in atomic mass unit.
 a. 0.0005498 b. 0.5119 c. 0.5498 d. None
- The atomic mass of Al^{27} is 26.9815 amu. The mass of electron is 0.0005498 amu. The rest mass energy of Al^{27} nucleus is
 a. 1862 MeV b. 25119.78 MeV
 c. 25113.12 MeV d. None of these
- The atomic mass of B^{10} is 10.811 amu. Find the binding energy of B^{10} nucleus. The mass of electron is 0.0005498 amu. The mass of proton is $m_p = 1.007276$ amu. The mass of neutron is $m_n = 1.008665$ amu.
 a. - 678.932 MeV b. 678.932 MeV
 c. 378.932 MeV d. None of these
- Find the binding energy of Na^{23} . Atomic mass of Na^{23} is 22.9898 amu and that of $^1\text{H}_1$ is 1.00783 amu. The mass of neutron = 1.00867 amu.
 a. 931 MeV b. 186.54 MeV
 c. 5.38 MeV d. None of these
- The binding energy per nucleon are 53 MeV, 6.2 MeV and 7.4 MeV for the nucleus with mass numbers, 3, 4 and 5 respectively. If one nucleus of mass number 3 combines with one nucleus of mass number 5 to give two nuclei of mass number 4, then
 a. 0.3 MeV energy is absorbed
 b. 0.3 MeV energy is released
 c. 28.1 MeV energy is absorbed
 d. 3.3 MeV energy is absorbed
- What is the binding energy per nucleon of $_{6}\text{C}^{12}$ nucleus?

Given, mass of C^{12} (m_c)_m = 12.000 u

Mass of proton (m_p) = 1.0078 u

Mass of neutron (m_n) = 1.0087 u

and 1 amu = 931.4 MeV

- 5.26 MeV
- 10.11 MeV
- 15.65 MeV
- 7.68 MeV

In this decay, the rest mass energy of O^{19} and F^{19} are 17692.33 MeV and 17687.51 MeV respectively. The Q factor of the decay is

- 4.82 MeV
- 7 MeV
- 17.69 MeV
- None of these

11. The binding energy expressed in MeV is given for the following nuclear reactions

Which of the following conclusion is correct?

- ${}_2\text{He}^4$ is less stable than both ${}_2\text{He}^3$ and ${}_2\text{He}^5$
- ${}_2\text{He}^4$ is less stable than ${}_2\text{He}^3$ but more stable than ${}_2\text{He}^5$
- ${}_2\text{He}^4$ is less stable than ${}_2\text{He}^5$ but more stable than ${}_2\text{He}^3$
- ${}_2\text{He}^4$ is more stable than both ${}_2\text{He}^3$ and ${}_2\text{He}^5$

12. Calculate the energy of the reaction,

If the binding energy per nucleon in Li^7 and He^4 nuclei are 5.60 MeV and 7.06 MeV, respectively.

- 19.6 MeV
- 2.4 MeV
- 8.4 MeV
- 17.28 MeV

13. A sample contains 1 kg O^{19} nuclei. The sample decays according to following equation

The mass of sample after one half-life period is

- lesser than 1/2 kg
- equal to 1/2 kg
- slightly less than 1 kg
- equal to 1 kg

14. The number of C^{14} atoms in a sample is 100. The half-life period of C^{14} is 5730 year. The number of C^{14} atoms in the sample after 5730 year.

- must be equal to 50
- must be equal to 100
- may be equal to 90
- must be equal to 90

15. Half-life of an element A is 25 days. After 25 days, three atoms of A become

- 1
- 2
- 3
- all may be

16. The half-life of Tc^{99} is 6 h. The activity of Tc^{99} in a patient, 60 h after receiving an injection containing this radioisotope is at least 0.125 μCi . What was the minimum activity (in μCi) of the sample injected?

- 1.25 μCi
- 12.5 μCi
- 128 μCi
- 125 μCi

17. A radioactive sample has an initial activity of 50 dpm, 20 minute later, the activity is 25 dpm. How many atoms of the radioactive nuclide were there originally?

a. 20 b. 1000 c. 1443 d. 2

18. A radioactive sample has a disintegration rate of 36×10^5 disintegrations per minute. The sample itself consisting of 10^{-5} μ mole of the active nuclei. The disintegration constant, λ is given by

a. $6 \times 10^{-7} \text{ s}^{-1}$ b. $6 \times 10^{15} \text{ s}^{-1}$
c. $6 \times 10^9 \text{ s}^{-1}$ d. 10^{-8} s^{-1}

19. A radioactive element undergoes two different types of radioactive disintegration, one with disintegration constant λ_1 and the other with λ_2 . The half-life of the element is

a. $\frac{0.693}{\lambda_1 + \lambda_2}$ b. $\frac{0.693}{(\lambda_1 + \lambda_2)/2}$
c. $0.693 \frac{\lambda_1 \lambda_2}{\lambda_1 + \lambda_2}$ d. $\frac{0.693 \lambda_1 \lambda_2}{2(\lambda_1 + \lambda_2)}$

20. Half-life period of a given radioactive sample is τ . Its average life would be

a. $\tau \ln 2$ b. $\frac{\tau}{\ln 2}$ c. $\frac{1}{\tau}$ d. $\frac{\ln 2}{\tau}$

21. Choose the correct option, if T_n and T_m denotes the half-value period and the mean-value period, respectively of a radioactive element.

a. $T_n = T_m$ b. $T_n > T_m$ c. $T_n < T_m$ d. $T_n \geq T_m$

22. The half-life of radium is 1600 years. Calculate the number of atoms that will decay from 1 g sample of radium per second (given, atomic weight of radium = 226)

a. 3.6×10^{10} b. 7.2×10^{10} c. 4.2×10^{10} d. 14.6×10^{10}

23. At certain time, the activity of three radioactive materials are in the ratio of 3 : 4 : 5. What will be the mark ratio of their activities at any further date?

a. 1 : 2 : 3 b. 2 : 3 : 4 c. 3 : 4 : 5 d. 5 : 6 : 8

24. 20% of a radioactive substance decay in 10 days. Calculate the amount of the original material left after 30 days.

a. 51.2% b. 62.6% c. 15% d. 21.27%

25. Calculate in how many months, $(3/4)^{\text{th}}$ of the substance will decay, if half-life of the radioactive substance is 2 months.

a. 4 months b. 6 months c. 8 months d. 14 months

26. The half-life of a freshly prepared radioactive sample is 2 hours. If the sample emits radiation of intensity which is 32 times the permissible safe level, then calculate the minimum time taken after which it would be possible to work safely with source.

a. 8 h b. 10 h c. 16 h d. 2 h

27. Calculate the ratio of half-life to the mean life of a radioactive sample. If λ be the decay constant of a radioactive sample.

a. 0.693 b. 0.746
c. $\frac{1}{0.693}$ d. $(0.693)^2$

28. Calculate the number of β -particles, if a radioactive element ${}_{90}\text{X}^{238}$ decays into ${}_{83}\text{Y}^{222}$.

a. 4 b. 6 c. 2 d. 1

29. A radioactive nucleus (initial mass number A and atomic number Z) emits 3α -particles and 2 positrons. the ratio of number of neutrons to that of protons in the final nucleus will be

a. $\frac{A - Z - 8}{Z - 4}$ b. $\frac{A - Z - 4}{Z - 8}$
c. $\frac{A - Z - 12}{Z - 4}$ d. $\frac{A - Z - 4}{Z - 2}$

30. How long will it take for 75% of the atoms of a certain radioactive element, originally present to disintegrate? The half-life of the element is 10 days.

a. 240 days b. 3.6 days
c. 15.6 days d. 4.15 days

31. For measuring the activity of a radioactive sample, a count rate meter is used. At certain observation, count rate meter recorded 5050 counts per minute but after 10 minute later, the count rate showed 2300 counts per minute. Calculate the disintegration constant (λ)

a. 0.065 per min
b. 0.078 per min
c. 0.24 per min
d. 0.868 per min

32. Consider $x \xrightarrow{-\alpha} y \xrightarrow{-\alpha} z$, where half-lives of x and y are z year and one month. The ratio of atoms of x and y when transient equilibrium $[T_{1/2}(x) > T_{1/2}(y)]$ has been established is

a. 1 : 22 b. 1 : 26
c. 26 : 1 d. 23 : 1

33. Analysis of potassium and argon atoms in a moon rock sample by a mass spectrometer shows that the ratio of the number of stable Ar^{40} atoms present to the number of radioactive K^{40} atoms is 7:1. Assume that all the argon were produced by the decay of potassium atoms, with a half-life of 1.25×10^9 year. How old is the rock?

a. 1.25×10^9 yr b. 3.75×10^9 yr
c. 8.75×10^9 yr d. 100×10^{10} yr

34. A radioactive sample decays by two different processes. Half-life for the first process is t_1 and for the second process is t_2 . The effective half-life is

a. $t_1 + t_2$ b. $t_1 - t_2$
c. $(t_1 + t_2)/2$ d. $\frac{t_1 t_2}{t_1 + t_2}$

35.

The alongside is a plot of binding energy per nucleon E_b , against the nuclear mass M , A, B, C, D, E, F correspond to different nuclei. Consider four reactions.

- (i) $A + B \rightarrow C + \varepsilon$ (ii) $C \rightarrow A + B + \varepsilon$
 (iii) $D + E \rightarrow F + \varepsilon$ (iv) $F \rightarrow D + E + \varepsilon$

where, ε is the energy released. In which reactions, is ε positive?

- a. (i) and (iv) b. (i) and (iii) c. (ii) and (iv) d. (ii) and (iii)

36. If ${}_{92}\text{U}^{235}$ reactor takes 30 day to consume 4 kg of fuel and each fission gives 185 MeV of usable energy, then calculate the power output.

- a. 2.75×10^{10} W b. 0.012×10^{10} W
 c. 3.5×10^{10} W d. 7.63×10^{10} W

37. Calculate the total energy released during a fission reaction.

The resulting fission fragments are unstable hence, decay into stable end products ${}_{42}^{98}\text{Mo}$ and ${}_{54}^{136}\text{Xe}$ by successive emission of β -particles. Take mass of neutron = 1.0087 amu, mass of ${}_{92}^{235}\text{U}$ = 236.0526 amu, mass of ${}_{42}^{98}\text{Mo}$ = 97.9054 amu and mass of ${}_{54}^{136}\text{Xe}$ = 135.9170 amu.

- a. 198 MeV b. 220 MeV
 c. 185 MeV d. 230 MeV

38. Calculate the energy released per nucleon of the reactant, in the thermonuclear reaction

- a. 21.6 MeV b. 7.2 MeV
 c. 3.6 MeV d. 1.8 MeV

BITSAT Archives

- Let binding energy per nucleon of nucleus is denoted by E_{bn} and radius of nucleus is denoted as r . If mass number of nuclei A, B are 64 and 125 respectively, then [2014]

a. $r_A < r_B, E_{bnA} < E_{bnB}$ b. $r_A > r_B, E_{bnA} > E_{bnB}$
 c. $r_A = \frac{4}{5} r_B, E_{bnA} < E_{bnB}$ d. $r_A < r_B, E_{bnA} > E_{bnB}$
- Half-lives of elements A and B are 1h and 2 h respectively. Which of the following is correct? [2013]

a. Element A decays slower
 b. Decay constant of A is smaller
 c. If initial number of nuclei are same, then activity of A is more
 d. Mean-life of A is more
- If a radioactive substance reduces to $\frac{1}{16}$ of its original mass in 40 days. Its half-life is [2011]

a. 10 days b. 20 days
 c. 40 days d. None of these
- If the total binding energies of ${}_1\text{H}^2$ and ${}_2\text{He}^4$, ${}_{26}\text{Fe}^{56}$ and ${}_{92}\text{U}^{235}$ nuclei are 2.22, 28.3, 492 and 1786 MeV respectively, identify the most stable nucleus out of the following. [2009]

a. ${}_1\text{H}^2$ b. ${}_2\text{He}^4$
 c. ${}_{26}\text{Fe}^{56}$ d. ${}_{92}\text{U}^{235}$
- Fusion reaction takes place at high temperature because [2006]

a. KE is high enough to overcome repulsion between nuclei
 b. nuclei are most stable at this temperature
 c. nuclei are unstable at this temperature
 d. None of the above
- Two nucleons are at a separation of one fermi. Protons have a charge of $+16 \times 10^{-19}$ C. The net nuclear force between them is F_1 , if both are neutrons, F_2 if both are protons and F_3 if one is proton and the other is neutron. Then, [2005]

a. $F_1 = F_2 > F_3$ b. $F_1 = F_2 = F_3$
 c. $F_1 < F_2 < F_3$ d. $F_1 > F_2 > F_3$
- Mean life of a radioactive sample is 100 s. Then, its half-life (in min) is [2005]

a. 0.693 b. 1
 c. 10^{-4} d. 1.155
- Consider two nuclei of the same radioactive nuclide. One of the nuclei was created in a supernova explosion 5 billion years ago. The probability of decay during the next time is [2005]

a. different for each nuclei
 b. nuclei created in explosion decays first
 c. nuclei created in the reactor decays first
 d. independent of the time of creation

Answer with Solutions

Practice Exercise

1. (a) $R = R_0 A^{1/3} = 1.1 \times 10^{-15} \times (23)^{1/3}$
 $= 3.125 \times 10^{-15} \text{ m}$

2. (c) $\frac{r_1}{r_2} = \frac{r_0 \times (A_1)^{1/3}}{r_0 \times (A_2)^{1/3}} = \left(\frac{A_1}{A_2}\right)^{1/3} = \left\{ \frac{\left(\frac{3}{5} \times A\right)}{\left(\frac{2}{5} \times A\right)} \right\}^{1/3} = \frac{3^{1/3}}{2^{1/3}}$

3. (c) $E = m_e c^2 = 9.1 \times 10^{-31} \times (3 \times 10^8)^2$
 $= 9.1 \times 10^{-31} \times 9 \times 10^{16}$
 $= 81.9 \times 10^{-15} \text{ J}$
 $= \frac{81.9 \times 10^{-15}}{1.6 \times 10^{-19} \times 10^6} \text{ MeV}$
 $= 0.5119 \text{ MeV}$

4. (a) $E = (\text{mass in amu}) \times 931 \text{ MeV}$

$\therefore \text{mass in amu} = \frac{E}{931 \text{ MeV}}$
 $= \frac{0.5119 \text{ MeV}}{931 \text{ MeV}}$
 $= 0.0005498 \text{ amu}$

5. (c) The mass of Al nucleus is

$m_0 = \text{atomic mass} - \text{mass of total electrons}$
 $= 26.9815 - 13 \times 0.0005498$
 $= 26.974353 \text{ amu}$

$\therefore E = m_0 \times 931 \text{ MeV}$
 $E = 26.974353 \times 931 \text{ MeV}$
 $= 25113.12 \text{ MeV}$

6. (a) The mass of B^{10} nucleus

$m_0 = 10.811 - 5 \times 0.0005498$
 $= 10.808251 \text{ amu}$

Binding energy
 $= \{(5m_p + 5m_n) - \text{mass of } B^{10} \text{ nucleus}\} \times 931 \text{ MeV}$
 $= \{(5 \times 1.007276 + 5 \times 1.008665) - 10.808251\} \times 931 \text{ MeV}$
 $= (10.079 - 10.808251) \times 931 \text{ MeV}$
 $= -678.932 \text{ MeV}$

7. (b) The mass of nucleus $= M_{\text{Na}} - 11m_e$

Binding energy
 $= \{11m_p + 12m_n - (M_{\text{Na}} - 11m_e)\} \times 931 \text{ MeV}$
 $= \{11(m_p + m_e) + 12m_n - M_{\text{Na}}\} \times 931 \text{ MeV}$
 $= \{(11M_H + 12m_n - M_{\text{Na}}) \times 931 \text{ MeV}\}$
 $= \{(11 \times 1.00783 + 12 \times 1.00867) - 22.9898\} \times 931 \text{ MeV}$
 $= (11.08613 + 12.10404 - 22.9898) \times 931 \text{ MeV}$
 $= 0.20037 \times 931 \text{ MeV} = 186.54 \text{ MeV}$

8. (d) $X^3 + Y^5 \longrightarrow 2Z^4$

$\Delta E = (3 \times 5.3 + 5 \times 7.4) - 2(4 \times 6.2) = 3.3 \text{ MeV}$

9. (d) Carbon nucleus has 6 protons and 6 neutrons. Total mass of carbon

$(6m_p + 6m_n) = 12.099 \text{ amu}$

and $m_C = 12.000 \text{ amu}$

mass defect $= \Delta m = 0.099 \text{ amu}$

$\frac{\text{Binding energy}}{\text{Nucleons}} = \frac{BE}{A} = \frac{(\Delta m) 931.4}{12}$
 $= \frac{(0.099)(931.4)}{12} = 7.68 \text{ MeV}$

10. (a) 11. (a)

12. (d) Binding energy of Li = 39.20 MeV

Binding energy of $\text{He}^4 = 28.24 \text{ MeV}$

Binding energy of ${}_2\text{He}^4 = 56.48 \text{ MeV}$

$\therefore \text{Energy} = 56.48 - 39.20 = 17.28 \text{ MeV}$

13. (c) 14. (c)

15. (d) After one half-life, out of three atoms of A, 1, 2, or 3 may decay.

16. (c) Number of half-lives, $x = \frac{t}{t_{1/2}} = \frac{60}{6} = 10$

Now, $r = r_0 \left(\frac{1}{2}\right)^x$

$\therefore r_0 + r^{2x} = 0.125 \mu\text{Ci} \times 2^{10} = 128 \mu\text{Ci}$

17. (c) Rate decreases from 50 to 25 dpm in 20 min, hence half-life is 20 min.

Now, $r_0 = \lambda N_0 = \frac{0.693}{t^{1/2}} \times N_0$

or $N_0 = \frac{r_0 \times t_{1/2}}{0.693} = \frac{50 \times 20}{0.693} = 1443$

18. (d)

19. (a) $\lambda_{\text{eff}} = \lambda_1 + \lambda_2$, hence $t_{1/2} = \frac{0.693}{\lambda_1 + \lambda_2}$

20. (b) The relation between half-life ($T_{1/2}$) and mean-life (τ) is

$\tau = 1.44 T_{1/2}$ or $T_{1/2} = \frac{\tau}{\ln 2}$

21. (c) We have, $T_n = \frac{0.693}{\lambda}$

$T_m = \frac{1}{\lambda}$ or $T_n = 0.693 T_m$

$\therefore T_n < T_m$

22. (a) $N_0 = \frac{6.02 \times 10^{23}}{266} = 2.65 \times 10^{21}$

$\lambda = \frac{0.693}{1600 \times 3.16 \times 10^7} = 1.37 \times 10^{-11} \text{ s}^{-1}$

We can assume $N \equiv N_0$ as the half-life is much larger.

$\frac{dN}{dt} = \lambda N_0$

$dN = (1.37 \times 10^{-11})(2.65 \times 10^{21}) \times 1 = 3.6 \times 10^{10}$

23. (c) Activity = $\left| -\frac{dN}{dt} \right| = \lambda N$

$\therefore$ Activity does not depend upon the time.

Hence, the ratio of their activities will be 3 : 4 : 5.

24. (a) Fraction of the substance left

$$= f = 1 - \frac{20}{100} = 0.8$$

Let, $t_1 = 10$ day, $t_2 = 30$ day

fraction, $n = \frac{t_2}{t_1} = \frac{30}{10} = 3$

but $\frac{N}{N_0} = (f)^n = (0.8)^3$

$$\frac{N}{N_0} \times 100 = 0.512 \times 100$$

$$= 51.2\%$$

25. (a)

26. (b) $\frac{1}{32} = \frac{1}{2^x}$

Time to work safely = $5 \times 2 = 10$ h

27. (a) Half-life = $\frac{0.693}{\lambda}$

Average life or mean life = $\frac{1}{\lambda}$

$$\text{Ratio} = \frac{\left(\frac{0.693}{\lambda} \right)}{\left(\frac{1}{\lambda} \right)} = 0.693$$

28. (d) Number of α -particles emitted = $\frac{238 - 222}{4} = 4$

and β^- particle emitted = 1 (as atomic number is 83)

29. (b) 30. (d)

31. (b) $\frac{dM}{dt} = \lambda N_0$

$$\therefore \frac{N_0}{N} = \frac{dN_1/dt}{dN_2/dt} = \frac{5050}{2300} = 2.19$$

Also, $\ln \frac{N_0}{N} = \lambda t$

$\ln(2.19) = \lambda t$

$$\lambda = \frac{\ln(2.19)}{10} = 0.078 \text{ per min}$$

32. (d) $N_2 = \frac{\lambda_1 N_1^0}{\lambda_2 - \lambda_1} (e^{-\lambda_1 t} - e^{-\lambda_2 t})$

When $(T_{1/2})_1 > (T_{1/2})_2$ at transient equilibrium

$$\lambda_1 < \lambda_2$$

$$e^{-\lambda_2 t} < e^{-\lambda_1 t}$$

$$\therefore N_2 = \frac{\lambda_1 N_1^0 e^{-\lambda_1 t}}{\lambda_2 - \lambda_1} = \frac{\lambda_1 N_1}{\lambda_2 - \lambda_1}$$

$$\therefore \frac{N_1}{N_2} = \frac{\lambda_2 - \lambda_1}{\lambda_1} = \frac{1}{\frac{0.693}{2 \times 12}} = \frac{23}{1}$$

Initial number of atoms N_0

Number of atoms after time t $N_0 - x$

But from question, $\frac{N_0 - x}{x} = \frac{1}{7}$

$$x = \frac{7}{8} N_0$$

$$\therefore (N_0 - x) = \frac{N_0}{8}$$

$$N_0 \rightarrow \frac{N_0}{2} \rightarrow \frac{N_0}{4} \rightarrow \frac{N_0}{8}$$

So, time = $3 \times T_{1/2} = 3.75 \times 10^9$ year

34. (d) As, $\lambda = \lambda_1 + \lambda_2 \Rightarrow \frac{1}{t} = \frac{1}{t_1} + \frac{1}{t_2} = \frac{t_2 + t_1}{t_1 t_2}$ or $t = \frac{t_1 t_2}{t_1 + t_2}$

35. (a) First reaction is fusion and 4th reaction is fission.

36. (b) 235 amu of uranium gives energy of 185 MeV.

or $\frac{185}{235} \times 1.6 \times 10^{-13} \text{ J}$

also, $1 \text{ amu} = 1.66 \times 10^{-27} \text{ kg}$

so, energy released by 1 amu or $1.66 \times 10^{-27} \text{ kg}$ of ${}_{92}\text{U}^{235}$

$$= \frac{185 \times 1.6 \times 10^{-13}}{235}$$

Energy released by 4 kg of ${}_{92}\text{U}^{235}$

$$\Rightarrow W = \frac{185 \times 1.6 \times 10^{-13} \times 4}{1.66 \times 10^{-27} \times 235}$$

$$= 3.035 \times 10^{14} \text{ J}$$

Power of reactor = $\frac{3.035 \times 10^{14}}{30 \times 24 \times 60 \times 60}$

$$= 0.012 \times 10^{10} \text{ W}$$

$$(10087 + 235.0439) = (97.9054 + 135.917 + 2.0174)$$

$$\Delta m = 0.2128$$

$\therefore$ Total energy released during a fission reaction

$$= 0.2128 \times 931 \text{ MeV} = 198 \text{ MeV}$$

38. (c)

BITSAT Archives

1. (d) $r = r_0 (A)^{1/3}$

r increases with increasing A mass number

So, $r_A < r_B$ as mass number of A is smaller E_{bn} decreases with increasing A for $A > 56$. ^{56}Fe has highest E_{bn} value.

So, E_{bn} for $A = 64$ is larger as compared to E_{bn} for nucleus with $A = 125$

$$E_{bnA} > E_{bnB}$$

2. (c) Let initial number of nuclei of each element = N_0

$$\text{Decay constants, } \lambda_A = \frac{0.693}{1} \text{ h}^{-1}, \lambda_B = \frac{0.693}{2} \text{ h}^{-2}$$

$$\lambda_A > \lambda_B$$

$$\text{Activities, } R_A = \lambda_A N_0$$

$$R_B = \lambda_B N_0$$

$$\Rightarrow R_A > R_B \text{ as } \lambda_A > \lambda_B$$

Less half-life of element A implies faster decay.

$$\text{Mean-life, } \tau = \frac{1}{\lambda}$$

$$\tau_A = \frac{1}{\lambda_A}, \tau_B = \frac{1}{\lambda_B}$$

$$\tau_A < \tau_B \text{ as } \lambda_A > \lambda_B$$

3. (a) From the formula,

$$N = N_0 \left(\frac{1}{2} \right)^n$$

$$\frac{N}{16} = N_0 \left(\frac{1}{2} \right)^n$$

N_0 = original number of atom

$$\left(\frac{1}{2} \right)^4 = \left(\frac{1}{2} \right)^n$$

$\Rightarrow$

$$n = 4$$

4 half-lives

$\therefore$

$$4T_{1/2} = 40$$

$$T_{1/2} = \frac{40}{4} = 10 \text{ days}$$

4. (c) Binding energy per nucleon for $^1\text{H}^2$ and $^2\text{He}^4$, $^{56}_{26}\text{Fe}$ and $^{235}_{92}\text{U}$ are respectively,

$$\frac{2.22}{2}, \frac{28.3}{4}, \frac{492}{56}, \frac{1786}{235}$$

Out of them all $\frac{492}{56}$ is the greatest. Therefore, $^{56}_{26}\text{Fe}$ is the most bound or most stable nucleus.

5. (a) Fusion reaction takes place at high temperature because KE is high enough to overcome repulsion between nuclei.
6. (b) Nuclear forces are charge independent

$$\text{So, } F_1 = F_2 = F_3$$

7. (d) Half-life, $T/2 = \frac{T}{1.44} = \frac{100}{1.44} \text{ s}$

$$= 69.44 \text{ s}$$

$$= \frac{69.44}{100} \approx 1115 \text{ min}$$

8. (d) Radioactive decay does not depend upon the time of creation.

32

Semiconductor Devices and Logic Gates

Introduction

Energy bands When covalent bond is broken down by valence electron, hole is created in valence band and valence electron goes to conduction band.

Conduction band has nothing to do with holes. Conduction electrons are found with free flow in conduction band. Holes exist and flow in valence band. Conduction electrons move twice as fast as the holes.

Insulators Here, valence electrons are bound very tightly to their parent atom and require a large energy to remove them.

- Insulators have a full valence band.
- Conduction band is empty.
- It has a large energy gap (E_g), i.e. 6 eV and above.

Conductors In the conductors, there are plenty of free electrons for conduction, here valence and conduction bands overlap each other.

- Energy gap is absent in conductors.
- No hole is created.
- The flow of current is the flow of electrons.

Semiconductors

Semiconductors are materials whose conductivity and resistivity lie in between metals and insulators.

Its resistivity is $\rho = 10^{-5}$ to $10^6 \Omega \text{ m}^{-1}$ and conductivity, $\sigma = 10^{-5}$ to 10^{-6} Sm^{-1} .

Band gap structure of a semiconductor at $T = 0 \text{ K}$, resembles that of an insulator but with a lower energy gap ($E_g < 3 \text{ eV}$).

For silicon, $E_g \approx 1.1 \text{ eV}$

For germanium, $E_g \approx 0.7 \text{ eV}$

At temperature higher than $T > 0 \text{ K}$, some of the electrons are excited from valence band to conduction band creating an equal number of holes (vacancy for electrons) in valence band.

An increase in temperature results in creation of more electron hole (intrinsic pairs), resulting in an increase in conductivity of the semiconductor.

Si and Ge are the good examples of semiconductors. Other than these, we have inorganic semiconductors such as CdS, GaAs, CdSe, organic semiconductors such as anthracene and doped semiconductors such as phalocyanines. For a pure (intrinsic) semiconductor, the number of free electrons in conduction band is equals to number of holes in valence band, i.e. $n_e = n_h = n_i$, where n_i = number of intrinsic pairs.

The highest energy level in the conduction band occupied by electrons at absolute zero temperature is called **fermi level** and the energy corresponding to the fermi level is called **fermi energy** (E_f).

Types of Semiconductors

Semiconductors are of two types

- Intrinsic semiconductor
- Extrinsic semiconductor

- Intrinsic semiconductor** The pure semiconductor is called the intrinsic semiconductor. The conductivity of intrinsic semiconductor is because of their own internal charge carriers. At room temperature, few covalent bonds break because of thermal collision.

For each broken bond, a pair of a free electron in conduction band and a hole in valence band is created. So, intrinsic semiconductor has an equal number of holes and electrons. Therefore, in an intrinsic semiconductor, the conductivity is due to holes and electrons both, which increases with rise of temperature. They are also called **carriers**. Holes move in valence band parallel to the direction of external field. Electrons move in anti-parallel direction to the external field.

- Extrinsic semiconductor** When a small quantity of impurity is mixed in a pure or intrinsic semiconductor, the conductivity of semiconductor increases. Such an **impure semiconductor** is called **extrinsic semiconductor**. The conductivity of resultant crystal depends on the nature and quantity of the impurity added called **dopant**.

In an extrinsic semiconductor, if n_e is the number density of electrons in conduction band and the density of holes in valence band is n_h in a pure semiconductor, then

$$n_e n_h = n_i^2$$

Depending upon the nature of impurity added in intrinsic semiconductor, the extrinsic semiconductors are of two types

- n -type semiconductor or donor and
- p -type semiconductor or acceptor

n -type Semiconductor

To prepare an n -type semiconductor a pentavalent impurity, e.g. P, As, Sb are used as a dopant with Si or Ge. Such an impurity is called donor impurity because each dopant atom provides one free electron.

Fig. (a) Formation of n -type semiconductor

In n -type semiconductor $n_e \gg n_h$, i.e. electrons are majority charge carriers and the holes are minority charge carriers, such that $n_e \cdot n_h = n_i^2$.

An *n*-type semiconductor is electrically neutral and is not negatively charged.

p-type Semiconductor

To prepare a *p*-type semiconductor a trivalent impurity, e.g. B, Al, In, Ga, etc., are used as a dopant with Si or Ge. Such an impurity is called **acceptor impurity** as each impurity atom wants to accept an electron from the crystal lattice. Thus, effectively each dopant atom provides a **hole**. In *p*-type semiconductor $n_h \gg n_e$, i.e. holes are majority charge carriers and electrons are minority charge carriers such that $n_h \cdot n_e = n_i^2$. A *p*-type semiconductor is electrically neutral and is not positively charged. The number of free electrons in a semiconductor varies with temperature as $T^{3/2}$.

Mobility of a Charged Carrier

Electrical mobility The drift velocity acquired by a charged carrier in a unit electric field is called its electrical mobility and is denoted by μ .

In a semiconductor,

Drift velocity of a charged carrier $\propto$ Applied electric field
i.e. $v \propto E$ or $v = \mu E$

$$\therefore \mu = \frac{v}{E}$$

Hence, the electrical mobility (μ) is the drift velocity per unit electric field. Its SI unit is $[\text{m}^2 \text{V}^{-1} \text{s}^{-1}]$.

Conductivity and Resistivity of Semiconductor

(i) **Resistivity** According to Ohm's law, at constant temperature $V \propto I$

$$\text{i.e. } V = IR \quad R = \frac{\rho I}{A}$$

$\Rightarrow$ (where, ρ is resistivity)

$$\therefore \rho = \frac{AR}{I}$$

So, the SI unit of resistivity ρ is $\Omega\text{-m}$.

(ii) The conductivity which is reciprocal of resistivity is given by

$$\sigma = \frac{1}{\rho} \quad \dots(i)$$

$$\sigma = e(n_e \mu_e + n_h \mu_h)$$

So, the SI unit of conductivity σ is Sm^{-1} .

From Eq. (i), the resistivity of the semiconductor is also given by

$$\rho = \frac{1}{e(n_e \mu_e + n_h \mu_h)}$$

Effect of Temperature on the Conductivity of Semiconductors

The conductivity of a semiconductor is given by

$$\sigma = e(n_e \mu_e + n_h \mu_h)$$

As the temperature increases, the mobilities μ_e and μ_h of electrons and holes decreases due to the increase in their collision frequency. But due to the small energy gap of semiconductors, more and more electrons ($n \propto e^{-E_g/2kT}$) from the valence band cross over to the conduction band. The increase in carrier concentration, n_e and n_h is so large that the decrease in the values of μ_e and μ_h has no influence.

In any semiconductor due to thermal effect, generation of free electrons and holes take place. Apart from the process of generation, a process of recombination also occurs simultaneously, in which free electron further recombine with hole. At equilibrium, rate of generation of charge carrier is equal to the rate of recombination of charge carriers.

Larger the value of n_e or n_h , higher is the probability of their recombination.

At equilibrium, $n_e \times n_h = n_i^2$

Semiconductor Diode

A *p-n* junction is obtained by joining a small *p*-type crystal with a small *n*-type crystal without employing any other binding material in between them.

Whenever a p - n junction is formed, electrons from n -region diffuse through the junction into p -region and the holes from p -region diffuse into n -region.

As a result of which neutrality of both n and p -regions is disturbed and a thin layer of immobile negative charged ions appear near the junction in the p -crystal and a layer of positive ions appear near the junction in n -crystal. This layer containing immobile ions is called **depletion layer**. The thickness of depletion layer is approximately of the order of 10^{-6} m.

The potential difference developed across the p - n junction due to diffusion of electrons and holes is called the **potential barrier** V_b (or emf of fictitious battery). For Germanium diode barrier potential is 0.3 V but for Si diode its value is 0.7 V. The barrier electric field developed due to it is of the order of 10^5 Vm $^{-1}$.

Forward Bias

In forward biasing, a positive potential is applied to p -side and negative potential is applied to n -side.

In forward biasing, in a p - n junction, the following changes occur.

- (i) Potential barrier reduces.
- (ii) Width of depletion layer decreases.
- (iii) p - n junction provides very small resistance.
- (iv) Forward current flows in circuit. (p to n)
- (v) Order of forward current is in mA.
- (vi) Forward current is due to the flow of majority charge carriers.

Reverse Bias

In reverse biasing, a positive potential is applied to n -side and negative potential to p -side.

Due to reverse biasing, the following changes occur.

- (i) Potential barrier increases.
- (ii) Width of depletion layer increases.
- (iii) p - n junction provides high resistance.
- (iv) Very small reverse current flows. (n to p)
- (v) Order of reverse current is in μ A.
- (vi) Reverse current is due to the flow of minority charge carriers.

I - V Characteristics of Forward and Reverse Bias Diode

The following circuit diagrams show the arrangement for studying V - I characteristics of a p - n junction diode.

(i) Forward bias

(ii) Reverse bias

(iii) Typical V - I characteristics of a silicon diode

Applications of p - n Junction Diode

Diode as a Rectifier

Junction diode allows current to pass only when it is forward biased. This property is used to rectify alternating voltages and the circuit used for this purpose is called as **rectifier** and this process of converting AC to DC is known as **rectification**. Junction diodes are also used to modify waveform.

Half-Wave Rectifier

In half-wave rectifier, a p - n junction is used with a transformer.

In half-wave rectifier of the single phase supply, either the positive or negative half of the AC wave is passed while the other half is blocked. Because, only one-half of the input waveform reaches the output, mean voltage is lower.

Half-wave rectifier requires a single diode in a single phase supply. Half-wave rectifier produces more ripple than full-wave rectifier, and much more filtering is needed to eliminate harmonics of the AC frequency from the output.

During Positive Half Cycle

Diode (D) $\rightarrow$ Forward biased $\rightarrow$ On switch $\rightarrow$ Output due to diode D received.

During Negative Half Cycle

$D \rightarrow$ Reverse biased $\rightarrow$ Off switch $\rightarrow$ No output due to diode D received.

Richardson-Dushman Equation

$$J = At^2 e^{\phi / kT}$$

shows relationship between current density J and absolute temperature T .

where, ϕ = work function of emitting surface in eV.

k = Boltzmann constant.

A = constant = $60 \text{ A/cm}^2 \text{ K}$ for pure metals

T = temperature in K.

Child Langmuir Law For a space charge limited current.

$$I_p \propto (V_p)^{3/2}$$

The no-load output DC voltage of an ideal half-wave rectifier is

$$V_{\text{rms}} = \frac{V_{\text{peak}}}{2}, V_{\text{DC}} = \frac{V_{\text{peak}}}{\pi}$$

where, $V_{\text{DC}}, V_{\text{av}}$ = DC or average output voltage

V_{peak} = peak value of the input voltage

V_{rms} = root mean square value of output voltage.

Full-Wave Rectifier

In full-wave rectifier two diodes are used, one for each half of the cycle with a centre tapped transformer. Output frequency of a full-wave rectifier is twice that of input.

Full-wave rectifier have some fundamental advantages over their half-wave rectifier counterparts. The average (DC) output voltage is higher than for half-wave, the output of the full-wave rectifier has much less ripple than that of the half-wave rectifier producing a smoother output waveform.

Since, this rectifier produces an output during both half cycles, so it is 100% efficient.

Here,

$$V_{\text{DC}} = \frac{2V_{\text{max}}}{\pi} = 0.637V_{\text{max}}$$

During Positive Half Cycle

$D_1 \rightarrow$ Forward biased $\rightarrow$ On switch $\rightarrow$ Output due to diode D_1

$D_2 \rightarrow$ Reverse biased $\rightarrow$ Off switch $\rightarrow$ No output due to diode D_1

During Negative Half Cycle

$D_1 \rightarrow$ Reverse biased $\rightarrow$ Off switch $\rightarrow$ No output due to diode D_1

$D_2 \rightarrow$ Forward biased $\rightarrow$ On switch $\rightarrow$ Output due to diode D_2

Ripple and Ripple Factor

In the output of rectifier, some AC components are present. They are called **ripple** and their measurement is given by a factor, so it is called **ripple factor**. For good rectifier, the ripple factor must be very low.

(i) For half-wave rectifier ripple factor, $r = 1.21$

(ii) For full-wave or bridge wave rectifier ripple factor,
 $r = 0.48$

Special Purpose Diodes

The special purpose diode that performs many different functions, e.g. diodes are used to regulate voltage (Zener diode), to produce light, Light Emitting Diode (LED) are given below.

Zener Diode

It is a highly doped p - n junction diode which is not damaged by high reverse current. It is always used in reverse bias in break down voltage region and is chiefly used as a voltage regulator.

Zener Diode as a Voltage Regulator

The following circuit is used for stabilizing voltage across a load R_L . The circuit consists of a series voltage-dropping resistance R and a Zener diode in parallel with the load R_L .

The Zener diode is selected with Zener voltage V_Z equal to the voltage desired across the load. The fluctuating DC input voltage may be the DC output of a rectifier. Whenever the input voltage increases, the excess voltage appears as increased voltage across the resistance R . This causes an increase in the input current i . This increase is taken away by the Zener diode while the current through the load and hence the voltage across it remains constant at V_Z . Likewise a decrease in the input voltage causes a decrease in the input current i . The current through the diode decreases correspondingly, again maintaining the load current.

Light Emitting Diode (LED)

It is a specially designed diode made of GaAsP, GaP, etc. When used in forward biased, it emits characteristic, almost monochromatic light. In reverse biased, it works like a normal diode.

I - V Characteristics of LED

LEDs are current dependent devices with its forward voltage drop (V_F) depending on the forward biased LED current. I - V characteristics of LED is given below

Before LED can emit any form of light it needs a current to flow through it, as it is a current dependent device with their light output intensity being directly proportional to the forward current flowing through the LED.

Photodiode

It is a special diode used in reverse bias which conducts only when light of suitable wavelengths is incident on the junction of diode. The energy of incident light photon must be greater than the band gap of semiconductor. Materials used are Cds, Se, Zns.

Solar Cell

It is a special p - n junction in which one of the semiconductors is made extremely thin so, that solar radiation falling on it reaches junction of diode without any absorption. A solar cell directly converts solar energy into electric energy. Popularly used solar cells, are Ni-cd, PbS cell.

Junction Transistor

Transistor is a three terminal device which is formed, when thin layer of one type of extrinsic semiconductor p or n -type is sandwiched between two thick layers of other two types of n -type or two types of p -type layers extrinsic semiconductor. Each transistor have three terminals which are as follows

- (i) **Emitter** It is the left most part of the transistor. It emits the majority carriers towards the base. It is highly doped and medium in size.
- (ii) **Base** It is the middle part of transistor which is sandwiched by emitter (E) and collector (C). It is lightly doped and very thin in size.
- (iii) **Collector** It is right part of the transistor which collect the majority carrier through base which is emitted by emitter. It has large size and moderately doped.

There are two semiconductor junctions, which are defined as below.

- (a) The junction between emitter and base is known as **emitter-base junction** (J_{EB}).
- (b) The junction between base and collector is known as **base-collector junction** (J_{CB}).

Types of Transistors

Transistors are of two types

- (i) **n - p - n transistor** If a thin layer of p -type semiconductor is sandwiched between two thick layers of n -type semiconductors, then it is known as n - p - n transistor.

- (ii) **p-n-p transistor** If a thin layer of *n*-type semiconductor is sandwiched between two thick layers of *p*-type semiconductor, then it is known as *p-n-p* transistor.

Transistor Action

The action of both types of transistors, i.e. *n-p-n* and *p-n-p* is similar except that the majority and minority charge carriers in the two cases are of opposite nature.

- (i) **Working of *n-p-n* transistor** The emitter-base junction is forward biased and collector-base junction is kept reversed biased for *n-p-n* transistor in a circuit. Its symbolic representation is shown in given figure.

When the emitter-base junction is forward biased, electrons (majority charge carriers) in emitter are repelled towards base. The barrier of emitter-base junction is reduced and the electrons enter the base. About 5% of these electrons recombine with holes in base region resulting in small current (I_B). The remaining electrons ($\approx 95\%$) enter the collector region, because they are attracted towards the positive terminal of battery (V_{CC}).

For each electron entering the positive terminal of the battery connected with collector-base junction, an electron from the negative terminal of the battery

connected with emitter-base junction enters the region. The emitter current (I_E) is approximately equal to the collector current (I_C). The base current is the difference between I_E and I_C .

$$\text{i.e.} \quad I_E = I_B + I_C$$

It may be pointed out that the arrows point in the direction of conventional current or hole current in spite of the fact that in the *n-p-n* transistor, the current is carried by electrons.

- (ii) **Working of *p-n-p* transistor** When emitter-base junction is forward biased, holes (majority charge carriers) in the emitter are repelled towards the base and diffuse through the emitter-base junction. The barrier potential of emitter-base junction decreases and holes enter the *n*-region (i.e. base).

A small number of holes ($\approx 5\%$) combines with electrons of *n*-region resulting in small current (I_B). The remaining holes ($\approx 95\%$) enter into the collector region, because they are attracted towards negative terminal of the battery connected with the collector-base junction. These holes constitute the collector current (I_C).

As one hole reaches the collector, it is neutralised by the battery. As soon as one electron and a hole neutralised in collector, a covalent bond is broken in emitter region. As a result, electron-hole pair is produced. The released electron enter the positive terminal of battery (V_{EE}).

Characteristics of a Transistor

In common emitter configuration, the variation of current on the input side with input voltage (I_E versus V_{BE}) is known as the **input characteristics** and the variation in the output current with output voltage (I_C versus V_{CE}) is known as **output characteristics**. From these characteristics, we obtain the values of following parameters.

- Input resistance

$$r_i = \left. \frac{\Delta V_{BE}}{\Delta I_B} \right|_{V_{CE} = \text{constant}}$$

- Output resistance

$$r_o = \left| \frac{\Delta V_{CE}}{\Delta I_C} \right|_{I_B = \text{constant}}$$

- AC current gain

$$\beta = \left| \frac{\Delta I_C}{\Delta I_B} \right|_{V_{CE} = \text{constant}}$$

The current gain for common-emitter configuration β ranges from 20 to 200.

- Transconductance

$$g_m = \frac{\Delta I_C}{\Delta V_{BE}} = \frac{\beta}{r_i}$$

A transistor can be used as an amplifier. The voltage gain of an amplifier will be given by

$$A_V = \frac{V_o}{V_i} = \beta \cdot \frac{R_C}{R_B}$$

where, R_C and R_B are net resistances in collector and base circuits respectively.

In common base configuration, AC current gain is defined as

$$\alpha = \left| \frac{\Delta I_C}{\Delta I_E} \right|_{V_{CE} = \text{constant}}$$

The value of α is slightly less than 1. In fact,
 $0.95 \leq \alpha \leq 1$.

Current gains α and β are correlated as

$$\beta = \frac{\alpha}{1 - \alpha} \quad \text{or} \quad \alpha = \frac{\beta}{1 + \beta}$$

Transistor as an Amplifier

The process of increasing the amplitude of input signal without distorting its wave shape and without changing its frequency is known as **amplification**.

The amplifier is a device which amplifies the power of varying current or alternating current.

As an amplifier, a transistor can be used in the following three configurations.

- Common base amplifier
- Common emitter amplifier
- Common collector amplifier

Common emitter amplifier The given circuit diagram shows an $n-p-n$ transistor which has been used in common-emitter mode. The input and output waveforms are shown along with the circuit.

Current gain in CE configuration, at constant collector to emitter voltage ratio of change in collector current the change in base current. It is denoted by β .

$\therefore$

$$\beta = \left(\frac{\Delta i_C}{\Delta i_B} \right)_{V_{CE} = \text{constant}}$$

The value of β is always greater than 1.

Voltage gain The ratio of change in output voltage to the change in input voltage is called voltage gain. It is denoted by A_V .

$$\text{Voltage gain, } A_V = \frac{\Delta V_C}{\Delta V_B} = \frac{\Delta i_C}{\Delta i_B} \times \frac{R_{out}}{R_{in}}$$

$$\Rightarrow A_V = \beta \times \frac{R_{out}}{R_{in}}$$

Power gain The ratio of change in output power to the change in input power is called power gain.

$$\therefore \text{Power gain} = \frac{P_{out}}{P_{in}}$$

$$\text{Also, power gain} = \beta^2 \times \frac{R_{out}}{R_{in}}$$

The relation between α and β is given by

$$\beta = \frac{\alpha}{1 - \alpha} \quad \text{or} \quad \alpha = \frac{\beta}{1 + \beta}$$

Transistor as an Oscillator

An electronic oscillator is a device that generates electrical oscillations of constant amplitude and of a desired frequency without any external input. The circuit providing such oscillation is known as a tank and oscillator using positive feedback.

Some of the properties of the oscillator are

1. Oscillator is using positive feedback.
2. To work as an oscillator

$$|\beta| = 1, \beta \rightarrow \text{feedback factor}$$

$$3. f = \text{frequency of oscillation} = \frac{1}{2\pi} \times \frac{1}{\sqrt{LC}}$$

Transistor as a Switch

Consider CE configuration of a transistor is shown as below in figure.

Applying Kirchhoff's voltage rule to the input sides of this circuit, we get

$$V_i = I_B \cdot R_B + V_{BE} \quad [V_i = \text{DC input voltage}]$$

and $V_o = V_{CC} - I_C \cdot R_C \quad [V_o = \text{DC output voltage}]$

Now, we can analyse that how V_o changes as V_i increases from zero onwards. In case of silicon transistor, if V_i is less than 0.6 V, I_B will be zero, hence, I_C will be zero and transistor will be said to be in cut-off state and $V_o = V_{CC}$.

When V_i becomes greater than 0.6 V, some I_B flows, so some I_C flows (transistor is in active state now) and output V_o decreases as the term $I_C \cdot R_C$ increases. With increase in V_i , the I_C increases almost linearly and so, V_o decreases linearly till its value becomes less than about 1.0 V.

Logic Gates

A logic gate is a digital electronic circuit which follows a logical relationship between its input and output. A logic gate may have one or more inputs but has only one output. Logic gates follow Boolean algebra, which consists of three basic operations, namely AND ($A \cdot B = Y$), OR ($A + B = Y$) and NOT ($\bar{A} = Y$).

Three Basic Logic Gates

On the basis of types of operations, i.e. OR, AND, NOT etc., there are three basic logic gates. These gates with their detailed descriptions are given below.

OR Gate

It has two inputs, and one output.

Logic symbol of OR gate is shown in Fig.(a). Its Boolean expression is $Y = A + B$ (being read as Y equals A or B).

An OR gate can be realised by using two $p-n$ junction diodes as shown in Fig. (b).

Truth table of OR gate is

A	B	Y
0	0	0
1	0	1
0	1	1
1	1	1

AND Gate

It also has two inputs and one output.

Boolean expression of AND gate is $Y = A \cdot B$ (being read as Y equals A and B). Truth table of AND gate is

A	B	Y
0	0	0
1	0	0
0	1	0
1	1	1

Logic symbol of AND gate is shown in Fig. (a) and the actual circuit arrangement used to realise AND gate in practice has been shown in Fig. (b).

NOT Gate

It has one input and one output.

Boolean expression of NOT gate $\bar{A} = Y$ (being read as A equals Y).

Truth table of the NOT gate is

A	Y
0	1
1	0

The logic symbol and actual circuit for realisation of NOT gate have been shown in above figure.

- | | |
|---|--|
| (i) $A + 0 = A$ | (ii) $A + A = A$ |
| (iii) $A + 1 = 1$ | (iv) $A + \bar{A} = 1$ |
| (v) $A \cdot 0 = 0$ | (vi) $A \cdot A = A$ |
| (vii) $A \cdot 1 = A$ | (viii) $A \cdot \bar{A} = 0$ |
| (ix) $\overline{A + B} = \bar{A} \cdot \bar{B}$ | (x) $\overline{A \cdot B} = \bar{A} + \bar{B}$ |

In the above expressions, A and B are to be assigned the values 0 or 1.

Here, if 0 implies low, then 1 implies high. Similarly, if 0 implies off, then 1 implies on. Also, if 0 stands for down, then 1 stand for up *vice-versa* may also be true. It may be kept in mind that in digital electronics, 0 and 1 represent two states and not two values.

Combination of Logic Gates

Some common combinations obtained from three fundamental gates OR, AND and NOT are as follows

NAND Gate

If the output of AND gate is joined to input of a NOT gate, the combination is a NAND gate.

Boolean expression of NAND gate is $\overline{A \cdot B} = Y$. Its logic symbol is shown in above figure.

Truth table of NAND gate is

A	B	Y
0	0	1
1	0	1
0	1	1
1	1	0

If both the inputs of a NAND gate are joined together, it will behave as a NOT gate as shown in figure.

Two/Three NAND gates may be joined so as to have the same effect as a single AND gate or OR gate.

NOR Gate

If the output of OR gate is joined to input of a NOT gate, the combination is a NOR gate.

Boolean expression of NOR gate is $\overline{A + B} = Y$. Its logic symbol is shown in figure.

Truth table of NOR gate is

A	B	Y
0	0	1
1	0	0
0	1	0
1	1	0

If both inputs of a NOR gate are joined together, it will behave as a NOT gate as shown in figure. Two/ Three NOR gates may be combined so as to have the same effect as a single OR/AND gate.

NAND and NOR gates are known as universal gate.

XOR Gate

The logic gate which gives high output (1) when either input A or input B , but not both of them, are high is called exclusive OR gate or the XOR gate. If both inputs A and B are either high (1) or low (0), then the output is zero.

XOR gate can be obtained by having a combination of two NOT gates, two AND gates and one OR gate as shown in Fig. (a). The logic symbol is shown in Fig. (b).

Boolean expression of XOR gate is

$$Y = A \oplus B = \bar{A} \cdot B + A \cdot \bar{B}$$

Truth table of XOR gate is

A	B	Y
0	0	0
1	0	1
0	1	1
1	1	0

The Boolean expressions obey the commutative law, associative law as well as distributive law.

Commutative law

$$(i) A + B = B + A \quad (ii) A \cdot B = B \cdot A$$

Associative law

$$(iii) A + (B + C) = (A + B) + C$$

$$(iv) (A \cdot B) \cdot C = A \cdot (B \cdot C)$$

Distributive law

$$(v) A \cdot (B + C) = A \cdot B + A \cdot C$$

$$(vi) A + \bar{A} \cdot B = A + B \quad (vii) A + A \cdot B = A$$

$$(viii) A \cdot (A + B) = A \quad (ix) A \cdot (\bar{A} + B) = A \cdot B$$

$$(x) \bar{A} \cdot \bar{B} = \overline{A + B}$$

Practice Exercise

- If the resistivity of copper is $1.7 \times 10^{-6} \Omega\text{-m}$, then the mobility of electrons in copper, if each atom of copper contributes one free electron for conduction is [the atomic weight of copper is 63.54 and density is 8.96 g/cc]
 - $23.36 \text{ cm}^2/\text{Vs}$
 - $503.03 \text{ cm}^2/\text{Vs}$
 - $43.25 \text{ cm}^2/\text{Vs}$
 - $88 \text{ cm}^2/\text{Vs}$
- The conductivity of a semiconductor increases with increase in temperature because
 - number density of free current carriers increases
 - relaxation time increases
 - both number density of carriers and relaxation time increase
 - number density of current carriers increases, relaxation time decreases but effect of decrease in relaxation time is much less than increase in number density
- In an n -type silicon, which of the following statement is true?
 - Electrons are majority charge carriers and trivalent atoms are the dopants
 - Electrons are minority charge carriers and pentavalent atoms are the dopants
 - Holes are minority charge carriers and pentavalent atoms are the dopants
 - Holes are majority carriers and trivalent atoms are the dopants
- Application of a forward bias to a p - n junction
 - increases the number of donors on the n -side
 - increases the electric field in the depletion zone
 - increases the potential difference across the depletion zone
 - widens the depletion zone
- In a three phase full-wave rectifier of 50 Hz, the ripple frequency is
 - 300 Hz
 - 50 Hz
 - 400 Hz
 - 600 Hz
- The dimension of $\sqrt{LC}$ is
 - $(\text{s})^2$
 - volt-s/amp
 - amp-s/volt
 - s
- Given, $\beta = 49$ and $I_e = 2 \text{ mA}$, I_c for a BJT is
 - 2 mA
 - 1.96 mA
 - 98 mA
 - $\frac{2}{49} \text{ mA}$
- A single ended class A transformer coupled amplifier delivers a power of 50 mW. $V_{CC} = 10$ volts. Assuming ideal conditions, the reflected primary resistance is given by
 - 2000 Ω
 - 1000 Ω
 - 500 Ω
 - 200 Ω
- In a vacuum diode, when the plate voltage is 40 V, the plate current is 10 mA. For a plate voltage of 160 V, the plate current is
 - 20 mA
 - 40 mA
 - 80 mA
 - 160 mA
- A triode is operating at $E_c = -4 \text{ V}$, $E_b = 175 \text{ V}$ and $I_b = 10 \text{ mA}$. Around this operating point, the plate characteristics are linear and the parameter values are $\mu = 20$, $g_m = 2.5 \text{ mA/V}$. If E_c is changed to -6 V with $E_b = 175 \text{ V}$, the value of I_b is given by
 - 10 mA
 - 20 mA
 - 15 mA
 - 5 mA
- Given the following set of values for a triode, the value of g_m and μ are given below in the table:

E_c	E_b	I_b
-12 V	-4 V	-4 V
230 V	230 V	150 V
25 mA	35 mA	25 mA

 - 1.25 mA/V and 8
 - 0.8 mA/V and 8
 - 1.25 mA/V and 10
 - 8 mA/V and 10

12. The table gives values of E_b , E_c , I_b for a triode

E_b	E_c	I_b
250 V	-35 V	10 mA
300 V	-45 V	10 mA
300 V	-35 V	25 mA

The value of r_p in $k\Omega$ and g_m in mA/V are given by

- a. 50 and 0.1 b. 10 and 3.0
c. 5 and 1.5 d. 3.33 and 1.5
13. A triode is operating at $E_c = -4$ V, $E_b = 175$ V and $I_b = 10$ mA. Around this operating point, the plate characteristics are linear and the parameters are $\mu = 20$, $r_p = 8$ $k\Omega$. E is changed to -6 V. To obtain the same plate current the value of E_b should be
- a. 40 b. 135 c. 191 d. 215
14. A triode has $r_p = 10$ $k\Omega$ and $\mu = 20$. Table gives the operating point with blanks

E_c	E_b	I_b
-8 V	250 V	8 mA
E_{b1}	250 V	12 mA
E_{c1}	E_{b1}	8 mA

The values of E_{b1} and E_{c1} are

- a. 290 V, -6 V b. 210 V, -10 V
c. 290 V, -10 V d. 210 V, -6 V
15. For a vacuum triode, the values of E_c , E_b and I_b are given as under

E_c	E_b	I_b
-1 V	100 V	5 mA
-1 V	140 V	9 mA
-6 V	200 V	5 mA

The values of μ and r_p are given by

- a. $\mu = 12$, $r_p = 10$ $k\Omega$ b. $\mu = 12$, $r_p = 20$ $k\Omega$
c. $\mu = 10$, $r_p = 20$ $k\Omega$ d. $\mu = 20$, $r_p = 10$ $k\Omega$
16. The temperature (T) dependence of resistivity (ρ) of a semiconductor is represented by

17. In figure, V_0 is the potential barrier across a p - n junction, when no battery is connected across the junction.

- a. 1 and 3 both correspond to forward bias of junction
b. 3 corresponds to forward bias of junction and 1 corresponds to reverse bias of junction
c. 1 corresponds to forward bias and 3 corresponds to reverse bias of junction
d. 3 and 1 both correspond to reverse bias of junction
18. In BJT, maximum current flows in which of the following?
a. Emitter region b. Base region
c. Collector region d. Equal in all the regions
19. A tungsten emitter works at 2500 K. To increase the emission current density by 20%, how much change in the work function is required (Given, $\log 2 = 0.3$, $\log 3 = 0.477$)
a. 0.016 eV b. 0.039 eV c. 2.54 eV d. 0.254 eV
20. In an unbiased p - n junction, holes diffuse from the p -region to n -region because
a. free electrons in the n -region attract them
b. they move across the junction by the potential difference
c. hole concentration in p -region is more as compared to n -region
d. All of the above
21. Zener breakdown in a semiconductor diode occurs when
a. forward current exceeds certain value
b. reverse bias exceeds certain value
c. forward bias exceeds certain value
d. potential barrier is reduced to zero
22. The voltage gain of an amplifier stage is 100. The gain expressed in db is
a. 100 b. 20 c. 40 d. 10
23. If $A = B = 1$, then in terms of Boolean algebra what is not equal to the value of $A \cdot B + A$?
a. $B \cdot A + B$ b. $B + A$ c. B d. None

24. The Boolean equation for the circuit given in figure is

- a. $Y = \bar{A} \cdot B + C$ b. $Y = \bar{A} \cdot (\bar{B} + \bar{C})$
c. $Y = \bar{A} \cdot (B + \bar{C})$ d. $Y = \bar{A} \cdot (B + C)$

25. In the above circuit, if the polarity is reversed of battery, the current flowing would be
a. 0 mA b. 2 mA c. 5 mA d. 10 mA

26. The given figure shows a rectifier of alternating current ($f = 50$ c/s), the number of pulses of rectified current obtained in 1s is

- a. 50 b. 25 c. 100 d. 200
27. In a sample of pure silicon 10^{13} atom/cm³ is mixed of phosphorus. If all atoms are active, then what will be the resistivity at 20° C if mobility of electron is 1200 cm²/V-s?
a. 0.5209 Ω-cm b. 5.209 Ω-cm
c. 52.09 Ω-cm d. 520.9 Ω-cm

28. For the given combination of gates, if the logic states of inputs A, B and C are as follows. $A = B = C = 0$ and $A = B = 1, C = 0$, then the logic states of output D are

- a. 0, 0 b. 0, 1 c. 1, 0 d. 1, 1
29. The plate voltage of a triode is increased from 225 V to 250 V, the grid voltage is changed from 4 to -4.7 V to maintain plate current constant. The amplification factor of the tube is
a. 35.7 b. 2 c. 70 d. 20

30. In a triode amplifier, the load resistance is equal to the plate resistance r_p . If μ is the amplification factor, the stage gain of the amplifier is

- a. $\frac{\mu}{2}$ b. μ c. 2μ d. $\frac{\mu}{4}$

31. The triodes P and Q have the same amplification factor 40. Their plate resistances are 4 kΩ and 8 kΩ, respectively. If an amplifier circuit is designed using anyone of them and a load resistance is of 8 kΩ, the ratio of the voltage gain obtained from them will be
a. 2 : 3 b. 4 : 3 c. 3 : 4 d. 1 : 2

32. When the plate voltage of a triode is 150 V, its cut-off voltage is -5 V. On increasing the plate voltage to 200 V, the cut-off voltage can be
a. -4.5 V b. -5.0 V
c. +2.3 V d. -6.66 V

33. In a diode vacuum tube, the plate current is 5 mA, When the plate voltage is 160 V, a grid is introduced between the plate and cathode and a voltage of -2 V is applied to it. The plate current will become

(If $g_m = 5 \times 10^{-3} \Omega^{-1}$)

- a. 20 mA b. 10 mA c. 4 mA d. 7.5 mA

34. In common emitter amplifier, the $\frac{I_c}{I_e}$ is 0.98, then the value of β is

- a. 98 b. 0.98
c. 49 d. None of these

35. For the given circuit of $p-n$ junction diode, which of the following statements is correct?

- a. In forward biasing the voltage across R is V
b. In forward biasing the voltage across R is 2 V
c. In reverse biasing the voltage across R is V
d. In reverse biasing the voltage across R is 2 V

36. When forward bias is applied to a $p-n$ junction, what happens to the potential barrier V_B and the width of charge depleted region x ?

- a. V_B increases, x decreases
b. V_B decreases, x increases
c. V_B increases, x increases
d. V_B decreases, x decreases

37. Carbon, silicon and germanium atoms have four valence electrons each. Their valence and conduction bands are separated by energy band gaps represented by $(E_g)_C$, $(E_g)_{Si}$ and $(E_g)_{Ge}$, respectively. Which one of the following relationship is true in their case?

- a. $(E_g)_C > (E_g)_{Si}$ b. $(E_g)_C = (E_g)_{Si}$
c. $(E_g)_C < (E_g)_{Ge}$ d. $(E_g)_C < (E_g)_{Si}$

38. What is the plate current in a diode valve under the space charge limited operation, when the plate potential is 60 V ? In a diode valve, the plate current is 320 mA, when the plate potential is 240 V.

- a. 30 mA b. 20 mA c. 40 mA d. 10 mA

39. In the following common emitter configuration, an $n-p-n$ transistor with current gain $\beta = 100$ is used. The output voltage of the amplifier will be

- a. 10 mV b. 0.1 V c. 1.0 V d. 10 V

40. In the case of forward biasing of p - n junction, which one of the following figures correctly depicts the direction of the flow of charge carriers?

41. In a forward biased p - n junction diode, the potential barrier in the depletion region will be of the form

42. The input resistance of a common emitter transistor amplifier, if the output resistance is $500 \text{ k}\Omega$, the current gain $\alpha = 0.98$ and the power gain is 6.0625×10^6 is

- a. $198 \text{ }\Omega$ b. $300 \text{ }\Omega$
c. $100 \text{ }\Omega$ d. $400 \text{ }\Omega$

43. In a figure given alongside assuming the diodes to be ideal

- a. D_1 is forward biased and D_2 is reverse biased and hence, current flows from A to B
b. D_2 is forward biased and D_1 is reverse biased and hence, no current flows from B to A and vice-versa
c. D_1 and D_2 are both forward biased and hence current flows from A to B
d. D_1 and D_2 are both reverse biased and hence no current flows from A to B and vice-versa

44. In the circuit shown in figure, if the diode forward voltage drop is 0.3 V , then the voltage difference between A to B is,

- a. 1.3 V
b. 2.3 V
c. zero
d. 0.5 V

45. The exclusive-OR of A, B is represented by $A \oplus B$. An equivalent form is

- a. $AB + \bar{A}\bar{B}$ b. $AB + \overline{A+B}$
c. $\bar{A}\bar{B} + \bar{A}B$ d. None of these

46. Given the truth table relating Y to A, B .

A	B	Y
0	0	1
0	1	0
1	0	0
1	1	0

Then, Y is given by

- a. $A + B$ b. AB c. $\bar{A}\bar{B}$ d. $\overline{A+B}$

47. Given the following truth table, where A, B are inputs and Y the output

A	B	Y
0	0	1
1	0	1
0	1	1
1	1	0

The output Y is

- a. $\bar{A}\bar{B}$ b. $\bar{A}B$ c. AB d. $\bar{A}B$

48. What will be the input of A and B for the Boolean expression $(\bar{A} + B) \cdot (A \cdot B) = 1$?

- a. 0, 0 b. 0, 1 c. 1, 0 d. 1, 1

49. Which of the following gates will have an output of 1?

50. Current in the circuit will be

- a. $5/40$ b. $5/50$ c. $5/10$ d. $5/20$

51. Find the value of V_{AB} .

- a. 10 V b. 20 V
c. 30 V d. None of these

52. A two volt battery forward biased and a diode. However, there is a drop of 0.5 V across the diode which is independent of current. Also, a current greater than 10 mA produces large joule loss and damages diode. If diode is to be operated at 5 mA, then the series resistance to be put is

- a. 3 k Ω b. 300 k Ω c. 300 Ω d. 200 k Ω

53. Which of the following statements concerning the depletion zone of an unbiased *p-n* junction is(are) true?

- The width of the zone is independent of the densities of the dopants (impurities)
- The width of the zone is dependent on the densities of the dopants
- The electric field in the zone is produced by ionised dopant atoms
- The electric field in the zone is provided by electrons in the conduction band and the holes in the valence band

54. The circuit shown in figure below will act as

- OR gate
- AND gate
- XOR gate
- None of these

55. The circuit shown below will act as

- AND gate
- OR gate
- NAND gate
- XOR gate

56. In Boolean algebra, $A + B = Y$ implies that

- sum of *A* and *B* is *Y*
- Y* exists when *A* exists or *B* exists or both *A* and *B* exist
- Y* exists only when *A* and *B* both exist
- Y* exists when *A* or *B* exist but not when both *A* and *B* exist

57. In the Boolean algebra, which of the following is wrong?

- $1 + 0 = 1$
- $0 + 1 = 1$
- $1 + 1 = 1$
- None of these

58. The output of a 2-input OR gate is fed to a NOT gate, the new gate obtained is

- OR gate
- NOT gate
- NOR gate
- XOR gate

59. Digital circuit can be made by the repetitive use of

- OR gates
- AND gates
- NOT gates
- NAND gates

BITSAT Archives

1. The circuit is equivalent to

[2013]

- AND gate
- OR gate
- Not gate
- None of these

2. Active state of *n-p-n* transistor, in circuit is achieved by

[2013]

- low input voltage
- high input voltage
- both *a* and *b*
- Neither *a* nor *b*

3. If a semiconductor has an intrinsic carrier concentration of $1.41 \times 10^{16}/\text{m}^3$ when doped with $10^{21}/\text{m}^3$ phosphorous atoms, then the concentration of holes / m^3 at room temperature will be

[2009]

- 2×10^{21}
- 2×10^{11}
- 1.41×10^{10}
- 1.41×10^{16}

4. Two identical capacitors each of capacitance *C* are charged to the same potential *V* and are connected in two circuits (i) and (ii) at $t = 0$ as shown. The charges on the capacitor at $t = CR$ are

[2009]

- $\frac{CV}{e}, \frac{CV}{e}$
- CV, CV
- $\frac{VC}{e}, VC$
- $VC, \frac{VC}{e}$

5. A transistor is preferable to a triode valve when used in amplifier because it

- can withstand large changes in temperature
- has a higher input impedance
- can handle larger powers
- does not require powers

which of the above statements is correct? [2009]

- Only (i), (ii) and (iii) are correct
- Only (i) and (iii) are correct
- Only (ii) and (iv) are correct
- Only (vi) is correct

Answer with Solutions

Practice Exercise

$$1. (c) \text{ Mobility of electron, } \mu = \frac{\sigma}{ne} \quad \dots(i)$$

$$\text{Resistivity, } \rho = \frac{1}{\sigma} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\mu = \frac{1}{nep} \quad \dots(iii)$$

n = number of free electrons per unit volume

$$n = \frac{N_0 \times d}{\text{atomic weight}} = \frac{6.023 \times 10^{23} \times 8.96}{63.54} = 8.5 \times 10^{22} \quad \dots(iv)$$

From Eqs. (iii) and (iv), we get

$$\mu = \frac{1}{8.5 \times 10^{22} \times 1.6 \times 10^{-19} \times 1.7 \times 10^{-6}} = 43.25 \text{ cm}^2/\text{Vs}$$

$$2. (d) \quad 3. (c) \quad 4. (a)$$

5. (a) For full-wave rectifier.

For single phase, ripple frequency

$$= 2 \times f \quad (f = \text{frequency of input})$$

$$f' = 2 \times 50 = 100 \text{ Hz} \quad (\text{frequency of supply})$$

For 3-phase, ripple frequency

$$= 3 \times f' = 3 \times 100 = 300 \text{ Hz}$$

$$6. (d) \text{ At resonance, } \omega L = \frac{1}{\omega C}$$

$$\omega^2 = \frac{1}{LC}$$

$$\Rightarrow \omega = \frac{1}{\sqrt{LC}}$$

$$2\pi f = \frac{1}{\sqrt{LC}}$$

Thus, dimensions of $\sqrt{LC}$ is second.

$$7. (b) \beta = 49, I_e = 2 \text{ mA}, I_c = ?$$

$$\beta = \frac{I_c}{I_b}, \alpha = \frac{I_c}{I_e}$$

$$\alpha = \frac{\beta}{1 + \beta} = \frac{49}{1 + 49} = \frac{49}{50}$$

$$\frac{49}{50} = \frac{I_c}{I_e}$$

$$I_c = \frac{49 \times 2}{50} \text{ mA}$$

$$I_c = 1.96 \text{ mA}$$

$$8. (b) \text{ For ideal condition, } P = \frac{V^2}{R + R}$$

$$2R = \frac{10 \times 10}{50 \times 10^{-3}} = 2000$$

$$R = 1000 \Omega$$

$$9. (c) V_p = 40 \text{ V}, I_p = 10 \text{ mA}, V'_p = 160 \text{ V}$$

$$\frac{I_p}{I'_p} \propto \frac{(V_p)^3}{(V'_p)^2}$$

$$\frac{10}{I'_p} = \left(\frac{40}{160} \right)^{\frac{3}{2}}$$

$$I'_p = (4)^{\frac{3}{2}} \times 10 = 80 \text{ mA}$$

$$10. (d) E_{c1} = -4 \text{ V}, I_b = 10 \text{ mA}, E_b = 175 \text{ V}, \mu = 20, g_m = 2.5 \text{ mA/V}$$

$$E_{c2} = -6 \text{ V}, E_b = 175 \text{ V}$$

At constant plate potential 175 V

$$g_m = \left(\frac{\Delta I_b}{\Delta I_c} \right)_{V_b}$$

$$2.5 \times 10^{-3} = \frac{\Delta I_b}{-4 + 6}$$

$$5 \times 10^{-3} = \Delta I_b$$

$$I_b - I'_b = 5 \text{ mA}$$

$$I'_b = 10 - 5 = 5 \text{ mA}$$

$$11. (c) \mu = \left(\frac{\Delta V_p}{\Delta V_g} \right)_{I_p} = \frac{80}{8}$$

$$\mu = 10$$

$$g_m = \left(\frac{\Delta I_p}{\Delta V_g} \right)_{I_p} = \frac{10 \text{ mA}}{8} = 1.25 \text{ mA/V}$$

$$12. (d) r_p = \left(\frac{\Delta V_p}{\Delta I_p} \right)_{V_g} = \frac{50}{15} = 3.33 \text{ k}\Omega$$

$$g_m = \left(\frac{\Delta I_p}{\Delta V_g} \right) = \frac{15}{10} = 1.5 \text{ mA/V}$$

$$13. (d) \mu = \left(\frac{\Delta V_b}{\Delta V_g} \right)_{I_p}$$

$$\Delta V_b = 20 \times 2 = 40$$

$$\Delta V_b = V'_b - V_b = 40$$

$$V'_b = 175 + 40 = 215$$

$$14. (d) r_p = \left(\frac{\Delta V_p}{\Delta I_b} \right)$$

$$10 \text{ k}\Omega = \frac{250 - E_{b1}}{4 \text{ mA}}$$

$$10 \times 4 = 250 - E_{b1}$$

$$E_{b1} = 210 \text{ V}$$

$$\mu = \frac{\Delta V_p}{\Delta V_g} = \frac{40}{E_{c1} + 8}$$

$$8 + E_{c1} = \frac{40}{20}$$

$$8 - 2 = -E_{c1}$$

$$E_{c1} = -6 \text{ V}$$

$$15. (d) \mu = \left(\frac{\Delta V_b}{\Delta V_g} \right)_{I_b} = \left(\frac{\Delta V_b}{\Delta V_c} \right)_{I_b} (\text{Max. } \Delta V_p)$$

$$= \frac{200 - 100}{5} = 20$$

$$r_p = \left(\frac{\Delta V_p}{\Delta I_p} \right)_{V_g} (\text{Min. } \Delta V_p) = \frac{140 - 100}{9 - 5} = \frac{40}{4} = 10 \text{ k}\Omega$$

$$16. (c) \quad 17. (b) \quad 18. (a)$$

$$19. (b) \quad 20. (c) \quad 21. (b)$$

$$22. (c)$$

$$23. (d) AB + A = 1 \cdot 1 + 1 = 1 + 1 = 1.$$

Same is true for $B \cdot A + B$ as well as $B + A$.

$$24. (d) Y = \bar{A} \cdot (B + C)$$

$$25. (a) \quad 26. (c)$$

$$27. (d) \frac{1}{\rho} = e (n_e \mu_e + n_h \mu_h) = 520.9 \text{ } \Omega\text{-cm} \quad [\text{By putting values}]$$

$$28. (d) \text{ The output } D \text{ for the given combination}$$

$$D = \overline{(A + B)} \cdot \bar{C} = \overline{(A + B)} + \bar{C}$$

$$\text{If, } A = B = C = D, \text{ then } D = \overline{(0 + 0)} + \bar{0} = \bar{0} + \bar{0} = 1 + 1 = 1$$

$$\text{If } A = B = 1, C = 0, \text{ then } D = \overline{(1 + 1)} + \bar{0} = \bar{1} + \bar{0} = 0 + 1 = 1$$

$$29. (a) V_{p1} = 225 \text{ V}, V_{p2} = 250 \text{ V}, V_{g1} = -4 \text{ V},$$

$$V_{g2} = -4.7 \text{ V}$$

$$\mu = \left(\frac{\Delta V_p}{\Delta V_g} \right)_{I_p} = \frac{25}{0.7} = 35.7$$

$$30. (a) A = \frac{\mu}{1 + \frac{r_p}{R}}$$

$$R = r_p$$

$$A = \frac{\mu}{2}$$

$$31. (b) \mu = 40 = \text{amplification factor}$$

$$\mu_P = \mu_Q = 40$$

$$r_P = 4 \text{ k}\Omega, r_Q = 8 \text{ k}\Omega$$

$$R_L = 8 \text{ k}\Omega$$

$$\text{Voltage gain for triode } A = \frac{\mu R_L}{r_P + R_L}$$

$$\text{For triode } P = A_P = \frac{40 \times 8}{4 + 8}$$

$$A_Q = \frac{40 \times 8}{8 + 8}$$

$$\frac{A_P}{A_Q} = \frac{4 + 8}{40 \times 8} = \frac{16}{12} = \frac{4}{3}$$

$$32. (d) V_{p1} = 150 \text{ V}, V_{p2} = 200 \text{ V}, V_{g1} = -5 \text{ V}, V_{g2} = ?$$

μ = amplification factor of a triode valve, it is a characteristic of valve remains constant.

So long as I_p is constant.

$$\therefore \mu = -\frac{V_{p1}}{V_{g1}} = -\frac{V_{p2}}{V_{g2}}$$

$$\frac{150}{-5} = \frac{200}{V_{g2}}$$

$$V_{g2} = -\frac{20}{3} = -6.66 \text{ V}$$

$$33. (c) V_{g1} = 0$$

$$I_p = \text{plate current} = 5 \text{ mA}$$

$$V_p = \text{plate voltage} = 150 \text{ V}$$

$$V_g = \text{grid voltage} = -2 \text{ V}$$

When $V_g = 0$, it is a diode

When $V_g = -2$, it is a triode

$$\therefore g_m = \left(\frac{\Delta I_p}{\Delta V_g} \right)_{V_p = \text{constant}}$$

$$5 \times 10^{-4} = \frac{I_2 - I_1}{V_2 - V_1} = \frac{I_2 - 5 \times 10^{-3}}{-2 - 0}$$

$$-10 \times 10^{-4} + 5 \times 10^{-3} = I_2$$

$$-1 \times 10^{-3} + 5 \times 10^{-3} = I_2$$

$$I_2 = 4 \text{ mA}$$

$$34. (c) \quad 35. (a) \quad 36. (d) \quad 37. (a)$$

$$38. (c) \text{ Using Child Langmuir law, } I \propto V^{3/2}$$

$$320 \propto (240)^{3/2} \quad \dots(i)$$

$$I \propto (60)^{3/2} \quad \dots(ii)$$

Dividing Eq. (i) by Eq. (ii), we get

$$\frac{320}{I} = (4)^{3/2} \Rightarrow I = \frac{320}{8} \Rightarrow I = 40 \text{ mA}$$

$$39. (c) \quad 40. (c) \quad 41. (d)$$

$$42. (a) \text{ Power gain} = \text{Current gain} \times \text{Voltage gain}$$

$$\text{Voltage gain, } A_V = \beta \frac{R_2}{R_1}$$

$$\text{Current gain } \beta = \frac{\alpha}{1 - \alpha} = \frac{0.98}{1 - 0.98} = 49$$

$$A_V = 49 \left(\frac{500 \times 10^3}{R_1} \right)$$

$$\text{Power gain, } R_1 = 6.0625 \times 10^6$$

$$= 49 \times \left(\frac{500 \times 10^3}{R_1} \right) \times 49 = 198 \text{ } \Omega$$

$$43. (b) \text{ If } V_p - V_n > 0, \text{ then diode is in forward biased. In case of } D_1, V_p - V_n = -10 - 0 = -10 < 0, \text{ so } D_1 \text{ is in reverse biased and for } D_2, V_p - V_n = 0 - (-10) = 10 > 0, \text{ so } D_2 \text{ is in forward biased.}$$

$$44. (b) \text{ Applying KVL across points } A \text{ and } B,$$

$$V_A - 0.2 \times 10^{-3} \times 5 \times 10^3 - 0.3 - 0.2 \times 5 - V_B = 0$$

$$\Rightarrow V_A - V_B = 2.3 \text{ V}$$

45. (c) Exclusive OR,

$$Y = A + B, Y = \overline{AB} + A\overline{B}$$

46. (d)
- $\overline{A+B} = \overline{0+0} = 1$

$$= \overline{0+1} = \overline{0} = 1 + \overline{0} = 0 = \overline{1+1} = 0$$

A	B	Y
0	0	1
0	1	0
1	0	0
1	1	0

47. (d)
- $\overline{AB} = \overline{(0.0)} = \overline{0} = 1$

$$\overline{AB} = \overline{(1.0)} = \overline{0} = 1$$

$$\overline{AB} = \overline{(0.1)} = \overline{0} = 1$$

$$\overline{AB} = \overline{(1.1)} = \overline{1} = 0$$

48. (a) The given Boolean expression can be written as

$$Y = (A+B) \cdot (\overline{AB}) = (\overline{A} \cdot \overline{B}) \cdot (\overline{A} + \overline{B})$$

$$= (\overline{A} \cdot \overline{A}) \cdot \overline{B} + \overline{A}(\overline{B} \cdot \overline{B}) = \overline{A} \cdot \overline{B} + \overline{A} \cdot \overline{B} = \overline{A} \cdot \overline{B}$$

So, the truth table is

A	B	Y
0	0	1
1	0	0
0	1	0
1	1	0

BITSAT Archives

1. (b)
- $Y = A + (\overline{A} \cdot B) = (A + \overline{A}) \cdot (A + B)$

$$= 1 \cdot (A + B) = A + B \text{ OR gate}$$

Here, t has value 1 for all inputs.

2. (d) Transfer characteristic of transistor is

Active state is achieved at intermediate input voltage.

49. (c) For option (c), it is a NAND gate, its output
- $= \overline{0.1} = \overline{0} = 1$

50. (b) Equivalent circuit is

$$R_{eq} = 50 \Omega \Rightarrow I = \frac{V}{R} = \frac{5}{50}$$

51. (a) Equivalent circuit is

$$\therefore R_{eq} = 15 \Omega$$

$$\text{Circuit current, } I = \frac{V}{R} = \frac{30}{15} = 2 \text{ A}$$

$$\text{So, } V_{AB} = I_{AB} \cdot R_{AB} = 1 \times 10 = 10 \text{ V}$$

52. (c) By KVL,
- $2 = 0.5 + IR = 0.5 + 5 \times 10^{-3} R$

$$\therefore R = \frac{1.5}{5 \times 10^{-3}}, R = \frac{1500}{5} = 300 \Omega$$

53. (b) 54. (a) 55. (a)

56. (d) 57. (a) 58. (c)

59. (d) The repetitive use of NAND and NOR gate gives digital circuits.

3. (d) Doping will increase the number of electrons only and not the holes. So, number of holes will be equal to number of intrinsic carrier concentration.

$$= 1.41 \times 10^{16} / \text{m}^3$$

4. (c) In figure (i) the
- $p-n$
- junction diode is forward biased and represents a very low resistance, the capacitor, therefore discharge itself through resistor
- R
- according to relation,

$$q = q_0 e^{-1/CR} \text{ and } q_0 = CV \text{ at } t = CR$$

$$\therefore q = q_0 e^{-1} = \frac{CV}{e}$$

In figure (ii), the $p-n$ junction diode is reverse biased, the capacitor therefore holds the charge intact.

$$\therefore q = q_0 = CV$$

5. (d) A transistor is preferable to a triode valve when used in amplifier because it does not require a power.

33

Universe

Introduction

1. **Solar system** It includes the Sun at centre, eight planets (Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune) revolving around the Sun with 59 natural satellites revolving around the planets.

Mercury and Venus have no satellite, while Saturn have maximum number of satellites twentyone (21).

(a) **Stars** These are very much like the Sun. They may occur as single stars, binary stars or in clusters.

(b) **Galaxies** A large group of stars is called a galaxy. The galaxy containing our Sun and hundred billion (10^{11}) stars is called milky way. There are billions of galaxies. Galaxies may be spiral, elliptical and irregular in shape. Most galaxies are spiral like milky way.

2. Mass (M) of Milky way is given by

$$\frac{v^2}{r} = \frac{GM}{r^2}, \text{ i.e. } M = \frac{v^2 r}{G}$$

where, v = orbital speed of Sun.

r = distance of Sun from centre of galaxy.

The mass M comes out to be nearly 3×10^{41} kg.

3. **Asteroids** The groups of small objects revolving around the Sun between orbits of Mars and Jupiter are called asteroids. It is believed that asteroids are pieces of planets, possibly due to gravitational effect of Jupiter.
4. **Comets** A small rock like material surrounded by large masses like water, ammonia and methane and revolving in highly elliptical orbits around the Sun are called comets.
5. **Meteors and meteorites** These objects which get completely burnt and blazing through the atmosphere are called meteors. The larger objects which are not completely burnt before reaching the earth are called meteorites.
6. **Colour of a star** The colour of a star is determined by Wien's displacement law, according to which

$$\lambda_m = \text{constant}$$

where, λ_m = wavelength corresponding to maximum energy of emission.

Accordingly, a blue star is hottest and the red star is coolest.

The expanding universe and observed red shift are in favour of Big-bang theory.

7. **Pulsating theory** According to this theory, the boundary of universe moves in and out with a period of 8×10^9 years.
8. **The steady state theory** According to this theory, the total number of galaxies in the universe has attained a steady value. If one is lost due to annihilation in observable part of universe, one new is formed. This theory is based on interconversion of mass and energy.
9. **Hubble's law** It states that the speed of recession v is related to distance (r) of galaxy by the relation

$$v = Hr$$

where, H is called Hubble's constant. Its value $10^{17} \text{ kms}^{-1} / \text{million light years}$.

Star

Dust particles, hydrogen and helium gas molecules present in the interstellar space first come together (at about -173°C) to form a cloud. Then, they start contracting. As a result of compression, heating of cloud takes place. When temperature of the core becomes about 10^7 K , the fusion of hydrogen atoms is initiated with the release of energy. This energy keeps the star shining for millions of years.

Death of a Star

A star lasts until the hydrogen in the core of the star is exhausted. The core now starts contracting, it results in the rise in temperature of the star. As a result of rise in temperature, the outer layer of the star expand. Expansion of outer layer brings about cooling effect in them. The process continues till the temperature of outer layer falls enough to make the star appear red. It is then called **red giant**.

At this stage, a violent explosion called **nova** or **supernova** occurs in the star. Due to the explosion its outer layers are thrown into interstellar space leaving behind the core of the star. The core of the star may further end up into one of the following three steller dead materials.

White Dwarf

The core dies as white dwarf, if the original mass of the star was 1.4 solar masses. It was discovered by **S Chandrasekhar** in 1930 and it is known as **Chandrasekhar limit**. The core is composed of protons and electrons. The core keeps on emitting heat and light for millions of years. As it cools steadily, its colour changes from white to yellow, then to red and finally it becomes black. It then becomes invisible forever as black dwarf and neither emits heat nor light.

Neutron Star

The core of the star finishes up as neutron star, if the mass of the star was between 1.5 to 5 solar masses. The

compressed core is made only of neutrons. Neutron stars produce very high magnetic fields. A spinning neutron star emitting electromagnetic waves is called **Pulsar**.

Black Hole

If the original mass of the star is greater than 5 solar masses, the core dies into black holes. The mass of a black hole is greater than the mass of the Sun but its size is very small, therefore the gravitational pull of a black hole is so strong that even the photon or radiation emitted by it, cannot escape from its surface. Since, no radiation is received from a black hole, it cannot be seen through a telescope.

The Milky Way

The Milky way or **Akash-ganga** is the name of the galaxy to which our solar system belongs. It is composed of a few hundred billion stars including our own Sun. The systematic study of the Milky way was undertaken in the eighteenth century by **William Herschel**, the same Herschel who discovered the planet Uranus.

To the naked eye, Milky way looks like a stream of milk across the sky. Some of the important features of Milky way are given below

- (i) Milky way is a convex lens shaped disc with a thick centre and thinning outwards.
- (ii) The Milky way contains about 150 billions of stars.
- (iii) The space in the Milky way is filled with dust and gases called the interstellar matter. About 90% of the interstellar matter is in the form of hydrogen.
- (iv) Some regions of the Milky way appear dark not because they are empty but because the intervening dust and gas obstructs the light from the stars behind them. These dark regions are called **dark nebulae**.
- (v) Sometimes the regions of dust show a great variety of brightness. They shine in the light of the nearby stars and such bright regions of dust are called bright nebulae. Orion is the example of bright nebulae.
- (vi) A remarkable feature of the Milky way is its rotation about its centre. This rotation is not rigid.

Our Sun, alongwith the planetary system is revolving around the centre of the Milky way with a speed $v = 250 \text{ km/s}$. It takes about 250 million years for the Sun to go round once.

- (vii) The mass of Milky way is estimated to be 150 billion solar masses or nearly $3 \times 10^{11} \text{ kg}$. The interstellar matter forms nearly 1.5% of the total mass of the Milky way

Practice Exercise

- Which planet is closest to Sun?
a. Earth b. Mercury c. Mars d. Jupiter
- Which planet is farthest to Sun?
a. Saturn b. Uranus c. Neptune d. Pluto
- The group of small pieces of rock revolving round the Sun between the orbits of Mars and Jupiter are called
a. meteors b. comets c. meteorites d. asteroids
- The tail of a comet points away from the Sun due to
a. centrifugal force
b. electrical repulsion
c. attraction of comet due to other planets
d. radiation pressure
- A star which appears blue will be
a. as hot as the Sun
b. cooler than the Sun
c. very cold indeed
d. much hotter than the Sun
- Sun radiates continuously and maintains its brightness because
a. helium is converted into iron in its core
b. of fusion of hydrogen nuclei in helium
c. fusion of helium in hydrogen
d. burning of carbon in its core
- One astronomical unit (AU) is equal to
a. 10^{-10} m b. 1.496×10^{11} m
c. 9.45×10^{15} m d. 4.964×10^{11} m
- The planet which has no satellite is
a. Neptune b. Mercury
c. Jupiter d. Mars
- The galaxy to which our solar system belongs is called
a. milky way b. radio galaxy
c. solar galaxy d. elliptical galaxy
- Galaxy in which we live is
a. milky way b. radio galaxy
c. circular galaxy d. irregular galaxy
- Milky way is
a. a planet of our solar system
b. a sun
c. one of the stars of solar system
d. one of the enormous galaxies of universe
- The universe is
a. expanding
b. contracting
c. constant in size
d. increasing northwards and decreasing southwards
- Hubble's law is expressed as [v = speed of recession, r = distance r of galaxy, H = Hubble constant]
a. $v = Hr^2$ b. $v = Hr$ c. $v = \frac{H}{r}$ d. $v = \frac{H}{r^2}$
- The group of 100 to 1000 stars held in position by mutual gravitational forces are called
a. galactic clusters b. globular clusters
c. comets d. asteroids
- The most common stars like the Sun are called
a. dwarfs b. white dwarfs
c. milky way d. neutron stars
- Very small stars having diameters $1/5$ th that of sun are called
a. dwarfs b. white dwarfs
c. milky way d. neutron stars
- The brightest planet in the solar system is
a. Mars b. Jupiter c. Venus d. Mercury
- The planet which has no atmosphere is
a. Venus b. Mercury c. Mars d. Earth
- The spectrum of stars is most closely related to
a. colour b. pressure
c. distance from Earth d. mass
- Venus appears brighter than other planets because
a. it is heavier than other planets
b. its density is more than other planets
c. it is nearest to Earth than other planets
d. fusion take place at its surface
- One main characteristic of black hole is that, it
a. emits a photon
b. absorbs a photon
c. changes photon into mass
d. changes all colours into black one
- The spectrum of a star is usually
a. continuous emission spectrum
b. continuous absorption spectrum
c. line absorption spectrum
d. line emission spectrum
- The solar constant at earth's surface is
a. 1.4 watt/m^2 b. 14 watt/m^2
c. 0.14 watt/m^2 d. 1400 watt/m^2
- If r denotes the mean distance of a planet from the sun and T is the time period of planet, then
a. $r \propto T^{2/3}$ b. $r \propto T^{3/2}$
c. $r \propto T^{1/3}$ d. $r \propto T$

25. Which of the following theories is the most satisfactory about the origin of the universe?
 a. Big-Bang theory b. Pulsating theory
 c. Steady state theory d. None of these
26. Hubble's law states that the velocity with which the galaxy is moving away from earth is proportional to
 a. square of distance of milky way
 b. distance of milky way from the Earth
 c. mass of milky way
 d. product of mass of milky way and its distance from earth
27. Albedo is
 a. a star
 b. a galaxy
 c. a constellation
 d. reflecting power of a planet
28. During a total solar eclipse, the disc of the Moon almost completely covers the disc of the sun. If the distance of the Sun from the Earth = 1496×10^{11} m, diameter of the Sun 1393×10^9 m and the distance of the Moon from the Earth = 3.845×10^8 m, then calculate the diameter of the moon.
 a. 1.26×10^6 m b. 4.30×10^6 m
 c. 3.58×10^6 m d. 6.86×10^6 m
29. Suppose the sun shrank from its present size so that its radius is halved. What would energy? (Given that mass of Sun = 1989×10^{30} kg and radius of the Sun = 6.95×10^8 m)
 a. 4.321×10^{50} J b. 2.275×10^{41} J
 c. 1.102×10^{30} J d. 8.123×10^{10} J
30. When the Jupiter is at a distance of 824.7 million km from the earth, its angular diameter is measured to be 35.72 sec of an arc. Calculate the diameter of Jupiter.
 a. 234265.54 km b. 142745.38 km
 c. 312108.82 km d. 121310.12 km

Answer with Solutions

Practice Exercise

- (b) Mercury is the only planet closest to Sun.
- (d) In comparison to the respective distances of all the planets from the Sun, Pluto is farthest to Sun.
- (d) Asteroids are the group of small pieces of rock revolving around the Sun between the orbits of Mars and Jupiter.
- (d) Radiation pressure is only a reason due to which the tail of the comet point away from the Sun.
- (d) A star which appears blue will be much hotter than the Sun.
- (b) Sun radiates continuously and maintain its brightness because of fusion of hydrogen nucleus in helium.
- (b) One astronomical unit is equal to 1.496×10^{11} m.
- (b) Mercury is the planet which has no satellite.
- (a) The galaxy to which our solar system belongs is called milky way.
- (a) Galaxy in which we live is milky way. It is the name of our galaxy to which our solar systems belongs.
- (d) Milky way is one of the enourmous galaxies of universe.
- (a)
- (b)
- (a)
- (a) The most common stars like the Sun are called dwarfs.
- (b) Very small stars having diameter $\frac{1}{5}$ th that of Sun are called white dwarfs. It was discovered by S.chandrasekhar in 1950 and it is known as Chanrdrasekhar limit.
- (c) Venus is the brightest planet in the solar system.
- (b) Mercury is the planet among the given options which has no atmosphere.
- (a) The spectrum of star is most closely related to colour.
- (c) Venus appears brighter than other planets because it is nearest to Earth than the other planets.
- (b) One main characteristic of black hole is that it absorbs a photon.
- (c) The spectrum of a star is usually line absorption spectrum.
- (d) The solar constant at Earth's surface is 1400 walt/m^2 .
- (a) According to Kepler's third law, the square of the time taken by the planet to revolve around the Sun is directly proportional to the cube of semi-major axis of its elliptical path.
 i.e. $T^2 \propto r^3 \Rightarrow r \propto T^{2/3}$
- (a) According to Big-Bang theory of universe, all the constituents of our universe were originally together as a single mass. A big explosion occured at some instant and the single mass burst in to a large number of fragments moving with different velocities.
- (b) Hubble's law states that the velocity with which the galaxy is moving away from the Earth is proportional to distance of milky way from the Earth.
- (d) Albedo is reflecting power of a planet.
- (c) Given, for Sun
 $d = 1393 \times 10^9 \text{ m}$
 $D = 1496 \times 10^{11} \text{ m}$

From the formula,

$$\begin{aligned}\therefore \alpha &= \frac{d}{D} \\ &= \frac{1393 \times 10^9}{1496 \times 10^{11}} \\ &= \frac{1393}{1496} \times 10^{-2} \text{ rad} \\ \text{For moon, } \alpha &= \frac{1393}{1496} \times 10^{-2} \text{ rad}\end{aligned}$$

$$D = 3.845 \times 10^8$$

$$\begin{aligned}\therefore d &= D\alpha \\ 3.845 \times 10^8 \times \frac{1393}{1496} \times 10^{-2} &= 3.58 \times 10^6 \text{ m}\end{aligned}$$

29. (b) Given,

$$M = 1989 \times 30 \text{ kg},$$

$$R = 6.95 \times 10^8 \text{ m}$$

$$G = 6.66 \times 10^{-11} \text{ Nm}^2 \text{ kg}^{-2}$$

Present gravitational potential energy of the Sun is given by

$$V = -\frac{3}{5} \frac{GM^2}{R}$$

In case Sun shrank from its present size till its radius is halved $\left(\frac{R}{2}\right)$, then

$$V' = -\frac{3}{5} \frac{GM^2}{R/2} = -\frac{6}{5} \frac{GM^2}{R^2}$$

$\therefore$ Change in gravitation potential energy of the Sun

$$V - V' = -\frac{3}{5} \cdot \frac{GM^2}{R} - \left(-\frac{6}{5} \cdot \frac{GM^2}{R}\right)$$

$$\begin{aligned}V - V' &= \frac{3}{5} \cdot \frac{GM^2}{R} = \frac{3}{5} \times \frac{6.66 \times 10^{-11} \times (1989 \times 10^{30})^2}{6.95 \times 10^8} \\ &= 2.275 \times 10^{41} \text{ J}\end{aligned}$$

30. (b) Given, $\alpha = 35.72 \text{ s of arc}$

$$\text{So, } \alpha = \frac{35.72 \times \pi}{60 \times 60 \times 180} \text{ rad}$$

$$D = 824.7 \times 10^6 \text{ km}$$

Diameter of Jupiter, $d = D\alpha$

$$\begin{aligned}\therefore d &= \frac{824.7 \times 10^6 \times 35.72 \pi}{60 \times 60 \times 180} \\ &= 142745.38 \text{ km}\end{aligned}$$

1

Some Basic Concepts of Chemistry

Introduction

Chemistry is a branch of science which deals with the study of the composition of matter and the chemical changes involved in it. In other words, chemistry is the science of matter and its transformation.

Laws of Chemical Combination

These are the simple statements which have the wide applications during chemical reactions (though some of these laws are not perfect in today's context)

1. Law of Conservation of Mass (Lavoisier, 1774)

According to this law during any chemical or physical change, the total mass of the system (reactants + products) remains constant or we can say that, mass can neither be created nor be destroyed.

2. Law of Definite/Constant Proportion (Proust, 1799)

This law states that a given chemical compound always contains its component elements in a fixed ratio (by weight) and does not depend on its source or method of preparation.

e.g. H_2O obtained from any source always contains H and O in the ratio 1 : 8 (by mass).

3. Law of Multiple Proportion (Dalton, 1808)

It states that if two elements combine to form more than one compound, then the different masses of one element which combine with a fixed mass of the other element, bear a simple ratio to one another.

e.g. Oxides of nitrogen

Fixed weight of N = 28

Compound	N ₂ O	NO	N ₂ O ₃	N ₂ O ₄	N ₂ O ₅
Weight of oxygen	16	32	48	64	80

Ratio = 1 : 2 : 3 : 4 : 5

4. Law of Reciprocal Equivalent and Combining Proportion (Richter, 1794)

According to this law, when two or more elements (say X, Y, Z, etc) combine with a fixed mass of another element (say A), then the ratio of their combining masses is same (or a simple multiple) as the proportion in which they combine with each other (XY, YZ, XZ, etc).

e.g. CH₄, CO₂ and H₂O

5. Gay-Lussac's Law of Combining Volumes (Gay-Lussac, 1808)

In a gaseous phase reaction at the same temperature and pressure, the volume of reactant and product gases bear a simple whole number ratio.

Dalton's Atomic Theory

On the basis of laws of chemical combinations, Dalton (1803) proposed atomic theory.

The main postulates of this theory are:

1. Matter is made up of indivisible and indestructible particles, called atoms.
2. Atoms are neither be created nor destroyed in the course of an ordinary chemical reaction.
3. Atoms combine with each other to form compounds in simple whole number ratio.
4. Atom is the smallest portion of matter which takes part in chemical reaction.
5. All atoms of an element have identical mass and similar chemical properties.

Atomic Weight

It may be defined as the relative weight of an atom of an element with respect to 1/12th of the mass of an atom of C-12.

i.e. Atomic weight

$$= \frac{\text{Mass of one atom of element}}{1/12\text{th part of the mass of one atom of C-12}}$$

The weight of one atom of C-12 is 12 amu, where amu stands for atomic mass unit.

$$1 \text{ amu} = \frac{1}{N_A} = 1.667 \times 10^{-24} \text{ g}$$

Sometimes, the amount of a substance is expressed in number of gram atoms. One gram atom contains N_A atoms of an element.

Weight of 1 gram atom of an element whose atomic number is $A = A \text{ g}$

Weight of one atom = $A \text{ amu}$

Molecular Mass

It is the relative mass of one molecule of a compound with respect to 1/12th of the mass of one atom of C-12.

i.e. Molecular mass

$$= \frac{\text{Weight of one molecule of compound}}{1/12\text{th part of the weight of one atom of C-12}}$$

NOTE For compounds, molecular weight is the sum of the atomic weights of all atoms present in the molecule.

Average Atomic/Molecular Mass

If an element exists in the isotopic forms having atomic masses m_1, m_2 and m_3 in the ratio x, y and z respectively, the average atomic mass

$$M_{av} = \frac{m_1 \times x + m_2 \times y + m_3 \times z}{x + y + z}$$

Equivalent Weight

Equivalent weight of an element or of a compound is the weight of an element or of a compound which would combine with or displace (by weight) 1 part of hydrogen or 8 parts of oxygen or 35.5 parts of chlorine.

$$\text{Equivalent weight} = \frac{\text{Atomic weight or molecular weight}}{n\text{-factor}}$$

where, n -factor = acidity (number of ionisable H⁺)

= basicity (number of ionisable OH⁻)

= charge of ions

= number of electrons lost or gained

Mole Concept

Mole is the amount of substance which contains Avogadro's number ($N_A = 6.023 \times 10^{23}$) of particles and has the mass equal to gram atomic mass or gram molecular mass.

$$\text{One mole} = 6.023 \times 10^{23} \text{ particles}$$

$$\text{One mole of atom} = 6.023 \times 10^{23} \text{ atoms}$$

For 1 mole of atoms,

Mass of 1 mole of a substance = Gram atomic mass

For 1 mole of molecules,

Mass of 1 mole of molecules = Gram molecular mass

For 1 mole of ions,

Mass of 1 mole of ions = Gram formula mass

$$\text{Number of moles of particles} = \frac{\text{Number of particles}}{\text{Avogadro's number}}$$

Mole of gas at STP occupies = 22.4 L volume

$$\text{Number of moles of gas} = \frac{\text{Volume of gas at STP (in L)}}{22.4 \text{ L}}$$

Percentage Composition

The percentage of any element or constituent in a compound is the number of parts by mass of that element or constituent present in 100 parts by mass of the compound.

$$\begin{aligned} \text{Mass per cent of an element} \\ = \frac{\text{Mass of element in 1 mole of compound} \times 100}{\text{Mass of 1 mole of compound}} \end{aligned}$$

Dividing percentage by atomic mass, gives molar ratio from which empirical formula is obtained.

$$n = \frac{\text{Molecular mass}}{\text{Empirical formula mass}}$$

Molecular formula = $n \times$ Empirical formula

Molar mass = $2 \times$ Vapour density

Empirical Formula

It shows the simplest relative whole number ratio of atoms of each element present in the molecule of the substance.

e.g. CH is the empirical formula of benzene (C_6H_6), C_6H_6 is its molecular formula.

Molecular Formula

It expresses the actual number of atoms of each element present in the molecule.

e.g. Molecular formula of hydrazine is NH_2NH_2 or N_2H_4 while its empirical formula is NH_2 .

One more type of chemical formula is seen, i.e. structural formula. It represents the relative position of atoms how they are combined in a molecule.

Chemical Equations and Stoichiometry

A balanced chemical equation with suitable stoichiometric coefficients represents the ratio of number of moles of reactants and products.

The equation provides qualitative and quantitative information about a chemical change in a simple manner.

Mole ratio	2 mol	1 mol	2 mol
Molecule ratio	$2 \times 6.022 \times 10^{23}$ molecules	6.022×10^{23} molecules	$2 \times 6.022 \times 10^{23}$ molecules
Weight ratio	4 g	32 g	36 g
Volume ratio	2 volumes	1 volume	2 volumes

Volume ratio is valid for gaseous state at same temperature and pressure.

Limiting Reagent

The substance which is completely consumed in a reaction, is called limiting reagent. It determines the amount of product.

$$\text{Reaction yield} = \frac{\text{Actual yield} \times 100}{\text{Theoretical yield}}$$

It must be noted that in stoichiometry, if the quantities of two or more reactants are given, the amounts of products formed depend upon the limiting reactant (the reactant which consumed first in the reaction).

Concentration Terms

(a) Mass%

It is defined as the amount of solute in gram present in 100 grams of solution.

$$\text{Mass\% of solute} = \frac{\text{Mass of solute}}{\text{Mass of solution}} \times 100$$

(b) % Mass by Volume

It is defined as the mass of solute present in 100 mL of solution.

(c) ppm

It is defined as the quantity of solute in grams present in 10^6 grams of solution.

(d) Mole Fraction

Suppose n_A moles of solute A and n_B moles of solvent B are present in a solution, then

$$\text{Mole fraction of } A = \chi_A = \frac{n_A}{n_A + n_B}$$

$$\text{Mole fraction of } B = \chi_B = \frac{n_B}{n_A + n_B}$$

$$\chi_A + \chi_B = 1$$

(e) Molarity (M)

It is defined as the number of moles of solute per litre of solution

$$M = \frac{n_A}{V} = \frac{W_A / M_A}{V}$$

where, V = volume of solution in litres

(f) Molality (m)

It is defined as the number of moles of solute present in 1 kg of the solvent

$$m = \left[\frac{W_A}{M_A W_B} \right] \times 1000$$

where, W_A = mass of solute (in gram)
 W_B = mass of solvent (in gram)
 M_A = molecular mass of solute

(g) Normality (N)

It is defined as the number of gram equivalents of solute present in 1 litre of solution.

$$N = \frac{W_A}{E_A V}$$

where, E_A = equivalent mass of A

NOTE Normality (N) = $n \times \text{molarity}$
 where, $n = \frac{\text{Molecular mass}}{\text{Equivalent mass}}$

Practice Exercise

- The answer of the calculation $\frac{2.568 \times 5.8}{4.168}$ in significant figures will be
 a. 3.570 b. 3.6
 c. 3.57 d. 3.579
- Number of significant figures in 78.000 g, 0.0206 g and 3.002 g respectively are
 a. 3, 4, and 5 b. 2, 5, and 4
 c. 3, 3, and 4 d. 5, 3, and 4
- Which of the following statements is true about the science of atoms and molecules?
 a. We can see, weigh and perceive the atoms and molecules through naked eyes
 b. It is possible to count the number of atoms and molecules in a given mass of matter through naked eyes and manually
 c. We can establish a quantitative relationship between the mass and number of these particles (atoms and molecules)
 d. Physical properties of matter can be qualitatively described using numerical values with suitable units
- Which of the following statements about a compound is incorrect?
 a. A molecule of a compound has atoms of different elements
 b. A compound cannot be separated into its constituent elements by physical methods of separation
 c. A compound retains the physical properties of its constituent elements
 d. The ratio of atoms of different elements in a compound is fixed
- Two students performed the same experiment separately and each one of them recorded two readings of mass which are given below. Correct reading of mass is 3.0 g. On the basis of given data, mark the correct option out of the following statements.

Student	Readings	
	(i)	(ii)
A	3.01	2.99
B	3.05	2.95

- Results of both the students are neither accurate nor precise
 - Results of student A are both precise and accurate
 - Results of student B are neither precise nor accurate
 - Result of student B are both precise and accurate
- What is the SI unit of density?
 a. gm^{-3} b. kg/m^3
 c. gcm^{-3} d. kg/cm^3
 - What temperature is 75°F on the Kelvin scale?
 a. 24 K b. 348 K
 c. 297 K d. 215 K
 - A jug contains 2 L of milk. Calculate the volume of the milk in m^3 .
 a. $2 \times 10^{-2} \text{ m}^3$
 b. $2 \times 10^{-1} \text{ m}^3$
 c. $2 \times 10^{-3} \text{ m}^3$
 d. $2 \times 10^{-4} \text{ m}^3$
 - Law of constant composition does not hold good for
 a. endothermic compounds
 b. exothermic compounds
 c. stoichiometric compounds
 d. non-stoichiometric compounds
 - One gram mole of a gas at NTP occupies 22.4 L. This fact is derived from
 a. law of gaseous volumes
 b. Avogadro's hypothesis
 c. Dalton's atomic theory
 d. Berzelius hypothesis

11. One part of element *A* reacts with two parts of another element *B*. 6 parts of element *C* reacts with 4 parts of element *B*. If *A* and *C* combine together, the ratio of their weight be governed by
 - a. law of conservation of mass
 - b. law of reciprocal proportions
 - c. law of definite proportions
 - d. law of multiple proportions
12. In which of the following numbers all zeroes are significant?
 - a. 30.000 b. 0.700 c. 0.00050 d. 0.0030
13. Which of the following is a homogeneous mixture?
 - a. Mixture of soil and water
 - b. Sugar solution
 - c. Mixture of sugar, salt and sand
 - d. Iodised table salt
14. Formation of CO and CO₂ illustrates the law of
 - a. conservation of mass b. multiple proportion
 - c. reciprocal proportion d. constant proportion
15. Which of the following reactions is not correct according to the law of conservation of mass?
 - a. $2\text{Mg}(s) + \text{O}_2(g) \longrightarrow 2\text{MgO}(s)$
 - b. $\text{C}_3\text{H}_8(g) + \text{O}_2(g) \longrightarrow \text{CO}_2(g) + \text{H}_2\text{O}(g)$
 - c. $\text{P}_4(s) + 5\text{O}_2(g) \longrightarrow \text{P}_4\text{O}_{10}(s)$
 - d. $\text{CH}_4(g) + 2\text{O}_2(g) \longrightarrow \text{CO}_2(g) + 2\text{H}_2\text{O}(g)$
16. Carbon dioxide contains 27.27% of carbon, carbon disulphide contains 15.79% of carbon and sulphur dioxide contains 50% of sulphur. This data is an agreement with
 - a. law of conservation of mass
 - b. law of definite proportions
 - c. law of multiple proportions
 - d. law of reciprocal proportions
17. One atom of an element weighs 1.8×10^{-22} g, its atomic mass is
 - a. 18 b. 29.4 c. 108.39 d. 154
18. 27 g of Al (at. mass = 27) will react completely with oxygen equal to
 - a. 24 g b. 8 g c. 40 g d. 10 g
19. Insulin contains 3.4% sulphur. What will be the minimum molecular weight of insulin?
 - a. 94.117 b. 1884 c. 941.176 d. -976
20. Molecular weight of a tribasic acid is *W*. Its equivalent weight will be
 - a. $\frac{W}{2}$ b. *W* c. $\frac{W}{3}$ d. 3*W*
21. Compounds having same empirical formula always have same
 - a. molecular mass
 - b. molecular formula
 - c. number of atoms
 - d. percentage composition by mass
22. What is the equivalent weight of SnCl₂ in the reaction, $\text{SnCl}_2 + \text{Cl}_2 \longrightarrow \text{SnCl}_4$? (mol. wt. of SnCl₂ = 190)
 - a. 95 b. 45
 - c. 60 d. 30
23. 5.6 L of a gas at NTP weighs equal to 8 g. The vapour density of gas is
 - a. 32 b. 16
 - c. 8 d. 40
24. The number of atoms present in 0.1 mole of P₄ (at. mass = 31) are
 - a. 2.4×10^{23} atoms
 - b. same as in 0.05 mole of S₈
 - c. 6.02×10^{22} atoms
 - d. same as in 3.1 g of phosphorus
25. The number of water molecules present in a drop of water (volume = 0.0018 mL) at room temperature is
 - a. 1.084×10^{18} b. 6.023×10^{19}
 - c. 4.84×10^{17} d. 6.023×10^{23}
26. Number of molecules in 4.25 g of NH₃, is
 - a. 1.505×10^{23} b. 6.02×10^{23}
 - c. 3.01×10^{23} d. None of these
27. Choose the wrong statement.
 - a. Molar mass is the mass of one molecule
 - b. Molar mass is the mass of one mole of substance
 - c. 1 mole means 6.023×10^{23} particles
 - d. Molar mass is the molecular mass (g)
28. A sample of AlF₃ contains 3.0×10^{24} F⁻ ions. The number of formula units of the sample are
 - a. 9.0×10^{24} b. 3.0×10^{24}
 - c. 0.75×10^{24} d. 1.0×10^{24}
29. Which of the following pairs contain equal number of atoms?
 - a. 22.4 L (STP) of nitrous oxide and 22.4 L of nitric oxide
 - b. 1 millimole of HCl and 0.5 millimole of H₂S
 - c. 1 mole of H₂O₂ and 1 mole of N₂O₄
 - d. 11.2 cc (STP) of nitrogen and 0.015 g of nitric oxide
30. Vapour density of a gas is 11.2. Volume occupied by 2.4 g of this at STP will be
 - a. 2.4 L b. 2.24 L
 - c. 22.4 L d. 11.2 L
31. Which of the following weigh the most?
 - a. One mole of water
 - b. One gram atom of nitrogen
 - c. One mole of sodium
 - d. One molecule of H₂SO₄
32. The total number of electrons present in 18 mL of water (density = 1g mL⁻¹) is
 - a. 6.02×10^{23} b. 6.02×10^{23}
 - c. 6.02×10^{24} d. 6.02×10^{25}

33. If 1 mL of water contains 20 drops, what is the number of water molecules in the one drop of water?
($A = \text{Avogadro's number}$)
 (a) $\frac{0.5}{18} A$ b. $0.05A$ c. $\frac{0.05}{18} A$ d. $0.5 A$
34. 3 g of an oxide of a metal is converted to chloride completely and it yielded 5 g of chloride. The equivalent weight of the metal is
 a. 33.25 b. 3.325 c. 12 d. 20
35. Assuming that the density of water to be 1g/cm^3 , calculate the volume occupied by one molecule of water.
 a. $2.989 \times 10^{-23} \text{ mL}$
 b. $6.023 \times 10^{23} \text{ cm}^3$
 c. 22400 mL
 d. 18 cm^{-3}
36. If 0.5 mole of BaCl_2 are mixed with 0.2 mole of Na_3PO_4 , the maximum number of moles of $\text{Ba}_3(\text{PO}_4)_2$ that can be formed, is
 a. 0.7 b. 0.5 c. 0.3 d. 0.1
37. If 10^{21} molecules are removed from 200 mg of CO_2 , the number of mole(s) of CO_2 left is/are
 a. 2.88×10^{-3} b. 28.8×10^{-3}
 c. 0.288×10^{-3} d. 1.66×10^{-2}
38. Which of the following pairs of gases contains the same number of molecules?
 a. 16 g of O_2 and 14 g of N_2
 b. 8 g of O_2 and 22 g of CO_2
 c. 28 g of N_2 and 22 g of CO_2
 d. 32 g of O_2 and 32 g of N_2
39. 10 dm^3 of N_2 gas and 10 dm^3 of gas X at the same temperature contain the same number of molecules. The gas X is
 a. CO b. CO_2 c. H_2 d. NO
40. A metal oxide contains 53% metal and carbon dioxide contains 27% carbon. Assuming the law of reciprocal proportions, the percentage of metal in the metal carbide is
 a. 75 b. 25 c. 37 d. 66
41. The number of gram molecules of oxygen in 6.02×10^{24} CO molecule is/are
 a. 10 b. 5 c. 1 d. 0.5
42. The weight of 1×10^{22} molecules of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ is
 a. 41.59 g b. 415.9 g
 c. 4.159 g d. None of these
43. The sulphate of a metal M contains 9.87% of M. The sulphate is isomorphous with $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$. The atomic weight of M is
 a. 40.3 b. 36.3
 c. 24.3 d. 11.3
44. Rearrange the following (I to IV) in the order of increasing masses and choose the correct answer
(Atomic masses : O = 16, Cu = 63 and N = 14)
 I. 1 molecule of oxygen
 II. 1 atom of nitrogen
 III. $1 \times 10^{-10} \text{ g}$ molecular weight of oxygen
 IV. $1 \times 10^{-10} \text{ g}$ atomic weight of copper
 a. $\text{II} < \text{I} < \text{III} < \text{IV}$ b. $\text{IV} < \text{III} < \text{II} < \text{I}$
 c. $\text{II} < \text{III} < \text{I} < \text{IV}$ d. $\text{III} < \text{IV} < \text{I} < \text{II}$
45. How many moles of magnesium phosphate, $\text{Mg}_3(\text{PO}_4)_2$ will contain 0.25 mole of oxygen atoms?
 a. 0.02 b. 3.125×10^{-2}
 c. 1.25×10^{-2} d. 2.5×10^{-2}
46. If we consider that $1/6$ in place of $1/12$, mass of carbon atom is taken to be the relative atomic mass unit, the mass of one mole of a substance will
 a. to be a function of the molecular mass of the substance
 b. remain unchanged
 c. increase two fold
 d. decrease twice
47. If 6.3 g of NaHCO_3 are added to 15.0 g CH_3COOH solution, the residue is found of weigh 18.0 g. What is the mass of CO_2 released in the reaction?
 a. 4.5 g b. 3.3 g c. 2.6 g d. 2.8 g
48. Consider the following reaction,
 $\text{Na}_2\text{CO}_3 + 2\text{HCl} \longrightarrow 2\text{NaCl} + \text{H}_2\text{O} + \text{CO}_2$
 Equivalent weight of Na_2CO_3 is
 a. $\frac{M}{2}$ b. M c. $2M$ d. $\frac{M}{4}$
49. The weight of lime obtained by heating 200 kg of 95% pure lime stone is
 a. 98.4 kg b. 106.4 kg
 c. 112.8 kg d. 122.6 kg
50. What will be the weight of CO having the same number of oxygen atoms as present in 22 g of CO_2 ?
 a. 28 g b. 22 g c. 44 g d. 72 g
51. An organic compound containing C and H has 92.3% of carbon, its empirical formula is
 a. CH b. CH_3 c. CH_2 d. CH_4
52. Mass of 0.1 mole of methane is
 a. 1 g b. 16 g c. 1.6 g d. 0.1 g
53. A person adds 1.71 g of sugar ($\text{C}_{12}\text{H}_{22}\text{O}_{11}$) in order to sweeten his tea. The number of carbon atoms added are (molecular mass of sugar = 342)
 a. 3.6×10^{22} b. 7.2×10^{21}
 c. 0.05 d. 6.6×10^{22}
54. The one which has least mass, is
 a. 2 g atom of N b. 3×10^{23} atoms of C
 c. 1 mole of S d. 7.0 g of Ag

55. 19.7 kg of gold was recovered from a smuggler. How many atoms of gold were recovered?
 a. 100 b. 6.02×10^{23}
 c. 6.02×10^{24} d. 6.02×10^{25}
56. If 8.4 g of hexane burns completely in oxygen, how many moles of CO_2 is/are produced?
 a. 6 b. 0.6 c. 0.9 d. 1.2
57. The number of atoms in 4.25 g of NH_3 is approximately
 a. 1×10^{23} b. 1.5×10^{23}
 c. 2×10^{23} d. 6×10^{23}
58. Two elements x (at. mass = 75) and y (at. mass = 16) combine to give a compound having 75.8% x. The formula of the compound is
 a. xy b. x_2y c. x_2y_2 d. x_2y_3
59. If we take 44 g of CO_2 and 14 g of N_2 , what will be the mole fraction of CO_2 in the mixture?
 a. 1/5 b. 1/3 c. 2/3 d. 1/4
60. One mole of calcium phosphide on reaction with excess of water gives
 a. one mole of phosphine
 b. two moles of phosphoric acid
 c. two moles of phosphine
 d. one mole of phosphorus pentoxide
61. The volume of water to be added to 100 cm^3 of 0.5 N H_2SO_4 to get decinormal concentration, is
 a. 100 cm^3 b. 450 cm^3
 c. 500 cm^3 d. 400 cm^3
62. 5 mL of N HCl, 20 mL of N/2 H_2SO_4 and 30 mL of N/3 HNO_3 are mixed together and volume made to 1 L. The normality of resulting solution is
 a. 0.45 b. 0.025 c. 0.9 d. 0.05
63. Consider the following reaction,

$$2\text{Al}(s) + 6\text{HCl}(aq) \longrightarrow 2\text{Al}^{3+}(aq) + 6\text{Cl}^{-}(aq) + 3\text{H}_2(g)$$
 Which of the following statements is incorrect?
 a. 6 L HCl (aq) is consumed for every 3 L $\text{H}_2(g)$ produced
 b. 33.6 L $\text{H}_2(g)$ is produced regardless of temperature and pressure for every mole of Al that reacts
 c. 67.2 L $\text{H}_2(g)$ at STP, is produced for every mole of Al that reacts
 d. 11.2 L $\text{H}_2(g)$ at STP, is produced for every mole of HCl (aq) consumed
64. Two solutions of a substance (non-electrolyte) are mixed in the manner, 480 mL of 1.5 M of first solution with 520 mL of 1.2 M of second solution. The molarity of final solution is
 a. 1.20 M b. 1.50 M c. 1.344 M d. 2.70 M
65. Amount of oxalic acid present in a solution can be determined by its titration with KMnO_4 solution in the presence of H_2SO_4 . The titration gives unsatisfactory result when carried out in the presence of HCl because HCl
 a. gets oxidised by oxalic acid to chlorine
 b. furnishes H^+ ions in addition to those from oxalic acid
 c. reduces permanganate to Mn^{2+}
 d. oxidises oxalic acid to carbon dioxide and water
66. Consider the following reaction,

$$\text{CH}_4(g) + 2\text{O}_2(g) \longrightarrow \text{CO}_2(g) + 2\text{H}_2\text{O}(g)$$
 How many moles of methane are required to produce 22 g $\text{CO}_2(g)$ after combustion?
 a. 1 mole b. 0.5 mole
 c. 0.25 mole d. 1.25 moles
67. Which of the following gases will have least volume if 10 g of each gas is taken at same temperature and pressure?
 a. CO_2 b. N_2 c. CH_4 d. HCl
68. A solution is made by dissolving 49 g of H_2SO_4 in 250 mL of water. The molarity of the solution prepared is
 a. 2 M b. 1 M c. 4 M d. 5 M
69. What volume of water is to be added to 100 cm^3 of 0.5 M NaOH solution to make it 0.1 M solution?
 a. 200 cm^3 b. 400 cm^3 c. 500 cm^3 d. 100 cm^3
70. What will be the molality of the solution made by dissolving 10 g of NaOH in 100 g of water?
 a. 2.5 m b. 5 m c. 10 m d. 1.25 m
71. How much of NaOH is required to neutralise 1500 cm^3 of 0.1 N HCl? [Na = 23]
 a. 40 g b. 4 g c. 6 g d. 60 g

BITSAT Archives

1. 10 g of sample of mixture of CaCl_2 and NaCl are treated to precipitate all the calcium as CaCO_3 . This CaCO_3 is heated to convert all the Ca to CaO and the final mass of CaO is 1.62 g. The per cent by mass of CaCl_2 in the original mixture is [2014]
 a. 32.1% b. 16.2% c. 21.8% d. 12.0%
2. The volume respectively of 10 N and 4 N HCl required to make 1 L of 7 N HCl respectively are [2014]
 a. 0.75 L of 10 N HCl and 0.25 L of 4 N HCl
 b. 0.50 L of 10 N HCl and 0.50 L of 4 N HCl
 c. 0.65 L of 10 N HCl and 0.35 L of 4 N HCl
 d. 0.85 L of 10 N HCl and 0.15 L of 4 N HCl

3. 0.1 g of metal combines with 46.6 mL of oxygen at STP. The equivalent weight of metal is [2013]
 a. 12 b. 24
 c. 18 d. 36
4. 5 moles of Ba(OH)_2 are treated with excess of CO_2 . How much Ba(OH)_2 will be formed? [2012]
 a. 39.4 g b. 197 g
 c. 591 g d. 985 g
5. One mole of P_2O_5 undergoes hydrolysis as

$$\text{P}_2\text{O}_5 + \text{H}_2\text{O} \longrightarrow \text{H}_3\text{PO}_4$$
 The normality of the phosphoric acid formed is (Volume of the solution is 1 L) [2011]
 a. 2 b. 12 c. 24 d. 4
6. 1 g of hydrogen is found to combine with 80 g of bromine and 1 g of calcium combines with 4 g of bromine. Equivalent weight of calcium is [2010]
 a. 16 b. 20
 c. 40 d. 80

7. How much water should be added to 200 mL of semi normal solution of NaOH to make it exactly decinormal? [2010]
 a. 200 mL b. 800 mL c. 1000 mL d. 11200 mL

8. Match the following columns. [2008]

Column I		Column II (At STP)	
A	10 g $\text{CaCO}_3 \xrightarrow[\text{Decomposition}]{\Delta}$	1.	0.224 L CO_2
B	1.06 g $\text{Na}_2\text{CO}_3 \xrightarrow{\text{Excess HCl}}$	2.	4.48 L CO_2
C	2.4 g C $\xrightarrow[\text{combustion}]{\text{Excess O}_2}$	3.	0.448 L CO_2
D	0.56 g CO $\xrightarrow[\text{combustion}]{\text{Excess O}_2}$	4.	2.24 L CO_2
		5.	22.4 L CO_2

The correct match is

	A	B	C	D		A	B	C	D
a.	4	1	2	3	b.	5	1	2	3
c.	4	1	3	2	d.	1	4	2	3

Answer with Solutions

Practice Exercise

1. (b) $\frac{2.568 \times 5.8}{4.168} = 3.5735$
 Thus, insignificant figures = 3.6
2. (d)
3. (c)
4. (c) Physical properties of a compound are different from those of elements.
5. (b) Average of reading of student A = $\frac{3.01 + 2.99}{2} = 3.00$

$$B = \frac{3.05 + 2.95}{2} = 3.00$$

Correct reading = 3.0

Results of student A are both precise and accurate.

6. (b) Density of a substance is defined as its amount of mass per unit volume.

$$\text{SI unit of density} = \frac{\text{kg}}{\text{m}^3} \text{ or } \text{kg m}^{-3}$$

7. (c) $75^\circ \text{F} = \frac{9}{5}^\circ \text{C} + 32 = \frac{43 \times 5}{9}^\circ \text{C} = 23.9^\circ \text{C}$
 $= (23.9 + 273) \text{ K}$
 $= 296.9 \approx 297 \text{ K}$

8. (c) $2 \times 10^{-3} \text{ m}^3$

$\therefore$ 1 L = 1000 cm^3
 and 1 m = 100 cm which gives

$$\frac{1 \text{ m}}{100 \text{ cm}} = 1 = \frac{100 \text{ cm}}{100 \text{ cm}}$$

To get m^3 from the above unit factors, the first unit factor is taken and it is cubed.

$$\left(\frac{1 \text{ m}}{100 \text{ cm}} \right)^3$$

$$\Rightarrow \frac{1 \text{ m}^3}{10^6 \text{ cm}^3} = (1)^3 = 1$$

Now, 2 L = $2 \times 1000 \text{ cm}^3$

The above is multiplied by unit factor

$$2 \times 1000 \text{ cm}^3 \times \frac{1 \text{ m}^3}{10^6 \text{ cm}^3} = \frac{2 \text{ m}^3}{10^3} = 2 \times 10^{-3} \text{ m}^3$$

9. (d) Law of constant composition does not hold good for non-stoichiometric compounds.
10. (b) One gram mole of a gas at NTP occupies 22.4 L. This fact is derived from Avogadro's hypothesis.
11. (b) Ratio will be governed by the law of reciprocal proportions.
12. (a) 30.000 has all significant zeroes.
13. (b) Sugar solution is a homogeneous mixture.
14. (b) Formation of CO and CO_2 illustrates the law of multiple proportion.
15. (b) $\text{C}_3\text{H}_8(\text{g}) + \text{O}_2(\text{g}) \longrightarrow \text{CO}_2(\text{g}) + \text{H}_2\text{O}(\text{g})$ is not correct.
 Correct equation is

$$\text{C}_3\text{H}_8(\text{g}) + 5\text{O}_2(\text{g}) \longrightarrow 3\text{CO}_2(\text{g}) + 4\text{H}_2\text{O}(\text{g})$$

16. (d) In
- CO_2

Weight of $\text{CO}_2 = 100$

Weight of carbon = 27.27

Weight of oxygen = 72.73

27.27 g of carbon combines with 72.73 g of oxygen

1g of carbon combines with $= \frac{72.73}{27.27} = 2.66$ g of oxygen $\therefore$ Ratio of C and O in $\text{CO}_2 = 1 : 2.66$ Similarly, in CS_2 Ratio of carbon and sulphur in $\text{CS}_2 = 1 : 5.3$ If sulphur and oxygen were to combine to form SO_2 , according to law of reciprocal proportions. They must combine in 5.3 : 2.66 or 2 : 1.In SO_2 , the ratio of S:O is 1:1.Thus, the ratio between the two ratios is $\frac{2}{1} : \frac{1}{1} = 2:1$

Since, the ratio of S : O is a simple whole number ratio, therefore law of reciprocal is proved.

17. (c) Atomic mass =
- $N_A \times \text{mass of one atom}$

$$= 6.022 \times 10^{23} \times 1.8 \times 10^{-22} = 108.39$$

18. (a) The equation of the reaction of aluminium and oxygen, is as

 $\therefore$ 108 g of Al reacts with 96 g of O_2 . $\therefore$ 27 g of Al will react with $= \frac{96 \times 27}{108} = 24$ g of O_2

19. (c) For minimum molecular mass, there must be one S-atom per insulin molecule.

If 3.4 g of S is present, the molecular mass = 100

 $\therefore$ If 32 g of S is present, the molecular mass will be

$$= \frac{100 \times 32}{3.4} = 941.176$$

20. (c) Equivalent weight =
- $\frac{\text{Molecular weight}}{\text{Basicity}} = \frac{W}{3}$

21. (d) Compound having same empirical formula always have same percentage composition by mass.

22. (a)
- $\text{SnCl}_2 + \text{Cl}_2 \longrightarrow \text{SnCl}_4$

Eq. wt. of $\text{SnCl}_2 = \text{Eq. wt. of Cl}_2$

$$\therefore \frac{190}{E_1} = \frac{71}{35.5} \text{ or } E_1 = 95$$

23. (b)
- $\therefore$
- 5.6 L of gas weighs at NTP = 8 g

$$\therefore 22.4 \text{ L of gas will weigh at NTP} = \frac{8 \times 22.4}{5.6} = 32 \text{ g}$$

 $\therefore$ Molecular weight of gas = 32

We know that,

Molecular weight = $2 \times \text{vapour density}$

$$\therefore \text{Vapour density} = \frac{32}{2} = 16$$

24. (a)
- $\therefore$
- 1 mole of
- P_4
- contains phosphorus atoms

$$= 4 \times 6.02 \times 10^{23}$$

 $\therefore$ 0.1 mole of P_4 contains phosphorus atoms

$$= 4 \times 6.02 \times 10^{23} \times 0.1$$

$$= 2.4 \times 10^{23} \text{ atoms}$$

25. (b) Number of moles =
- $\frac{\text{Weight}}{\text{Molecular weight}}$

$$= \frac{0.0018}{18} = 1 \times 10^{-4}$$

$$[\therefore 0.0018 \text{ mL} = 0.0018 \text{ g}]$$

$$\text{Number of water molecules} = 1 \times 10^{-4} \times 6.023 \times 10^{23}$$

$$= 6.023 \times 10^{19}$$

26. (a)
- $\therefore$
- 17 g of
- NH_3
- contains
- $= 6.023 \times 10^{23}$
- molecules of
- NH_3

$$\therefore 4.25 \text{ g of } \text{NH}_3 \text{ will contain} = \frac{6.023 \times 10^{23}}{17} \times 4.25$$

$$= 1.505 \times 10^{23} \text{ molecules of } \text{NH}_3$$

27. (a) Molar mass is the mass of 1 mole or
- 6.022×10^{23}
- molecules of the substance

28. (d)
- $\therefore 3 \text{ F}^- = 1 \text{ formula unit of } \text{AlF}_3$

$$\therefore 3.0 \times 10^{24} \text{ F}^- = 1 \times 10^{24} \text{ formula units of } \text{AlF}_3$$

29. (d) Number of atoms in
- N_2

$$= \frac{11.2 \times 10^{-3} \times 6.023 \times 10^{23} \times 2}{22.4} = 6.023 \times 10^{20}$$

$$\text{Number of atoms in NO} = \frac{0.015 \times 2 \times 6.023 \times 10^{23}}{30}$$

$$= 6.023 \times 10^{20}$$

30. (a) Molecular mass =
- $2 \times \text{vapour density}$

$$= 2 \times 11.2 = 22.4$$

$$\text{Number of moles of gas} = \frac{2.4}{22.4}$$

 $\therefore$ 1 mole occupies = 22.4 L volume

$$\therefore \frac{2.4}{22.4} \text{ mole will occupy} = 22.4 \times \frac{2.4}{22.4}$$

$$= 2.4 \text{ L}$$

31. (c) One mole of water = 18 g

1 g atom of nitrogen = 14 g

1 mole of sodium = 23 g

$$1 \text{ molecule of } \text{H}_2\text{SO}_4 = \frac{98}{6.023 \times 10^{23}} \text{ g}$$

$$= 1.627 \times 10^{-24} \text{ g}$$

Hence, one mole of sodium weigh the most.

32. (c) 18 mL
- $\text{H}_2\text{O} = 18 \text{ g } \text{H}_2\text{O} = 1 \text{ mol}$

$$= 6.02 \times 10^{23} \text{ molecules}$$

$$= 10 \times 6.02 \times 10^{23} \text{ electrons}$$

$$= 6.02 \times 10^{24} \text{ electrons}$$

33. (c) $\therefore 18 \text{ mL} = 18 \text{ g}$ of water contains $= 20 \times 18$ drops

$$= A \text{ molecules}$$

$$\therefore 1 \text{ drop contains} = \frac{A}{20 \times 18} \text{ molecules} = \frac{0.05 A}{18} \text{ molecules}$$

34. (a) $\frac{\text{Weight of metal oxide}}{\text{Weight of metal chloride}}$

$$= \frac{\text{Eq. wt. of metal} + \text{Eq. wt. of oxide}}{\text{Eq. wt. of metal} + \text{Eq. wt. of chloride}}$$

$$\frac{3}{5} = \frac{E + 8}{E + 35.5}$$

$$\text{or } 5E + 40 = 3E + 106.5 \text{ or } 2E = 66.5$$

$$\therefore E = 33.25$$

35. (a) $\therefore$ Density of water $= 1 \text{ g/cm}^3$

$$\therefore 6.023 \times 10^{23} \text{ molecules of } \text{H}_2\text{O} \text{ contain} = 18 \text{ cm}^3 \text{ volume}$$

$$\therefore 1 \text{ molecule of } \text{H}_2\text{O} \text{ will contain} = \frac{18}{6.023 \times 10^{23}} \\ = 2.989 \times 10^{-23} \text{ mL}$$

36. (d) $3\text{BaCl}_2 + 2\text{Na}_3\text{PO}_4 \longrightarrow \text{Ba}_3(\text{PO}_4)_2 + 3\text{NaCl}$

Limiting reactant is Na_3PO_4 .

$$0.2 \text{ mole of } \text{Na}_3\text{PO}_4 \text{ will give} = \frac{1}{2} \times 0.2 \\ = 0.1 \text{ mole of } \text{Ba}_3(\text{PO}_4)_2$$

37. (a) $200 \text{ mg CO}_2 = 0.2 \text{ g} = \frac{0.2}{44} \text{ mol} = 0.00454 \text{ mol}$

$$= 4.54 \times 10^{-3} \text{ mol}$$

$$10^{21} \text{ molecules of } \text{CO}_2 = \frac{10^{21}}{6.02 \times 10^{23}} = 1.66 \times 10^{-3} \text{ mol}$$

$$\therefore \text{Number of moles left} = (4.54 - 1.66) \times 10^{-3} = 2.88 \times 10^{-3}$$

38. (a) $16 \text{ g of } \text{O}_2 = 0.5 \text{ mol} = \frac{N_A}{2} \text{ molecules}$

$$14 \text{ g of } \text{N}_2 = 0.5 \text{ mol} = \frac{N_A}{2} \text{ molecules}$$

39. (a) Number of moles of N_2 and X should be equal. This can be so if X has same molecular weight as N_2 .

CO has same molecular weight as N_2 .

40. (a) In metal oxide, metal $= 53\%$, $\text{O} = 47\%$

In CO_2 , $\text{C} = 27\%$, $\text{O} = 73\%$

$\therefore 73$ parts of oxygen combines with 27 parts of carbon.

$$\therefore 47 \text{ parts of oxygen will combine} = \frac{27}{73} \times 47$$

$$= 17.38 \text{ parts of C}$$

Thus, metal and carbon will be present in the ratio of $53 : 17.38$.

$$\text{Hence, \% of metal} = \frac{53}{53 + 17.38} \times 100 = 75.3\%$$

41. (b) $6.02 \times 10^{24} \text{ CO molecules} = 10 \text{ moles of CO}$

$$= 10 \text{ g atoms of O}$$

$$= 5 \text{ g molecules of } \text{O}_2$$

42. (c) $\therefore 6.02 \times 10^{23} \text{ molecules of } \text{CuSO}_4 \cdot 5\text{H}_2\text{O}$

$$= 63.5 + 32 + 64 + 90 = 249.5 \text{ g}$$

$$\therefore 10^{22} \text{ molecules of } \text{CuSO}_4 \cdot 5\text{H}_2\text{O}$$

$$= \frac{249.5}{6.02 \times 10^{22}} = 4.15 \text{ g}$$

43. (c) As the given sulphate is isomorphous with $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$, its formula would be $\text{MSO}_4 \cdot 7\text{H}_2\text{O}$. If m is the atomic weight of M , molecular weight of

$$\text{MSO}_4 \cdot 7\text{H}_2\text{O} = m + 32 + 64 + 126 = m + 222$$

$$\text{Hence, \% of } M = \frac{m}{m + 222} \times 100 = 9.87 \text{ (given)}$$

$$\text{or } 100m = 9.87m + 222 \times 9.87$$

$$\text{or } 90.13m = 222 \times 9.87 \text{ or } m = 24.3$$

44. (a) I. 1 molecule of $\text{O}_2 = \frac{32}{6.022 \times 10^{23}} = 5.3 \times 10^{-23} \text{ g}$

$$\text{II. 1 atom of N} = \frac{14}{6.022 \times 10^{23}} = 2.3 \times 10^{-23} \text{ g}$$

$$\text{III. } 10^{-10} \text{ g molecular weight of oxygen} \\ = 10^{-10} \times 32 = 3.2 \times 10^{-9} \text{ g}$$

$$\text{IV. } 10^{-10} \text{ g atomic weight of copper} \\ = 10^{-10} \times 63 = 6.3 \times 10^{-9} \text{ g}$$

$\therefore$ Order of increasing mass is

$\text{II} < \text{I} < \text{III} < \text{IV}$

45. (b) $\text{Mg}_3(\text{PO}_4)_2 : 1 \text{ mol}$

8 moles of O-atom are contained by 1 mole of $\text{Mg}_3(\text{PO}_4)_2$.

Hence, 0.25 mole of O-atom are contained by

$$= \frac{1}{8} \times 0.25 = 3.125 \times 10^{-2} \text{ mole of } \text{Mg}_3(\text{PO}_4)_2$$

46. (b) Mass of the given amount of a substance is a constant quantity, i.e. remains unchanged.

47. (b) According to law of conservation of mass,

Mass of reactants = Mass of products

$$\therefore 6.3 + 15.0 = 18.0 + x$$

$$\text{or } x = 21.3 - 18.0 = 3.3 \text{ g}$$

48. (a) $\text{Na}_2\text{CO}_3 + 2\text{HCl} \longrightarrow 2\text{NaCl} + \text{H}_2\text{O} + \text{CO}_2$

In the above reaction, equivalent weight of Na_2CO_3 is $\frac{M}{2}$

because 2 moles of Na^+ being transferred per mole of Na_2CO_3 .

49. (b) 200 kg of 95% pure means $\frac{95}{100} \times 200 = 190 \text{ kg}$

$\therefore 100 \text{ g of } \text{CaCO}_3 \text{ on heating gives lime} = 56 \text{ g}$

$$\therefore 190 \text{ g of } \text{CaCO}_3 \text{ on heating will give lime} = \frac{56 \times 190}{100} \\ = 106.4 \text{ g}$$

50. (a) Number of O-atoms in 22 g of
- $\text{CO}_2 = 44 \text{ g}$

Molar mass of $\text{CO}_2 = 44 \text{ g}$ $44 \text{ g} = 1 \text{ mol}$, $22 \text{ g} = 0.5 \text{ mol}$ 1 mole of CO_2 contains $= 2 \times 6.023 \times 10^{23}$ O-atoms0.5 mole of CO_2 will contain $= 6.023 \times 10^{23}$ O-atomsNumber of O-atoms in $\text{CO} = 6.023 \times 10^{23}$ molecules of CO
 $= 1 \text{ mole of CO}$ 1 mole of $\text{CO} = 6.023 \times 10^{23}$ O-atomsMolar mass of $\text{CO} = 12 + 16 = 28 \text{ g}$

Element	% atomic weight	Simplest ratio
C	$\frac{92.3}{12} = 7.69$	$\frac{7.69}{7.69} = 1$
H	$\frac{7.7}{1} = 7.70$	$\frac{7.70}{7.69} = 1$

 $\therefore$ Empirical formula $= \text{CH}$

52. (c) Mass of 1 mole of methane (
- CH_4
-)
- $= 16 \text{ g}$

Mass of 0.1 mole of methane $= 16 \times 0.1 \text{ g} = 1.6 \text{ g}$

53. (a) Number of moles of sugar
- $= \frac{1.71}{342} = 0.005$

 $\therefore$ 1 mole of sugar contains $= 12 \times 6.02 \times 10^{23}$ atoms of carbon $\therefore$ 0.005 mole of sugar will contain $= 12 \times 0.005 \times 6.02 \times 10^{23}$ $= 0.36 \times 10^{23} = 3.6 \times 10^{22}$ C-atoms

54. (b) 2 g atom of
- $\text{N}_2 = 2 \times 14 = 28 \text{ g}$

 3×10^{23} C atoms $= \frac{3 \times 10^{23}}{6 \times 10^{23}} \times 12 = 6 \text{ g}$ 1 mole of S $= 32 \text{ g}$

55. (d) Atoms recovered
- $= \frac{19700}{197} \times N_A$
-
- $= 100 \times 6.02 \times 10^{23} = 6.02 \times 10^{25}$

56. (b)
- $\text{C}_6\text{H}_{12} + 9\text{O}_2 \longrightarrow 6\text{CO}_2 + 6\text{H}_2\text{O}$

 $6 \times 12 + 12 = 84$ $\therefore$ 84 g C_6H_{12} gives $= 6$ moles of CO_2 $\therefore$ 8.4 g C_6H_{12} will give $= \frac{6 \times 8.4}{84} = 0.6$ mole of CO_2

57. (d) Mol. wt. of
- $\text{NH}_3 = 14 + 3 = 17$

 $\therefore$ 17 g of ammonia contains atoms $= 4 \times N_A$ $(\because \text{one molecule of } \text{NH}_3 \text{ has 4 atoms})$ $\therefore$ 4.25 g of ammonia contain atoms $= \frac{4 \times 6.02 \times 10^{23} \times 4.25}{17} = 6.02 \times 10^{23}$ atoms

58. (d) Mole ratio of
- $x = \frac{75.8}{75} = 1.01$

Mole ratio of $y = \frac{24.2}{16} = 1.5$ Simple ratio $= x : y = 1 : 1.5 = 2 : 3 = x_2 y_3$

59. (c) Number of moles of
- $\text{CO}_2 = \frac{44}{44} = 1$

Number of moles of $\text{N}_2 = \frac{14}{28} = 0.5$ $\therefore$ Mole fraction of $\text{CO}_2 = \frac{1}{1 + 0.5} = \frac{1}{1.5}$ or $= \frac{2}{3}$

60. (c)
- $\text{Ca}_3\text{P}_2 + 6\text{H}_2\text{O} \longrightarrow 3\text{Ca}(\text{OH})_2 + 2\text{PH}_3$

61. (d)
- $N_1V_1 = N_2V_2$

i.e. $0.5 \times 100 = 0.1 \times V_2$ or $V_2 = 500 \text{ cm}^3$ $\therefore$ Water to be added to 100 cm^3 solution
 $= 500 - 100 = 400 \text{ cm}^3$

62. (a) Normality equation is

$$N_1V_1 + N_2V_2 + N_3V_3 = N_4(V_1 + V_2 + V_3)$$

$$\text{or } 1 \times 5 + 20 \times \frac{1}{2} + 30 \times \frac{1}{3} = N_4(5 + 20 + 30)$$

(HCl) (H_2SO_4) (HNO_3) $\therefore$ Resulting normality (N_4) $= \frac{25}{55} = 0.45 \text{ N}$

63. (c) 2 moles of Al produce
- $= 3 \times 22.4 \text{ L}$
- of
- H_2
- gas

 $\therefore$ 1 mole of Al will produce $= \frac{3 \times 22.4}{2} = 33.62 \text{ L}$ of H_2 gas

64. (c) For solution I, millimoles
- $= MV = 480 \times 1.5 = 720$

For solution II, millimoles $= MV = 520 \times 1.2 = 624$ Total millimoles $= 720 + 624 = 1344$ $\therefore$ Molarity $= \frac{1344}{480 + 520} = 1.344 \text{ M}$

65. (c) Titration of oxalic acid by
- KMnO_4
- in the presence of HCl gives unsatisfactory result because HCl is a better reducing agent than oxalic acid and HCl reduces preferably
- MnO_4^-
- to
- Mn^{2+}
- .

66. (b) According to the chemical equation

44 g of $\text{CO}_2(g)$ is obtained from 16 g of $\text{CH}_4(g)$. $[\because 1 \text{ mole of } \text{CO}_2(g) \text{ is obtained from 1 mole of } \text{CH}_4(g)]$ Mole of $\text{CO}_2(g) = \frac{22 \text{ g } \text{CO}_2(g)}{44 \text{ g } \text{CO}_2(g)} = 0.5$ Hence, 0.5 mole of $\text{CO}_2(g)$ would be obtained from 0.5 mole of $\text{CH}_4(g)$ or 0.5 mole of $\text{CH}_4(g)$ would be required to produce 22 g of $\text{CO}_2(g)$.

67. (a) Number of moles
- $\propto \frac{1}{\text{Molecular mass}}$

Molecular masses : $\text{CO}_2 = 44$, $\text{N}_2 = 28$, $\text{CH}_4 = 16$,
and $\text{HCl} = 36.5$ CO_2 will have least volume.

68. (a) Molarity (
- M
-)
- $= \frac{\text{Weight of solute}}{\text{Molecular weight of solute}} \times \frac{1000}{\text{Volume of solution (mL)}}$
-
- $= \frac{49}{98} \times \frac{1000}{250} = 2 \text{ M}$

69. (b) $M_1V_1 = M_2V_2$

$$0.5 \times 100 = 0.1 \times V_2$$

$$V_2 = 500 \text{ cm}^3$$

Volume of water to be added to 100 cm³ of solution
 $= 500 - 100 = 400 \text{ cm}^3$

70. (a) Molality (m)

$$= \frac{\text{Weight of solute}}{\text{Molar weight of solute}} \times \frac{1000}{\text{Weight of solvent}}$$

$$= \frac{10}{40} \times \frac{1000}{100} = 2.5 \text{ m}$$

71. (c) 1500 cm³ of 0.1 N HCl

$$= \frac{0.1}{1000} \times 1500 = 0.15 \text{ g eq}$$

$$= 0.15 \text{ g eq. of NaOH}$$

$$= 0.15 \times 40 = 6 \text{ g NaOH}$$

BITSAT Archives

1. (a) $\text{CaCl}_2 + \text{NaCl} = 10 \text{ g}$

Let, weight of $\text{CaCl}_2 = x \text{ g}$

$$\text{Mole of CaO} = \frac{1.62}{56} \Rightarrow \frac{x}{111} = \frac{1.62}{56}, x = 3.21 \text{ g}$$

$$\% \text{ of CaCl}_2 = \frac{3.21}{10} \times 100 = 32.1\%$$

2. (b) Let, V litre of 10 N HCl be mixed with $(1 - V)$ litre of 4 N HCl to give $(V + 1 - V) = 1 \text{ L}$ of 7 N HCl

As we know that, $N_1V_1 + N_2V_2 = NV$

$$10V + 4(1 - V) = 7 \times 1$$

$$10V + 4 - 4V = 7, 6V = 7 - 4, V = \frac{3}{6} = 0.50 \text{ L}$$

Volume of 10 N HCl = 0.50 L

Volume of 4 N HCl = $1 - 0.50 = 0.50 \text{ L}$

3. (a) 1 mole of $\text{O}_2 = 4$ equivalent of oxygen

22400 mL of $\text{O}_2 = 4$ equivalent of oxygen

$$46.6 \text{ mL of } \text{O}_2 = \frac{4}{22400} \times 46.6 = 0.00832 \text{ eq.}$$

Equivalent of metal = Equivalent of oxygen

$$\frac{\text{Weight}}{\text{Equivalent}} = 0.00832$$

$$\frac{0.1}{E} = 0.00832 \Rightarrow E = \frac{0.1}{0.00832} = 12.0$$

$\therefore$ 5 moles of $\text{Ba(OH)}_2 = 5$ moles of BaCO_3

$\therefore$ Mass of BaCO_3

$$= \text{Moles of BaCO}_3 \times \text{Molecular mass of BaCO}_3$$

$$= 5 \times 197 = 985 \text{ g}$$

$\therefore$ 1 L solution contains 4 moles of H_3PO_4 .

$\therefore$ Molarity of $\text{H}_3\text{PO}_4 = 4 \text{ M}$

Normality = Molarity $\times$ Basicity = $4 \times 3 \text{ N} = 12 \text{ N}$

6. (b) 1g H_2 combines with $\text{Br}_2 = 80 \text{ g}$

Equivalent weight of $\text{Br}_2 = 80$

4g of Br_2 combine with = 1 g Ca

$$\therefore 80 \text{ g of Br}_2 \text{ will combine with} = \frac{1 \times 80}{4} = 20 \text{ g Ca}$$

7. (b) $N_1V_1 = N_2V_2, \frac{1}{2} \times 200 = \frac{1}{10} \times V_2$

$$V_2 = \frac{1}{2} \times 200 \times 10 = 1000 \text{ mL}$$

$\therefore$ Volume of water added = $1000 - 200 = 800 \text{ mL}$

100 g Decomposition 22.4 L

$\therefore$ 100 g CaCO_3 on decomposition gives = 22.4 L CO_2

$\therefore$ 10 g CaCO_3 on decomposition will give

$$= \frac{22.4 \times 10}{100} \text{ L } \text{CO}_2 = 2.24 \text{ L } \text{CO}_2$$

106 g 22.4 L

106 g Na_2CO_3 gives = 22.4 L CO_2

$$1.06 \text{ g Na}_2\text{CO}_3 \text{ will give} = \frac{22.4 \times 1.06}{106} \text{ L } \text{CO}_2 = 0.224$$

L CO_2

12 g combustion 22.4 L

12 g carbon on combustion gives = 22.4 L CO_2

2.4 g carbon on combustion will give

$$= \frac{22.4 \times 2.4}{12} \text{ L } \text{CO}_2 = 2 \times 2.24 \text{ L } \text{CO}_2 = 4.48 \text{ L } \text{CO}_2$$

2 [12 + 16] combustion 2 $\times$ 22.4 L
 $= 56 \text{ g}$

56 g carbon monoxide on combustion gives

$$= 2 \times 2.24 \text{ L } \text{CO}_2$$

0.56 g carbon monoxide on combustion will give

$$= \frac{2 \times 22.4 \times 0.56}{56} \text{ L } \text{CO}_2$$

$$= 0.448 \text{ L } \text{CO}_2$$

Hence, $A \rightarrow 4, B \rightarrow 1, C \rightarrow 2, D \rightarrow 3$

2

Atomic Structure

Introduction

In the later half of the 19th century and in the beginning of the 20th century the discovery of several scientists like Faraday, Thomson, Rutherford etc. clearly revealed that the atom is divisible and composed of several smallest particles like electrons, protons, neutrons etc. although still it is the smallest particle that takes part in a chemical reaction. After the discovery of these particles, several questions arise, about the nature of these particles, their arrangement in an atom etc. Our study of inorganic chemistry must therefore begin with a review of the structure and properties of atoms.

In this chapter we consider the development of our understanding of atomic structure and the behaviour of electrons in atoms.

Subatomic Particles

A large number of subatomic particles have been discovered so far but only electron, proton and neutron are of great importance among them and hence, are called **fundamental particles**.

Atom

Atomic structure is the study of structure of atom. The word atom is derived from a Greek word 'atomio' which means indivisible and indestructible.

The main facts related to atom are as follows:

1. Atom is the building block particle of matter.
2. Atom is made mainly from three subatomic particles viz. electron, proton and neutron.
3. **Charge to mass ratio (e/m)** is determined by using discharge tube and applying electric and magnetic field. Deviation of particle takes place when electric and magnetic field is applied to it.
4. **Millikan oil drop model** is used to measure charge of the electron and it was found that electrical charge is always an integral multiple of charge on electron.

$$q = ne$$

where,

q = total charge, e = charge of one electron = 1.602×10^{-19} C and

n = positive integer = 0, 1, 2, 3.

Cathode Rays

Cathode rays were discovered by Sir J J Thomson. Cathode rays were a stream of fast moving negatively charged particles, called **electrons**.

The specific charge is the ratio of charge to mass of an electron. It is found by Thomson and denoted as e/m ratio. The e/m ratio of electron was found to be same for all gases.

$$e/m \text{ ratio} = -1.758 \times 10^{11} \text{ C/kg.}$$

Anode Rays (Positive Rays or Canal Rays)

Positive rays were discovered by Goldstein. These rays consist of positively charged particles, called **protons**. Unlike cathode rays, their e/m value depends upon the nature of gas taken in the tube.

The e/m value is maximum, when hydrogen gas is taken in the tube, i.e. $9.58 \times 10^7 \text{ C / kg}$.

Neutrons

Neutrons are neutral particles and discovered by Chadwick. Neutrons are the heaviest particles of the atom.

Types of Atomic Species

There are various types of atomic species depending upon their different distribution of subatomic particles (e , p and n) within an atom.

- (i) **Isotopes** are atoms having same atomic number but different mass number.
e.g. ${}_1\text{H}^1$, ${}_1\text{D}^2$ and ${}_1\text{T}^3$ are three isotopes of hydrogen.
- (ii) **Isobars** are atoms having same mass number but different atomic number.
e.g. ${}_{18}\text{Ar}^{40}$, ${}_{19}\text{K}^{40}$ are isobars.
- (iii) **Isotones** are atoms having same number of neutrons but different atomic number and mass number, e.g. ${}_1\text{H}^3$ and ${}_2\text{He}^4$ are isotones.
- (iv) **Isoelectronic** are atoms or species having same number of electrons.
e.g. F^- , Ne and Na^+ are isoelectronic to each other.
- (v) **Isodiaphers** are atoms/species having same isotopic number and can be calculated as
Isotopic number
= mass number (A) – $2 \times$ atomic number (Z)
e.g. ${}_{19}\text{K}^{39}$ and ${}_{9}\text{F}^{19}$ are isodiaphers.

Atomic Models

Various atomic models are proposed to explain the structure of atom which are as follows:

Thomson Model (1898)

This is also known by some other names like plum pudding, watermelon and raisin pudding model.

Thomson visualised atom as a pudding or cake of positive charge with electrons embedded into it.

It fails to explain the result of gold foil scattering experiment.

Rutherford Model (α -particle Scattering Experiment)

This model was set up by Rutherford to discover the nucleus. He used gold foil alpha particles set up and found the following results.

Representation of Rutherford Experiment

- (i) Most of the α -particles passed through the atom without any deflection.
- (ii) A small proportion of α -particles were deflected by small angles.
- (iii) A very few α -particles (about 1 in 20,000) returned back to their direction, i.e. reflected by 180° .

Conclusion of Rutherford Experiment

- (i) Atom consists of a very small sized nucleus where the entire mass of atom resides (diameter of nucleus = 10^{-15} m). Nucleus is made up of nucleons (neutrons + protons).
- (ii) Very large space inside the atom is empty which was confirmed when most of α -particles passed straight without any deflection.
- (iii) Volume occupied by the nucleus is very less as compared to total volume of atom.
- (iv) An electron in an atom revolves around the nucleus in stationary orbit and occupies almost all the space around nucleus (same as solar system).

Limitations of Rutherford Model

- Main drawback of this model is that it does not tell anything about electronic structure of atom.
- According to classical theory of electromagnetism, if a charged particle revolves around oppositely charged particle, it loses or radiates energy continuously resulting the decrease in its speed. Hence, the circular orbit gradually becomes spiral and electrons finally falls into the nucleus but in real sense, this does not happen.
- When spectrum of an atom is observed, it has been found that the spectrum consists of well defined lines rather than continuous spectrum (electron radiates energy continuously which gives continuous spectrum).

Development Leading to the Bohr's Model of Atom

Interaction of EMR with matter provides us various important information such as structure, energy, radius etc. EMR have dual nature, i.e. particle as well as wave nature.

Black Body Radiation and Planck's Quantum Theory

A body when heated emits radiation over a wide range of wavelength. The ideal body which emits or absorbs radiations of all possible frequency is known as **black body** and the radiation emitted by black body is called black body radiation.

Quantum is a measure of emission or absorption of energy in discrete quantity. Energy of radiation is directly proportional to frequency of light

$$E \propto \nu \Rightarrow E = h\nu$$

where, h = Planck's constant = 6.625×10^{-34} Js

The emitted energy is integral multiple of $h\nu$ such as $2h\nu, 3h\nu, 5h\nu$, i.e. energy is quantised.

Photoelectric Effect

When the light of certain frequency is allowed to fall on a metal surface, electrons are ejected from metal surface, this phenomenon is known as **photoelectric effect** and such ejected electrons are known as **photoelectrons**.

When a photon (the smallest particle of light) of certain energy strikes electron in an atom, it transfers its energy to electron. Greater the energy of photon greater will be energy transferred to electron.

The minimum amount of energy required to eject an electron from the metal surface is known as **threshold energy** and the frequency is known as **threshold frequency** (ν_0).

Threshold energy (work function) $E = h\nu_0$

Energy of photon = $h\nu$

Energy transferred from photon to electron
= Energy of photoelectrons = $h\nu - h\nu_0 = h(\nu - \nu_0)$

Kinetic energy of photoelectron = $\frac{1}{2}m_e v^2$

Energy transferred from photon to electron
= Kinetic energy of electron

$$\therefore h(\nu - \nu_0) = \frac{1}{2}m_e v^2$$

Bohr's Model

Bohr's model is a quantitative measure of general features of structure of hydrogen atom and its spectrum such as radius, energy, velocity of electron, etc.

Postulates of Bohr's Model

- Electrons revolve around the nucleus in specific circular path known as **orbit** or **stationary energy levels**, i.e. energy of each orbit is constant.
- When an electron absorbs required amount of energy, it undergoes transition from lower energy level to higher energy level and when it emits energy, it comes to the lower energy level.
- Energy absorbed or emitted during transition is given by

$$\Delta E = E_2 - E_1 = hc\bar{\nu} = \frac{hc}{\lambda} \quad \left[\because \bar{\nu} = \frac{1}{\lambda} \right]$$

where, $\bar{\nu}$ = wave number

Frequency of radiation absorbed or emitted during transition is given by ν .

$$\nu = \frac{E_2 - E_1}{h} \quad [\because \nu = c\bar{\nu}]$$

where, E_2 = higher energy level

E_1 = lower energy level

- The angular momentum of an electron present in any orbit must be an integral multiple of $\frac{h}{2\pi}$.

$$mvr = n \times \frac{h}{2\pi}$$

where, $n = 1, 2, 3, \dots$

Bohr's representation of an atom

Bohr's Parameters

(i) Radius of Bohr Orbit

Radius is the distance between nucleus and orbit, it is also known as Bohr's radius. The radius of an orbit is given by

$$\text{Bohr radius, } r_n = \frac{n^2 h^2}{4\pi^2 k m e^2 Z} = 0.529 n^2 \text{ \AA} \quad (\text{for H-atom})$$

where, m = mass of electron, h = Planck's constant,

e = charge of electron, $\pi = 3.14$,

n = orbit number, Z = nuclear charge,

$k = 1$ (in CGS system),

$= 9 \times 10^9 \text{ Nm}^2 \text{ C}^{-2}$ (in MKS system)

(ii) Energy of Electron in Bohr's Orbit

Bohr energy is the sum of kinetic energy and potential energy.

Bohr energy, $E = \text{KE} + \text{PE}$

$$= -\frac{2\pi^2 m Z^2 e^4 k^2}{n^2 h^2} = \frac{-13.6}{n^2} \text{ eV}$$

$$\text{For H-like atom, } E_n = \frac{-13.6}{n^2} \text{ eV or } -13.6 \times \left(\frac{Z^2}{n^2}\right) \text{ eV}$$

where, Z = atomic number

Ionisation energy of electron present in first orbital of H-atom is equal to energy of first orbit of H-atom. As the value of n (orbit number) increases, the value of Bohr's energy increases and becomes zero when $n = \infty$.

(iii) Velocity of an Electron

Velocity of electron in n th orbit is calculated by given formula.

$$v = \frac{2\pi e^2 k Z}{nh} = 2.1847 \times 10^6 \left(\frac{Z}{n}\right) \text{ ms}^{-1}$$

Velocity of electron present in first orbit of H

$$= v_H = 2.18 \times 10^6 \left(\frac{1}{1}\right) = 2.18 \times 10^6 \text{ ms}^{-1}$$

Velocity of electron present in first orbit of He

$$= v_{\text{He}} = 2.18 \times 10^6 \times \frac{2}{1} = 4.36 \times 10^6 \text{ ms}^{-1}$$

i.e. velocity of electron present in first orbit of He is double the velocity of electron present in first orbit of H.

Limitations of Bohr's Model

Bohr's model was not able to explain the following phenomena.

- Heisenberg uncertainty principle
- Dual character of particle
- Spectra of multielectron system

- Zeeman effect, i.e. splitting of spectral line in magnetic field.
- Stark effect, i.e. splitting of spectral line in an electric field.
- Fine structure of spectral line.

Bohr-Sommerfeld Model

In order to explain fine structure of H-atom, Sommerfeld suggested a model which states that electrons are present in elliptical orbit along with circular orbit. They revolve around the nucleus in two velocity

components viz. radial velocity and angular velocity.

Radial velocity along the radius vector and angular velocity which is perpendicular to radius vector give rise to radial and angular momentum simultaneously.

$$\text{Radial momentum} = n_r \frac{h}{2\pi}$$

$$\text{Angular momentum} = n_\phi \times \frac{h}{2\pi}$$

where, n_r = radial quantum number

n_ϕ = angular quantum number

Spectrum of Hydrogen Atom

A spectrum is defined as "pictorial representation of arrangement of radiation in the increasing order of wavelength or decreasing order of frequency".

Bohr's Explanation of Hydrogen Spectrum

Line spectrum of hydrogen was obtained when a beam of light was passed through a discharge tube containing hydrogen gas at low pressure.

Line spectrum of hydrogen atom is classified into the following six series:

Name of series		n_1	n_2
Lyman series	← UV	1	2, 3, 4, ...
Balmer series	← visible	2	3, 4, 5, ...
Paschen series	← IR	3	4, 5, 6, ...
Brackett series	← IR	4	5, 6, 7, ...
Pfund series	← IR	5	6, 7, 8, ...
Humphery series	← IR	6	7, 8, 9, ...

Spectrum of H-atom is expressed in terms of wave number $\bar{\nu}$,

$$\bar{\nu} = R_H \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right) \quad \left[\bar{\nu} = \frac{1}{\lambda} \right]$$

where, $R = 1,09,677 \text{ cm}^{-1}$ (Rydberg constant)

n_1 = emission to lower energy level

n_2 = emission from higher energy level

For elements other than hydrogen,

$$\bar{\nu} = R_H Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

where, Z = atomic number of atom

Modern Structure of Atom

Following relationship and principle lead to explain the structure of atom

Dual Nature of Matter

de-Broglie proposed that microscopic particle show dual nature similarly as the radiation. Thus, de-Broglie relation can be stated as "All microscopic particles such as electron, proton, etc, shows wave as well as particle like behaviour, i.e. dual nature of behaviour."

$$\text{Mathematically, } \lambda = \frac{h}{p} = \frac{h}{mv} = \frac{h}{\sqrt{2mE}} = \frac{h}{\sqrt{2mqV}}$$

$$\therefore \quad \begin{aligned} E &= q \cdot V \\ \text{and } p &= \sqrt{2mE} \end{aligned}$$

where, h = Planck's constant = $6.626 \times 10^{-34} \text{ Js}$

m = mass of microscopic particle

p = momentum of particle, v = velocity of particle

E = energy of particle, q = charge and

V = potential difference

This equation is known as de-Broglie relation and applicable for microscopic particle only.

Wave like nature of microscopic particle is confirmed by diffraction pattern of electron beam.

Heisenberg Uncertainty Principle

Heisenberg states that exact position and momentum of microscopic particle cannot be determined simultaneously.

$$\text{Mathematically, } \Delta x \cdot \Delta p \geq \frac{h}{4\pi}$$

$$\text{or } \Delta x \cdot \Delta v \geq \frac{h}{4\pi m}$$

Quantum Mechanical Model and its Important Features

On the basis of dual nature of matter and Heisenberg uncertainty principle, E Schrödinger, in 1926 gave quantum mechanical model for an atom.

According to this model, yet exact position and momentum of particle cannot be determined although the probability of finding an electron can be determined.

Schrödinger Wave Equation

Schrodinger wave equation of any particle along all three directions may be written as

$$\frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2} + \frac{\partial^2 \psi}{\partial z^2} + \frac{8\pi^2 m}{h^2} (E - V) \psi = 0$$

where, ψ = acceptable wave function

E = total energy of electron = KE + PE

V = potential energy of electron

h = Planck's constant

$$\text{or, } \nabla^2 \psi + \frac{8\pi^2 m}{h^2} (E - V) \psi = 0$$

On rearranging we get $H\psi = E\psi$

H = Hamiltonian operator or total energy operator

Now, for hydrogen-atom, it may be solved using wave function in polar coordinates

$$\psi = R(r) \cdot \theta(\theta) \cdot \phi(\phi)$$

Thus, an atomic orbital (ψ) is a product of two factors

- (i) Radial part, i.e. $R(r)$; depends upon distance and tells about the size of atom.
- (ii) Angular part, i.e. $\theta(\theta) \cdot \phi(\phi)$ depends upon angle variable θ and ϕ . It gives an idea about the shape of orbital.

Radial part depends upon principal quantum number (n) and azimuthal quantum number (l), while angular part depends upon azimuthal quantum number (l) and magnetic quantum number (m).

Variation of ψ and ψ^2 with r for 1s and 2s

ψ^2 has physical significance and it measures the probability of finding electron around nucleus.

ψ is a wave function of any orbital along 3 directions of polar coordinates may be written as

$$\psi(r, \theta, \phi) = \underset{\text{Radial part}}{R(r)} \cdot \underset{\text{Angular part}}{\theta(\theta), \phi(\phi)}$$

There are two ways to represent probability distribution curve:

- Radial probability distribution curve
- Angular probability distribution curve

Radial probability distribution curve tells about the variation of ψ^2 (probability of finding electron) with respect to radial distance (r), without any reference to its direction from nucleus.

For both 1s and 2s the shape of orbital is spherical, so it is more useful to discuss the probability of finding an electron between the sphere of radius ($r + dr$) and r .

$$\text{Volume of shell} = \frac{4}{3}\pi(r + dr)^3 - \frac{4}{3}\pi r^3 = 4\pi r^2 dr$$

Conclusion of Curves

- Electron finding probability is zero at nucleus.
- As distance from the nucleus increases, probability of finding electron increases as $1s < 2s < 3s < 4s \dots$
- Total number of peaks appearing in the curve for s , p and d -orbitals are equal to n , $(n - 1)$ and $(n - 2)$ respectively.
- The region where the probability density function (ψ^2) becomes zero is called **nodal surface** or simply node.
- For ns -orbital, number of nodes = $n - 1$

Calculation of Number of Nodes

$$\text{Number of radial nodes} = (n - l - 1)$$

$$\text{Number of angular nodes} = l$$

$$\text{Total nodes} = (n - 1)$$

$$\text{Number of nodal planes} = l$$

where,

- $l = 0$ for s -subshell,
- $= 1$ for p -subshell,
- $= 2$ for d -subshell,
- $= 3$ for f -subshell,

Electronic Configuration

Distribution of Electrons in Different Orbits (Shells)

It is the arrangement of electrons in various shells, subshells and orbitals of an atom.

Bohr Burry Scheme

The distribution of electrons into different orbits of an atom was suggested by Bohr and Burry in 1921. According to them, the electrons enter in the orbit in accordance with the following rules

- Maximum number of electrons in a shell is given by formula $2n^2$ ($n = 1, 2, 3, \dots$ for $K, L, M \dots$ shells)
- The outermost shell can have maximum of 8 electrons.

$n l^x$ Types Scheme

It is written as 2, 8, 8, 18, 32 or as $n l^x$ (where, n indicates the principal quantum number, l indicates the azimuthal quantum number or subshell and x is the number of electrons).

Rules for Filling Electrons in Orbitals

Various terms and rules have to be followed while filling up electrons in orbitals:

Aufbau Rule

Aufbau is a German word having mean "building up", i.e. the electrons are filled up in orbitals in the order of increasing energies, i.e. orbital having smaller energy will be filled first followed by higher energy orbitals. The arrangement of orbitals in the increasing order of energy are given as

$$1s, 2s, 2p, 3s, 3p, 4s, 3d, 4p, 5s, 4d, 5p, 4f, 5d, 6p, 7s \dots$$

The subshell having lowest $(n + l)$ value will be filled up first followed by higher value of $(n + l)$. If both the orbitals have same $(n + l)$ value then the orbital having lower value of n will be filled up first, this is known as $(n + l)$ rule.

Pauli Exclusion Principle

According to Pauli exclusion principle, "No two electrons can occupy same orbital with same value of all the four quantum numbers". An orbital can accommodate two electrons with opposite spin as shown in the given figure:

Two electrons can have same value of n , l and m but value of s can never be same.

e.g. in N-atom ($Z=7$): $1s^2, 2s^2, 2p^3$

Q.No.	1s	2s	2p _x	2p _y	2p _z
n	1	2	2	2	2
l	0	0	1	1	1
m	0	0	+1	0	-1
s	$+\frac{1}{2}, -\frac{1}{2}$	$+\frac{1}{2}, -\frac{1}{2}$	$+\frac{1}{2}$	$+\frac{1}{2}$	$+\frac{1}{2}$

Hund's Rules for Maximum Spin Multiplicity

No electron pairing takes place in p , d and f -orbitals until each orbital in the given subshell contains one electron having parallel spin, e.g. N(7) has electronic configuration $1s^2, 2s^2, 2p_x^1, 2p_y^1, 2p_z^1$, according to Hund's rule and not $1s^2, 2s^2, 2p_x^2, 2p_y^1$.

Extra Stability of Half-filled and Completely Filled Orbitals

In case of half-filled and fully filled electronic configuration, the extra stability is due to the possibility of larger number of exchange of electron in degenerate energy levels which causes evolution of more exchange energy.

	
Incomplete unstable p -orbital	Half-filled stable d -orbital
	
Incomplete unstable f -orbital	Complete fully-filled stable f -orbital

Quantum Numbers

There are four quantum numbers

(i) Principal Quantum Number (n)

It is the measure of the effective volume of the electron cloud. It is represented by ' n '. Greater the value of ' n ' larger is the average distance of an electron in the orbital from the nucleus and therefore, larger is the orbital. The maximum number of electrons possible in a given shell is $2n^2$.

(ii) Angular Momentum or Azimuthal Quantum Number (l)

It gives the shape of the orbitals. Values of l varies from 0 to $(n-1)$.

Value of l	Subshell	Shape of orbital
0	s	Spherical
1	p	Dumb-bell
2	d	Double dumb-bell
3	f	Complicated

Orbital angular momentum,

$$mvr = \frac{h}{2\pi} \sqrt{l(l+1)}$$

(iii) Magnetic Quantum Number (m_l)

It says about orientation or distribution of atomic orbital.

Values of $m_l = -l$ to $+l$

Note

- Total number of orbitals present in any subshell $= 2l + 1$.
- The middle orbital of a subshell has a value of zero. Orbitals to the left of middle orbital have -ve numbers; to the right have +ve numbers.

$M_e = 0$	-1	0	+1	-2	-1	0	+1	+2	-3	-2	-1	0	+1	+2	+3
															
s	p			d				f							
$l = 0$	1			2				3							

(iv) Spin Quantum Number (m_s)

It gives the spin motion of electron and describes the behaviour of electron.

Value of $m_s \Rightarrow$ for clockwise spin ($\uparrow$),

$$s = +\frac{1}{2}$$

For anticlockwise spin ($\downarrow$),

$$s = -\frac{1}{2}$$

These spin produces spin angular momentum

$$= \sqrt{s(s+1)} \frac{h}{2\pi}$$

Practice Exercise

- The charge on electron was determined by
 - Schrodinger
 - Chadwick
 - Thomson
 - Millikan
- Deflection back of a few particles on hitting thin foil of gold shows that
 - nucleus is heavy
 - nucleus is small
 - Both a and b
 - electrons create hindrance in the movement of α -particles
- A photon of frequency ν has momentum
 - $h\nu/c$
 - hc/ν
 - $\frac{h}{\nu c}$
 - $\frac{\nu c}{h}$
- The energy of one quantum of light with a wavelength of $6500 \text{ \AA}$ ($1 \text{ \AA} = 10^{-10} \text{ cm}$)
 - $9.04 \times 10^{-24} \text{ J}$
 - $3.02 \times 10^{-20} \text{ J}$
 - $3.06 \times 10^{-19} \text{ J}$
 - $6.02 \times 10^{-20} \text{ J}$
- Sodium lamp emits yellow light of wavelength $5800 \text{ \AA}$. The wave number of the light is
 - $1.72 \times 10^6/\text{m}$
 - $17.2 \times 10^8/\text{m}$
 - $5.17 \times 10^{14}/\text{s}$
 - $17.2 \times 10^7/\text{m}$
- The ultraviolet radiation has frequency $6 \times 10^{16}/\text{s}$. The wavelength would be
 - $2 \times 10^6 \text{ cm}$
 - $5 \times 10^{-7} \text{ cm}$
 - $18 \times 10^{-26} \text{ cm}$
 - $2 \times 10^7 \text{ cm}$
- A radiation of $2000 \text{ \AA}$ falls on the metal whose work function is 4.2 eV . Then the kinetic energy of the fastest photo electron is
 - $6.4 \times 10^{-10} \text{ J}$
 - $16 \times 10^{-10} \text{ J}$
 - $1.6 \times 10^{-19} \text{ J}$
 - $3.2 \times 10^{-19} \text{ J}$
- The threshold wavelength for the ejection of electron from metal is 330 nm , then work function for the photoelectric emission is
 - $6 \times 10^{-12} \text{ J}$
 - $6 \times 10^{-19} \text{ J}$
 - $1.2 \times 10^{-20} \text{ J}$
 - $1.2 \times 10^{-18} \text{ J}$
- It is given that $E = \frac{2.859}{\lambda} \text{ cal/mol}$. The energy associated with radiation of wavelength $4 \times 10^{-5} \text{ m}$ will be
 - 71.5 kcal/mol
 - 35.75 kcal/mol
 - 32.0 kcal/mol
 - 7.15 kcal/mol
- The ratio of energy of a photon of $2000 \text{ \AA}$ radiation to that of $4000 \text{ \AA}$ radiation.
 - 2
 - 4
 - $\frac{1}{4}$
 - $\frac{1}{2}$
- Which of the following electromagnetic radiation has maximum wavelength?
 - Infrared
 - Ultraviolet rays
 - X-rays
 - Radiowave
- The kinetic energy of proton, whose mass is 140 times that of electron and potential difference V is
 - 1 KeV
 - 1840 KeV
 - 920 KeV
 - $\frac{1}{1840} \text{ KeV}$
- In first Bohr orbit of hydrogen atom, the velocity of electron would be (given that radius of first Bohr orbit is $0.53 \times 10^{-10} \text{ m}$)
 - $2.2 \times 10^6 \text{ m/s}$
 - $3.3 \times 10^6 \text{ m/s}$
 - $1.1 \times 10^6 \text{ m/s}$
 - $4.4 \times 10^6 \text{ m/s}$
- Bohr atomic model explains
 - finer details of atomic spectra
 - splitting of spectral lines in the presence of magnetic and electric field
 - spectra of hydrogen or hydrogen like atoms
 - intensity of various spectral lines
- The expression for Bohr radius of n th orbit of an atom is
 - $r = \frac{n^2 h^2}{4\pi^2 m Z e^2}$
 - $r = \frac{nh}{4\pi^2 m Z e^2}$
 - $r = \frac{n^2 h^2}{4\pi^2 m Z}$
 - $r = \frac{n^2 h^2}{4\pi^2 m e^2}$
- The potential energy of the electron in the hydrogen atom is -6.8 eV . The excited state in which the electron is present is
 - first
 - second
 - third
 - None of these
- The energy required for the ionisation of excited hydrogen atom would be (in eV)
 - < 13.6
 - > 13.6
 - 13.6
 - None of these
- For hydrogen atom, radius of first Bohr's orbit is a . For Li^{2+} , the radius of first Bohr's orbit is
 - $27a$
 - $3a$
 - $\frac{a}{27}$
 - $\frac{a}{3}$
- If the velocity of an electron in the first orbit of hydrogen atom is approximately $2.2 \times 10^8 \text{ cm/s}$, its velocity in the fourth orbit would be
 - $5.5 \times 10^7 \text{ cm/s}$
 - $4.4 \times 10^7 \text{ cm/s}$
 - $3.3 \times 10^7 \text{ cm/s}$
 - $6.6 \times 10^7 \text{ cm/s}$

20. Energy of an electron in hydrogen atom is given by $E = -\frac{13.6}{n^2}$ eV. If n is changed from 1 to 4, then energy of 1 is
 a. four times that of 4 b. five times that of 4
 c. sixteen times that of 4 d. equal that of 4
21. The radii of nuclei and atoms are known to be of the order of 10^{-13} cm and 10^{-8} cm respectively assuming them to be spherical. The fraction of atomic volume occupied by the nucleus would be
 a. 10^{-15} b. 10^{-17}
 c. 10^{-14} d. 10^{-16}
22. Which of the following statements is false?
 a. Spin quantum number corresponds to two possible directions of spin
 b. No two electrons in an atom may have the same set of values for the four quantum numbers
 c. Number of electrons in an atom is equal to the number of orbitals
 d. The momentum and position of an electron cannot be known simultaneously
23. For hydrogen atom, radius of first Bohr orbit would be
 a. 9.63×10^{-10} m b. 0.43×10^{-10} m
 c. 0.50×10^{-10} m d. 0.53×10^{-10} m
24. The relation between radius of third orbit r_3 and radius of first orbit r_1 in hydrogen atom would be
 a. $r_3 = 3r_1$ b. $r_3 = 9r_1$ c. $r_1 = 3r_3$ d. $r_1 = 9r_3$
25. The electron of hydrogen atom is excited to certain level. When the electron returns to the first Bohr orbit, the wavelength of line emitted, if the energy difference is 11.0 eV would be
 a. 11.25×10^{-7} m b. 2.2×10^{-6} m
 c. 9.1176×10^{-8} m d. 1.22×10^{-7} m
26. Ionisation energy of He^+ is -19.6×10^{-18} J. The energy of the first stationary state ($n = 1$) of Li^{2+} is
 a. 4.41×10^{-16} J atom $^{-1}$ b. -4.41×10^{-17} J atom $^{-1}$
 c. -2.2×10^{-15} J atom $^{-1}$ d. 8.82×10^{-17} J atom $^{-1}$
27. Assuming atom to be a sphere, the radius of atom would be [if the apparent volume of atom of a metal is 1.23×10^{-23} mL]
 a. 1.401 Å b. 1.942 Å c. 1.642 Å d. 1.541 Å
28. In hydrogen an electron transition takes place from $n = 2$ level to $n = 3$ level. The wavelength of the line in the hydrogen spectrum would be
 a. 5.485×10^7 m b. 6.56×10^{-7} m
 c. 4.57×10^{14} m d. 0.529×10^{-10} m
29. The line spectra are characteristics of
 a. molecules in ground state
 b. atoms in ground state
 c. molecules in the excited state
 d. atoms in excited state
30. In Bohr's series of lines of hydrogen spectrum, the third line from the red end corresponds to which one of the following inter orbit jumps of the electron for Bohr's orbit in an atom of hydrogen?
 a. $5 \rightarrow 2$ b. $4 \rightarrow 1$ c. $2 \rightarrow 5$ d. $3 \rightarrow 2$
31. The wavelength of the radiation emitted when the electron jumps from 4th shell to 2nd shell is
 a. 4862 Å b. 2056 Å c. 5241 Å d. 109700 cm
32. First line of Paschen series has wave number ($R_H = 109700 / \text{cm}$)
 a. $2854 \times 10^8 (\text{Å})^{-1}$ b. $6243 \times 10^8 (\text{Å})^{-1}$
 c. $6856 \times 10^8 (\text{Å})^{-1}$ d. $3452 \times 10^8 (\text{Å})^{-1}$
33. Which of the following statement is false?
 a. Violet radiations have a longer wavelength than red radiations
 b. The energy of light with $\lambda = 600$ nm is lower than that of $\lambda = 500$ nm
 c. Spectrum of an atom is known as line spectrum
 d. The wavelength associated with an electron is longer than that of proton if they have the same speed
34. The effect of splitting of spectral lines under the influence of magnetic field is called
 a. photoelectric effect b. Zeeman effect
 c. Raman effect d. Stark effect
35. In the influence of electric field the splitting of spectral lines is called
 a. Zeeman effect b. Stark effect
 c. photoelectric effect d. None of these
36. The visible part of electromagnetic radiations is
 a. 2000 Å to 4000 Å b. 2000 Å to 5000 Å
 c. 4000 Å to 8000 Å d. 1000 Å to 2000 Å
37. In hydrogen spectrum wave number of different lines is given by $\frac{1}{\lambda} = R_H \left[\frac{1}{n_f^2} - \frac{1}{n_i^2} \right]$
 where, $R_H = 1.090678 \times 10^7 \text{ m}^{-1}$
 The wavelength of first line of Lyman series would be
 a. 122×10^{-7} m b. 9.1176×10^{-8} m
 c. 12.2×10^{-7} m d. 1.22×10^{-7} m
38. The mass of a photon of wavelength 1.54 Å is
 a. 2.5×10^{-32} kg b. 1.42×10^{32} kg
 c. Both of these d. None of these
39. The uncertainty in the velocity of moving bullet of mass 10 g, when uncertainty in its position is 10^{-5} m is
 a. 5.2×10^{-28} m/s b. 5.2×10^{-22} m/s
 c. 3×10^{-28} m/s d. 3×10^{-22} m/s
40. The momentum of a particle having de-Broglie wavelength of 6 Å is
 a. 1.1×10^{34} kg-m/s b. 39.6×10^{-34} kg-m/s
 c. 1.1×10^{-24} kg-m/s d. 39.6×10^{-24} kg-m/s

41. When an electron is moving uniformly, it produces
 a. both electric and magnetic fields
 b. an electric field only
 c. a magnetic field only
 d. no such fields
42. Which of the following scientists demonstrated the wave nature of electron?
 a. Davisson
 b. Heisenberg
 c. de-Broglie
 d. Schrödinger
43. Which one of the following statements is most appropriate?
 a. Electron spins around its own axis only
 b. Electron moves around the nucleus in spherical orbits
 c. Electron moves around the nucleus in elliptical orbits
 d. Electron moves around the nucleus in spherical or elliptical orbits spins around its own axis
44. The maximum number of electrons that can be taken by a subshell with $l = 3$ is
 a. 8
 b. 14
 c. 10
 d. 12
45. The spectrum of He^+ is expected to be similar to that of
 a. hydrogen
 b. Li^+
 c. Na
 d. He
46. The orbital with $n = 3$ and $l = 2$ is
 a. $5d$
 b. $3d$
 c. $4d$
 d. $5s$
47. If n and l are respectively the principal and azimuthal quantum numbers, then which of the following expression represent the total number of electrons in any energy level
 a. $\sum_{l=0}^{l=n} 2(2l+1)$
 b. $\sum_{l=1}^{l=n-1} 2(2l+1)$
 c. $\sum_{l=0}^{l=n+1} 2(2l+1)$
 d. $\sum_{l=0}^{l=n-1} 2(2l+1)$
48. Which of the following set of quantum number is not applicable for an electron in an atom?
 a. $n = 2, l = 0, m = 0, s = +1/2$
 b. $n = 1, l = 0, m = 0, s = -1/2$
 c. $n = 1, l = 0, m = 0, s = +1/2$
 d. $n = 1, l = 1, m = 1, s = +1/2$
49. The maximum number of electrons that d -orbital can contain is
 a. 10
 b. 2
 c. 14
 d. 6
50. The shape of the orbital is determined by
 a. spin quantum number
 b. magnetic quantum number
 c. azimuthal quantum number
 d. principal quantum number
51. For the valency electron in copper, the four quantum numbers are
 a. $n = 4, l = 0, m = 0, s = +1/2$
 b. $n = 4, l = 2, m = 2, s = -1/2$
 c. $n = 4, l = -2, m = 2, s = +1/2$
 d. $n = 4, l = 2, m = 0, s = +1/2$
52. What will be the uncertainty in velocity of a cricket ball of 100 g if the uncertainty in its position is $1.65 \text{ \AA}$?
 a. $\frac{10^{-23}}{\pi} \text{ ms}^{-1}$
 b. $\frac{6.6}{\pi} 10^{-45} \text{ ms}^{-1}$
 c. $4.65 \times 10^{-43} \text{ ms}^{-1}$
 d. $\frac{10^{-26}}{\pi} \text{ ms}^{-1}$
53. The electrons, identified by quantum numbers n and l ,
 (i) $n = 4, l = 1$ (ii) $n = 4, l = 0$ (iii) $n = 3, l = 2$
 (iv) $n = 3, l = 1$ can be placed in increasing order of energy, from the lowest to highest, as
 a. (iv) < (ii) < (iii) < (i)
 b. (ii) < (iv) < (i) < (iii)
 c. (i) < (iii) < (ii) < (iv)
 d. (iii) < (i) < (iv) < (ii)
54. An element has atomic number 37. The electronic configuration of the element is
 a. $(2, 8), 3s^2 3p^6 3d^{10}, 4s^2 5s^6 4p^5$
 b. $(2, 8), 3s^2 3p^6 3d^{10}, 4s^2 4p^6, 5s^1$
 c. $(2, 8), 3s^2 3p^6, 4s^2 3d^9 5s^1 4p^5$
 d. None of the above
55. The number of unpaired electrons in ferrous ion is
 a. 5
 b. 2
 c. 4
 d. 3
56. The triad of the nuclei that is isotonic
 a. ${}^{14}_6\text{C}, {}^{14}_7\text{N}, {}^{19}_9\text{F}$
 b. ${}^{14}_6\text{C}, {}^{15}_7\text{N}, {}^{17}_9\text{F}$
 c. ${}^{14}_6\text{C}, {}^{14}_7\text{N}, {}^{17}_9\text{F}$
 d. ${}^{12}_6\text{C}, {}^{14}_7\text{N}, {}^{19}_9\text{F}$
57. In which of the following orbital diagram Aufbau principle is not violated
 a.  
 b.  
 c.  
 d.  
58. Nitrogen has electronic configuration $1s^2 2s^2 2p_x^1 2p_y^1 2p_z^1$. This is because of
 a. Pauli's exclusion principle
 b. $(n+1)$ rule
 c. Hund's rule
 d. Uncertainty principle

BITSAT Archives

- Which of the following relation is incorrect regarding Bohr's theory? [2014]
 - Velocity of electron $\propto \frac{1}{n}$
 - Frequency of revolution $\propto \frac{1}{n^2}$
 - Radius of orbit $\propto n^2/Z$
 - Force on electron $\propto \frac{1}{n^4}$
- Bohr theory is applicable to [2013]

 - 0.36 Å
 - 0.53 Å
 - 0.59 Å
- Which of the following has the largest de-Broglie wavelength, given that all have equal velocity? [2011]
 - CO₂ molecule
 - NH₃ molecule
 - Electron
 - Proton
- The wave number of a spectral line is $5 \times 10^5 \text{ m}^{-1}$. The energy corresponding to this line is [2010]
 - $3.49 \times 10^{-23} \text{ kJ}$
 - $4.45 \times 10^{-24} \text{ J}$
 - $5.50 \times 10^{-22} \text{ J}$
 - $9.93 \times 10^{-23} \text{ kJ}$
- Energy of third orbit of Bohr's atom is [2009]
 - 13.6 eV
 - 3.4 eV
 - 1.5 eV
 - None of these
- An electronic transition in hydrogen atom result in the formation of H α line of hydrogen in Lyman series, the energies associated with the electron in each of the orbits involved in the transition (in kcal mol⁻¹) are [2008]
 - 313.6, -34.84
 - 313.6, -78.4
 - 78.4, -34.84
 - 78.4, -19.6
- The velocities of two particles A and B are 0.05 and 0.02 ms⁻¹ respectively. The mass of B is five times the mass of A. The ratio of their de-Broglie's wavelength is [2008]
 - 2 : 1
 - 1 : 4
 - 1 : 1
 - 4 : 1
- Cr has electronic configuration as [2007]
 - $3s^2 3p^2 3d^4, 4s^1$
 - $3s^2 3p^6 3d^5, 4s^1$
 - $3s^2 3p^6 3d^6$
 - None of these
- The number of waves in an orbit are [2006]
 - n^2
 - n
 - $n-1$
 - $n-2$
- The probability of finding the electron in the orbital is [2006]
 - 100%
 - 90-95%
 - 70-80%
 - 50-60%
- The velocity of electron in first orbit of H-atom as compared to the velocity of light is [2005]
 - $\frac{1}{10}$ th
 - $\frac{1}{100}$ th
 - $\frac{1}{1000}$ th
 - same

Answer with Solutions

Practice Exercise

1. (d)

2. (c)

3. (c) $\lambda = \frac{h}{p}$

where, p = momentum

$$h = \text{Planck's constant} \Rightarrow P = \frac{h}{\lambda} = \frac{h}{c\nu}$$

4. (c) $E = h\nu = \frac{hc}{\lambda} = \frac{6.625 \times 10^{-34} \times 3 \times 10^8}{6500 \times 10^{-10}}$

$$E = 3.06 \times 10^{-19} \text{ J}$$

5. (a) Wave number = $\frac{1}{\lambda}$

$$= \frac{1}{5800 \times 10^{-10} \text{ m}} = 1.724 \times 10^6 / \text{m}$$

6. (b) $\lambda = \frac{c}{\nu} = \frac{3 \times 10^8}{6 \times 10^{16}} = 0.5 \times 10^{-8} \text{ m} = 5 \times 10^{-7} \text{ cm}$

7. (d) Kinetic energy (KE) = $h\nu - W$

$$= \frac{hc}{\lambda} - 4.2 \text{ eV} = \frac{6.62 \times 10^{-34} \times 3 \times 10^8}{2000 \times 10^{-10}} - 4.2 \times 1.6 \times 10^{-19}$$

$$= 9.9 \times 10^{-19} \text{ J} - 6.7 \times 10^{-19} \text{ J} = 3.2 \times 10^{-19} \text{ J}$$

8. (b) $W = h\nu_0$

$$W = \frac{hc}{\lambda_0} = \frac{6.62 \times 10^{-34} \times 3 \times 10^8}{330 \times 10^{-9}} = 6 \times 10^{-19} \text{ J}$$

9. (a) Given, $E = \frac{2.859}{\lambda} \text{ cal/mol}$

$$\lambda = 4 \times 10^{-7}$$

$$E = \frac{2.859 \text{ cal/mol}}{4 \times 10^{-5} \text{ m}} = 71.5 \text{ kcal/mol}$$

10. (a) $E = \frac{hc}{\lambda}$

$$\frac{E_1}{E_2} = \frac{\lambda_2}{\lambda_1} = \frac{4000 \text{ Å}}{2000 \text{ Å}} = 2$$

11. (d) Radiowave has maximum wavelength of the order of 10^2 in metre.

12. (a) According to law of conservation of energy, "Sum of potential energy and kinetic energy remain constant".
Now initially proton starts from rest. Hence, kinetic energy of proton at initial point is zero but it has potential energy.

$$PE = qV$$

$$\text{where, } q = 1.6 \times 10^{-19} \text{ C and } V = 1000 \text{ V}$$

Assuming the proton no longer experiences the potential energy and it is all converted to kinetic energy

$$PE^* = 0, KE^* = \frac{1}{2}mv^2$$

$$\text{Since, } KE + PE = \text{Total energy} = PE^* + KE^*$$

$$qV + 0 = 0 + \frac{1}{2}mv^2 \quad \text{or} \quad KE = qV = 1.6 \times 10^{-16} \text{ J} = 1 \text{ KeV}$$

13. (a) From Bohr postulate

$$mvr = \frac{nh}{2\pi} \quad \text{or} \quad v = \frac{nh}{2\pi mr}$$

$$v = \frac{1 \times 6.625 \times 10^{-34}}{2 \times 3.14 \times 9.1 \times 10^{-31} \times 0.53 \times 10^{-10}} = 2.2 \times 10^6 \text{ m/s}$$

14. (c) Spectra of hydrogen or hydrogen like atoms such as He^+ , Li^{2+} were successfully explained by Bohr's model.

15. (a) $r = \frac{n^2 h^2}{4\pi^2 m Z e^2} = R_0 \frac{n^2}{Z} = 0.529 \frac{n^2}{Z} \text{ Å}$

16. (a) Total energy = $E_n = \frac{1}{2}$ (Potential energy)

$$E_n = \frac{-6.8}{2} = -3.4 \text{ eV}$$

$$\text{We know that, } E_n = -\frac{13.6 \text{ eV}}{n^2}$$

$$-3.4 \text{ eV} = \frac{-13.6 \text{ eV}}{n^2}$$

$$n^2 = 4$$

$$n = 2 \text{ First excited state}$$

17. (a) ($n = 2$) $\rightarrow$ Energy of first excited state = -3.4 eV

($n = 3$) $\rightarrow$ Energy of second excited state = -1.51 eV

18. (d) $\frac{r(\text{H})}{r(\text{Li}^{2+})} = \frac{Z_{\text{Li}^{2+}}}{Z_{\text{H}}}$

$$r(\text{Li}^{2+}) = \frac{Z_{\text{H}}}{Z_{\text{Li}^{2+}}} r_{\text{H}} = \frac{1 \times a}{3} = \frac{a}{3}$$

19. (a) $mvr = \frac{nh}{2\pi}$

$$v = \frac{hn}{2\pi mr}$$

$$\frac{v_1}{v_2} = \frac{r_2}{r_1} \Rightarrow v_2 = \left(\frac{r_1}{r_2}\right) v_1 \Rightarrow v_2 = \frac{1}{4} v_1$$

$$v_2 = \frac{1}{4} \times 2.2 \times 10^8$$

$$v_2 = 0.55 \times 10^8 \text{ cm/s}$$

$$= 5.5 \times 10^7 \text{ cm/s}$$

20. (c) $E \propto \frac{1}{n^2}$

$$\frac{E_1}{E_4} = \frac{(4)^2}{(1)^2}$$

$$E_4 = \frac{E_1}{16}$$

21. (a) $\frac{\text{Volume of nucleus}}{\text{Volume of an atom}} = \text{fraction of atom}$
Volume occupied by nucleus

$$\frac{\frac{4}{3}\pi (10^{-13})^3}{\frac{4}{3}\pi (10^{-8})^3} = 10^{-15}$$

22. (c) Number of electrons in an atom is equal to the number of orbitals.

23. (d) $r = \frac{n^2 h^2}{4\pi^2 m e^2 Z}$

$$n = 1, h = 6.62 \times 10^{-34} \text{ Js}^{-1}$$

$$\therefore r = 0.53 \times 10^{-10} \text{ m} = 0.53 \text{ Å}$$

24. (b) $r = \frac{n^2 h^2}{4\pi^2 m e^2 Z}$, i.e. $r \propto n^2$

25. (a) $E_2 - E_1 = \Delta E = \frac{hc}{\lambda}$

$$\lambda = \frac{hc}{\Delta E} = \frac{6.62 \times 10^{-34} \times 3 \times 10^8}{11.0 \times 1.6 \times 10^{-19}}$$

$$\lambda = 11.25 \times 10^{-7} \text{ m}$$

26. (b) $IE = -E_1$

$$E_1 \text{ for } \text{He}^+ = -19.6 \times 10^{-18} \text{ J atom}^{-1}$$

$$\frac{(E_1)_{\text{He}^+}}{(E_1)_{\text{Li}^{2+}}} = \frac{(Z_{\text{He}^+})^2}{(Z_{\text{Li}^{2+}})^2} \Rightarrow \frac{-19.6 \times 10^{-18}}{(E_1)_{\text{Li}^{2+}}} = \frac{4}{9}$$

$$\text{or } E_1(\text{Li}^{2+}) = \frac{-19.6 \times 9 \times 10^{-18}}{4} = -4.41 \times 10^{-17} \text{ J atom}^{-1}$$

27. (a) $V = \frac{4}{3}\pi r^3$

$$\frac{3V}{4\pi} = r^3 \Rightarrow r = \left(\frac{3V}{4\pi}\right)^{1/3}$$

$$\log r = \frac{1}{3} \log \left[\frac{3V}{4\pi} \right]$$

$$\log r = \frac{1}{3} \log \left[\frac{3 \times 1.23 \times 10^{-23}}{4 \times 3.14} \right]$$

$$28. (b) \frac{1}{\lambda} = 109677 \left[\frac{1}{n_1^2} - \frac{1}{n_2^2} \right] = 6.56 \times 10^{-7} \text{ m}$$

29. (d) Radiations obtained by exciting a substance has dark space between two consecutive lines. This is line spectrum.

30. (a) The lines at the red end belong to Balmer series. These are obtained for jumps to $n=2$ from outer orbits (1st line from $n=3$, 2nd line from $n=4$, 3rd line from $n=5$).

31. (a) According to Balmer equation

$$\begin{aligned} \text{Wave number } (\bar{\nu}) &= 109677 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right) \text{ cm}^{-1} \\ \bar{\nu} &= 109677 \left(\frac{1}{(2)^2} - \frac{1}{(4)^2} \right) \text{ cm}^{-1} \\ &= \frac{109677 \times 3}{16} \text{ cm}^{-1} \\ \lambda &= \frac{1}{\bar{\nu}} = \frac{16}{109677 \times 3} = 4862 \times 10^{-8} \text{ cm} \\ &= 4862 \times 10^{-10} \text{ m} = 4862 \text{ Å} \end{aligned}$$

32. (c) $n_i = 3, n_f = 4$

$$\frac{1}{\lambda} = 109677 \left[\frac{1}{n_i^2} - \frac{1}{n_f^2} \right] = 6856 \times 10^8 (\text{Å})^{-1}$$

33. (a) Violet radiations have a lower wavelength than red radiations.

34. (b) The splitting of spectral lines under the influence of magnetic field is called Zeeman effect.

35. (b) In the influence of electric field the splitting of spectral lines is called Stark effect.

36. (c) The visible part of electromagnetic radiation is 4000 Å to 8000 Å.

37. (d) For first line in Lyman series

$$n_i = 1, n_f = 2$$

$$38. (b) \lambda = \frac{h}{mv} = \frac{h}{\lambda \nu}$$

$$\text{where, } \nu = 3 \times 10^8 \text{ m/s; } h = 6.625 \times 10^{-34} \text{ Js}$$

$$\lambda = 1.54 \times 10^{-10} \text{ m}$$

$$\therefore m = 1.42 \times 10^{-32} \text{ kg}$$

$$39. (a) \Delta x \cdot \Delta p = \frac{h}{4\pi} \text{ or } \Delta x \cdot m \Delta v = \frac{h}{4\pi}$$

$$\begin{aligned} \Delta v &= \frac{h}{4\pi \Delta x m} = \frac{6.626 \times 10^{-34} \text{ Js}}{4 \times 3.14 \times 10^{-5} \text{ m} \times 10^{-2} \text{ kg}} \\ &= 5.2 \times 10^{-28} \text{ m/s} \end{aligned}$$

$$40. (c) p = \frac{h}{\lambda} = \frac{6.62 \times 10^{-34}}{6 \times 10^{-10}}$$

$$p = 1.1 \times 10^{-24} \text{ kg-m/s}$$

41. (a) Moving electron produces both electric and magnetic fields.

42. (c) Electron behaves as a material as well as wave, this was proposed by de-Broglie.

$$\lambda = \frac{h}{mv}$$

43. (d) Electron moves around the nucleus in spherical or elliptical orbits and spins around its own axis.

44. (b) When $l = 3, m = -3, -2, -1, 0, 1, 2, 3$. Each m can have two electrons with opposite spins, thus maximum number of electrons = $2 \times 7 = 14$

45. (a) Both H and He^+ have one electron.

$$46. (b) 3d \text{ orbital } \begin{bmatrix} l=0, 1, 2, 3 \\ =s, p, d, f \end{bmatrix}$$

47. (d) e.g. when $n = 3, l = 0, 1, 2$

$$\begin{aligned} \text{Total electrons} &= \sum_{l=0}^2 2(2l+1) \\ &= 2 + 2[2 \times 1 + 1] + 2[2 \times 2 + 1] \\ &= 2 + 6 + 10 = 18 \text{ electrons} \end{aligned}$$

48. (d) For $n=1, l=1$ not possible

$$\text{Since, } l = 0 \text{ to } (n-1)$$

49. (a) 10 electrons

$$d\text{-orbital } \begin{array}{ccccc} +2 & +1 & 0 & -1 & -2 \\ \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow \end{array}$$

50. (c) The shape of the orbital is determined by azimuthal quantum number.

51. (a) The valence electronic configuration of copper is $3d^{10} 4s^1$

$$\text{Hence, } n=4, l=0, m=0, s=+1/2$$

52. (a) According to Heisenberg uncertainty principle,

$$\Delta x \times m \Delta v = \frac{h}{4\pi}$$

$$1.65 \times 10^{-10} \times \frac{100}{1000} \times \Delta v = \frac{6.625 \times 10^{-34}}{4\pi}$$

$$\Delta v = \frac{6.625 \times 10^{-34+10}}{1.65 \times 4\pi} \times 10 = \frac{10^{-23}}{\pi} \text{ m/s}$$

53. (a) (i) $4p$ (ii) $4s$ (iii) $3d$ (iv) $3p$

$$\text{Order of increasing energy is } 3p < 4s < 3d < 4p$$

54. (b) $\text{Rb} (Z=37); (2, 8), 3s^2 3p^6 3d^{10}, 4s^2 4p^6, 5s^1$

55. (c) Ferrous (Fe^{2+}) ion. Its electronic configuration is d^6 .

$$\begin{array}{cccccc} \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow \end{array}$$

$$\text{Number of unpaired electrons} = 4$$

56. (b) Number of neutrons are

$$\text{C} \longrightarrow 14 - 6 = 8$$

$$\text{N} \longrightarrow 15 - 7 = 8$$

$$\text{F} \longrightarrow 17 - 9 = 8$$

57. (b)

$$58. (c) \text{N} - \begin{array}{ccccc} 1s & 2s & 2p_x & 2p_y & 2p_z \\ \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow \end{array}$$

BITSAT Archives

1. (c) Radius of orbit is directly proportional to ratio of square of principal quantum number and atomic number

i.e. Radius of orbit $\propto \frac{n^2}{Z}$

For H-atom $r_n = \frac{n^2 \times 0.529 \times 10^{-8}}{Z} \text{ cm}$

2. (b) Bohr's theory is applicable to H-like species containing one electron only, e.g. Li^{2+} .
3. (a) The radius of hydrogen atom = 0.53 Å. ${}_3\text{Li}^{2+}$ ion also has only one electron but it has 3 protons in nucleus, hence, its electron feels three times more attraction from nucleus in comparison to hydrogen atom. Thus, the radius of ${}_3\text{Li}^{2+}$ will be

$$= \frac{0.53}{3} = 0.17 \text{ Å}$$

4. (c) $\lambda = h / mv$

For same velocity $\lambda \propto 1/m$

Electron has the least mass, so its wavelength is maximum.

5. (d) Energy $E = \frac{hc}{\lambda} = hc \bar{\nu}$ $\left(\because \bar{\nu} = \frac{1}{\lambda} \right)$
- $$= 6.62 \times 10^{-34} \times 3 \times 10^8 \times 5 \times 10^5$$
- $$= 9.93 \times 10^{-23} \text{ kJ}$$

6. (c) $E_n = \frac{-13.6 Z^2}{n^2} \text{ eV}$

where, Z = atomic number and n = number of orbit

For H, $Z = 1$, and for 3rd orbit $n = 3$

$$\therefore E_3 = -\frac{13.6}{(3)^2} = -\frac{13.6}{9} = -1.5 \text{ eV}$$

7. (b) Energy of an electron in n th orbit,

$$E_n = \frac{2\pi^2 Z^2 e^4}{n^2 h^2}$$

On substituting the values of k , m , e and h , we get

$$E_n = -\frac{2.172 \times 10^{-18} Z^2}{n^2} \text{ J atom}^{-1}$$

$$= \frac{1311.8 Z^2}{n^2} \text{ kJ mol}^{-1} = -\frac{313.52 Z^2}{n^2} \text{ kcal mol}^{-1}$$

[$\therefore 1 \text{ kcal} = 4.184 \text{ kJ}$]

For H-atom,

$$Z = 1$$

For Lyman series,

$$n_1 = 1, n_2 = 2$$

Energy of electron in n_1 orbit

$$= -\frac{313.52 \times (1)^2}{(1)^2} \text{ kcal mol}^{-1}$$

$$= -313.52 \text{ kcal mol}^{-1}$$

$$\approx -313.6 \text{ kcal mol}^{-1}$$

Energy of electron in n_2 orbit

$$= -\frac{313.52 \times (1)^2}{(2)^2} \text{ kcal mol}^{-1}$$

$$= -\frac{313.52}{4} \text{ kcal mol}^{-1}$$

$$= -78.38 \text{ kcal mol}^{-1}$$

8. (a) Given velocity of particle $A = 0.05 \text{ ms}^{-1}$

Velocity of particle $B = 0.02 \text{ ms}^{-1}$

Let the mass of particle $A = x$

$\therefore$ The mass of particle $B = 5x$ de-Broglie's equation is

$$\lambda = \frac{h}{mv}$$

For particle A $\lambda_A = \frac{h}{x \times 0.05} \quad \dots(i)$

For particle B $\lambda_B = \frac{h}{5x \times 0.02} \quad \dots(ii)$

Eq. (i)/(ii) $\frac{\lambda_A}{\lambda_B} = \frac{5x \times 0.02}{x \times 0.05}$

$$\frac{\lambda_A}{\lambda_B} = \frac{2}{1}$$

or $2 : 1$

9. (b) $\text{Cr}(24) = 1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^5, 4s^1$

10. (b) The number of waves in an orbit is equal to n . (principal quantum number)

11. (b) The probability of finding the electron in the orbital is 90-95%.

12. (b)

3

Nuclear Chemistry

Radioactivity

“It is a process in which nuclei of certain elements undergo spontaneous disintegration without excitation by any external means.” And such elements whose atoms disintegrate and emit radiations are called radioactive elements. On applying electric or magnetic field, these radiations were split into three types of rays: α , β and γ -rays.

Comparison of α , β and γ -rays

Properties	α -particle or rays	β -particle or rays	γ -rays
Charge and mass	It carries 2 unit positive charge and 4 unit mass.	It carries 1 unit negative charge and has no mass.	These are electromagnetic rays with very short wavelength (approx. 0.05 Å).
Nature	It is represented as helium nucleus or helium ion, ${}_2\text{He}^4$ or He^{2+} .	It is represented as electron ${}_{-1}e^0$.	It is represented as ${}_0\gamma^0$.
Action of a magnetic field	These are deflected towards the cathode.	These are deflected towards the anode.	These are not deflected.
Velocity	2×10^9 cm/s or 2×10^7 m/s ($\frac{1}{10}$ th of velocity of light).	2.36 to 2.83×10^{10} cm/s or 2.36 to 2.83×10^8 m/s ($\frac{1}{3}$ rd to $\frac{9}{10}$ th of velocity of light)	Same as that of light, 3×10^{10} cm / s or $(3 \times 10^8$ m/s)
Ionising power	Very high, nearly 100 times to that of β -rays.	Low, nearly 100 times to that of γ -rays.	Very low
Effect on ZnS plate	They cause luminescence.	Very little effect.	Very little effect
Penetrating power	Low, easily stopped by air.	100 times to that of α -particles.	10,000 times to that of β -particles.
Kinetic energy	High due to their high mass.	Very less due to their small mass.	Zero
Nature of product	Product obtained by the loss of 1 α -particle has atomic number less by 2 units and mass number less by 4 units, e.g. ${}_y A^n \longrightarrow {}_{y-2} A^{n-4} + {}_2\text{He}^4$	Product obtained by the loss of 1 β -particle has atomic number more by 1 unit, without any change in mass number, e.g. ${}_y A^n \longrightarrow {}_{y+1} A^n + {}_{-1}e^0$	There is no change in the atomic number as well as in mass number, e.g. ${}_y A^n \longrightarrow {}_y A^n + {}_0\gamma^0$

NOTE Rate of radioactive disintegration is independent of temperature, pressure and chemical combination, etc.

Group Displacement Law

It was first stated by Fajans and Soddy in 1913. According to them, “in an α -emission, the parent element will be displaced to a group two places to the left and in a β -emission, it will be displaced to a group one place to the right.”

Disintegration Series

There are four radioactive disintegration series:

- The thorium series ($4n$ series)
- The neptunium series ($4n + 1$ series)
- The uranium series ($4n + 2$ series)
- The actinium series ($4n + 3$ series)

Kinetics of Radioactive Disintegration

The rate of radioactive disintegration is found to decrease with time. Radioactive disintegration is found to follow first order kinetics and hence, for first order radioactive disintegration, the rate constant or specific reaction rate (k or λ) is given by

$$\lambda \text{ or } k = \frac{2.303}{t} \log \frac{N_0}{N} \quad \dots(i)$$

where, N_0 = amount of element at start,

N = amount of element remained after t time

and k = disintegration constant (also denoted by λ)

Half-life Period

Half-life is the period, in which a radioactive element disintegrates to half of its original mass. It is represented by $t_{1/2}$.

when, $t = t_{1/2}$ then, $N = \frac{N_0}{2}$,

Hence,

$$k = \frac{2.303}{t_{1/2}} \log \frac{N_0}{N_0/2}$$

$$= \frac{2.303 \log 2}{t_{1/2}}$$

$$t_{1/2} = \frac{0.693}{k} \quad \dots(ii)$$

Average Life Period

It is the reciprocal of disintegration constant and is represented by t_{av} .

Average life $(t_{av}) = \frac{1}{k} = \frac{t_{1/2}}{0.693} = 1.44 \times t_{1/2} \quad \dots(iii)$

Units of Radioactivity

$$1 \text{ curie} = 3.7 \times 10^{10} \text{ dps}$$

$$1 \text{ rutherford} = 10^6 \text{ dps}$$

Becquerel is the SI unit of radioactivity

$$\text{becquerel} = 1 \text{ dps}$$

Nuclear Stability

The stability of the nucleus is decided by the following factors:

(i) Neutron-Proton Ratio

It has been observed that the stability of nucleus depends upon the neutron to proton ratio (n/p).

It has been found that

- n/p ratio for stable nuclei = 1 (for elements with atomic number ≤ 20) and n/p ratio for stable nuclei > 1 (for elements with atomic number > 20)
- When n/p ratio is higher than the ratio required for stability, the nuclei have the tendency to emit β -rays, i.e. a neutron is converted into proton.
- When n/p ratio is lower than the ratio required for stability, the nuclei increase the ratio either by emitting α -particle or by emitting a positron or by K -electron capture.

(ii) Mass Defect and Binding Energy

Mass of an atom is always less than the sum of masses of its constituent nucleons (neutrons and protons). This loss of mass is called mass defect (Δm). This mass defect, in fact, changes into energy according to Einstein equation

$$E = \Delta m \cdot c^2 \quad \dots(iv)$$

We can calculate the binding energy (BE), if mass defect is known as BE equivalent to ($\Delta m = 1 \text{ amu}$) is 931 MeV.

Hence, $\text{BE} = \Delta m \times 931 \text{ MeV} \quad \dots(v)$

The total binding energy of a nucleus divided by the number of nucleons, is called specific binding energy or binding energy per nucleon. It is denoted by $\bar{B}$.

i.e. $\bar{B} = \frac{\text{Total binding energy of nucleus}}{\text{Number of nucleons}}$

Greater is the value of specific binding energy ($\bar{B}$) of a nucleus, greater is its stability. Nuclei having specific binding energy, ranging from 7.5 – 9.0 MeV per nucleon, are most stable.

Artificial Transmutation

It is defined as the conversion of one element into another or one type of atoms into another. When this conversion is achieved by artificial means, i.e. by means of bombarding with some fundamental particles, it is known as artificial transmutation,

Fundamental particles used in the bombardment of different elements are

α -particle (${}_2\text{He}^4$), proton (${}_1\text{H}^1$), deuteron (${}_1\text{H}^2$) or (${}_1\text{D}^2$) and neutron (${}_0n^1$)

Artificial Radioactivity

Many stable nuclei when bombarded with high speed particles produce unstable nuclei that are radioactive. The radioactivity produced in this manner by artificial means is known as artificial radioactivity or induced radioactivity.

Nuclear Reactions

A nuclear reaction is the process, in which a change in the composition of nucleus occur. It results in the formation of another element. While writing a nuclear reaction, the sum of the mass numbers and atomic numbers should be same on both sides of the reaction.

Nuclear reactions are of various types as given below :

Particle-particle Reactions

In these reactions, bombarding particle (${}_2\text{He}^4$, ${}_0n^1$, ${}_1\text{H}^1$, ${}_1\text{H}^2$, ${}_1\beta^0$, etc.) is absorbed by stable nucleus to become unstable and it emits other particle and form stable nuclei.

Spallation Reactions

In these reactions, a high speed projectile chips a fragment off from a heavier nucleus and a large number of lighter particles are emitted.

Nuclear Fission

In 1939, German scientists, Otto Hahn and F Strassman discovered these type of reactions. They bombarded U-235 nuclei with slow moving neutrons and found that this nucleus splitted into two lighter nuclei with the liberation of three neutrons and a large amount of heat energy, i.e.

Such reactions are called nuclear fission reactions and the energy produced is called nuclear energy. About 199 MeV of energy is released by the fission of one nucleus of uranium.

The source of this nuclear energy is actually mass defect (Δm) occurring in the reaction, which changes into the energy according to Einstein equation.

In this reaction, two or three neutrons are also produced, which split other uranium nuclei. Thus, this reaction goes on increasing and then it is called a chain reaction.

In chain reaction, a huge amount of nuclear energy is obtained which can be used either for destructive purpose or for constructive purpose.

Nuclear Fusion

It is a reaction, in which lighter nuclei combine to form a single heavier nucleus. In this process also, some mass defect changes into energy called nuclear fusion energy.

Nuclear fusion differs from nuclear fission in mainly two respects :

- Unlike nuclear fission, nuclear fusion require very high temperature (of the order of 10^6°C) and high pressure.
- Nuclear fusion reaction cannot be controlled in contrast to nuclear fission.

Thus, nuclear fusion is much hazardous. Hydrogen bomb is based on this reaction. Also the source of solar energy is nuclear fusion reactions between hydrogen nuclei, which is continuously occurring on sun.

Other Important Terms

1. Magic Numbers

The nuclei with protons and/or neutrons equal to 2, 8, 20, 28, 50, 82, and 144 have been found much stable. These numbers are called magic numbers.

2. Packing Fraction (PF)

$$\text{PF} = \frac{\text{Actual isotopic mass} - \text{mass number}}{\text{Mass number}} \times 10^4$$

PF depends upon the manner of packing of the nucleons within the nucleus. Its value can be negative, positive or even zero. Higher the negative PF value, more stable is the nucleus.

NOTE

- Lower the packing fraction, greater is the binding energy per nucleon and hence, greater is the stability.
- Packing fraction is highest for H and least for Fe.

3. Uses of Isotopes

${}_6\text{C}^{14}$ is used for radiocarbon dating. ${}_{92}\text{U}^{238}$ is used for determining age of rocks, earth or an ore, etc. Co-60 is used in the treatment of cancer.

${}_{53}\text{I}^{131}$ is used to detect functioning of thyroid gland. ${}_{11}\text{Na}^{24}$ is used to detect blood clot and position of tumour. Besides these uses, various isotopes are used as radioactive tracers in various fields of research.

4. Age of Old Piece of Wood

$$\lambda = \frac{0.693}{t_{1/2}} = \frac{2.303}{t} \times \log \frac{\text{C}^{14} \text{ in living plants}}{\text{C}^{14} \text{ in dead plants}}$$

where, t = age of wood

and $t_{1/2}$ = half-life of C^{14}

It is determined by uranium-lead method using the formula,

$$\lambda = \frac{0.693}{t_{1/2}}$$

$$= \frac{2.303}{t} \log \frac{(\text{U}^{238} + \text{Pb}^{206})}{\text{U}^{238}}$$

NOTE $206 \text{ g Pb}^{206} \equiv 238 \text{ g U}^{238}$
 $\therefore x \text{ g Pb}^{206} \equiv \left(\frac{238}{206} \times x\right) \text{ g U}^{238}$

6. Relation between Disintegration Per Second and Amount of Substance

$$-\frac{dN}{dt} = \lambda \cdot N, \quad -\frac{dN}{dt} = \lambda \cdot \frac{6.023 \times 10^{23} \times w}{M}$$

where, $-\frac{dN}{dt}$ = number of disintegration per sec.

$$N = 6.023 \times 10^{23} \text{ per gram mole of substance}$$

$$= 6.023 \times 10^{23} \times \frac{w}{M} \text{ atoms}$$

w = weight and M = molecular weight

Practice Exercise

- The nuclear radius as compared to the atomic radius, is of the order of
 - 10^{-2}
 - 10^{-15}
 - 10^{-4}
 - 10^{-8}
- Arrange the following particles in the increasing order of their penetration capacity as the projectiles for artificial transmutation of elements :
Proton (${}_1\text{H}^1$) , alpha particle (${}_2\text{He}^4$), deuteron (${}_1\text{H}^2$), neutron (${}_0n^1$)
 - ${}_2\text{He}^4 < {}_1\text{H}^2 < {}_1\text{H}^1 < {}_0n^1$
 - ${}_1\text{H}^1 < {}_1\text{H}^2 > {}_0n^1 < {}_2\text{He}^4$
 - ${}_1\text{H}^1 < {}_1\text{H}^2 < {}_2\text{He}^4 < {}_0n^1$
 - ${}_0n^1 < {}_1\text{H}^2 < {}_2\text{He}^4 < {}_1\text{H}^2$
- Which of the following radiations is most easily stopped by air?
 - β -rays
 - α -rays
 - X-rays
 - γ -rays
- β -particle is emitted in radioactivity by
 - conversion of proton into neutron
 - from outermost orbit
 - conversion of neutron into proton
 - β -particle is not emitted
- ${}_7\text{N}^{13}$ changes to ${}_6\text{C}^{13}$ by the emission of
 - electron
 - neutron
 - positron
 - proton
- Which of the following processes are feasible?
 - ${}_1\text{p}^1 + {}_0n^1 \longrightarrow {}_1\text{D}^2 + \bar{\nu}$
 - ${}_1\text{H}^1 + {}_{-1}\text{e}^0 \longrightarrow {}_0n^1$
 - ${}_0n^1 \longrightarrow {}_1\text{p}^1 + {}_{-1}\text{e}^0 + \bar{\nu}$
 - None of the above
- ${}_{11}\text{Na}^{24}$ is a radioactive and it decays to
 - ${}_{12}\text{Mg}^{24}$ and β -particles
 - ${}_{11}\text{Na}^{21}$ and neutron
 - ${}_{13}\text{F}^{24}$ and positron
 - ${}_9\text{F}^{20}$ and α -particles
- Loss of β -particle is equivalent to
 - decrease of one neutron only
 - increase of one proton only
 - Both (a) and (b)
 - None of the above
- Which of the following processes cause the emission of X-rays?
 - α -emission
 - γ -emission
 - Positron emission
 - Electron capture
- What will be the product, if ${}_{92}\text{U}^{235}$ emits two α -and one β -particle?
 - ${}_{87}\text{Ac}^{211}$
 - ${}_{89}\text{Ac}^{235}$
 - ${}_{89}\text{Ac}^{225}$
 - ${}_{89}\text{Ac}^{227}$
- In the reaction, $\text{Po} \xrightarrow{-\alpha} \text{Pb} \xrightarrow{-\beta} \text{Bi}$, if Bi belongs to group 15, to which group Po belongs?
 - 13
 - 14
 - 15
 - 16
- Which of the following transformation is not correct?
 - ${}_{33}\text{As}^{75} + {}_2\text{He}^4 \longrightarrow {}_{35}\text{Br}^{78} + {}_0n^1$
 - ${}_3\text{Li}^7 + {}_1\text{H}^1 \longrightarrow {}_4\text{Be}^7 + {}_0n^1$
 - ${}_8\text{O}^{16} + {}_0n^1 \longrightarrow {}_6\text{C}^{14} + {}_2\text{He}^4$
 - ${}_{83}\text{Bi}^{209} + {}_1\text{H}^2 \longrightarrow {}_{84}\text{Po}^{210} + {}_0n^1$
- For the nuclear reaction, ${}_0n^1 \longrightarrow {}_1\text{H}^1 + ?$, the missing nuclide is
 - ${}_{-1}\text{e}^0$
 - ${}_1\text{e}^0$
 - ${}_1\text{H}^2$
 - ${}_2\text{He}^4$
- The end product of the series, starting with ${}_{90}\text{Th}^{232}$, is
 - Pb-208
 - Pb-206
 - Bi-209
 - Pb-207
- The number of α -and β -particles emitted in the nuclear reaction, ${}_{90}\text{Th}^{228} \longrightarrow {}_{83}\text{Bi}^{212}$, respectively are
 - 4 α and 1 β
 - 3 α and 7 β
 - 8 α and 1 β
 - 4 α and 7 β

16. The radioactive disintegration follows the kinetics of
 a. zero order b. first order
 c. second order d. third order
17. The amount of substance that gives 3.7×10^7 dps is
 a. one becquerel b. one curie
 c. one millicurie d. one rutherford
18. The weight of 1 curie ${}_{82}\text{Pb}^{214}$ ($t_{1/2} = 26.8$ min) in grams is
 a. 3.1×10^{-8} g b. 1.55×10^{-8} g
 c. 6.2×10^{-8} g d. 3.1×10^{-10} g
19. Radium has atomic weight 226 and a half-life of 1600 yr. The number of disintegrations produced per second from one gram are
 a. 4.8×10^{10} b. 9.2×10^6 c. 3.7×10^{10} d. zero
20. Only 1/8th of the original amount of a radioactive element remains after 96 min. The value of $t_{1/2}$ of this element is
 a. 12.0 min b. 32.0 min c. 24.0 min d. 48.0 min
21. The half-life of radium is 1600 yr, after how much time will 1 g radium be reduced to 125 mg?
 a. 800 yr b. 1600 yr
 c. 3200 yr d. 4800 yr
22. If one starts with 1 curie of radioactive substance ($t_{1/2} = 12$ h), the activity left after a period of 1 week will be about
 a. 1 curie b. 129 microcurie
 c. 60 microcurie d. 8 millicurie
23. 20 mg of C-14 has a half-life of 5760 yr. 100 mg of sample containing C-14 is reduced to 25 mg in
 a. 57600 yr b. 1440 yr
 c. 17280 yr d. 11520 yr
24. In the case of a radioisotope, the value of $t_{1/2}$ and λ are identical in magnitude. The value of $t_{1/2}$ is
 a. 1/0.693 b. $(0.693)^{1/2}$ c. $\frac{0.693}{2}$ d. 0.693
25. The half-life of a radioactive isotope is 3 h. If the initial mass of the isotope was 300 g, the mass which remained undecayed in 18 h would be
 a. 1.17 g b. 9.36 g
 c. 2.34 g d. 4.68 g
26. The half-life period of a radioactive element is 140 day. After 560 days, 1 g of the element will reduce to
 a. 1/8 g b. 1/16 g
 c. 1/4 g d. 1/2 g
27. If 5 g of a radioactive substance has $t_{1/2} = 14$ h, 10 g of the same substance will have $t_{1/2}$ equal to
 a. 70 h b. 14 h c. 28 h d. 50 h
28. Choose the incorrect one.
 a. 1 curie = $3.7 \times 10^{10} \text{ ds}^{-1}$ b. 1 rutherford = 10^6 ds^{-1}
 c. 1 becquerel = 1 ds^{-1} d. 1 fermi = 10^3 ds^{-1}
29. The decay constant of a radioactive sample is λ . The half-life and mean life of the sample respectively are
 a. $\frac{1}{\lambda}, \frac{\ln 2}{\lambda}$ b. $\frac{\ln 2}{\lambda}, \frac{1}{\lambda}$ c. $\lambda \ln 2, \frac{1}{\lambda}$ d. $\frac{\lambda}{\ln 2}, \frac{1}{\lambda}$
30. Which is the most stable nucleus among these?
 a. ${}_2\text{He}^3$ b. ${}_{11}\text{Na}^{24}$ c. ${}_{83}\text{Bi}^{210}$ d. ${}_{82}\text{Pb}^{207}$
31. Sometimes, the ejection of an α -particle does not completely stabilise the nucleus. In such a case, more α -particles may be emitted. The α -decay
 a. raises the n/p ratio and is often followed by β -emission
 b. lowers the n/p ratio and is often followed by positron emission
 c. raises the n/p ratio and is often followed by neutron emission
 d. lowers the n/p ratio and is often followed by γ -rays emission
32. Which of the following nuclear reaction is incorrect?
 a. ${}_{20}\text{Ca}^{40} + {}_0n^1 \longrightarrow {}_{19}\text{K}^{40} + {}_1\text{H}^1$
 b. ${}_{12}\text{Mg}^{24} + {}_2\text{He}^4 \longrightarrow {}_{14}\text{Si}^{27} + {}_0n^1$
 c. ${}_{48}\text{Cd}^{113} + {}_0n^1 \longrightarrow {}_{48}\text{Cd}^{112} + {}_{-1}\text{e}^0$
 d. ${}_{20}\text{Co}^{43} + {}_2\text{He}^4 \longrightarrow {}_{21}\text{Sc}^{46} + {}_1\text{H}^1$
33. The easily fissionable isotope of uranium is with the number
 a. 236 b. 235 c. 237 d. 238
34. Atom bomb is based on the principle of
 a. carbon dating b. nuclear transformation
 c. nuclear fission d. nuclear fusion
35. The compound used in the enrichment of the uranium in nuclear power plant is
 a. UCl_4 b. $\text{UO}_2(\text{NO}_3)_2$
 c. UF_6 d. U_3O_8
36. If uranium (mass number = 238 and atomic number = 92) emits an α -particle, the product has mass number and atomic number respectively are
 a. 236 and 92 b. 236 and 90
 c. 238 and 90 d. 234 and 90
37. In a nuclear reactor, heavy water is used
 a. to provide high speed neutrons
 b. to increase the speed of neutrons
 c. to capture neutrons produced by nuclear fission
 d. to transfer the heat from the nuclear reactor
38. Which one of the following is an exact example of artificial radioactivity?
 a. ${}_0n^1 + {}_{11}\text{Na}^{23} \longrightarrow {}_{11}\text{Na}^{24} + \gamma$; ${}_{11}\text{Na}^{24} + {}_1\text{H}^1 \longrightarrow {}_{12}\text{Mg}^{24} + {}_0n^1$
 b. ${}_2\text{He}^4 + {}_7\text{N}^{14} \longrightarrow {}_8\text{O}^{17} + {}_1\text{H}^1$; ${}_8\text{O}^{17} + {}_0n^1 \longrightarrow {}_7\text{O}^{18} + \gamma$
 c. ${}_2\text{He}^4 + {}_{13}\text{Al}^{27} \longrightarrow {}_{15}\text{P}^{30} + {}_0n^1$; ${}_{15}\text{P}^{30} \longrightarrow {}_{14}\text{Si}^{30} + {}_1\text{e}^0$
 d. ${}_{89}\text{Ac}^{228} \longrightarrow {}_{90}\text{Th}^{228} + \beta$; ${}_{90}\text{Th}^{228} \longrightarrow {}_{88}\text{Ra}^{224} + \alpha$
39. The function of the cadmium rod in a nuclear reactor is
 a. to produce rays b. to produce neutrons
 c. to absorb neutrons d. to speed up neutrons

40. The nuclear reaction ${}^2_1\text{H} + {}^2_1\text{H} \longrightarrow {}^4_2\text{He}$ is called
 a. fission reaction b. fusion reaction
 c. chain reaction d. thermal reaction

41. Which of the following nuclei is not doubly magic?
 a. ${}^4_2\text{He}$ b. ${}^{16}_8\text{O}$ c. ${}^{208}_{82}\text{Pb}$ d. ${}^{238}_{92}\text{U}$

42. Atom *A* possesses higher values of packing fraction than atom *B*. The relative stabilities of *A* and *B* are
 a. *A* is more stable than *B*
 b. *B* is more stable than *A*
 c. *A* and *B* both are equally stable
 d. Stability does not depend on packing fraction

43. Match the Column I and Column II and pick the correct matching from the codes given below.

Column I	Column II
A. Isotope	1. ${}^{228}_{88}\text{Ra}$ and ${}^{228}_{89}\text{Ac}$
B. Isobar	2. ${}^{39}_{18}\text{Ar}$ and ${}^{40}_{19}\text{K}$
C. Isotone	3. ${}^2_1\text{H}$ and ${}^3_1\text{H}$
D. Isosters	4. ${}^{235}_{92}\text{U}$ and ${}^{231}_{90}\text{Th}$
E. Isodiaphers	5. CO_2 and N_2O

The correct matching is

Codes

	A	B	C	D	E
a.	5	4	1	2	3
b.	3	1	2	5	4
c.	2	1	4	5	3
d.	2	5	1	4	3

44. An isobar of ${}^{40}_{20}\text{Ca}$ is

- a. ${}^{40}_{18}\text{Ar}$ b. ${}^{38}_{20}\text{Ca}$
 c. ${}^{42}_{20}\text{Ca}$ d. ${}^{38}_{18}\text{Ar}$

45. An isotope of ${}^{231}_{90}\text{Th}$ can be converted into ${}^{227}_{90}\text{Th}$ by the emission of

- a. one α -particle
 b. one β -particle
 c. two α and one β -particle
 d. one α and 2 β -particles

46. Nuclides having the same difference in mass number and atomic number, are known as

- a. isotopes b. isobars
 c. isotones d. isomers

47. Which of the following statements is wrong?

- a. P^{32} is used in the treatment of leukemia
 b. I^{131} is used the treatment of thyroid gland cancer
 c. Co^{59} cannot be used in the treatment of cancer
 d. Excessive use radioactive elements is responsible of cancerous growth

48. The isotope of carbon used in radiocarbon dating is

- a. ${}^{12}_6\text{C}$ b. ${}^{13}_6\text{C}$
 c. ${}^{14}_6\text{C}$ d. ${}^{15}_6\text{C}$

49. Which one of the following radioisotopes is used in the treatment of blood cancer?

- a. Na^{24} b. I^{131}
 c. Co^{62} d. P^{32}

50. The proper rays for radio carbon dating are

- a. cosmic rays b. X-rays
 c. UV rays d. IR rays

BITSAT Archives

1. 1 g of U-235 is converted into UF_6 . The radioactivity of UF_6 thus obtained is [2011]

- a. zero
 b. less than that of 1 g of U-235
 c. more than that of 1 g of U-235
 d. same as that of 1 g of U-235

2. A sample of radioactive substance shows an intensity of 2.3 millicurie at a time *t* and an intensity of 1.62 millicurie after 600 s. The half-life period of the radioactive metal is [2010]

- a. 1000 s b. 1187 s c. 1200 s d. 1500 s

3. If the mass defect of ${}^{11}_5\text{B}$ is 0.081 u, its average binding energy (in MeV) is [2008]

- a. 8.60
 b. 6.85
 c. 5.60
 d. 5.86

4. When radioactive minerals like cleveite, monozite and pitch blende are heated to 1273 K in vacuo the noble gas obtained is [2007]

- a. Rn b. Kr
 c. He d. Ne

Answer with Solutions

Practice Exercise

1. (c) The nuclear radius is of the order of 10^{-14} m while that of atom is of the order of 10^{-10} m. Hence,

$$\frac{\text{Nuclear radius}}{\text{Atomic radius}} = \frac{10^{-14}}{10^{-10}} = 10^{-4}$$

2. (a) The penetrating power increases with increase in velocity of particles. Thus, the correct order of penetrating power of given particles is

$${}_0n^1 > {}_1H^1 > {}_1H^2 > {}_2He^4$$

3. (b) α -rays have less penetrating power.
4. (c) It is considered that β -particle is emitted from the nucleus by the conversion of neutron into proton.

5. (c) ${}_7N^{13} \longrightarrow {}_6C^{13} + {}_{+1}e^0$
Positron

Positron is an anti-particle of electron (${}_{-1}e^0$).

6. (c) The electron does not exist in the nucleus but it is formed at the time of emission and indicates as

7. (a) ${}_{11}Na^{24}$ is a radioactive isotope and it decays to ${}_{12}Mg^{24}$ and β -particles, which is shown as

8. (c) ${}_0n^1 \longrightarrow {}_1H^1 + {}_{-1}e^0$

So, it is equivalent to increase of one proton and decrease of one neutron.

9. (d) X-rays are produced when high energy electrons are captured by a metal of high atomic number.

Thus, according to group displacement law, Po belongs to 16 group.

12. (c) Mass number are not balanced in

Therefore, it is not correct transformation

13. (a) ${}_0n^1 \longrightarrow {}_1H^1 + {}_{-1}e^0$

14. (a) ${}_{90}Th^{232}$ is in ($232 = 4 \times 58 = 4n$) series. The end product of this series will be, thus, Pb-208 as ($208 = 4 \times 52 = 4n$).

15. (a) Number of α -particles

$$= \frac{\left(\begin{array}{c} \text{mass number} \\ \text{of emitter} \end{array} - \begin{array}{c} \text{mass number} \\ \text{of end product} \end{array} \right)}{4}$$

$$= \frac{228 - 212}{4} = \frac{16}{4} = 4$$

Number of β -particles = $2 \times \alpha$ -particle

– (difference in atomic number)

$$= 2 \times 4 - (90 - 83) = 8 - 7 = 1$$

Hence, α and β -particles, emitted are 4 and 1 respectively.

16. (b) The radioactive disintegration follows the first order kinetics, for which decay constant is given by

$$\lambda = \frac{2.303}{t} \log \frac{N_0}{N}$$

17. (c) The amount of substance, which give 3.7×10^{10} disintegration per second, is known as 1 curie. Hence,

$$3.7 \times 10^7 \text{ dps} = 1 \text{ millicurie}$$

18. (a) We know that, $\frac{-dN}{dt} = \lambda \frac{6.023 \times 10^{23} \times w}{M}$

$$\text{Here, } \frac{-dN}{dt} = 1 \text{ curie} = 3.7 \times 10^{10} \text{ dps}$$

$$\lambda = \frac{0.693}{t_{1/2}} = \frac{0.693}{26.8 \times 60} \text{ s}^{-1}$$

$$\therefore 3.7 \times 10^{10} = \frac{0.693}{26.8 \times 60} \times \frac{6.023 \times 10^{23} \times w}{214}$$

$$\text{or } w = 3.1 \times 10^{-8} \text{ g}$$

19. (c) Given, $M = 226$, $t_{1/2} = 1600$ yrs, $w = 1$ g

$$\frac{-dN}{dt} = \lambda \frac{6.023 \times 10^{23} \times w}{M} = \frac{0.693}{t_{1/2}} \times \frac{6.023 \times 10^{23} \times 1}{226}$$

$$= \frac{0.693 \times 6.023 \times 10^{23}}{1600 \times 226 \times (365 \times 24 \times 3600)}$$

$$= 3.7 \times 10^{10} \text{ disintegrations per second}$$

20. (b) Given that, $N_0 = 1$, $N = \frac{1}{8}$, $t = 96$ min

$$\text{We know that, } N = N_0 \left(\frac{1}{2} \right)^{\frac{t}{t_{1/2}}} \text{ or } \frac{1}{8} = \left(\frac{1}{2} \right)^{\frac{96}{t_{1/2}}}$$

$$\text{or } \left(\frac{1}{2} \right)^3 = \left(\frac{1}{2} \right)^{\frac{96}{t_{1/2}}} \text{ or } \frac{96}{t_{1/2}} = 3 \text{ or } t_{1/2} = \frac{96}{3} = 32 \text{ min}$$

21. (d) Given, $t_{1/2} = 1600$ yr, $N_0 = 1$ g, $N = 125$ mg = $\frac{125}{1000}$ g

$$\text{We know that, } N = N_0 \left(\frac{1}{2} \right)^{\frac{t}{t_{1/2}}}$$

$$\frac{125}{1000} = \left(\frac{1}{2} \right)^{\frac{t}{1600}}, \left(\frac{1}{8} \right) \text{ or } \left(\frac{1}{2} \right)^3 = \left(\frac{1}{2} \right)^{\frac{t}{1600}}$$

$$\text{Hence, } \frac{t}{1600} = 3 \text{ or } t = 3 \times 1600 = 4800 \text{ yr}$$

22. (c) Given,
- $t_{1/2} = 12$
- h.

$$t = 1 \text{ week} = 7 \times 24 \text{ h}, N = N_0 \left(\frac{1}{2} \right)^{\frac{t}{t_{1/2}}} = 1 \times \left(\frac{1}{2} \right)^{\frac{7 \times 24}{12}}$$

$$= \left(\frac{1}{2} \right)^{14} = 6.1 \times 10^{-5} \text{ curie} = 60 \text{ microcurie}$$

23. (d) Half-life period for a nucleus is a constant quantity. It does not change with amount or mass. Hence,

$$t_{1/2} = 5760 \text{ yr}, N = N_0 \left(\frac{1}{2} \right)^{\frac{t}{t_{1/2}}}$$

$$\frac{25}{100} = \left(\frac{1}{2} \right)^{\frac{t}{5760}} \text{ or } \left(\frac{1}{2} \right)^2 = \left(\frac{1}{2} \right)^{\frac{t}{5760}}$$

$$\therefore \frac{t}{5760} = 2 \text{ or } t = 2 \times 5760 = 11520 \text{ yr}$$

24. (b) We know that,
- $t_{1/2} = \frac{0.693}{k}$
- or
- $(t_{1/2})^2 = 0.693$
- (as,
- $t_{1/2} = k$
-)

$$\text{or } t_{1/2} = (0.693)^{1/2}$$

25. (d)
- $N = N_0 \times \left(\frac{1}{2} \right)^n = 300 \times \left(\frac{1}{2} \right)^6 = 4.68 \text{ g}$

26. (b) Number of half-lives (
- n
-) =
- $\frac{\text{Total time}}{t_{1/2}} = \frac{560}{140} = 4$

$$\text{Amount left} = \left(\frac{1}{2} \right)^n \times \text{Initial amount} = \left(\frac{1}{2} \right)^4 \times 1 \text{ g} = \frac{1}{16} \text{ g}$$

27. (b)
- $t_{1/2} = \frac{0.693}{\lambda}$
- and it is independent of initial amount or mass.

28. (d) The nuclear radius is expressed in fermi (Fm) units.

$$1 \text{ fermi} = 10^{-13} \text{ cm} = 10^{-15} \text{ m}$$

29. (b)
- $t_{1/2} = \frac{\log_e 2}{\lambda}$
- and average life =
- $\frac{1}{\lambda}$

30. (d)
- n/p
- ratio for
- ${}_2\text{He}^3 = \frac{1}{2} = 0.5 (< 1)$

$$n/p \text{ ratio for } {}_{11}\text{Na}^{24} = \frac{13}{11} = 1.19 \text{ (greater than that of stable isotope } {}_{11}\text{Na}^{23})$$

$$n/p \text{ ratio for } {}_{83}\text{Bi}^{210} = \frac{127}{83} = 1.54 (> 1.53)$$

$$n/p \text{ ratio for } {}_{82}\text{Pb}^{207} = \frac{125}{82} = 1.53$$

Hence, ${}_{82}\text{Pb}^{207}$ is the most stable as its n/p ratio lies between the stability range, i.e. (1.00 – 1.53).

31. (a) The
- n/p
- ratio increases in case of
- α
- decay while decreases during
- β
- decay.

32. (c) A nuclear reaction must be balanced in terms of atomic numbers and mass number. Hence, following reaction is unbalanced.

33. (b) The most unstable isotope of uranium is
- ${}_{92}\text{U}^{235}$
- .

34. (c) Atom bomb is based on the principle of nuclear fission.

35. (c) The fuel used in nuclear power plant is enriched in uranium-235 in the form of
- UF_6
- .

36. (d)
- ${}_{92}\text{U}^{238} \longrightarrow {}_{90}\text{Th}^{234} + {}_2\text{He}^4$

37. (d)

38. (c) Nucleus bombarded should be stable and nucleus produced should be radioactive.

39. (c) Cadmium is used to absorb neutron.

40. (b)

41. (d) The magic numbers for protons are 2, 8, 20, 28, 50, 82, 114 and for neutrons are 2, 8, 20, 28, 50, 82, 126, 184, 196.

42. (b) The atom which has lower value of packing fraction is more stable.

43. (b)

44. (a)

45. (d) Isotopes of an element can be obtained by emitting one
- α
- and
- 2β
- particles from its nucleus.

46. (c)

47. (c)

48. (c)

49. (c)
- Co^{62}
- is used in the treatment of blood cancer.

50. (a)

BITSAT Archives

1. (d) Radioactivity does not depend upon the state of combination so it remains unaffected.

2. (b)
- $\frac{N_0}{N} = \frac{2.30}{1.62}$
- , Now,
- $\lambda = \frac{2.303}{600} \log \frac{2.30}{1.62} = 0.000584$

$$\therefore t_{1/2} = \frac{0.693}{\lambda} = \frac{0.693}{0.000584} = 1187 \text{ s}$$

3. (b) Given,
- Δm
- for
- ${}_5\text{B}^{11} = 0.081 \text{ u}$

$$\text{Number of nucleons} = 11$$

$$\text{Binding energy} = 931 \times \Delta m \text{ MeV}$$

$$= 931 \times 0.081 = 75.411 \text{ MeV}$$

$$\text{Average binding energy} = \frac{\text{Binding energy}}{\text{Number of nucleons}}$$

$$= \frac{75.411}{11}$$

$$= 6.85 \text{ MeV}$$

4. (c)

4

Chemical Bonding

Bond or Chemical Bond

A bond is a kind of interatomic, intermolecular or inter-ionic attraction which holds two or more constituents (atoms, molecules or ions) together, e.g. ionic bond, covalent bond etc. It is formed so that the atoms acquire stability.

Valency

The combining capacity of different constituents is called their valency. In case of elements of I A and II A group, it is equal to their group number, i.e. +1 and +2 respectively.

For other elements, it varies from group number to group number – 8,

i.e. Valency = group number to (group number – 8)

Here, group number are in accordance with modern periodic table, e.g. nitrogen an element of group V A, has valency from +5 to –3 (= 5 – 8).

Lewis Octet Rule

The tendency of atoms to acquire 8 electrons in their outermost shell is known as Lewis octet rule.

Exceptions

(a) Incomplete octet BF_3 , BeCl_2 etc.

(b) Octet expansion PCl_5 , BF_6 etc.

Ionic Bonding

Electrons are completely transferred from electropositive element to electronegative element forming charged ions which are held together by strong electrostatic forces.

Conditions Favourable for Ionic Bonding

- The electropositive element should have low ionisation energy.
- The electronegative element should have higher electron affinity.
- Lattice energy should be high.

Lattice Energy

A lattice is a regular arrangement of cations and anions in an ionic crystal. The amount of energy released, when free ions combine to form one mole of a crystal lattice, is known as lattice energy.

Factors affecting of Lattice energy

- Size of ions
- Charge on ions

$$\text{Lattice energy (LE)} = -\frac{NAZ^+Z^-e^2}{r} + \frac{ue^2}{r^n}$$

(Born Lande equation)

where, Z^+ , Z^- are the charges on cation and anion respectively.

e = electronic charge, N = Avogadro's number

r = interionic distance, A = Madelung constant

u = Born exponent

Born Haber Cycle

e.g. Formation of NaCl

More is the negative value of ΔH_{form} , more stable will be the compound.

Characteristics of Ionic Compounds

- They are crystalline in nature with 3-D solid aggregates due to non-directional force of attraction.
- They are good conductors of electricity and heat, but only in aqueous phase or molten state. In solid state, there is no free electron.
- They have very high melting and boiling point.
- They are soluble in polar solvents.
- Ionic reactions are very fast due to presence of ions.

Covalent Bonds

Such chemical bonds are formed by sharing of electrons between the elements of almost same electronegativity or between the elements having less difference in electronegativity.

e.g. Formation of O_2 molecule

Dipole Moment (μ)

$$\mu = q \times d$$

where, q = charge

and d = distance between positive and negative charges

Unit $\rightarrow$ Debye, $1 D = 10^{-18}$ esu cm

In symmetric molecules, $\mu = 0$

Higher the value of μ , more is the polarity of bond.

$$\% \text{ Ionic character} = \frac{\text{Observed } \mu}{\text{Calculated } \mu} \times 100$$

Covalency $\rightarrow$ number of electrons contributed by an elements

e.g. Formation of Cl_2 molecule

Formation of CO_2 $\longrightarrow$ molecule

The above structures are known as electron-dot structures or Lewis structure.

Properties of Covalent Compound

- They generally exist in gaseous or liquid form or sometimes as soft solids (e.g. S, P etc). Sometimes, they exist as hard solids, e.g. SiC, BN etc.
- They have low boiling point and melting point except some covalent solids such as SiC, diamond, SiO_2 etc.
- In general, covalent compounds are bad conductors of heat and electricity due to the absence of ions or free electrons. An exception is graphite, since in graphite, electrons can pass from one layer to another.
- Non-polar covalent compounds are soluble in non-polar solvents such as CCl_4 , C_6H_6 , CS_2 etc.
- Covalent substances show slower chemical reactions.
- Covalent substances show isomerism.

Fajan's Rule

The partial covalent character of an ionic bond has been explained by Fajan as follows:

When a cation approaches an anion, the electrons cloud of the anion is deformed which is called polarisation. Greater the polarisation, more is the covalent character.

Covalent character $\propto$ polarising power of cation

$$\propto \frac{1}{\text{size of cation}}$$

Polarisability of anion $\propto$ size of anion

Coordinate Covalent (Dative) Bond

A bond in which complete pair of shared electrons is contributed by the same element. Atom contributing its extra electron pair is called donor while other atom is called acceptor and the bond is represented by an arrow ($\rightarrow$) from donor to acceptor.

Theories Developed for Covalent Bonding

1. Valence Bond Theory (VBT)

(Given by Heitler and London)

It explains bond formation in terms of overlapping of orbitals, e.g. the formation of H_2 molecule from two hydrogen atoms involves the overlap of 1s-orbital of two H-atoms which are singly occupied.

Because of orbital overlap, electron density between the nuclei increases which helps in bringing them closer.

The overlapping of orbitals may results in two types of bonds given below:

Sigma (σ) Bond

It is the result of end to end overlapping or axial overlapping between s-s, p-p, s-p orbitals, e.g. single bond.

The electron density accumulates between the centres of the atoms being bonded.

Pi (π) Bond

It is formed by incomplete, sidewise or parallel overlapping of orbitals.

Double bond has one σ -bond and one π -bond. Triple bond has two π -bonds and one σ -bond.

2. Valence Shell Electron Pair Repulsion Theory (VSEPR theory)

Main Postulates

- In polyatomic molecules, one atom is called central atom to which all other atoms (or group of atoms) are linked.
- The shape of any molecule depends upon the total number of valence shell electron pairs on central atom.
- If all the atoms linked to central atom (having no lone pair) are same then molecule is symmetrical.
- The relative order of repulsion is as follows:

Concept of Hybridisation

(Involving s, p, d and f-orbitals)

Intermixing of orbitals of almost similar energy belonging to the same atom to form same number of orbitals of exactly equal energy is known as hybridisation. The new orbital thus formed are known as hybrid orbitals.

Features of Hybridisation

Only valence shell atomic orbitals of an atom or ion takes part in hybridisation. Types of hybridisation along with geometry and bond angles are listed below.

Types of Hybridisation

Number of hybrid orbitals	Hybridisation	Geometry	Bond angle
2	sp	Linear	180°
3	sp^2	Triangular planar	120°
4	sp^3 dsp^2	Tetrahedral Square planar	109.5° 90°
5	sp^3d	Trigonal bipyramidal	$120^\circ, 90^\circ$
6	sp^3d^2 or d^2sp^3	Octahedral	90°
7	sp^3d^3	Pentagonal bipyramidal	$72^\circ, 90^\circ$

The hybridisation of the molecule can be determined by

$$H = \frac{1}{2}[V + Y - C + A]$$

where, V = valence shell electrons of the central metal

Y = number of monovalent atoms

C = total positive charge

A = total negative charge on the molecule

H	2	3	4	5	6	7
Hybridisation	sp	sp^2	sp^3	sp^3d	sp^3d^2	sp^3d^3

Resonance

Single Lewis structure of some molecules is not adequate to explain the properties. Hence, the molecule could be represented by more than one structural molecule. These structure having similar energy are called resonance structures.

e.g. CO_3^{2-} (carbonate ion) can be represented as

I, II and III are resonating structures of CO_3^{2-} ion. The structure IV is known as resonance hybrid which describes the structure of CO_3^{2-} more accurately.

3. Molecular Orbital Theory (1932 Mulliken and Hund)

When the atoms to be bonded come close together, the orbitals of the bonded atoms lose their individual character and overlap to form larger orbitals called molecular orbitals, in which electrons move under the influence of many nuclei. Molecular Orbitals (MO) possess different energy levels and their shapes depend on the atomic orbitals from which they are formed. The combining orbitals must be of comparable energy and should overlap to a larger extent. The filling of electrons in molecular orbital is governed by Aufbau principle, Hund's rule and Pauli's exclusion principle.

Formation of bonding and antibonding molecular orbitals A sigma molecular orbital has cylindrical symmetry around the internuclear axis and has no nodal plane along this axis.

When atomic orbitals overlap laterally, the resulting molecular orbital energetic is called a π -molecular orbital. It has no cylindrical symmetry and contains a nodal plane along the internuclear axis. π -orbital is more energetic than σ -orbital.

Relative Energy of MO

Case I Total $e^- \leq 14$

$$\begin{aligned}\sigma 1s &< \sigma^* 1s < \sigma 2s < \sigma^* 2s < \pi 2p_y \\ &= \pi 2p_z < \sigma 2p_x < \pi^* 2p_y = \pi^* 2p_z < \sigma^* 2p_x\end{aligned}$$

Case II Total $e^- > 14$

$$\begin{aligned}\sigma 1s &< \sigma^* 1s < \sigma 2s < \sigma^* 2s < \sigma 2p_x < \pi 2p_z \\ &= \pi 2p_y < \pi^* 2p_z = \pi^* 2p_y < \sigma^* 2p_x\end{aligned}$$

$$\begin{aligned}\text{Bond order} &= \frac{1}{2} (\text{number of electrons in bonding orbitals} \\ &\quad - \text{number of electrons in anti-bonding orbitals}) \\ &= \frac{1}{2}(N_b - N_a)\end{aligned}$$

If there are unpaired electrons in any molecular orbitals, then the substance is paramagnetic otherwise it is diamagnetic. If $N_b \leq N_a$, the molecule is unstable.

e.g. (a) He_2

Total electrons = 4

Molecular orbital electronic configuration = $\sigma 1s^2 \sigma^* 1s^2$

$$\text{Bond order} = \frac{1}{2}(2 - 2) = 0 \text{ (cannot exist)}$$

(b) O_2

Total electrons = 16

Molecular orbital electronic configuration

$$\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \sigma 2p_x^2 \pi 2p_y^2 \pi 2p_z^2 < \pi^* 2p_y^1 \pi^* 2p_z^1$$

$$\text{Bond order} = \frac{1}{2}(10 - 6) = 2$$

O_2 is paramagnetic molecule as it contains unpaired electrons.

Non-Bonding Combination of AOs

In such an overlap of AOs, any stabilisation due to positive-positive combination is destabilised by an equal amount of positive negative overlap.

Metallic Bond

Attraction between the metallic cations and the mobile electrons which hold the crystal together, is known as metallic bond.

Some properties of metals are :

Metallic luster, electrical conductivity, thermal conductivity, malleability, ductility, high tensile strength etc.

Some Weaker Bonds

Hydrogen bond

It can be defined as the attractive force which binds hydrogen atom of one molecule with the electronegative atom (F, O or N) of another molecule. Cl has some electronegativity as nitrogen but it does not form strong H-bonds due to its large size.

Strong H-bond exist in KHF_2 .

1. Intermolecular hydrogen bond

2. Intramolecular hydrogen bond

Effects of hydrogen bond

- (a) Association
- (b) High melting point and boiling point
- (c) Solubility in water
- (d) Viscosity and surface tension

van der Waals' Forces

These are effective only in non-polar molecules.

$$\begin{aligned} \text{van der Waals' force} &\propto \text{molecular weight} \\ &\propto \text{number of electrons} \\ &\propto \text{atomic weight} \end{aligned}$$

$$\text{Boiling point} \propto \text{van der Waals' forces}$$

NOTE The relative strength of various bond is as follows:

$$\text{Ionic bond} > \text{covalent} > \text{metallic} > \text{hydrogen bond} > \text{van der Waals' forces}$$

Practice Exercise

- Which of the following is not correct?
 - $\text{Na}^+ + \text{Cl}^- \longrightarrow \text{NaCl}$
 - $\text{Ca}^{2+} + 2\text{F}^- \longrightarrow \text{CaF}_2$
 - $\text{Na}^+ + \text{F}^- \longrightarrow \text{NaF}$
 - $\text{Ca}^+ + 2\text{Na}^+ \longrightarrow \text{CaNa}_2$
- Which postulation provide the basic for the modern concepts regarding ion formation by electron transfer and the formation of ionic crystalline compounds?
 - Kossel's postulations
 - Langmuir's postulations
 - Newton's postulations
 - Lewis postulations
- In chlorine atom, how many electrons are short of the argon configuration?
 - One
 - Two
 - Three
 - Four
- Which is not paramagnetic?
 - O_2
 - O_2^+
 - O_2^-
 - O_2^{2-}
- Which of the following is the weakest bond?
 - Hydrogen bond
 - Covalent bond
 - Ionic bond
 - Metallic bond
- Which of the following compounds has the smallest bond angle?
 - H_2O
 - H_2S
 - NH_3
 - CO_2
- The molecule which contains ionic as well as covalent bond, is
 - NH_4Cl
 - H_2O
 - CaCl_2
 - CCl_4
- Consider the following Lewis structure of HNO_3 ,

The formal charge on $O_{(1)}$, $O_{(2)}$ and $O_{(3)}$ are given in column II. Match the following and choose the correct option from the codes given below.

Column I		Column II	
A.	O_1	1.	Zero
B.	O_2	2.	-1
C.	O_3	3.	+3

Codes

	A	B	C
a.	1	2	3
b.	2	1	2
c.	1	1	2
d.	3	2	1

9. Which one has covalent as well as ionic valency?
a. NaCl b. HCl c. H₂O d. NaOH
10. In NO₃⁻ ion, the number of bond pairs and lone pairs of electrons on nitrogen atom respectively are
a. 2 and 2 b. 3 and 1 c. 1 and 3 d. 4 and 0
11. Which one of the following contains both ionic and covalent bonds?
a. C₆H₅Cl b. H₂O
c. NaOH d. CO₂
12. Lewis dot structures of CO, NO₂⁻ and CO₃²⁻ are I, II and III respectively given below.

Which of these structure(s) is/are wrong?

- a. Only I
c. Only III
- b. Only II
d. I, II and III
- In the following electron dot structure, calculate the formal charge from left to right nitrogen atom respectively :
- $$\begin{array}{c} \cdot\cdot \\ \cdot\cdot \end{array} \text{N} = \text{N} = \begin{array}{c} \cdot\cdot \\ \cdot\cdot \end{array}$$
- a. -1, -1 and +1
b. -1, +1 and -1
c. +1, -1 and -1
d. +1, -1 and +1
- Lattice energy of a solid increases if
- a. size of ions is small
b. charges of ions are small
c. ions are neutral
d. None of the above
- If the electronic configuration of an element is $1s^2 2s^2 2p^6 3s^2 3p^6 3d^2 4s^2$, four electrons involved in chemical bond formation will be.....
- a. $3p^6$
c. $3p^6, 3d^2$
- b. $3p^6, 4s^2$
d. $3d^2, 4s^2$
- The electronic configuration of the outermost shell of the most electronegative element is
- a. $2s^2 2p^5$
c. $4s^2 4p^5$
- b. $3s^2 3p^5$
d. $5s^2 5p^5$
- An electronic arrangement is said to be stable if its outer shell consists
- a. doublet of electrons
c. octet of electrons
- b. triplet of electrons
d. singlet of electron

18. Which is the most covalent?
 a. C—F b. C—O
 c. C—S d. C—Br
19. Which of the following molecules is correct regarding BeCl_2 ?
 a. It violates octet rule and has sp^2 -hybridisation
 b. It has sp -hybridisation and follow octet rule
 c. It violates octet rule and has linear structure
 d. All of the above are true
20. The correct order of increasing covalent character of the following is
 a. $\text{SiCl}_4 < \text{AlCl}_3 < \text{CaCl}_2 < \text{KCl}$
 b. $\text{KCl} < \text{CaCl}_2 < \text{AlCl}_3 < \text{SiCl}_4$
 c. $\text{AlCl}_3 < \text{CaCl}_2 < \text{KCl} < \text{SiCl}_4$
 d. None of the above
21. The metallic lustre exhibited by sodium is explained by
 a. diffusion of sodium ions
 b. excitation of free protons
 c. oscillation of loose electrons
 d. existence of body centred cubic lattice
22. Arrange the following ionic compounds in order of increasing ionic character:

- a. $A < B < C < D$
 b. $D < C < B < A$
 c. $B < A < C < D$
 d. $C < A < B < D$
23. Consider the Born-Haber cycle for the formation of an ionic compound given below.

Here, Z refers to

- a. $M^+X^-(l)$ b. $M^+X^-(s)$
 c. MX_2 d. $M^+X^-(g)$
24. Which of the following structures is/are correct?

- a. I, II and IV b. II, III and IV
 c. II and III d. I, II, III and IV

25. In which of the following molecule/ion, all the bonds are not equal?
 a. XeF_4 b. BF_4^-
 c. C_2H_4 d. SiF_4
26. If the electronegativity difference between two atoms A and B is 2.0, then the percentage of covalent character in the molecule is
 a. 54% b. 46%
 c. 23% d. 72%
27. Which of the following is a favourable factor for cation formation?
 a. Low ionisation potential
 b. High electron affinity
 c. High electron negativity
 d. Small atomic size
28. Match the reaction given in Column I with enthalpy in Column II and choose the correct option from the codes given below.

Column I	Column II
A. $\text{Mg} \longrightarrow \text{Mg}^{2+} + 2e^-$	1. Electron gain enthalpy
B. $\text{O} \longrightarrow \text{O}^{2-} - 2e^-$	2. Ionisation enthalpy
C. $M(g) \longrightarrow M^+(g) + e^-$	
D. $X(g) \longrightarrow X^-(g) - e^-$	

Codes

	A	B	C	D
a.	1	2	1	2
b.	2	1	2	1
c.	1	1	2	2
d.	2	2	1	1

29. In the formation of a molecule, only the outer shell electrons take part in chemical combination and are known as
 a. valence electrons
 b. inner electrons
 c. inert electrons
 d. reactive electrons
30. How many double bonds are present in carbon dioxide molecule?
 a. One b. Two c. Three d. Four
31. Which of the following hybridisations is not possible?
 a. sp^3
 b. sp^3d^3
 c. sd^3
 d. None of the above
32. The hybridisation of atomic orbitals of nitrogen in NO_2^+ , NO_3^- and NH_4^+ respectively are
 a. sp^2, sp^3 and sp^2
 b. sp, sp^2 and sp^3
 c. sp^2, sp and sp^3
 d. sp^2, sp^3 and sp

33. What is the type of hybridisation of carbon atoms marked with star?

- a. sp^2 and sp b. sp^2 and sp^2
c. sp and sp^2 d. None of these
34. Among the three molecules XeF_4 , SF_4 , SiF_4 , which has/have tetrahedral structure?
a. All three b. SiF_4 and SF_4
c. Only SiF_4 d. Only SF_4
35. What is the structure of XeF_6 ?
a. Tetrahedral b. Distorted octahedral
c. Octahedral d. None of these
36. Which of the molecules has trigonal bipyramidal geometry with bond angles 120° and 90° ?
a. SF_6 b. PCl_5 c. CH_4 d. BF_3
37. Which of the following species has tetrahedral geometry?
a. BH_4^- b. NH_2^-
c. CO_3^{2-} d. H_3O^+
38. The species having pyramidal shape is
a. SO_3 b. BrF_3 c. SiO_3^{2-} d. OSF_2
39. Which of the following molecules have same molecular geometry?
I. CH_4 II. BF_3 III. NH_4^+ IV. SF_4
a. I and II b. III and IV
c. I and III d. I, III and IV
40. The structure of IF_7 is
a. square pyramidal b. trigonal bipyramidal
c. octahedral d. pentagonal bipyramidal
41. Based on VSEPR theory, the number of 90° degree $\text{F}-\text{Br}-\text{F}$ angles in BrF_5 , is
a. 0 b. 1 c. 2 d. 3
42. A σ -bonded molecule MX_3 is T-shaped. The number of non-bonding pairs of electrons is
a. 0
b. 2
c. 1
d. Can be predicted only if atomic number of M is known
43. An atom X has three valence electrons and atom Y has six valence electrons. The compound formed between them will have the formula
a. X_2Y_6 b. XY_2 c. X_2Y_3 d. X_3Y_2

44. The number of oxygen atoms bonded to one phosphorus atom in P_4O_6 is
a. 4 b. 3
c. 6 d. 5

45. In PO_4^{3-} ion, the formal charge on the oxygen atom of $\text{P}-\text{O}$ bond is
a. +1 b. -1 c. -0.75 d. +0.75

46. Which of the following is not the correct representation of resonance?

- a. Only I b. Only II
c. Both I and II d. None of these
47. Which of the following molecules represent the resonance?
a. O_3 b. CO_3^{2-}
c. CO_2 d. All of these
48. The structure represents the molecules more accurately, is called
a. resonance hybrid b. canonical structure
c. resonating structure d. None of these
49. Match the following columns and choose the correct option from the codes given below.

Column I		Column II	
A.	BeCl_2	1.	Linear
B.	BF_3	2.	Trigonal planar
C.	CO_2		

Codes

	A	B	C		A	B	C
a.	1	1	2	b.	2	2	1
c.	1	2	1	d.	2	1	2

50. The compound MX_4 is tetrahedral. The number of $\angle \text{XMX}$ angles formed in the compound is
a. three b. four c. five d. six
51. In accordance to molecular theory,
a. O_2^+ is diamagnetic and bond order is more than O_2
b. O_2^+ is diamagnetic and bond order is less than O_2
c. O_2^+ is paramagnetic and bond order is less than O_2
d. O_2^+ is paramagnetic and bond order is more than O_2
52. Which bond angle, θ would result in the maximum dipole moment for a triatomic molecule XY_2 as shown below?

- a. $\theta = 90^\circ$ b. $\theta = 120^\circ$
c. $\theta = 150^\circ$ d. $\theta = 180^\circ$

53. The bond angles of NH_3 , NH_4^+ and NH_2^- are in the order

a. $\text{NH}_2^- > \text{NH}_3 > \text{NH}_4^+$ b. $\text{NH}_4^+ > \text{NH}_3 > \text{NH}_2^-$
 c. $\text{NH}_3 > \text{NH}_2^- > \text{NH}_4^+$ d. $\text{NH}_3 > \text{NH}_4^+ > \text{NH}_2^-$

54. The molecule having zero dipole moment is

a. ClF_3 b. CH_4 c. PH_3 d. CH_2Cl_2

55. Which of the following show correct structure of ICl_2 ?

d. None of these

56. The net dipole moment of H_2O molecule is

a. zero b. 1.85 D
 c. 4.90×10^{-30} cm d. 0.80×10^{-30} cm

57. Deviation of O—O bond length in ozone molecule from the normal bond length seems as

a. single bond length increases while double bond length decreases
 b. single bond length decreases while double bond length increases
 c. single bond length increases while double bond length remains same
 d. single bond length remains same while double bond length increases

58. The decreasing order of dipole moments of the molecules HF , H_2O , BeF_2 , NF_3 is

a. $\text{HF} > \text{H}_2\text{O} > \text{BeF}_2 > \text{NF}_3$
 b. $\text{H}_2\text{O} > \text{HF} > \text{NF}_3 > \text{BeF}_2$
 c. $\text{BeF}_2 > \text{NF}_3 > \text{HF} > \text{H}_2\text{O}$
 d. $\text{NF}_3 > \text{BeF}_2 > \text{H}_2\text{O} > \text{HF}$

59. Which of the following will have largest dipole moment?

60. Which one of the following pairs of molecules will have permanent dipole moments for both the members?

a. SiF_4 and NO_2 b. NO_2 and CO_2
 c. NO_2 and O_3 d. SiF_4 and CO_2

61. The correct stability order of the following resonance structure is

a. $\text{I} > \text{II} > \text{IV} > \text{III}$ b. $\text{I} > \text{III} > \text{II} > \text{IV}$
 c. $\text{II} > \text{I} > \text{III} > \text{IV}$ d. $\text{III} > \text{I} > \text{IV} > \text{II}$

62. The correct order of bond angles in NH_3 , PCl_3 and BCl_3 is

a. $\text{PCl}_3 > \text{NH}_3 > \text{BCl}_3$ b. $\text{NH}_3 > \text{BCl}_3 > \text{PCl}_3$
 c. $\text{NH}_3 > \text{PCl}_3 > \text{BCl}_3$ d. $\text{BCl}_3 > \text{NH}_3 > \text{PCl}_3$

63. The correct order of decreasing polarity is

a. $\text{HF} > \text{SO}_2 > \text{H}_2\text{O} > \text{NH}_3$
 b. $\text{HF} > \text{H}_2\text{O} > \text{SO}_2 > \text{NH}_3$
 c. $\text{HF} > \text{NH}_3 > \text{SO}_2 > \text{H}_2\text{O}$
 d. $\text{H}_2\text{O} > \text{NH}_3 > \text{SO}_2 > \text{HF}$

64. In case of sodium and chlorine, the electron transfer takes place from

a. sodium to chlorine b. chlorine to sodium
 c. Both (a) and (b) d. None of these

65. The bond order of superoxide ion O_2^{2-} is

a. 2.5 b. 1.5 c. 1.0 d. 2

66. AlCl_3 is covalent while AlF_3 is ionic. This can be justified on the basis of

a. valence bond theory b. crystal structure
 c. lattice energy d. Fajan's rule

67. VSEPR theory was proposed by

a. Pauling b. Sidgwick and Powell
 c. Hund and Mulliken d. GN Lewis

68. The bond order of O_2^- is

a. 2 b. 1.5 c. 1 d. 2.5

69. In the case of Cl_2 , the bond is formed by

a. transfer of electrons b. sharing of electrons
 c. Both (a) and (b) d. None of the above

70. Match the following species with chemical formula and choose the correct option from the codes given below.

Column I		Column II	
A.	Compounds	1.	NH_4^+
B.	Atoms	2.	H_2O
C.	Ions	3.	Li_2O
		4.	Ne
		5.	Li^+

Codes

A	B	C	A	B	C
a. 2,3	4	1,5	b. 3	1,2	4,5
c. 2	3,1	4,5	c. 1	2,3	4,5

71. Sodium chloride is soluble in water but not in benzene because
- $\Delta H_{\text{hydration}} < \Delta H_{\text{lattice}}$ (in water)
 $\Delta H_{\text{hydration}} > \Delta H_{\text{lattice}}$ (in benzene)
 - $\Delta H_{\text{hydration}} < \Delta H_{\text{lattice}}$ (in benzene)
 $\Delta H_{\text{hydration}} > \Delta H_{\text{lattice}}$ (in water)
 - $\Delta H_{\text{hydration}} = \Delta H_{\text{lattice}}$ (in water)
 $\Delta H_{\text{hydration}} < \Delta H_{\text{lattice}}$ (in benzene)
 - $\Delta H_{\text{hydration}} < \Delta H_{\text{lattice}}$ (in water)
 $\Delta H_{\text{hydration}} = \Delta H_{\text{lattice}}$ (in benzene)
72. Which of the following bonds is present in BF_4^- ?
- Electrovalent
 - Metallic
 - Dative
 - Hydrogen
73. KF combines with HF to form KHF_2 . The compound contains the species
- K^+ , F^- and H^+
 - K^+ , F^- and HF
 - K^+ and $[\text{HF}_2]^-$
 - $[\text{KHF}]^+$ and F_2
74. Among the following, choose the correct pair which is isostructural and isoelectronic?
- NO_3^- , CO_3^{2-}
 - SO_3 , NO_3^-
 - ClO_3^- , CO_3^{2-}
 - CO_3^{2-} , ClO_3^-
75. When two atoms share two electron pairs, they are said to be joined by a
- single bond
 - double bond
 - triple bond
 - None of these
76. Which of the following molecules have same bond order?
- | | | | | |
|--------------|---------------|-------------|---------------|--------------|
| H_2 | Cl_2 | CO | Br_2 | N_2 |
| I | II | III | IV | V |
- I, II and IV have same bond order
 - III and V have same bond order
 - Both (a) and (b)
 - None of the above
77. An ionic solid is poor conductor of electricity because
- ions do not conduct electricity
 - charge on the ions is uniformly distributed
 - ions have uniform field of influence around it
 - ion occupy fixed position in solids
78. The molecule having one unpaired electron is
- NO
 - CO
 - CN^-
 - CO_2
79. How many corners of a cube would be occupied in the case of noble gas?
- 1
 - 2
 - 4
 - 8
80. The noble gases have a particularly stable outer shell electronic configuration represented as
- ns^2np^6
 - ns^2np^5
 - ns^2np^4
 - ns^2np^8
81. Which of the following has a linear structure?
- CCl_4
 - SO_2
 - C_2H_2
 - C_2H_4
82. In XeF_2 , XeF_4 and XeF_6 , the number of lone pairs of Xe respectively are
- 2, 3 and 1
 - 1, 2 and 3
 - 4, 1 and 2
 - 3, 2 and 1
83. The largest bond angle is in
- AsH_3
 - NH_3
 - H_2O
 - PH_3
84. If the bond enthalpy of O_2 , N_2 and H_2 are 498, 946 and 435.8 kJ mol^{-1} respectively. Choose the correct order of decreasing bond strength.
- $\text{H}_2 > \text{N}_2 > \text{O}_2$
 - $\text{N}_2 > \text{O}_2 > \text{H}_2$
 - $\text{O}_2 > \text{H}_2 > \text{N}_2$
 - $\text{H}_2 > \text{O}_2 > \text{N}_2$
85. The one which has no coordinate bond, is
- HNO_3
 - CO
 - CO_3^{2-}
 - CH_3-NC
86. For the given two compounds, vapour pressure of B at a particular temperature is expected to be

- higher than that of A
- lower than that of A
- same as that of A
- Can be higher or lower depending upon the size of the vessel

BITSAT Archives

- Which of the following pairs has identical shape?
 - CH_4 and SF_4
 - BCl_3 and ClF_3
 - XeF_2 and ZnCl_2
 - SO_2 and CO_2
 [2014]
- Using MOT, which of the following pairs denote paramagnetic species?
 - B_2 and C_2
 - B_2 and O_2
 - N_2 and C_2
 - O_2 and O_2^{2-}
 [2013]
- Which of the following is isoelectronic with carbon?
 - Na^+
 - Al^{3+}
 - O^{2-}
 - N^+
 [2012]
- Which of the following does not contain any coordinate bond?
 - H_3O^+
 - BF_4^-
 - HF_2^-
 - NH_4^+
 [2011]
- The number of unpaired electrons in nickel carbonyl, is
 - zero
 - one
 - four
 - five
 [2011]
- The highest bond strength is shown by
 - O—O bond
 - S—S bond
 - Se—Se bond
 - Te—Te bond
 [2010]

7. Which of the following has maximum dipole moment?
a. NCl_3 b. NBr_3 c. NH_3 d. NI_3 [2009]
8. Which of the following has giant covalent structure?
a. NaCl b. SiO_2 c. AlCl_3 d. PbO_2 [2009]
9. Which one of the following species has the largest internuclear distance for its ion pair? [2009]
a. NaCl b. NaBr c. LiCl d. KI
10. The pair of species with similar shape is [2009]
a. $\text{PCl}_3, \text{NH}_3$ b. CF_4, SF_4 c. $\text{PbCl}_2, \text{CO}_2$ d. PF_5, IF_5
11. The bond length of HCl molecule is $1.275 \text{ \AA}$ and its dipole moment is 1.03 D . The ionic character of the molecule (in per cent) is
(Charge of the electron = $4.8 \times 10^{-10} \text{ esu}$) [2008]
a. 100 b. 67.3 c. 33.66 d. 16.83
12. Which of the following is a correct set? [2008]
a. $\text{H}_2\text{O}, sp^3$, angular
b. BCl_3, sp^3 , angular
c. NH_4^+, dsp^2 , square planar
d. CH_4, dsp^2 , tetrahedral
13. The isoelectronic pair is [2007]
a. $\text{Cl}_2\text{O}, \text{ICl}_2^-$ b. $\text{Cl}_2^-, \text{ClO}_2$
c. $\text{IF}_2^+, \text{I}_3^-$ d. $\text{ClO}_3^-, \text{ClF}_2^+$
14. Which of the following species has a bond order other than 3? [2006]
a. CO b. CN^- c. NO^+ d. O_2^+
15. The molecular electronic configuration of Be_2 is [2005]
a. $\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2p^2$ b. $KK\sigma 2s^2$
c. $\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2$ d. None of these

Answer with Solutions

Practice Exercise

1. (d) Both Ca and Na are metals and form positive ions, which repel each other. Hence, the given reaction is not feasible.
2. (a) Kossel's postulations provide the basic for the modern concepts regarding ion formation by electron transfer and the formation of ionic crystalline compounds.

Chlorine is short of one electron only in electronic configuration in comparison with argon.

4. (d) O_2^{2-} has no unpaired electron, hence it is diamagnetic.

5. (a) H-bond is only an interaction between electronegative element and hydrogen therefore, it is the weakest bond among all.

6. (b) Bond angle of H_2S is smallest because S-atom is large in size and has low electronegativity.

7. (a) 3 N—H bonds are covalent.

1 N—H bond is coordinate and bond between NH_4^+ and Cl^- is ionic.

For $\text{O}_{(1)}$ Formal charge = $6 - \frac{1}{2}(4) - 4 = 0$

For $\text{O}_{(2)}$ Formal charge = $6 - \frac{1}{2}(4) - 4 = 0$

For $\text{O}_{(3)}$ Formal charge = $6 - \frac{1}{2}(2) - 6 = -1$

9. (d) NaOH has following structure

Hence, it has both ionic as well as covalent bonds.

10. (d) For NO_3^- ion,

Bond pairs = $4(3\sigma + 1\pi)$

Lone pair = 0

11. (c) In NaOH , Na^+ and OH^- ions are bonded together by ionic bond while in OH^- ion, oxygen and hydrogen atoms are bonded together by covalent bond $\text{Na}^+[\text{O} - \text{H}]^-$.

12. (a) I may be correctly represented as

13. (b)

For $\text{N}_{(1)}$ and $\text{N}_{(3)}$,

Formal charge = $5 - \left[\frac{4}{2} + 4 \right] = 5 - 6 = -1$

For $\text{N}_{(2)}$, Formal charge = $5 - \frac{1}{2} \times 8 - 0 = +1$

14. (a) According to Born-Landé equation,

$$U = \frac{Z^+ Z^- e^2 N_A M}{r_{\text{node}}} \left(\frac{1}{n} - 1 \right)$$

$\therefore$ Ions should be of small size to have high lattice energy.

15. (d) The outer shell electron takes part in chemical reaction to complete the octet. Therefore, four electrons involved in chemical bond formation will be $3d^2, 4s^2$.

16. (a) The electronegativity order of halogens is

Fluorine is the most electronegative element of the periodic table.

17. (c) Eight electrons (octet) in outer shell show stable electronic arrangement.

18. (c) $\therefore$ Covalent character $\propto \frac{1}{\text{Ionic character}}$
 $\propto \frac{1}{\text{difference in electronegativity}}$

$\therefore$ C—S is the most covalent.

19. (c) For BeCl_2 , $H = \frac{2+2}{2} = 2$

$\Rightarrow$ Hybridisation = sp

$\Rightarrow$ Linear shape

20. (b) EN difference in $\text{SiCl}_4 = 3.0 - 1.8 = 1.2$

in $\text{AlCl}_3 = 3.0 - 1.5 = 1.5$

in $\text{CaCl}_2 = 3.0 - 1.0 = 2.0$

in $\text{KCl} = 3.0 - 0.8 = 2.2$

$\therefore \text{KCl} < \text{CaCl}_2 < \text{AlCl}_3 < \text{SiCl}_4$

This order is also obtained by applying Fajan's rule.

i.e. covalent character $\propto$ charge on ion.

21. (c) Metallic lustre is due to oscillation of loose electrons.

22. (b) Higher the electronegativity difference, higher is the ionic character.

Hence, the correct order is

23. (b) The Born-Haber cycle takes place as follows:

24. (d) I. Represents Lewis-dot structure of CCl_4 .

II. Represents Lewis-dot structure of Cl_2 .

III. Represents Lewis-dot structure of CO_2 .

IV. Represents Lewis-dot structure of H_2O .

25. (c) In C_2H_4 molecule, there are two types of bonds arise from the central metal atom.

C—H (107 pm bond length)

C = C (133 pm bond length)

While in rest of the cases, all bonds from the central atom are similar.

26. (a) If the electronegativity difference between two atoms A and B is 2.0, then the percentage of covalent character in the molecule is 54%.

27. (a) Low ionisation potential indicates that element can easily lose electron to form cation.

28. (b) $\left. \begin{array}{l} \text{Mg} \longrightarrow \text{Mg}^{2+} + 2e^- \\ M(g) \longrightarrow M^+(g) + e^- \end{array} \right\}$ Ionisation enthalpy involved

- $\left. \begin{array}{l} \text{O} \longrightarrow \text{O}^{2-} - 2e^- \\ X(g) \longrightarrow X^- - e^- \end{array} \right\}$ Electron gain enthalpy involved

29. (a) Outer shell is known as valence shell and its electrons are called valence electrons.

30. (b) 

31. (d) sp^3 = tetrahedral geometry

sp^3d^3 = pentagonal bipyramidal geometry

sd^3 = it is possible, e.g. $\rightarrow \text{MnO}_4^-$ (tetrahedral)

32. (b) Hybridisation in $\text{NO}_2^+ = \frac{1}{2}(5 + 0 - 1) = sp$

Hybridisation in $\text{NO}_3^- = \frac{1}{2}(5 + 0 + 1) = 3 = sp^2$

Hybridisation in $\text{NH}_4^+ = \frac{1}{2}(5 + 4 - 1) = 4 = sp^3$

33. (b)

34. (c) For SiF_4

σ -bond = 4, $lp = 0$

$\therefore$ Structure is tetrahedral.

35. (b) For XeF_6

$\Rightarrow$ Hybridisation = sp^3d^3

Due to the presence of one lone pair of electron, XeF_6 has distorted octahedral geometry.

36. (b) 

37. (a) BH_4^- has tetrahedral geometry.

38. (d)

39. (c) CH_4 and NH_4^+ both have tetrahedral shape while BF_3 has trigonal planar and SF_4 has *see-saw* shape.
40. (d) According to VBT, structure of IF_7 can be determined as

Pentagonal bipyramidal structure

41. (a) In BrF_5 , number of electron pairs
($1lp + 5bp$)

So, the structure is supposed to be square pyramidal but will be distorted because of additional *lp-bp* interaction. Additional *lp-bp* interaction reduced the all bond angle and do not let any angle to be 90° .

42. (b)
43. (c) If an atom X has three valence electrons and atom Y has six valence electrons, the compound formed between them will have the formula X_2Y_3 like Al_2O_3 .
44. (b) One phosphorus is bonded to three O-atoms as represented by 1,2,3 for P-atom present in the structure given below

Structure of P_4O_6

45. (b)
46. (d) Both representation of resonating structures in molecules of CO_2 and CO_3^{2-} are correct.

48. (a)
49. (c)
50. (b) Since, MX_4 is tetrahedral, therefore, total number of $\angle \text{XMX}$ are four.
51. (d) O_2^+ contains 1 unpaired electron and therefore it has bond order of 2.5 while O_2 contains only 2 unpaired electrons. So, it possesses bond order of 2.
52. (a) $\mu = \sqrt{\mu_1^2 + \mu_2^2 + 2\mu_1\mu_2 \cos \theta}$
If $\theta = 90^\circ$, μ is maximum.
Because $\cos 90^\circ = 0$, since, the angle increases from 90 to 180, the value of $\cos \theta$ becomes more and more negative and hence resultant decreases. Thus, dipole moment is maximum, when $\theta = 90^\circ$.
53. (b) As the number of lone pairs of electrons increases, bond angle decreases. Therefore, the order of bond angle is

54. (b)
55. (b) To minimise *lp-lp* repulsion, they exist as shown in option (b).
56. (b) The dipole moment of a molecule is the vector sum of the dipole moments of various bonds.
e.g. In H_2O molecule which has a bent structure, two O—H bonds are oriented at an angle of 104.5° with dipole moment 1.85D.
57. (b)
58. (b) $\text{H}_2\text{O} > \text{HF} > \text{NF}_3 > \text{BeF}_2$
1.85 D 1.78 D 0.23 D 0 D

Above compound has the highest dipole moment among the given structures because it is totally unsymmetrical. Usually symmetrical molecules have less dipole moment in comparison to unsymmetrical molecules.

60. (c) NO_2 and O_3 both having irregular geometry due to which they have permanent dipole moments.
61. (b) I has maximum covalent bond and negative charge on electronegative nitrogen, most stable. III has more covalent bond than both II and IV, III is second most stable. II is more stable than IV, since it has negative charge on nitrogen. So, the order is

62. (d)
- | | |
|----------------|---------------|
| NH_3 | (107°) |
| PCl_3 | (93°) |
| BCl_3 | (120°) |

63. (b) $\therefore$ Polarity $\propto$ difference in electronegativity
 $\therefore$ Correct order of polarity is

64. (a) $\text{Na}^+ + \cdot\ddot{\text{Cl}}\cdot \longrightarrow \text{Na}^+ \cdot\ddot{\text{Cl}}\cdot \equiv \text{Na}^+ \text{Cl}^-$

65. (c) $\text{BO} = \frac{N_b - N_a}{2} = \frac{6 - 4}{2} = 1.0$

66. (d) According to Fajan's rule, smaller the anion, lesser will be its polarisability. Hence in AlF_3 , F^- ions are polarised to very little extent, therefore it has more ionic character.

In AlCl_3 , Cl^- are polarised to greater extent (due to larger size), hence AlCl_3 has more covalent character.

67. (b) VSEPR theory was first of all proposed by Sidgwick and Powell in 1940. Later on, it was developed by Gillespie and Nyholm in 1957.

68. (b) $\text{BO} = \frac{1}{2}(6 - 3) = 1.5$

69. (b)

70. (a)

71. (b) For a compound to be soluble, the hydration energy must be greater than the lattice energy. Since, NaCl is soluble in water but insoluble in benzene.

$$\Delta H_{\text{hydration}} < \Delta H_{\text{lattice (in benzene)}}$$

and $\Delta H_{\text{hydration}} > \Delta H_{\text{lattice (in water)}}$

72. (c) BF_4^- can be considered as being made by BF_3 by accepting lone pair of F^- ,

i.e. $\text{F}_3\text{B} \longleftarrow \text{F}^-$ (thus, it has dative bond).

73. (c) F^- forms H-bond with HF, therefore the species $[\text{H} \cdots \text{F} \cdots \text{H}]^-$ or HF^- exists and hence, option (c) is correct.

74. (a) For NO_3^- ion, number of electrons = $7 + 3 \times 8 + 1 = 32$

$$H = \frac{V + M - C + A}{2} = \frac{5 + 1}{2} = 3$$

$\Rightarrow$ Hybridisation = sp^2

For CO_3^{2-} ion, number of electrons = $6 + 3 \times 8 + 2 = 32$

$$H = \frac{4 + 2}{2} = 3$$

$\Rightarrow$ Hybridisation = sp^2

$\therefore$ Both NO_3^{2-} and CO_3^{2-} are isoelectronic and isostructural species.

75. (b) When two atoms are linked to each other by sharing of electrons pair, they are said to be joined to each other by a double bond.

76. (c) In CO (three shared electron pairs between C and O), the bond order is 3. For N_2 , bond order is 3.

Cl_2 , Br_2 and H_2 have same bond order, i.e. 1.

77. (d) An ionic solid is a good conductor of electricity only in molten or solution state, when ions are free to move.

78. (a) NO has 15 electrons in its molecular orbitals which are distributed as follows

As it contains one unpaired electron, hence it is paramagnetic.

79. (d) Eight corners of a cube would be occupied in the case of noble gas.

80. (a) The noble gas have a particular stable outer shell electronic configuration represented as $ns^2 np^6$.

81. (c) C_2H_2 has linear structure.

82. (d) Xe-atom has 8 electrons in its outermost shell. In case of XeF_2 out of these 8 electrons, 2 are used for bond formation while 3 pairs remain as such, that's why it has 3 lone pairs.

In case of XeF_4 , 4 electrons of Xe are used for bonding, therefore number of lone pairs (non-bonding electrons) is 2.

In case of XeF_6 , 6 electrons are involved for bond formation, thus number of lone pair is only 1.

83. (b) The largest bond angle is present in NH_3 (107°). All the given molecules are sp^3 -hybridised but due to the presence of 2 lone pairs in H_2O , its bond angle is less (104.5°). While in PH_3 and AsH_3 , due to less difference in electronegativities, the bonded e^- pair remain between P and H (in PH_3) and As and H (in AsH_3) so that large $lp - bp$ repulsion makes bond angle smaller.

84. (b) Larger the bond dissociation enthalpy, stronger will be the bond in the molecule. So,

$$\text{N}_2 > \text{O}_2 > \text{H}_2$$

$946 \text{ kJ mol}^{-1} \quad 498 \text{ kJ mol}^{-1} \quad 435.8 \text{ kJ mol}^{-1}$

85. (c) Structure of CO_3^{2-} ion is

Hence, it has no coordinate bond. In it, carbon is sp^2 -hybridised and hence the ion has trigonal planar geometry.

86. (a)

BITSAT Archives

1. (c) XeF_2 and ZnCl_2 both have linear shape.
 2. (b) Among given four pairs, B_2 and O_2 are paramagnetic due to presence of unpaired electron.

MO electronic configuration of B_2

$$= \sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \pi 2p_z^1 \equiv \pi 2p_z^1$$

MO electronic configuration of O_2

$$= \sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \sigma 2p_z^2 \pi 2p_x^2 \equiv \pi 2p_x^2 \pi^* 2p_x^1 \equiv \pi 2p_y^1$$

3. (d) $\therefore \text{N}^+ (7 - 1 = 6 e^-)$ is isoelectronic with C as both have 6 electrons.
 4. (c) Among the given, only HF_2^- has H-bonding $[\text{F} \cdots \text{H} \cdots \text{F}]^-$. Rest all the molecules have coordinate bonds.
 5. (a) In nickel carbonyl $\text{Ni}(\text{CO})_4$, Ni is present as Ni^0 .

$$\text{Ni} = [\text{Ar}] 3d^8 4s^2$$

CO being strong field ligand, shifts electrons from 4s to 3d orbital.

Therefore, number of unpaired electrons in nickel carbonyl is 0.

6. (b) As the size increases, bond strength decreases. But S—S bond is stronger than O—O bond because of smaller size of O-atoms.
 7. (c) Electronegativity difference between N(3.0) and Cl(3.0) is zero and hence, N—Cl bonds are non-polar. As a result, the overall dipole moment of NCl_3 molecule and its direction is just the dipole moment of the lone pair of electrons.

On the other hand, N—Br, (3.0 – 2.8), N—I (3.0 – 2.5) and N—H (3.0 – 2.1) are polar and hence, contribute towards the overall dipole moment of the respective molecules. Since, the electronegativity difference is highest in case of N—H bonds, therefore NH_3 has the highest dipole moment.

8. (b)

9. (d) Among the given compounds, K^+ is the largest cation and I^- is the largest anion, therefore KI has the largest internuclear distance.

10. (a) Both PCl_3 and NH_3 have pyramidal shape, since both have sp^3 -hybridisation and one lone pair of electrons. In contrast, all other pairs have difference hybridisations and hence, different shapes, i.e. CF_4 has sp^3 while SF_4 has sp^3d -hybridisation, PbCl_2 is ionic while CO_2 has sp -hybridisation, PF_5 has sp^3d while IF_5 has sp^3d^2 -hybridisation.

11. (d) Theoretical value of dipole moment $= e \times d$
 $= 4.8 \times 10^{-10} \times 1.275 \times 10^{-8} \text{ esu cm}$
 $= 6.12 \times 10^{-18} \text{ esu cm}$
 $= 6.12 \text{ D}$

%Ionic character

$$= \frac{\text{Observed dipole moment}}{\text{Theoretical value of dipole moment}} \times 100$$

$$= \frac{1.03}{6.12} \times 100 = 16.83\%$$

12. (a)

13. (d) ClO_3^- and ClF_2^+ contain 34 electrons each hence they are isoelectronic.

14. (d) The configuration of the given species can be written as

CO or CN^- or NO^+ ($14 e^-$)

$$= \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2$$

$$\text{O}_2^+ (8 + 8 - 1) = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2$$

$$\{ \pi 2p_z^2 = \pi 2p_z^2 \pi^* 2p_y^1 \}$$

$$\text{Bond order} = \frac{1}{2} (N_b - N_a)$$

$$\text{CO or } \text{CN}^- \text{ or } \text{NO}^+ = \frac{1}{2} (10 - 4) = 3$$

$$\text{O}_2^+ = \frac{1}{2} (10 - 5) = \frac{5}{2} = 2.5$$

15. (c) Molecular electronic configuration of Be_2 is

$$\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2$$

5

Periodic Properties

Classification of Elements

The elements are considered as the basic units of all types of matter. As the more elements were discovered in the recent times, it becomes a very difficult task to study the chemistry of elements and their compounds. In order to remove this difficulty, we need to organise the elements in a systematic pattern.

The efforts to classify the elements are as follows :

Laws for Classifying the Elements

Many attempts were made to classify the known elements from time to time.

These are as follows:

Dobereiner's Triads (1800, Johann Dobereiner)

Dobereiner arranged the elements in several groups of three elements each called **triads**, with similar properties. He found that in triads, the atomic weight of middle element is about half of the sum of the first and third element. This relation is known as **law of triads**.

e.g.

Li	Na	K	Ca	Sr	Ba	Cl	Br	I
7	23	39	40	88	137	35.5	80	127

Law of Octaves (1865, John Alexander Newlands)

Newland arranged the elements on the basis of the increasing order of their atomic weights and noted that the properties of every eighth element resembles the properties of the first element just like the octaves of music. This is known as Newlands law of octaves.

Lothar Meyer's Curve

Lothar Meyer plotted the physical properties such as atomic volume, melting and boiling points etc., with atomic weight and observed a periodic repetition in their properties. In 1868, Lothar Meyer had developed a table of elements which show clear resemblance with the modern periodic table but his work was not published.

Notation for IUPAC Nomenclature of Elements

S.No.	Digit	Name	Abbreviation
1.	0	nil	n
2.	1	un	u
3.	2	bi	b
4.	3	tri	t
5.	4	quad	q
6.	5	pent	p
7.	6	hex	h
8.	7	sept	s
9.	8	oct	o
10.	9	enn	e

To write the name of any element with atomic number more than 100, write the name of each number from the table followed by “ium”.

Atomic no.	Name
101	un-nil-unium 1 0 1
109	un-nil-ennium 1 0 9

Periodic Properties

The elements in the periodic table are arranged in order of increasing atomic number. All of these elements display several other trends and we can use the periodic law and table formation to predict their chemical, physical and atomic properties.

1. Atomic Size or Atomic Radius

Left to right size of atom decreases; down the group size increases.

(i) **Ionic radius** Distance of the outermost shell of an ion from its nucleus.

(ii) **Covalent radius**

(a) In homodiatom molecule, ($A - A$)

$$r = \frac{d_{A-A}}{2}, \quad d_{A-A} = \text{bond length in molecule}$$

(b) In heterodiatom molecule, ($A - B$)

• When ($X_A - X_B$) is very small

$$d_{A-B} = r_A + r_B$$

$$d_{A-B} = \text{bond length}$$

r_A and r_B = covalent radii of A and B respectively

X_A and X_B = electronegativities of A and B

• When ($X_A - X_B$) is considerable

$$d_{A-B} = r_A + r_B - 0.09 (X_A - X_B)$$

(iii) **Metallic radius**, $r' = \frac{d}{2}$

$r' >$ actual size of atom

(iv) **van der Waals' radius**, $r_1 = \frac{d}{2}$, $r_1 > >>$ actual size of atom

Covalent radius < Metallic radius < van der Waals' radius

In the end of the period, atomic radii of inert gases are exceptionally higher because they do not form molecule and their radii are simply van der Waals' radii.

2. Ionisation Enthalpy

It is the energy required when an electron is removed from an isolated gaseous atom. Generally left to right in periods, IE increases; down the group it decreases but half-filled orbitals and fully filled orbitals are stable form and have high IE.

Various factors affecting ionisation energy varies are:

- (i) Atomic size : varies inversely
- (ii) Screening effect : varies inversely
- (iii) Nuclear charge : varies directly
- (iv) Helium has the highest IE_1 while Cs has the lowest.
- (v) IE values of inert gases are exceptionally higher due to stable configuration.

Screening Effect

Shielding (or screening) effect is the repulsion of valence electrons by the electrons in penultimate shell to reduce effective nuclear charge.

$$Z_{\text{eff}} = Z - \sigma$$

where, Z = atomic number, σ = shielding constant

$\sigma = [0.35 \times \text{number of electrons in } n\text{th shell excluding last (valence) electron}] + [0.85 \times \text{number of electrons in } (n-1)\text{th shell}] + [1.0 \times \text{number of electrons in inner shell}]$

3. Electron Gain Enthalpy

It is the energy released when an electron is added in an isolated gaseous atom. Chlorine has the highest electron affinity but oxidising power of fluorine is larger than chlorine.

Various factors affecting electron gain enthalpy are:

- (i) Atomic size : varies inversely
- (ii) Nuclear charge : varies directly
- (iii) Configuration : Half-filled orbitals and fully filled orbitals are stable form, therefore electron gain enthalpy will be low or even sometimes energy is required rather than getting released.

Exception $\text{Cl} > \text{F}$ (electron gain enthalpy)

$\text{S} > \text{O}$

F and O-atoms have small size and high charge density, therefore have lower electron gain enthalpy.

4. Electronegativity

It is the tendency to attract the shared pair of electrons. F is the most electronegative element while Cs is the least.

Difference in the electronegativities of two atoms (A and B)

$$X_A - X_B = 0.208 \sqrt{\Delta}$$

where, Δ = actual bond energy

– energy for 100% covalent bond

$$\therefore \Delta = E_{A-B} - \sqrt{E_{A-A} \times E_{B-B}}$$

Here, E_{A-B} = dissociation enthalpy of A — B (kcal mol^{-1})

E_{A-A} = dissociation enthalpy of A — A (kcal mol^{-1})

E_{B-B} = dissociation enthalpy of B — B (kcal mol^{-1})

Mulliken's approach

$$X_M = \frac{\text{IE} + \text{EA}}{2}$$

Mulliken values are ≈ 2.8 times greater than Pauling values.

$$X_P = \frac{\text{IE} + \text{EA}}{5.6} \text{ or } X_P = 0.336 [X_M - 0.615]$$

Unit of electronegativity = eV

For noble gases, its value is taken as zero.

Decreasing order of electronegativity

In periods left to right, electronegativity increases.

In groups down the group, electronegativity decreases.

5. Valency

The valency of an element is related to the electronic configuration of its atom and usually determined by electrons present in valence shell (outer shell).

Variation of Valency in a Period

Valency of the elements with respect to hydrogen increases from 1 to 4 upto 14th group and then decreases to 1.

e.g. NaH , CaH_2 , AlH_3 , SiH_4 , PH_3 , H_2S , HCl .

But valency of the elements with respect to oxygen increases from one to seven along a period.

e.g. Na_2O , CaO , Al_2O_3 , SiO_2 , P_4O_{10} , SO_3 , Cl_2O_7

Variation of Valency in a Group

All elements in a group have the same valency as they have same number of electrons in their outer shell. *p*-block elements show variable valency on account of inert pair effect.

Term oxidation state is also being used for covalency, which indicates the actual charge on atom in that particular molecule. It follows the same trend along period or group as valency.

NOTE Tin has maximum number of isotopes (10 in number) and Os has the highest oxidation state or valency (+8).

Variation of Valency in Transition Elements

Transition elements and inner-transition elements show variable valency of 1, 2 or 3 as they use electrons from outer as well as penultimate or inner-penultimate shell.

6. Chemical Reactivity

Reactivity of metals increases with decrease in ionisation energy, electronegativity and increase in atomic radii and electropositive character.

Reactivity of non-metals increases with increase in electronegativity and electron gain enthalpy and decreases with increase in atomic radii.

Variation in a Group

On moving down the group, reactivity of metals increases while for non-metals, it decreases.

Variation in a Period

Reactivity of metals decreases while reactivity of non-metals increases across the period.

Some other Periodic Trends

- Bond energy $\propto$ electronegativity difference
- Bond length $\propto \frac{1}{\text{electronegativity difference}}$
- Acidic character of hydride $\propto$ electronegativity of central atom
- Acidic character of hydra acids increases on moving left to right and top to bottom.
- **Periodicity of oxyacids** Acidic character increases left to right while decreases top to bottom.
- **Nature of oxides** Acidic character increases left to right while decreases top to bottom.

Practice Exercise

- Which of the following has firstly organised the elements according to same trend?
 - Newland
 - Mendeleev
 - Lothar Meyer
 - Dobereiner
- Johann Dobereiner gave the idea of trends among the physical and A..... of several groups of three elements. Here, A refers to
 - atomic number
 - atomic mass
 - chemical properties
 - electronic configuration
- Lothar Meyer plotted the physical properties such as atomic volume, melting point and A..... against atomic weight. Here, A refers to
 - mass
 - boiling point
 - surface tension
 - molecules
- Lothar Meyer drew a graph showing the relation between
 - atomic number and atomic weight
 - atomic number and atomic size
 - atomic weight and atomic volume
 - atomic weight and atomic size
- Which of the following is incorrect explanation about Mendeleev's periodic law?
 - Mendeleev arranged elements in horizontal rows only
 - Mendeleev arranged elements with increasing atomic weight
 - Mendeleev's system of classifying elements was more elaborate than that of Lothar
 - Both (a) and (b)
- Which basic concept was used by Mendeleev for organising the elements?
 - They organise the metals only
 - They organise the non-metals only
 - They organise the both metals and non-metals according to increasing number of masses
 - None of the above
- Which element was named as eka-silicon in Mendeleev classification of elements?
 - Germanium
 - Gallium
 - Thallium
 - Selenium
- The statement that is not correct for the periodic classification of elements, is
 - the properties of the elements are the periodic function of their atomic number
 - non-metallic elements are lesser in number than metallic elements
 - the first ionisation energies of elements along a period do not vary in a regular manner with increase in atomic number
 - for transition elements, the *d*-subshells are filled with electrons monotonically with increase in atomic numbers
- The period number in the long form of the periodic table is equal to
 - magnetic quantum number of any element of the period
 - atomic number of any element of the period
 - maximum principal quantum number of any element of the period
 - maximum azimuthal quantum number of any element of the period
- Which of the following is incorrect?
 - Henry Moseley observed regularities in the characteristics X-ray spectra of elements
 - A plot of frequency of X-ray emitted against atomic number (*Z*) gives a straight line
 - The atomic number of an element is equal to the number of neutron(s) in a neutral atom
 - Electronic configuration of an atom determines the physical and chemical properties
- Match the Column I with Column II and select the correct answer by given codes.

Column I (Number of periods)	Column II (Number of elements)
A. First period	1. 14
B. Third period	2. 02
C. Lanthanoids	3. 14
D. Actinoids	4. 08
	5. 04

Codes

A	B	C	D	A	B	C	D
a. 2	4	1	5	b. 2	4	1,3	3,1
c. 4	2	1	3	d. None of these			
- Observe the following statements,
 - The physical and chemical properties of elements are the periodic functions of their electronic configuration.
 - Electronegativity of fluorine is less than the electronegativity of chlorine.
 - Electropositive nature decreases from top to bottom in a group.
 The correct answer is
 - I, II and III
 - Only I
 - I and II
 - II and III
- In an element ${}_ZM^{19}$, there are 10 neutrons in the nucleus. It belongs to
 - s-block
 - d-block
 - f-block
 - None of the above

14. The third alkaline earth metal ion contains number of electrons and protons as
 a. $20e^-$, $20p$ b. $18e^-$, $18p$
 c. $18e^-$, $20p$ d. $19e^-$, $20p$
15. A metal having electronic configuration $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2$ is in
 a. s-block b. d-block
 c. p-block d. None of these
16. Which of the following orbitals are in the process of filling in the 6th period?
 a. $6s, 6p, 6d, 6f$ b. $6s, 5f, 6d, 6p$
 c. $6s, 4f, 5d, 6p$ d. $5s, 5p, 5d$
17. The configuration to second excited state of the element is (O) electronic with O_2 or P^- or Cl^+ is
 a. $[Ne] 3s^2 3p_x^2 3p_y^1 3p_z^1$
 b. $[Ne] 3s^2$
 c. $[Ne] 3s^1 3p_z^1 3p_y^1 3p_x^1 3d_{xy}^1 3d_{yz}^1$
 d. $[Ne] 3s^2 3p_x^1 3p_z^1 3p_{xy}^1$
18. The element having atomic number 33 lies in the group
 a. 16 b. 14 c. 15 d. 13
19. General configuration of ultimate and penultimate shell is $-(n-1)s^2 (n-1)p^6 (n-1)d^x ns^2$. If $n=4$ and $x=5$, the number of protons in the nucleus would be
 a. < 24 b. 25 c. 24 d. > 25
20. Generally, the valency of noble gases is
 a. two b. three c. one d. zero
21. Identify the least stable ion among the following.
 a. Li^- b. Be^- c. B^- d. C^-
22. The electronic configuration of an element is $1s^2, 2s^2 2p^6, 3s^2 3p^3$. The atomic number and the group number of the element X which is just below the above element in the periodic table respectively, are
 a. 23 and 5 b. 23 and 15
 c. 33 and 15 d. 33 and 5
23. What will be the IUPAC name of element having $Z=106$?
 a. Unnilquadium b. Unnilhexium
 c. Unnilheptium d. Ununhexium
24. The one with the largest ionic size is
 a. O^{2-} b. Mg^{2+} c. F^- d. Na^+
25. Fluorine and neon have atomic radii in angstrom given by
 a. 1.60, 1.60 b. 0.72, 0.72
 c. 0.72, 1.60 d. None of these
26. Which of the following alkali metals has smallest size?
 a. Cs b. Rb c. Na d. K
27. Which of the following ionic species has largest size?
 a. $Rb^+(aq)$ b. $Li^+(g)$ c. $Na^+(aq)$ d. $Li^+(aq)$
28. Chloride ion and potassium ion are isoelectronic, then
 a. their sizes are same
 b. Cl^- ion is bigger than K^+ ion
 c. K^+ ion is relatively bigger
 d. their sizes depend on other cation and anion
29. Which one of the following is correct increasing order of size?
 a. $Mg < Na^+ < F^- < Al$ b. $Na^+ < Al < Mg < F^-$
 c. $Na^+ < F^- < Al < Mg$ d. $Na^+ < F^- < Mg < Al$
30. Ionic radii vary in
 a. inverse proportion to the effective nuclear charge
 b. inverse proportion to the square of effective nuclear charge
 c. inverse proportion to the screening effect
 d. direct proportion to the square of the screening effect
31. The first ionisation energy of beryllium is more than that of boron because
 a. boron has higher nuclear charge
 b. boron has only one electron in p-subshell
 c. atomic size of boron is less than that of beryllium
 d. atomic size of boron is more than that of beryllium
32. Among the following, the element with highest ionisation potential is
 a. boron b. carbon
 c. oxygen d. nitrogen
33. The isoelectronic ion having lowest ionisation energy is
 a. S^{2-} b. Ca^{2+} c. K^+ d. Cl^-
34. The values in electron-volt per atom which represent the first ionisation energy of oxygen and nitrogen atom respectively are
 a. 13.6 and 14.6 b. 14.6 and 13.6
 c. 14.6 and 14.6 d. 13.6 and 13.6
35. The pair in which the ionisation energy of first species is less than that of second is
 a. N, P b. Be, Be^+ c. S, P d. N, N^-
36. How many Cs-atoms can be converted to Cs^+ ion by 1 J energy if IE_1 for Cs is 376 kJ mol^{-1} ?
 a. 1.60×10^{23} b. 1.60×10^{15}
 c. 1.60×10^{18} d. 16.0×10^{26}
37. How many joules of energy must be absorbed to convert Li to Li^+ , all the atoms present in 1.00 mg of gaseous Li? IE_1 of Li is $520.3 \text{ kJ mol}^{-1}$ ($Li = 7$).
 a. 0.00743 kJ b. 0.520 kJ
 c. 520 kJ d. 0.0743 kJ
38. The incorrect statements among the following is
 a. the first ionisation potential of Al is less than the first ionisation potential of Mg
 b. the second ionisation potential of Mg is greater than the second ionisation potential of Na
 c. the first ionisation potential of Na is less than the first ionisation potential of Mg
 d. the third ionisation potential of Mg is greater than the third ionisation potential of Al

39. Ionisation enthalpy of Na would be same as
 a. value of electron affinity of Na^+
 b. value of electronegativity of Na
 c. value of ionisation potential of Mg
 d. value of electron affinity of Na
40. Which one of the following statements is incorrect in relation to ionisation enthalpy?
 a. Ionisation enthalpy increases for each successive electrons
 b. The greatest increase in ionisation enthalpy is experienced on removal of electron from core noble gas configuration
 c. End of valence electrons is marked by a big jump in ionisation enthalpy
 d. Removal of electron from orbitals bearing lower n value is easier than from orbitals having higher n value

41. The formation of the oxide ion, $\text{O}^{2-}(\text{g})$ from oxygen atom requires first an exothermic and then an endothermic step as shown below

Thus, process of formation of O^{2-} in gas phase is unfavourable even though O^{2-} is isoelectronic with neon. It is due to the fact that,

- a. oxygen is more electronegative
 b. addition of electron in oxygen results in larger size of the ion
 c. electron repulsion outweighs the stability gained by achieving noble gas configuration
 d. O^- ion has comparatively smaller size than oxygen atom
42. Which one of the following arrangements represent the correct order of electron gain enthalpy (with negative sign) of the given atomic species?
 a. $\text{Cl} < \text{F} < \text{S} < \text{O}$
 b. $\text{O} < \text{S} < \text{F} < \text{Cl}$
 c. $\text{S} < \text{O} < \text{Cl} < \text{F}$
 d. $\text{F} < \text{Cl} < \text{O} < \text{S}$
43. Electronic configurations of four elements A, B, C and D are given below
 A. $1s^2, 2s^2, 2p^6$ B. $1s^2, 2s^2, 2p^4$
 C. $1s^2, 2s^2, 2p^6, 3s^1$ D. $1s^2, 2s^2, 2p^5$
- Which of the following is the correct increasing order of tendency to gain electron?
 a. $A < C < B < D$ b. $A < B < C < D$
 c. $D < B < C < A$ d. $D < A < B < C$
44. In which of following order of arrangement does not agree with variation of property indicated against it?
 a. $\text{Al}^{3+} < \text{Mg}^{2+} < \text{Na}^+ < \text{F}^-$ (Increasing ionic size)
 b. $\text{B} < \text{C} < \text{N} \geq \text{O}$ (Increasing first ionisation enthalpy)
 c. $\text{I} < \text{Br} < \text{Cl} < \text{F}$ (Increasing electron gain enthalpy)
 d. $\text{Li} < \text{Na} < \text{K} < \text{Rb}$ (Increasing metallic radius)

45. The electron affinity values (in kJ mol^{-1}) of three halogens X, Y and Z are -349 , -333 and -325 respectively. Then, X, Y and Z respectively are
 a. F_2 , Cl_2 and Br_2 b. Cl_2 , F_2 and Br_2
 c. Cl_2 , Br_2 and F_2 d. Br_2 , Cl_2 and F_2

46. Which one of the following statements is false?
 a. The electron affinity of chlorine is less than that of fluorine
 b. The electronegativity of fluorine is more than that of chlorine
 c. The electron affinity of bromine is less than that of chlorine
 d. The electronegativity of chlorine is more than that of bromine

47. Which of the following element has highest electronegativity?

a. Oxygen b. Chlorine
 c. Fluorine d. Nitrogen

48. In C, N, O and F, the electronegativity
 a. increases from carbon to fluorine
 b. decreases from carbon to oxygen and then increases
 c. decreases from carbon to fluorine
 d. increases from carbon to oxygen and then decreases

49. Electronegativity of F on Pauling scale is 4.0. What will be its value on Mulliken scale?
 a. 10.0 b. 11.2 c. 8.54 d. 16

50. Two elements whose electronegativities are 1.2 and 3.0 respectively, the bond formed between them would be
 a. ionic b. covalent c. coordinate d. metallic

51. What will be the electronegativity of carbon at Pauling scale? Given that, $E_{\text{H}-\text{H}} = 104.2 \text{ kcal mol}^{-1}$,

$$E_{\text{C}-\text{C}} = 83.1 \text{ kcal mol}^{-1}, E_{\text{C}-\text{H}} = 98.8 \text{ kcal mol}^{-1}$$

[Electronegativity of hydrogen = 2.1]

a. 0.498 b. 0.598 c. 2.134 d. 2.597

52. Which one of the following is incorrect?

a. Non-metals have strong tendency to gain electron
 b. Electronegativity is directly related to non-metallic properties of elements
 c. Electronegativity is inversely proportional to the metallic properties of elements
 d. Increase in electronegativity down the group is accompanied by a decrease in non-metallic properties

53. Pauling's equation for determining the electronegativity of an element, is

(X_A, X_B are electronegativity values of elements A and B respectively, Δ represents the polarity of A—B bond.)

a. $X_A - X_B = 0.208 \sqrt{\Delta}$ b. $X_A + X_B = 0.208 \sqrt{\Delta}$
 c. $X_A - X_B = 0.208 \Delta^2$ d. $X_A - X_B = \sqrt{\Delta}$

54. Match the Column I with Column II and select the correct answer by given codes.

Column I (Elements)	Column II (Properties)
A. $\text{Li}^+ < \text{Al}^{3+} < \text{Mg}^{2+} < \text{K}^+$	1. ΔEA (Electron affinity)
B. $\text{Li}^+ > \text{Al}^{3+} > \text{Mg}^{2+} > \text{K}^+$	2. Ionic radii
C. $\text{Cl} > \text{F} > \text{Br} > \text{I}$	3. EN (Electronegativity)
D. $\text{F} > \text{Cl} > \text{Br} > \text{I}$	4. ENC

Codes

	A	B	C	D		A	B	C	D
a.	2	4	3	1	b.	2	4	1	3
c.	4	2	3	1	d.	4	2	1	3

55. The set that contains pairs of elements that do not belong to same group but show chemical resemblance is
 a. B, Al b. Be, Al c. Hf, Zr d. K, Pb

56. Which pair of elements has same chemical properties?
 a. 13, 22 b. 3, 11 c. 4, 24 d. 2, 4
57. The element of second period which forms most acidic oxide is
 a. carbon b. boron c. fluorine d. nitrogen
58. In periodic table, melting point/ boiling point increases down the group in which of the following group?
 a. Group 13 b. Group 2
 c. Group 17 d. Group 1
59. Considering the elements B, C, N, F and Si, the correct order of their non-metallic character is [NCERT]
 a. $\text{B} > \text{C} > \text{Si} > \text{N} > \text{F}$ b. $\text{Si} > \text{C} > \text{B} > \text{N} > \text{F}$
 c. $\text{F} > \text{N} > \text{C} > \text{B} > \text{Si}$ d. $\text{F} > \text{N} > \text{C} > \text{Si} > \text{B}$
60. Considering the elements B, Al, Mg, and K, the correct order of their metallic character is
 a. $\text{B} > \text{Al} > \text{Mg} > \text{K}$ b. $\text{Al} > \text{Mg} > \text{B} > \text{K}$
 c. $\text{Mg} > \text{Al} > \text{K} > \text{B}$ d. $\text{K} > \text{Mg} > \text{Al} > \text{B}$

BITSAT Archives

1. Elements/ions having same number of electrons are known as isoelectronic species. Arrange the following elements in correct order of atomic/ionic radii and choose the correct option from the four choices given below [2013]
 $\text{O}^{2-}, \text{Na}^+, \text{Mg}^{2+}, \text{F}^-, \text{Al}^{3+}$
 a. $\text{Al}^{3+} < \text{Mg}^{2+} < \text{Na}^+ < \text{F}^- < \text{O}^{2-}$
 b. $\text{Al}^{3+} < \text{Na}^+ < \text{Mg}^{2+} < \text{F}^- < \text{O}^{2-}$
 c. $\text{Al}^{3+} > \text{Mg}^{2+} > \text{Na}^+ > \text{F}^- > \text{O}^{2-}$
 d. None of the above
2. For the properties mentioned, the correct trend for the different species is in [2012]
 a. Strength as Lewis acid— $\text{BCl}_3 > \text{AlCl}_3 > \text{GaCl}_3$
 b. Inert pair effect— $\text{Al} > \text{Ga} > \text{In}$
 c. Oxidising property— $\text{Al}^{3+} > \text{In}^{3+} > \text{Tl}^{3+}$
 d. First ionisation enthalpy— $\text{B} > \text{Al} > \text{Ti}$
3. Which of the following choices represent the correct order of first ionisation enthalpy? [2012]
 a. $\text{B} < \text{C} < \text{N} < \text{O} < \text{F}$ b. $\text{B} > \text{C} > \text{N} > \text{O} > \text{F}$
 c. $\text{B} < \text{C} < \text{N} > \text{O} < \text{F}$ d. $\text{B} < \text{C} < \text{N} > \text{O} > \text{F}$
4. Electron gain enthalpy of fluorine is lower than that of chlorine is due to [2010]
 a. smaller size
 b. smaller nuclear charge
 c. difference in their electronic configurations
 d. its highest reactivity
5. The atomic numbers of elements A, B, C and D are $Z - 1$, Z , $Z + 1$ and $Z + 2$ respectively. If B is a noble gas, choose the correct statement among the the following statements: [2010]
 I. A has higher electron affinity.
 II. C exists in +2 oxidation state.
 III. D is an alkaline earth metal.
 a. I and II b. II and III c. I and III d. I, II and III

Answer with Solutions

Practice Exercise

- (d) Dobereiner has firstly used triad system to organise the elements.
- (c) Johann Dobereiner in early 1800's was the first to consider the idea of trends among properties of elements. By 1829 he noted a similarity among the physical and chemical properties of several groups of three elements (triads).
- (b)
- (c) Lothar Meyer drew a graph showing the relation between atomic weight and atomic volume.
- (a) Mendeleef arranged elements in horizontal rows and vertical columns of a table in increasing order to their atomic weights.
- (c) Mendeleef observed that the periodic properties of an element is a periodic function of atomic masses.
- (a) Germanium was called eka-silicon in Mendeleef's time.

8. (d) 9. (c)
10. (c) The atomic number of elements is equal to the number of electrons/number of protons in a neutral atom.
 $Z = \text{number of } e^- / p^+$
 $A = \text{number of proton} + \text{number of neutron}$
11. (b) $A \rightarrow 2, B \rightarrow 4, C \rightarrow 1, 3, D, \rightarrow 3, 1$
 A. First period contains 2 elements.
 B. Third period contains 8 elements.
 C. D. 14 elements of both sixth and seventh periods are known as lanthanoids and actinoids respectively.
12. (b) The physical and chemical properties of elements are periodic functions of their electronic configuration.
 Electronegativity of fluorine is more than that of chlorine.
 Electropositive nature increases from top to bottom in a group.
13. (d) $Z = 19 - 10 = 9$
 $EC = 1s^2 2s^2 2p^5$, hence, it belongs to p -block.
14. (c) $Ca^{2+}; p = 20, e^- = 18$
15. (b) $Zn(3d^{10} 4s^2)$ is d -block element.
16. (c) The order in which orbitals are filled, is
 $6s \rightarrow 4f \rightarrow 5d \rightarrow 6p$
17. (c) In O_2 or P^- or Cl^+ the electrons present are 16. The element is sulphur ($Z = 16$). The electronic configuration of sulphur in second excited state is given by (c).
18. (c) Arsenic is in group 15.
19. (b) The element having outer electronic configuration $3s^2 3p^6, 3d^5 4s^2$, has atomic number 25. Therefore, the number of protons is 25.
20. (d) They are chemically inert (inactive).
21. (b) Be has fully filled $2s$ -subshell ($2s^2$) and therefore, show least tendency to accept an electron. Thus, Be^- is least stable.
22. (c) Atomic number of the given element = 15
 Group number = $10 + 5$ (valence electrons) = 15
 Period = 3
 Atomic number of the element just below = 33
23. (b) For $Z = 106$, Root of 1 — un, Root of 0 — nil
 Root of 6 — hex + ium, IUPAC name = unnilhexium
24. (a) O^{2-}, F^-, Mg^{2+} and Na^+ are isoelectronic species (each having $10 e^-$). The size of isoelectronic species decreases with increase in nuclear charge (number of protons). Hence, correct order of size is
 $O^{2-} > F^- > Na^+ > Mg^{2+}$
25. (c) 26. (c) 27. (d) 28. (b)
29. (b) Na^+ and F^- ions are isoelectronic, therefore F^- has the largest and Na^+ has the lowest size. Further, Al with higher nuclear charge has lower size than Mg. Thus, the overall order is
 $Na^+ < Al < Mg < F^-$
30. (a)
31. (b) Boron has only one electron in p -subshell, hence it can be lost easily, while beryllium has comparatively stable configuration ($1s^2, 2s^2$) hence, cannot give an electron easily, consequently its IE is greater.
32. (d) Nitrogen has stable half-filled orbital.
33. (b)
34. (a) Ionisation energy of N > ionisation energy of oxygen, since, nitrogen has stable configuration due to half-filled $2p$ -orbitals.
35. (c) P has higher ionisation energy due to stable half-filled configuration.
36. (c) $376 \times 10^3 \text{ J}$ energy produces 6.023×10^{23} ions.
 $\therefore 1 \text{ J}$ energy will produce = $\frac{6.023 \times 10^{23}}{3.76 \times 10^3}$
 $= 1.60 \times 10^{18} \text{ Cs}^+$ ions
37. (d) $1.00 \text{ mg} = 1 \times 10^{-3} \text{ g} = \frac{1 \times 10^{-3}}{7} \text{ mol Li}$
 1 mole of Li is converted by 520.3 kJ.
 $\therefore \frac{1 \times 10^{-3}}{7} \text{ mole is converted to } Li^+ \text{ by}$
 $= \frac{520.3 \times 1 \times 10^{-3}}{7} \text{ kJ} = 0.0743 \text{ kJ}$
38. (b) IE_2 of Mg is lower than that of Na because in case of Mg^{2+} , $3s$ electron has to be removed while in case of Na^+ , an electron from the stable inert gas configuration (neon) has to be removed.
39. (a) $Na \longrightarrow Na^+ + e^-$
 $Na^+ + e^- \longrightarrow -X; \Delta_{eg} = -IE$
40. (d) Higher n value has lower value of IE due to large size.
41. (c) The process of formation of O^{2-} in gas phase is unfavourable even though O^{2-} is isoelectronic with neon because electron repulsion outweighs the stability gained by achieving noble gas configuration.
42. (b)
43. (b) np^5 and ns^1 elements possess a large tendency to accept the electron than fully and half-filled elements
44. (c)
45. (b) The electron affinity for halogens,
 $F = 332.6 \approx 333 \Rightarrow Y$
 $Cl = -348.5 \approx -349 \Rightarrow X$
 $Br = -324.7 \approx -325 \Rightarrow Z$
 X has the highest value of electron affinity. Therefore, the correct order of electron affinity is
 $Cl_2 > F_2 > Br_2$
46. (a) The electron affinity of fluorine is less than that of chlorine, due to very small size of fluorine in which negative charge is highly concentrated and repels the incoming electrons.

47. (c)

48. (a) In a period, it increases from left to right.

49. (b) Electronegativity on Mulliken scale and Pauling scale are given by

$$X_M = X_P \times 2.8 = 4.0 \times 2.8 \\ = 11.2$$

Usually, Mulliken's value of electronegativity are 2.8 times of Pauling value.

50. (a) When the electronegativity difference is more than 1.7, the bond formed will be ionic in nature.

51. (d) $X_C - X_H = 0.208 \sqrt{\Delta}$

$$\text{where, } \Delta = E_{C-H} - \sqrt{E_{C-C} \times E_{H-H}}$$

$$\Delta = 98.8 - \sqrt{83.1 \times 104.2}$$

$\therefore$

$$\Delta = 5.75 \\ X_C - 2.1 = 0.208 \sqrt{5.75}$$

$$X_C - 2.1 = 0.497$$

$$X_C = 2.597$$

52. (d) Decrease in electronegativity down the group is accompanied by a decrease in non-metallic properties.

53. (a) Pauling's equation

$$X_A - X_B = 0.208 \sqrt{\Delta}$$

where, X_A and X_B are electronegativity values of elements A and B and $\Delta = E_{A-B} - \sqrt{E_{A-A} \times E_{B-B}}$

Here, E_{A-B} , E_{A-A} and E_{B-B} are the bond energies of the molecules AB, A_2 and B_2 respectively.

54. (b) $A \rightarrow 2, B \rightarrow 4, C \rightarrow 1, D \rightarrow 3$

A. $Li^+ < Al^{3+} < Mg^{2+} < K^+$

The cation with the greater positive charge will have a smaller radius because of the greater attraction of the electrons to the nucleus. Anion with the greater negative charge will have the larger radius.

$$\text{Positive charge} \propto \frac{1}{\text{ionic radius}}$$

Negative charge $\propto$ ionic radius

B. Greater positive charge, increases ENC in case of isoelectronic species while for same group elements, ENC decreases down the group.

C. $Cl > F > Br > I$

Electron affinity of Cl is highest in halogen family.

D. $F > Cl > Br > I$

Electronegativity of fluorine (F) is higher than that of Cl, Br and I.

55. (b)

56. (b) The pair which belongs to same group, i.e. in which both the elements have same outer electronic configuration has same chemical properties.

$$3 \Rightarrow 1s^2, 2s^1$$

$$11 \Rightarrow 1s^2, 2s^2, 2p^6, 3s^1$$

57. (c)

58. (c)

59. (d)

60. (d)

BITSAT Archives

1. (a) Elements/ions having equal number of electrons are known as isoelectronic species. Among isoelectronic species, cations having highest charge are smallest while anion having highest charge are largest.

Cation < Neutral atom < Anion

Hence, correct choice is

$$Al^{3+} < Mg^{2+} < Na^+ < F^- < O^{2-}$$

2. (d) As we know on moving down the group, first ionisation enthalpy decreases top to bottom, therefore order of first ionisation enthalpy for group 13 elements is

$$B > Al > Ga > In > Tl$$

3. (d) Ionisation energy is the minimum amount of energy required to remove the outermost electron from an isolated gaseous atom. Quantitatively, it depends on the attraction between electron present on outermost shell and nucleus. Greater the interaction between outermost electron and nucleus, higher will be its ionisation enthalpy. So, correct order of first it must be

$$B < C < N < O < F$$

But due to extra stable half-filled electronic configuration of p-orbital, N has more value of first ionisation enthalpy than oxygen hence, correct order is

$$B < C < N > O > F$$

4. (a) Because of the small size of F, electron-electron repulsions present in its relatively compact 2p-subshell, do not easily allow the addition of an extra electron. On the other hand, Cl because of its comparatively bigger size than F, allows the addition of an extra electron more easily. Thus, the EA of Cl is higher than that of F.

5. (c) $A = Z - 1$

$B = Z \rightarrow$ Noble gas (outer subshells are s or p)

$$C = Z + 1$$

$$D = Z + 2$$

Noble gas with outer s-subshell = He ($1s^2$)

Noble gas with outer p-subshell

$$= ns^2 np^6 \text{ like [Ne]}$$

In periodic table, electron affinity is highest in chlorine of group 17 with electronic configuration of $3s^2 3p^5$.

$$\text{Noble gas} = 3s^2 3p^6 = [\text{Ar}]$$

$$B = [\text{Ar}] \rightarrow Z \rightarrow 3s^2 3p^6 \text{ (Noble gas)}$$

$$A = Z - 1 \rightarrow 3s^2 3p^5 \text{ (Halogen family)}$$

$$C = Z + 1 \rightarrow 3s^2 3p^6, 4s^1 \text{ (Alkali metal)}$$

$$D = Z + 2 \rightarrow 3s^2 3p^6, 4s^2 \text{ (Alkaline earth metal)}$$

6

States of Matter

Matter

Anything that has mass and takes up space is known as, 'matter'. It clearly means, it is everything around us.

In general, matter exists in three states:

- (i) Solids: They have definite volume, a definite shape and hence they are rigid.
- (ii) Liquids: They have definite volume, but do not have definite shape and hence they are non-rigid.
- (iii) Gases: They have neither definite shape, nor definite volume and hence they are non-rigid. It is the simplest state and shows great uniformity in behaviour.

Gaseous State

It is the most disordered state of matter. In this state, matter neither have fixed volume nor fixed shape. It takes the shape and volume of the container in which it is placed.

Gas Laws

Gases exhibit dependency on temperature, pressure, volume and mass. The inter relationship of these factors can be analysed through gas laws which are given below:

1. Boyle's Law (1662)

At constant temperature (T), $p \propto \frac{1}{V}$

$$pV = \text{constant (for given moles and } T) \text{ or } p_1V_1 = p_2V_2$$

2. Charles' Law (1787)

At constant pressure (p), $V \propto T$

$$\frac{V}{T} = \text{constant (for given } n \text{ and } p)$$

or
$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

Charles obtained experimentally that for 1°C change in temperature of a gas, the volume get changed by a fraction of $\frac{1}{273}$. Hence, if V_0 be the volume of a gas at 0°C and it is recorded to be V at $t^\circ\text{C}$ then

$$V = V_0 + \frac{1}{273.15} T \quad V_0 = V_0 \left(1 + \frac{T}{273.15} \right) = V_0 \left(\frac{273.15 + T}{273.15} \right)$$

If temperature is lowered, the volume decreases at constant pressure and becomes zero at -273.15°C . Further lowering is not possible thus, it is called the lowest possible temperature or absolute zero of temperature.

$$T(\text{K}) = t(^{\circ}\text{C}) + 273.15$$

3. Gay-Lussac's Law

At constant volume (V)

$$p \propto T$$

$$\frac{p}{T} = \text{constant (for given } n \text{ and } V)$$

or
$$\frac{p_1}{T_1} = \frac{p_2}{T_2}$$

4. Avogadro's Law

It states that equal volumes of all gases at same pressure and temperature contain equal number of molecules.

$$V \propto n \quad (\text{at given } T \text{ and } p)$$

or
$$\frac{V_1}{n_1} = \frac{V_2}{n_2}$$

5. Ideal Gas Equation

$$pV = nRT \quad \text{or} \quad pV = \frac{w}{M} RT \quad \text{or} \quad pM = dRT$$

where, w = mass of a gas

M = molecular weight of a gas

d = density of a gas

$$R = \text{gas constant} = 0.0821 \text{ L atm K}^{-1} \text{ mol}^{-1} \\ = 8.314 \text{ J K}^{-1} \text{ mol}^{-1}$$

6. Dalton's Law of Partial Pressures

Total pressure of a mixture of a number of non-reacting gases is equal to the sum of the pressures exerted by individual gases.

$$p_{\text{total}} = p_1 + p_2 + p_3 + p_4 + \dots$$

- Partial pressure of a gas = Its mole fraction $\times$ total pressure exerted by the mixture
- When a gas is collected over the water, the pressure of the gas

$$p_{\text{observed or moist}} = \text{Pressure of dry gas} \\ + \text{aqueous tension or water VP}$$

- Relative humidity (R_H) is given by $R_H = \frac{\text{Partial pressure of water in air}}{\text{vapour pressure of water}}$.

7. Graham's Law of Diffusion

Rate of diffusion or effusion

$$\propto \frac{1}{\sqrt{\text{Molecular weight}}} \propto \frac{1}{\sqrt{\text{density}}} \\ \text{Density} = \frac{\text{Molecular weight}}{2}$$

$$\text{Rate of effusion (r)} = \frac{\text{Volume effused}}{\text{Time taken}}$$

Hence,
$$\frac{r_1}{r_2} = \frac{t_2}{t_1} = \sqrt{\frac{d_2}{d_1}} = \sqrt{\frac{M_2}{M_1}}$$

If p is not constant, $r \propto p$

$$\therefore \frac{r_1}{r_2} = \frac{p_1}{p_2} \sqrt{\frac{M_2}{M_1}}$$

Kinetic Theory of Gases

The molecular details regarding gases can be visualised with the help of kinetic molecular theory of gases which is based on the following assumptions:

- A gas consists of extremely small discrete molecules so that volume of the molecules is negligible as compared to the total volume of the gas.
- Gas molecules are in constant random motion with high velocities and change directions on collision with other molecules or walls of container.
- The intermolecular forces and the force of gravity on them are negligible.
- The collisions are perfectly elastic, therefore, there is no loss of kinetic energy during collision.
- The pressure of a gas is caused by bombardment of moving molecules against the walls of container.
- In a gas, different molecules have different kinetic energies but the average kinetic energy of molecules is proportional to absolute temperature of the gas. This is known as Maxwell's generalisation.

On the basis of these assumptions, the following mathematical expression is derived :

$$pV = \frac{1}{3} mNu^2$$

or $pV = \frac{1}{3} Mu^2$ ($\because M = m \times N$, for one mole, $m = 1$)

where, u = rms velocity

Average kinetic energy per molecule

$$= \frac{\text{Average KE per mole}}{N}$$

$$= \frac{3}{2} \frac{RT}{N} = \frac{3}{2} KT \quad \left[\because \frac{R}{N} = K \right]$$

where, K = Boltzmann constant

Different Types of Molecular Velocities

Average velocity (v_{av})

It is the average of the velocities of different molecules of the gas at a particular temperature.

Average velocity $\bar{v}$ or $v_{av} = \sqrt{\frac{8RT}{\pi M}}$

Root mean square velocity (v_{rms})

It is the square root of the mean of the square of velocities of various molecules of the gas at a particular temperature.

Root mean square velocity,

$$v_{rms} = \sqrt{\frac{3pV}{M}} = \sqrt{\frac{3RT}{M}}$$

$$= \sqrt{\frac{3p}{d}} \quad [\because d = \text{density of the gas}]$$

Most probable velocity (v_{mp})

It is the velocity possessed by the maximum fraction of molecules of the gas at a particular temperature.

$$v_p \text{ or } v_{mp} = \sqrt{\frac{2RT}{M}} \quad [\because M = \text{Molecule mass of the gas}]$$

$$v_{rms} : v_{av} : v_{mp} :: \sqrt{3} : \sqrt{\frac{8}{\pi}} : \sqrt{2} = 1.2248 : 1.1284 : 1$$

$$= 1 : 0.921 : 0.816$$

$$v_{rms} = 1.085 \times v_{av} \text{ or } v_{av} = 0.921 \times v_{rms}$$

$$v_{rms} = 1.224 \times v_{mp} \text{ or } v_{mp} = 0.816 \times v_{rms}$$

$$v_{av} = 1.128 \times v_{mp} \text{ or } v_{mp} = 0.886 \times v_{av}$$

Ideal and Real Gases

The gas which obeys gas law exactly or at standard condition is called an ideal gas while the gases which obey gas laws under moderate conditions of temperature and pressure are called 'Real gases'.

Deviation from ideal behaviour

At very low temperature and high pressure, real gases show deviation from the ideal gas behaviour.

The causes of deviation are that

- at low temperature and high pressure, volume of a real gas is materially larger than that predicted for an ideal gas as the molecules of gas have their own volume.
- intermolecular forces are not negligible.

Compressibility factor (Z)

$$\frac{pV}{RT} = 1 \text{ (for ideal gas)}$$

Different conditions of compressibility factor (Z) for real gases

- $Z < 1$ (as for CH_4, CO_2) can be attributed to predominance of attractive forces among the molecules of these gases at the temperature of experiment.
- $Z > 1$ can be attributed to the dominance of strong repulsive forces among the molecules.

van der Waals' Equation

van der Waals' gave the gas equation for real gases as,

$$\left(p + \frac{an^2}{V^2} \right) (V - nb) = nRT \quad (\text{for } n \text{ mole of gas})$$

$$\left(p + \frac{a}{V^2} \right) (V - b) = RT \quad (\text{for 1 mole of gas})$$

Here, a and b are van der Waals' constants whose values depend on the nature of gas.

Critical Phenomenon and Liquefaction of Gases

The phenomenon of converting a gas into liquid is known as liquefaction at particular temperature, pressure and volume. When a gas changes into liquid, these conditions are known as critical conditions, e.g. T_c, V_c, p_c etc.

$$\text{Critical temperature } (T_c) = \frac{8a}{27Rb}$$

$$\text{Critical pressure } (p_c) = \frac{a}{27b^2}$$

$$\text{Critical volume } (V_c) = 3b$$

Relation between critical p, V and T

$$\frac{p_c V_c}{RT_c} = \frac{3}{8}, Z < 1 \text{ at critical point}$$

At critical point, there is no distinction between gaseous state and liquid state as densities of a substance in gaseous and liquid states are same.

Liquid State

It is the state of matter in which the molecules are held close to each other and execute random motion through intervening spaces. Most of the physical properties of liquids are controlled by the strength of intermolecular attractive forces.

Evaporation

The transformation of a liquid into gaseous state, at surface, is called its evaporation. It occurs at all temperatures but increase with temperature. Evaporation causes a fall in temperature of liquid because the molecules with higher kinetic energy, leaves the surface and hence, average kinetic energy and consequently temperature decreases.

Vapour Pressure

When evaporation takes place, the gaseous state of liquid is called its vapour. These vapours now exert a pressure on the liquid. This pressure is called the vapour pressure. Thus, vapour pressure of a liquid also increases with temperature.

Boiling Point

During evaporation, the temperature at which vapour pressure of liquid becomes equal to atmospheric pressure is called boiling point of that liquid. Obviously, boiling point increases with increases in atmospheric pressure. Liquids having weak attractive forces, have low boiling point.

The temperature of liquid always remains constant during boiling until all the liquid is changed into gaseous vapours.

Surface Tension

The surface tension (γ) is defined as the force acting right angles to the surface along unit length of surface.

Due to the surface tension liquid drops are spherical. The rise of a liquid in a capillary is also due to surface tension. Mathematically, surface tension

$$\gamma = \frac{\text{Work done to expand the surface}}{\text{Change in area}}$$

Units of γ are dynes per cm or Nm^{-1} (in SI system).

Viscosity

The resistance due to which, liquid does not flow with same speed is called viscosity of liquid.

Thus, the liquid with less viscosity flow rapidly (e.g. water, alcohol etc) and *vice-versa*.

The resistance between two layers of liquid (i.e. the force of friction, f) is given by

$$f = \eta \cdot \frac{A \cdot \Delta v}{x}$$

where, η = coefficient of viscosity

A = surface area of each layer of liquid

Δv = velocity difference of two layers

x = distance between two layers

Units of viscosity coefficient (η) are $\text{dynes cm}^{-2} \text{ s}$ or poise.

Reciprocal of viscosity coefficient is known as fluidity of liquid (ϕ), i.e.

$$\phi = \frac{1}{\eta}$$

Solid State

The state of matter which has definite volume and a definite shape due to strong internuclear force of attraction among the constituent particles is known as 'solid'. Solids do not have translatory motion but can have only vibrational motion about their mean positions.

Classification of Solids

On the basis of the arrangement of their atoms or ions or molecules, solids are broadly *classified into two groups* :

1. Crystalline Solids

They have systematic and regular arrangement of particles and sharp melting point. They have flat faces and sharp edges.

On the basis of types of bond present, they are further divided into four groups:

(i) **Molecular crystal** or van der Waals' crystals

e.g. $\text{I}_2(s)$, $\text{H}_2\text{O}(s)$ etc.

(ii) **Atomic crystals** or covalent crystals

e.g. Graphite, diamond etc.

(iii) **Metallic crystals** e.g. All metallic solids etc.

(iv) **Ionic crystals** e.g. NaCl , CsCl , ZnS etc.

2. Amorphous Solids

In these solids, the constituent particles are not arranged in a regular manner, e.g. rubber, glass, pitch, fused silica, plastics, polymer of high molecular mass.

Crystalline solids are anisotropic, i.e. their physical properties have different values in different directions while amorphous solids are isotropic, i.e. their physical properties have same values in different directions.

Bragg's Equation

It is used to calculate interfacial distances (d) of a crystal. In this method, X-rays are used, which are reflected back by crystal faces in a definite manner. Following reaction is the Bragg's equation:

$$n\lambda = 2d \sin\theta$$

where, λ = wave length of X-rays used

n = order of diffraction, θ = angle of diffraction

d = interfacial distance

Space Lattice or Crystal Lattice

An array of lattice points showing arrangement of constituent particles in different position in three dimensional space, is known as space lattice or crystal lattice.

Crystal Systems

All the crystals found in nature, can be grouped into 7 types of crystal systems which have 14 types of unit cell (Bravais lattice) can be tabulated as,

	Crystal system	Axial ratio	Axial angles	Example
1.	Cubic	$a = b = c$	$\alpha = \beta = \gamma = 90^\circ$	NaCl
2.	Tetragonal	$a = b \neq c$	$\alpha = \beta = \gamma = 90^\circ$	TiO ₂
3.	Rhombic	$a \neq b \neq c$	$\alpha = \beta = \gamma = 90^\circ$	Rhombic sulphur
4.	Monoclinic	$a \neq b \neq c$	$\alpha = \gamma = 90^\circ \neq \beta$	Monoclinic sulphur
5.	Triclinic	$a \neq b \neq c$	$\alpha \neq \beta \neq \gamma \neq 90^\circ$	K ₂ Cr ₂ O ₇
6.	Trigonal	$a = b = c$	$\alpha = \beta = \gamma = 90^\circ$	Quartz
7.	Hexagonal	$a = b \neq c$	$\alpha = \beta = 90^\circ, \gamma = 120^\circ$	Graphite

Unit Cell

It is the smallest group of lattice points which when repeated in all directions will develop the entire lattice.

It can be

- (i) **Simple unit cell** or **primitive unit cell** in which particles are present only at corners.

$$\therefore \text{Number of atoms per unit cell} = \frac{1}{8} \times 8 = 1$$

- (ii) **Face centred cell** in which the particles are present at the corners as well as at the centre of each face.

$$\therefore \text{Number of atoms per unit cell} = \frac{1}{8} \times 8 + \frac{1}{2} \times 6 = 4$$

- (iii) **Body centred unit cell** in which the particles are present at the corners of the cube as well as one particle is present at the centre within the body.

$$\therefore \text{Number of atoms per unit cell} = \frac{1}{8} \times 8 + 1 = 2$$

Packing in Solids

In solid, each atom is surrounded by certain number of atoms leaving the minimum vacant space.

It is expressed in terms of packing fraction (PF).

$$\text{Packing fraction} = \frac{\text{Total volume of spheres}}{\text{Volume of the unit cell}} \times 100$$

The number of spheres surrounding a particular atom is known as coordination number (CN).

Packing in solids may be divided into the following categories:

One Dimensional Packing

When the spheres are placed in horizontal row, touching each other, an edge of the crystal is formed, this is known as one dimensional packing.

Two Dimensional Packing

It is of two types:

- (i) **Square Close Packing (scp)** The particles, when placed in the adjacent rows, show a horizontal as well as vertical alignment and form squares.

This is also known as AAA... type arrangement.

- (ii) **Hexagonal Close Packing (hcp)** The particles in every next row are placed in the depression between the particles of the first row. The particles in the third row will be vertically aligned with those in the first row.

This is also known as ABAB... type arrangement.

Three Dimensional Packing

It is of two types:

- (i) **Hexagonal Closed Packing (hcp)** The first layer *A* and second layer *B*, are arranged as *AB AB*... pattern is called hexagonal closed packing (hcp).
- (ii) **Cubic Close Packing (ccp)** When the third layer is placed over the second layer in such a way that spheres cover the octahedral voids, a layer different from layers *A* and *B* is produced. i.e layer *C*.

This pattern of stacking spheres is called *ABC ABC*... pattern or cubic close packing (ccp). It is similar to **face centred cubic (fcc)** packing.

Voids

The empty space between stacked atoms is known as void.

Number of tetrahedral voids

$$= 2 \times \text{Number of octahedral voids}$$

Number of octahedral voids = Number of lattice point

Sizes vary the order,

Trigonal > Tetrahedral > Octahedral

Radius Ratio Rule

$$\text{Radius ratio} = \frac{\text{Radius of cation}}{\text{Radius of anion}}$$

Relation between radius ratio and coordination number

Radius Ratio $\left(\frac{r_+}{r_-}\right)$	Cation occupied	Coordination number	Structure	Example
< 0.155		2	Linear	
0.155 – 0.225	Trigonal void	3	Planar triangular	B ₂ O ₃
0.225 – 0.414	Tetrahedral void	4	Tetrahedral	ZnS
0.414 – 0.732	Octahedral void	6	Octahedral	NaCl
0.732 – 1.0	Cubic void	8	bcc	CsCl

Calculation Involving Unit Cell Parameters

(i) Relation between edge length, radius of sphere and packing fraction

Unit cell	Side/edge length	Radius	Packing fraction
Simple cubic	a	$a/2$	52 %
bcc	a	$(\sqrt{3}/4)a$	68 %
fcc	a	$a/2\sqrt{2}$	74 %

(ii) Determination of density of crystals

$$\text{Density, } d = \frac{Z \times M}{N_A \times a^3(V)}$$

where, Z = number of atoms per unit cell

M = molar mass

a = edge length of unit cell

N_A = Avogadro's number = 6.022×10^{23}

Imperfections as Defects in Solids

These are of following two types:

(i) Stoichiometric Defects

If imperfection in crystals are such that the ratio between the cations and the anions remain the same as in its molecular formula, the defect will be called stoichiometric defects.

These defects are found as Schottky and Frenkel defects.

S. No.	Schottky Defect	Frenkel Defect
1.	It is due to equal number of cations and anions missing from the lattice sites.	It is due to the missing of ions (usually cations) from the lattice sites and they occupy the interstitial sites.
2.	This results in the decrease in density of crystal.	It has no effect on the density of crystal.
3.	This type of defect is found in highly ionic compounds with high coordination number, e.g. NaCl, CsCl, AgBr etc.	This type of defect is found in crystals, where the difference in the size of cations and anions is very large, e.g. AgCl, AgBr, ZnS etc.

(ii) Non-Stoichiometric Defects

When the ratio of cations and anions, due to imperfection, differ from that indicated by their molecular formula, the defects are called non-stoichiometric defects.

***F*-centre** A negative ion may be missing from its lattice site, leaving a hole which is occupied by an electron, thereby maintaining the electrical balance.

The electrons, thus trapped in the anion vacancies are called *F*-centres because they are responsible for imparting colour to the crystals.

Properties of Solids

Some remarkable properties of solids are described below :

Electrical Properties of Solids

Depending upon conduction power, solids are divided into conductors conductivity $10^7 (\Omega\text{m})^{-1}$, semiconductors $(10^{-6} \text{ to } 10^4) (\Omega\text{m})^{-1}$ and insulators $(10^{-20} - 10^{-10}) (\Omega\text{m})^{-1}$.

Superconductivity is the property of the conductor by which they allow electricity to pass through them without any resistance.

The temperature at which a substance starts behaving as superconductor is called transition temperature, e.g. Ba₂Cu₃O₇ at 90K, Bi₂Ca₂Sr₂Cu₃O₁₀ at 105 K, Tl₂Ca₂Ba₂Cu₃O₁₀ at 125 K start behaving as superconductors.

Band Theory to Explain Electrical Property of Solids

Atomic orbitals combine with each other to form molecular orbitals which are close to each other. These are called band. There are two types of band which are valence band and conduction band.

The energy gap between valence band and conduction band is used to explain electrical properties of metal.

- (a) In a conductor, there is no gap between valence band and conduction band.
 (b) In a semiconductor, the gap between valence band and conduction band is small. So, conductivity of semiconductor is low but conductivity can be increased by supplying energy.

There are two types of semiconductors depending upon the doping of foreign elements:

***n*-type semiconductors** Group 14 elements when doped with group 15 elements form *n*-type semiconductors.

***p*-type semiconductors** Group 14 elements when doped with group 13 elements form *p*-type semiconductors.

- (c) In an insulator, the energy gap is so large that it cannot be covered up by supplying energy.

Magnetic properties

Properties	Description	Alignment of magnetic dipole	Examples	Applications
Diamagnetic	Which are feebly repelled by the magnetic fields due to existence of paired electron.	All electrons are paired. $\uparrow\downarrow\uparrow\downarrow\uparrow\downarrow$	TiO ₂ , V ₂ O ₅ , NaCl, C ₆ H ₆	Insulator
Paramagnetic	Attracted by magnetic field due to the presence of unpaired electrons acts as a tiny bar magnet.	At least one unpaired electron. $\uparrow\downarrow\uparrow\uparrow$	O ₂ , Cu ²⁺ , Fe ³⁺ , TiO, Ti ₂ O ₃ , VO, VO ₂ , CuO	Electronic applications
Ferromagnetic	Acts as a permanent magnet even after removing magnetic field. Above curie temperature, no ferromagnetism occurs.	All unpaired electrons are in same direction. $\uparrow\uparrow\uparrow\uparrow\uparrow$	Fe, Ni, Co, CrO ₂	CrO ₂ is used in audio and video tapes.
Anti ferromagnetic	Net dipole moment becomes zero due to equal and opposite alignment.	$\uparrow\downarrow\uparrow\downarrow\uparrow\downarrow$	CoO, Co ₃ O ₄ , MnO, MnO ₂ , M ₂ O ₃ , FeO, Fe ₂ O ₃ , NiO	
Ferrimagnetic	This arises when there is no dipole moment.	$\uparrow\downarrow\uparrow\downarrow\uparrow\downarrow$	Fe ₃ O ₄ , Ferrites	

Practice Exercise

- To which of the following Dalton's law of partial pressure is not applicable?
 - SO₂ and CO₂ at room temperature
 - N₂ and H₂ at room temperature
 - SO₂ and O₂ at room temperature
 - HCl and NH₃ at room temperature
- A sample of gas has a volume of 0.2 litre at 1 atm pressure and 0°C. At the same pressure but at 273°C its volume will become.
 - 0.1 L
 - 0.4 L
 - 0.8 L
 - 0.6 L
- A vessel is filled with a mixture of equal masses of oxygen and nitrogen. What is the ratio of partial pressure of oxygen and nitrogen?
 - $p_{O_2} = 0.5p_{N_2}$
 - $p_{O_2} = 0.875p_{N_2}$
 - $p_{O_2} = p_{N_2}$
 - $p_{O_2} = 1.14p_{N_2}$
- At 25°C and 760 mm of Hg pressure a gas occupies 600 mL volume. What will be its pressure at a height where temperature is 10°C and volume of the gas is 640 mL?
 - 676.6 mm Hg
 - 600 mm Hg
 - 700 mm Hg
 - 752 mm Hg
- The pressure of 1 atmosphere is equal to
 - 760 cm
 - 10^5 Nm^{-2}
 - $10^4 \text{ dyne cm}^{-2}$
 - 1 bar
- A vessel contains a mixture of different types of gases. Which of the following statements is correct?
 - On the average, the heavier molecules have higher speed
 - The average translational energy of different types of molecules is the same
 - The average speed of different molecules is same
 - On an average, the heavier molecules have higher translational energy

7. Diffusion of He gas is
 - a. 4 times faster than CO_2
 - b. 4 times faster than SO_2
 - c. 4 times faster than NO_2
 - d. 4 times faster than ClO_2
8. The vapour density of a gas is 11.2. The volume occupied by 11.2 g of the gas at NTP is
 - a. 22.4 L b. 11.2 L c. 1 L d. 2.24 L
9. The volume of 2.8 g of carbon monoxide at 27°C and 0.821 atm pressure, is
 - a. 30 L b. 3 L c. 0.3 L d. 1.5 L
10. What will be the temperature when the rms velocity is four times of that at 300 K?
 - a. 300 K b. 900 K c. 4800 K d. 1200 K
11. The density of neon is lowest at
 - a. STP b. 0°C , 2 atm
 - c. 273°C , 1 atm d. 273°C , 2 atm
12. When 3.2 g sulphur is vaporised at 450°C and 723 mm Hg pressure, the vapours occupy a volume of 780 mL. What is the molecular formula of S vapours?
 - a. S_2 b. S_4 c. S_6 d. S_8
13. At what temperature, the rms velocity of SO_2 be same as that of O_2 at 303 K?
 - a. 273 K b. 606 K c. 303 K d. 403 K
14. The value of compression factor, Z for critical constants, is
 - a. $\frac{1}{2}$ b. $\frac{3}{4}$
 - c. $\frac{2}{3}$ d. $\frac{3}{8}$
15. The ratio between the root mean square velocity of H_2 at 50 K and that of O_2 at 800 K, is
 - a. 4 b. 2 c. 1 d. $1/4$
16. A vessel contains He and H_2 in the molar ratio 1 : 5. The ratio of mean translational kinetic energies, at the same temperature, is
 - a. 1 : 1 b. 1 : 2 c. 2 : 1 d. 1 : 5
17. The ratio of root mean square velocity to average velocity of a gas molecule at a particular temperature is
 - a. 1 : 1.086 b. 2 : 1.86
 - c. 1.086 : 1 d. 2.086 : 1
18. The RMS speed of helium in ms^{-1} (atomic mass = 4.0 g mol^{-1}) at 400 K, is
 - a. 16.8 b. 60
 - c. 168 d. 1580
19. A mixture of gases having different molecular weights is separated by which method?
 - a. Atmolysis
 - b. Metathesis
 - c. Ostwald and Walker method
 - d. Reverse osmosis

20. The units of van der Waals' constants a and b respectively are
 - a. $\text{L}^{-2} \text{ atm}^{-1} \text{ mol}^{-1}$ and L mol^{-2}
 - b. $\text{L}^2 \text{ atm mol}^{-2}$ and $\text{mol}^{-1} \text{ L}$
 - c. L atm mol^2 and mol L
 - d. $\text{L atm}^2 \text{ mol}^{-1}$ and mol L^{-1}
21. If van der Waals' parameters for gases P, Q, R and S are given as

Gas	a ($\text{time}^2 \text{ atm/mol}^2$)	b (time/mol)
P	4.0	0.027
Q	8.0	0.030
R	12.0	0.027
S	6.0	0.024

The gas which has the highest Boyle temperature is

- a. P b. Q c. R d. S
22. A balloon is filled with hydrogen at room temperature. It will burst, if pressure exceeds 0.2 bar. If a 1 bar pressure the gas occupied 2.27 L volume, up to what volume can the balloon be expanded?
 - a. 6.25 L b. 11.35 L c. 8.35 L d. 10.50 L
23. The average velocity of an ideal gas molecule at 300 K is 2 m/s. The average velocity at 1200 K will be
 - a. 6 m/s b. 4 m/s c. 2 m/s d. 8 m/s
24. In van der Waals' equation of the gas law, the constant ' a ' is a measure of
 - a. intermolecular repulsion
 - b. intermolecular attraction
 - c. volume occupied by the molecules
 - d. relative velocity of gas molecules
25. Which of the following liquid will exhibit highest vapour pressure?
 - a. $\text{C}_2\text{H}_5\text{OH}(l)$ b. $\text{NH}_3(l)$ c. $\text{HF}(l)$ d. $\text{H}_2\text{O}(l)$
26. Which of the following relation is correct for an ideal gas regarding its pressure (p) and translational kinetic energy per unit volume (E)?
 - a. $p = \frac{3}{2} E$ b. $p = \frac{2}{3} E$
 - c. $p = \frac{1}{2} E$ d. $p = 2E$
27. The surface tension of which of the following liquids is maximum?
 - a. H_2O b. CH_3OH c. $\text{C}_2\text{H}_5\text{OH}$ d. C_6H_6
28. Which of the following is not a crystalline solid?
 - a. KCl b. CsCl
 - c. Glass d. Rhombic sulphur
29. The arrangement $ABC\ ABC\ \dots$ is referred to as
 - a. octahedral close packing
 - b. hexagonal close packing
 - c. tetrahedral close packing
 - d. cubic close packing

30. How many Cl^- ions are there around Na^+ ion in a NaCl crystal?
a. 3
b. 4
c. 6
d. 8
31. Which of the following statements is not true about NaCl structure?
a. Cl^- ions are in fcc arrangement
b. Na^+ ions have coordination number four
c. Cl^- ions have coordination number six
d. Each unit cell contains 4 NaCl molecules
32. The number of atoms in 100 g of a fcc crystal with density = 10 g cm^{-3} and cell edge as 200 pm, is equal to
a. 3×10^{25}
b. 5×10^{24}
c. 1×10^{25}
d. 2×10^{25}
33. Which of the following expressions is correct for a CsCl unit cell with lattice parameter, a ?
a. $r_{\text{Cs}^+} + r_{\text{Cl}^-} = 2a$
b. $r_{\text{Cs}^+} + r_{\text{Cl}^-} = \frac{a}{\sqrt{2}}$
c. $r_{\text{Cs}^+} + r_{\text{Cl}^-} = \frac{\sqrt{3}}{2} a$
d. $r_{\text{Cs}^+} + r_{\text{Cl}^-} = \frac{3}{2} a$
34. In diamond, the coordination number of carbon is
a. four and its unit cell has eight carbon atoms
b. four and its unit cell has six carbon atoms
c. six and its unit cell has four carbon atoms
d. four and its unit cell has four carbon atoms
35. The molar volume of KCl and NaCl are 37.46 mL and 27.94 mL respectively. The ratio of the unit cube edges of the crystals is
a. 1.296
b. 1.116
c. 1.341
d. 0.950
36. Calcium crystallises in a face centred cubic unit cell with $a = 0.556 \text{ nm}$. Calculate the density if it contained 0.1% Schottky defects.
a. 1.5463 g/cm^3
b. 1.4962 g/cm^3
c. 1.5448 g/cm^3
d. 1.5943 g/cm^3
37. Calculate the ionic radius of a Cs^+ ion, assuming that the cell edge length for CsCl is 0.4123 nm and that the ionic radius of a Cl^- ion is 0.181 nm.
a. 0.176 nm
b. 0.231 nm
c. 0.357 nm
d. 0.116 nm
38. Iron crystallises in a bcc system with a lattice parameter of 2.861 Å. Calculate the density of iron in the bcc system.
(Atomic weight of Fe = 56, $N_A = 6.02 \times 10^{23} \text{ mol}^{-1}$)
a. 7.92 g mL^{-1}
b. 8.96 g mL^{-1}
c. 2.78 g mL^{-1}
d. 6.72 g mL^{-1}
39. A monoclinic crystal has dimensions
a. $a \neq b \neq c, \alpha = \gamma = 90^\circ; \beta \neq 90^\circ$
b. $a = b = c, \alpha = \beta = \gamma = 90^\circ$
c. $a = b = c, \alpha = \beta = 90^\circ; \gamma = 120^\circ$
d. $a \neq b = c, \alpha = \beta = \gamma = 120^\circ$
40. In A^+B^- ionic compound, radii of A^+ and B^- ions are 180 and 187 pm respectively. The crystal structure of the compound will be
a. NaCl type
b. CsCl type
c. ZnS type
d. similar to diamond
41. A compound having bcc geometry has atomic mass 50. Calculate the density of the unit cell, if its edge length is 290 pm.
a. 6.81 g cm^{-3}
b. 3.40 g cm^{-3}
c. 13.62 g cm^{-3}
d. None of these
42. If 'a' stands for the edge length of the cubic systems, simple cubic, body centred cubic and face centred cubic, then the ratio of radii of the spheres in these systems respectively will be
a. $\frac{1}{2} a : \sqrt{3} a : \frac{1}{\sqrt{2}} a$
b. $\frac{1}{2} a : \frac{\sqrt{3}}{2} a : \frac{\sqrt{2}}{2} a$
c. $1 a : \sqrt{3} a : \sqrt{2} a$
d. $\frac{1}{2} a : \frac{\sqrt{3}}{4} a : \frac{1}{2\sqrt{2}} a$
43. Calculate the approximate number of unit cells present in 1g of gold. It is well known that gold crystallises in the face centred cubic lattice (atomic mass of gold is 197u).
a. 7.64×10^{20}
b. 6.02×10^{23}
c. 197
d. 4
44. A solid compound contains X, Y and Z atoms in a cubic lattice with X atoms occupying the corners. Y atoms in the body centred positions and Z atoms at the centres of faces of the unit cell. What is the empirical formula of the compound?
a. XY_2Z_3
b. XYZ_3
c. $\text{X}_2\text{Y}_2\text{Z}_3$
d. X_8YZ_6
45. Total volume of atoms present in a fcc unit cell of a metal is (r = atomic radius).
a. $\frac{16}{3} \pi r^3$
b. $\frac{12}{3} \pi r^3$
c. $\frac{24}{3} \pi r^3$
d. $\frac{20}{3} \pi r^3$
46. What will be the per cent fraction of edge length not covered by atom when a metal crystallises in bcc lattice?
a. 11.4%
b. 10.4%
c. 13.4%
d. 12.4%

BITSAT Archives

- The temperature 30.98°C is called critical temperature (T_c) of carbon dioxide. The critical temperature is the [2014]
 - lowest temperature at which liquid carbon dioxide is observed
 - highest temperature at which gas carbon dioxide is observed
 - highest temperature at which solid carbon dioxide is observed
 - highest temperature at which liquid carbon dioxide is observed
- Point out the correct statement for the set of characteristics of ZnS crystal. [2014]
 - Coordination number (4 : 4) ; ccp; Zn^{2+} ion in the alternate tetrahedral voids
 - Coordination number (6 : 6) ; hcp; Zn^{2+} ion in all tetrahedral voids
 - Coordination number (6 : 4) ; hcp; Zn^{2+} ion in all octahedral voids
 - Coordination number (4 : 4) ; ccp; Zn^{2+} ion in all tetrahedral voids
- KCl crystallises in the same type of lattice as does NaCl. Given that, $r_{\text{Na}^+} / r_{\text{Cl}^-} = 0.55$ and $r_{\text{K}^+} / r_{\text{Cl}^-} = 0.74$. Determine the ratio of the side of the unit cell for KCl to that of NaCl [2013]

- A gas is heated through 1°C in a closed vessel and so the pressure increases by 0.4%. The initial temperature of the gas was [2012]
 - -23°C
 - $+23^{\circ}\text{C}$
 - 250°C
 - 523°C
- Barium titanate has the perovskite structure, i.e. a cubic lattice with Ba^{2+} ions at the corners of the unit cell, oxide ions at the face centres and titanium ions at the body centred. The molecular formula of barium titanate is [2012]
 - BaTiO_3
 - BaTiO_4
 - BaTiO_2
 - BaTiO
- 1 L of a gas is at a pressure of 10^{-6}mm of Hg at 25°C . How many molecules are present in the vessel? [2011]
 - 3.2×10^6
 - 3.2×10^{13}
 - 3.2×10^{10}
 - 3×10^4
- An ideal gas cannot be liquefied because [2009]
 - its critical temperature is always above 0°C
 - its molecules are relatively smaller in size
 - it solidifies before becoming a liquid
 - forces operating between its molecules are negligible
- A compound contains P and Q elements. Atoms Q are in ccp arrangement while P occupy all tetrahedral sites, formula of compound is [2009]
 - PQ
 - PQ_2
 - P_2Q
 - P_3Q
- What is the temperature at which the kinetic energy of 0.3 mole of helium is equal to the kinetic energy of 0.4 mole of argon at 400K ? [2008]
 - 400K
 - 873K
 - 533K
 - 300K
- For a crystal, the angle of diffraction (2θ) is 90° and the second order line has a d value of $2.28\text{\AA}$. The wavelength (in $\text{\AA}$) of X -rays used for Bragg's diffraction is [2008]
 - 1.612
 - 2.00
 - 2.28
 - 4.00
- A solid has a structural in which W atom are located at the corners of a cubic lattice, O atom at the centre of edge and Na atoms at the centre of cube. The formula for the compound is [2007]
 - Na_2WO_3
 - Na_2WO_2
 - NaWO_2
 - NaWO_3
- Which of the following is most volatile compound? [2007]
 - HI
 - HCl
 - HBr
 - HF
- The root mean square velocity of a gas is double when temperature is [2007]
 - increased four times
 - increased two times
 - reduced to half
 - reduced to one - fourth
- The molar volume of CO_2 is maximum at [2006]
 - NTP
 - 0°C and 2.0atm
 - 127°C and 1atm
 - 273°C and 2atm
- The RMS speed of hydrogen is $\sqrt{7}$ times the RMS speed of nitrogen. If T is the temperature of the gas, then [2005]
 - $T_{\text{H}_2} = T_{\text{N}_2}$
 - $T_{\text{H}_2} > T_{\text{N}_2}$
 - $T_{\text{H}_2} < T_{\text{N}_2}$
 - $T_{\text{H}_2} = \sqrt{7} T_{\text{N}_2}$
- Which gas has the highest partial pressure in atmosphere? [2005]
 - CO_2
 - H_2O
 - O_2
 - N_2

Answer with Solutions

Practice Exercise

1. (d) Dalton's law is applicable to those mixtures of gases which don't react. HCl and NH_3 react at room temperature react to give NH_4Cl .

2. (b) According to Charles's law, $\frac{V_1}{T_1} = \frac{V_2}{T_2}$

$$V_2 = \frac{0.2 \times 546}{273} = 0.4 \text{ L}$$

3. (b) Let 32 g of each gas is taken. Then,

$$\text{Total moles} = \frac{32}{32} + \frac{32}{28} = \frac{15}{7}$$

$$\text{Mole fraction of } \text{O}_2 = \frac{1}{15/7} = \frac{7}{15}$$

$$\text{Mole fraction of } \text{N}_2 = \frac{8/7}{15/7} = \frac{8}{15}$$

$$\therefore \frac{p_{\text{O}_2}}{p_{\text{N}_2}} = \frac{\frac{7}{15} \times 1}{\frac{8}{15} \times 1} = \frac{7}{15} \times \frac{15}{8} = \frac{7}{8} = 0.875$$

$$p_{\text{O}_2} = 0.875 p_{\text{N}_2}$$

4. (a) According to combined gas law, $\frac{p_1 V_1}{T_1} = \frac{p_2 V_2}{T_2}$

$$\Rightarrow p_2 = \frac{(760 \text{ mm Hg}) \times (600 \text{ mL}) \times (283 \text{ K})}{(640 \text{ mL}) \times (298 \text{ K})} = 676.6 \text{ mmHg}$$

5. (d) 1 atmosphere = $1.01 \times 10^5 \text{ Nm}^{-2} = 1 \text{ bar}$

6. (b) The average translational energy of different types of molecules is the same because it depends only on temperature.

7. (b) According to the Graham's law, $\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}}$

$$4 = \sqrt{\frac{M_2}{4}} \Rightarrow 16 = \frac{M_2}{4}$$

$$\therefore M_2 = 64$$

64 is the molecular weight of SO_2 hence, (b) is correct.

8. (b) Molecular weight of gas = $2 \times \text{VD} = 2 \times 11.2 = 22.4$

$$\text{Hence, number of moles of gas taken} = \frac{11.2}{22.4} = \frac{1}{2}$$

$$\text{Hence, volume of gas at NTP} = \frac{1}{2} \times 22.4 \text{ L} = 11.2 \text{ L}$$

9. (b) $pV = nRT$ or $V = \frac{nRT}{p} = \frac{2.8 \times 0.0821 \times 300}{28 \times 0.821} = 3 \text{ L}$

10. (c) $U_{\text{rms}} (\text{velocity}) = \sqrt{\frac{3RT}{M}}$

$$\text{Hence, } u \propto \sqrt{T} \Rightarrow \frac{u_1}{u_2} = \sqrt{\frac{T_1}{T_2}} \quad \dots(i)$$

$$\text{From Eq. (i), } \frac{1}{4} = \sqrt{\frac{300}{T_2}}$$

$$\frac{1}{16} = \frac{300}{T_2}$$

$$T_2 = 16 \times 300 = 4800 \text{ K}$$

11. (c) On applying ideal gas equation we get

$$d \propto \frac{p}{T}$$

Therefore, for low density, p should be less while temperature should be high. Hence, at 273°C and 1 atm pressure, density of neon will be minimum.

12. (d) From ideal gas equation,

$$pV = \frac{w}{M} RT$$

$$\therefore M = \frac{3.2 \times 0.0821 \times 760 \times 1000 \times 723}{723 \times 780} = 256$$

$\therefore$ 32 g sulphur has 1 atom of S.

$\therefore$ Molecular formula = S_8

13. (b) $\frac{U_{\text{rms}} (\text{SO}_2)}{U_{\text{rms}} (\text{O}_2)} = \sqrt{\frac{T (\text{SO}_2)}{M (\text{SO}_2)} \times \frac{M (\text{O}_2)}{T (\text{O}_2)}}$

$$\text{i.e. } 1 = \sqrt{\frac{T (\text{SO}_2)}{64} \times \frac{32}{303}} \quad \text{or } T (\text{SO}_2) = 606 \text{ K}$$

14. (d) Compressibility factor (Z_c) = $\frac{p_c V_c}{RT_c} = \frac{a \times 3b \times 27}{27b^2 \times 8a} = \frac{3}{8}$

$$\frac{p_c V_c}{RT_c} = \frac{3}{8}$$

15. (c) $U_{\text{rms}} = \sqrt{\frac{3RT}{M}}$

$$\therefore \frac{U_1}{U_2} = \sqrt{\frac{3RT_1}{M_1} \times \frac{M_2}{3RT_2}} = \sqrt{\frac{T_1 M_2}{T_2 M_1}} = \sqrt{\frac{50 \times 32}{800 \times 2}} = 1$$

16. (d) $\text{KE} = \frac{3}{2} pV = \frac{3}{2} nRT$

$$\frac{(\text{KE})_{\text{He}}}{(\text{KE})_{\text{H}_2}} = \frac{\frac{3}{2} RT}{\frac{3}{2} RT} \left(\frac{1}{5} \right) = \frac{1}{5} = 1 : 5$$

17. (c) For a gas at temperature T , M is constant.

$$\therefore \text{Ratio of } \frac{v_{\text{rms}}}{v_{\text{av}}} = \sqrt{\frac{3RT}{M}} \times \sqrt{\frac{\pi M}{8RT}} = \frac{\sqrt{3} \times \sqrt{\pi}}{\sqrt{8}}$$

$$\therefore = \frac{\sqrt{3} \times \sqrt{3.14}}{\sqrt{8}} = \frac{1.086}{1}$$

18. (d) $v_{\text{rms}} = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3 \times 8.314 \times 400}{(4 \times 10^{-3}) \text{ kg}}} \approx 1580 \text{ m/s}$

19. (a) Diffusion method is used to separate a mixture of gases having different molecular weight as rate of diffusion varies inversely with molecular mass, i.e.

$$r \propto \frac{1}{\sqrt{M}}$$

This method is called atmolysis.

20. (b) $\therefore$ Units of $a = \frac{pV^2}{n^2} = \frac{\text{atm} \times \text{L}^2}{\text{mol}^2} = \text{L}^2 \text{ atm mol}^{-2}$

$$\therefore \text{Units of } b = \frac{V}{n} = \frac{\text{L}}{\text{mol}} = \text{mol}^{-1} \text{ L}$$

21. (c) $T_B = \frac{a}{Rb} \Rightarrow$ Higher the value of $\frac{a}{b}$, higher will be the Boyle's temperature.

22. (b) According to Boyle's law, $p_1V_1 = p_2V_2$

$$V_2 = \frac{p_1V_1}{p_2} = \frac{1 \text{ bar} \times 2.27 \text{ L}}{0.2 \text{ bar}} = 11.35 \text{ L}$$

23. (b) $v_{\text{av}} = \sqrt{\frac{8RT}{\pi M}} \Rightarrow v_{\text{av}} \propto \sqrt{T}$

$$\frac{2}{V_2} = \sqrt{\frac{300}{1200}} = \sqrt{\frac{1}{4}} = \frac{1}{2} \Rightarrow v_2 = 4 \text{ m/s}$$

24. (b)

25. (b) NH_3 have weakest hydrogen bonding among these. Hence, its molecules have most escaping tendency and therefore NH_3 has greatest vapour pressure among these liquids.

26. (b) $E = \frac{E'}{V} = \frac{1}{2} \frac{mNU_{\text{rms}}^2}{V} = \frac{3}{2} \times \frac{1}{3} \frac{mNU_{\text{rms}}^2}{V} = \frac{3}{2} p$

$$P = \frac{2}{3} E$$

27. (a) Surface tension of H_2O is maximum due to maximum hydrogen bonding among the given.

28. (c) Glass is an amorphous solid.

29. (d)

30. (c) In NaCl , both Na^+ and Cl^- ions, have coordination number 6.

31. (b) NaCl has a fcc structure have CN 6 : 6.

32. (b) We know that, $d = \frac{Z \cdot M}{n \times a^3}$

$$n = \frac{4 \times 100}{10 \times (200 \times 10^{-10})^3} = 5 \times 10^{24}$$

33. (c) CsCl crystal has bcc structure,

$$\Rightarrow r_{\text{Cs}^+} + r_{\text{Cl}^-} = \frac{\sqrt{3}}{2} a$$

34. (a) The space lattice of diamond is fcc and has tetrahedral geometry. Thus, the conventional unit cube contains eight atoms with CN four.

35. (b) $\frac{d_{\text{KCl}}}{d_{\text{NaCl}}} = \left(\frac{37.46}{27.94} \right)^{\frac{1}{3}} = 1.116$

36. (c) $d = \frac{ZM}{N_0 a^3}$; $Z = 4 \times \left(1 - \frac{0.1}{100} \right) = 3.996$

(because it contains 0.1% Schottky defect)

$$d = \frac{3.996 \times 40}{6.02 \times 10^{23} \times (0.556 \times 10^{-7})^3} = 1.5448 \text{ g/cm}^3$$

37. (a) $r_{\text{Cs}^+} + r_{\text{Cl}^-} = \frac{d_{\text{body}}}{2} = \frac{0.7141}{2} \text{ nm} = 0.3571 \text{ nm}$

$$r_{\text{Cs}^+} = 0.3571 - 0.181 = 0.176 \text{ nm}$$

38. (a) $d = \frac{ZM}{N_A a^3}$ (for bcc, $Z = 2$)

$$d_{\text{Fe}} = \frac{(2) \times 56.0 \text{ g mol}^{-1}}{(6.02 \times 10^{23} \text{ mol}^{-1}) (2.861 \times 10^{-8})^3 \text{ cm}^3} = 7.92 \text{ g cm}^{-3}$$

39. (a) Dimensions of a monoclinic crystal lattice are $a \neq b \neq c$ and $\alpha = \gamma = 90^\circ$, $\beta \neq 90^\circ$.

40. (b) $\frac{r^+}{r^-} = \frac{180}{187} = 0.96$, this value lies in the range of 0.732 – 1.000.

$\therefore$ Crystal structure will be of CsCl type.

41. (a) Density of unit cell, $d = \frac{Z \times M}{N_A \times a^3}$

$$d = \frac{2 \times 50}{(290 \times 10^{-10})^3 \times 6.023 \times 10^{23}} = 6.81 \text{ g/cm}^3$$

[$\therefore$ For bcc, $Z = 2$]

42. (d) Ratio of radius of scc, bcc, fcc will be $\frac{a}{2} : \frac{\sqrt{3}}{4} a : \frac{1}{2\sqrt{2}} a$.

43. (a) 1 mole of gold = 197 g = 6.02×10^{23} atoms.

$$\therefore \text{Number of atoms available in 1 g of gold} = \frac{6.02 \times 10^{23}}{197}$$

As fcc unit cell contains 4 atoms.

$$\therefore \text{Number of unit cells present} = \frac{6.02 \times 10^{23}}{197 \times 4} = 7.64 \times 10^{20}$$

44. (b) $Z_x = \frac{1}{8} \times 8 = 1$ (at corner)

$$Z_y = 1 \text{ [At Body centre]}, \quad Z_z = 3 \text{ [At Face centre]}$$

Hence, the formula of compound = XYZ_3

45. (a) Total number of atoms in the unit cell of fcc = 4

$$\therefore \text{Total volume of an atom} = \frac{4}{3} \pi r^3 \times 4 \quad [\therefore v = \frac{4}{3} \pi r^3]$$

$$= \frac{16}{3} \pi r^3$$

46. (c) Edge length not covered by atom = $a - 2r$

$$[\therefore \text{For bcc, } r = \frac{\sqrt{3}}{4} a]$$

$$= a - 2 \times \frac{\sqrt{3}}{4} a = a \left[\frac{2 - \sqrt{3}}{2} \right]$$

$$a \left[\frac{2 - \sqrt{3}}{2} \right] \times 100$$

$$\therefore \% \text{ of fraction not covered} = \frac{a \left[\frac{2 - \sqrt{3}}{2} \right] \times 100}{a} = 0.134 \times 100 = 13.4\%$$

BITSAT Archives

1. (d)

2. (a) ZnS has zinc blende type structure (i.e. ccp structure). The S^{2-} ions are present at the corners of the cube and at the centre of each face. Zinc ions occupy half of the tetrahedral sites. Each zinc ion is surrounded by four sulphide ions which are disposed towards the corner of regular tetrahedron. Similarly, S^{2-} ion is surrounded by four Zn^{2+} ions.

3. (b) Given that $r_{Na^+}/r_{Cl^-} = 0.55$, $r_{K^+}/r_{Cl^-} = 0.74$

$$\therefore \frac{r_{Na^+}}{r_{Cl^-}} = 0.55$$

$$\therefore \frac{r_{Na^+}}{r_{Cl^-}} + 1 = 0.55 + 1$$

$$\frac{r_{Na^+} + r_{Cl^-}}{r_{Cl^-}} = 1.55 \quad \dots(i)$$

$$\therefore \frac{r_{K^+}}{r_{Cl^-}} = 0.74$$

$$\text{Similarly } \frac{r_{K^+} + r_{Cl^-}}{r_{Cl^-}} = 1.74 \quad \dots(ii)$$

Dividing Eq. (ii) by Eq. (i)

$$\frac{r_{K^+} + r_{Cl^-}}{r_{Na^+} + r_{Cl^-}} = \frac{1.74}{1.55} = 1.1226$$

4. (a) Let $T_1 = T \Rightarrow T_2 = (T + 1)$

$$\text{and } p_1 = p \Rightarrow p_2 = p + \frac{0.4p}{100} = \frac{100.4p}{100}$$

$$\text{From } \frac{p_1 V_1}{T_1} = \frac{p_2 V_2}{T_2}, \frac{pV}{T} = \frac{100.4p}{100} \times \frac{V}{(T+1)}$$

$$100T + 100 = 100.4T$$

$$T = \frac{100}{0.4} = 250 \text{ K}$$

$$= (250 - 273)^\circ \text{C} = -23^\circ \text{C}$$

5. (a) Number of Ba^{2+} ions at the corner of unit cell

$$= 8 \times \frac{1}{8} = 1$$

$$\text{Number of } O^{2-} \text{ ions at the face centres} = 6 \times \frac{1}{2} = 3$$

$$\text{Number of } Ti^{4+} \text{ ions at the body centre} = 1$$

$$\therefore \text{Molecular formula of barium titanate} = BaTiO_3$$

$$6. (b) \frac{p_1 V_1}{T_1} = \frac{p_2 V_2}{T_2} \Rightarrow \frac{10^{-6} \times 1000}{298} = \frac{760 \times V_2}{273}$$

$$V_2 = 1.2 \times 10^{-6} \text{ cc} \quad (\text{at STP})$$

Number of molecules

$$= \frac{6.02 \times 10^{23}}{22400} \times 1.2 \times 10^{-6} = 3.2 \times 10^{13}$$

7. (d) In the ideal gas, the intermolecular forces of attraction are negligible and hence, it cannot be liquefied.

8. (c) Suppose number of atoms Q in the ccp arrangement = 100

Then, number of tetrahedral sites = 200

As all the tetrahedral sites are occupied by atoms P , therefore their number = 200

Hence, ratio $P : Q = 2 : 1$

i.e. the formula is $P_2 Q$.

9. (c) We know that, kinetic energy = nRT

$$\text{Kinetic energy of helium} = 0.3 \times R \times T \quad \dots (i)$$

$$\text{Kinetic energy of argon} = 0.4 \times R \times 400 \quad \dots (ii)$$

According to question

$$\text{Kinetic energy of helium} = \text{Kinetic energy of argon}$$

$$0.3 \times R \times T = 0.4 \times R \times 400$$

$$T = 533 \text{ K}$$

10. (a) Given, angle of diffraction (2θ) = 90°

$$\theta = 45^\circ$$

Distance between two planes, $d = 2.28 \text{ \AA}$

$$n = 2 \quad [\because \text{second order diffraction}]$$

Bragg's equation is $n\lambda = 2d \sin \theta$

$$2 \times \lambda = 2 \times 2.28 \times \sin 45^\circ \Rightarrow \lambda = 1.612$$

11. (d) In a unit cell, W-atoms at the corner = $\frac{1}{8} \times 8 = 1$

$$\text{O-atoms at the centre of edge} = \frac{1}{4} \times 12 = 3$$

Na-atoms at the centre of the cube = 1

$$W : O : Na = 1 : 3 : 1$$

Hence, formula = $NaWO_3$

12. (b) Boiling point of HF is highest due to H-bonding. For other halogen acids boiling point increases in the order $HCl < HBr < HI$. Therefore, most volatile (with lower boiling point) is HCl.

$$13. (a) v_{rms} = \sqrt{\frac{3RT}{M}} \text{ or } v_{rms} \propto \sqrt{T}$$

$$\frac{v_{rms}}{v'_{rms}} = \sqrt{\frac{T}{T'}} \Rightarrow \frac{1}{2} = \sqrt{\frac{T}{T'}} \Rightarrow T' = 4T$$

$$14. (c) \text{From } v = \frac{nRT}{P}$$

At high T and low p , V is high.

$$15. (c) \frac{u_{rms}(H_2)}{u_{rms}(N_2)} = \sqrt{7} = \left[\frac{T(H_2)M(N_2)}{M(H_2)T(N_2)} \right]^{1/2} = \sqrt{7}$$

$$\text{Hence, } \frac{T(H_2)}{T(N_2)} = 7 \frac{M(H_2)}{M(N_2)} = 7 \left(\frac{2}{28} \right) = \frac{1}{2}$$

$$T_{H_2} < T_{N_2}$$

16. (d) N_2 has the highest partial pressure in atmosphere.

7

Chemical Thermodynamics

Thermodynamics

The various forms of energy are interrelated and under certain conditions these may be transformed from one form into another. The study of these energy transformation forms the subject matter of thermodynamics. It is based on four generalisations, i.e. zeroth, first, second and third law of thermodynamics.

System

It is the part of the universe, which is under the thermodynamic investigation.

Types of System

- (i) **Open system** The system, which can exchange energy as well as matter with the surroundings, e.g. tea in a cup, human body, etc.
- (ii) **Closed system** The system, which can exchange only energy with the surroundings but not the matter, e.g. hot water in a sealed tube.
- (iii) **Isolated system** The system, which is perfectly insulated and hence, cannot exchange energy and matter with the surroundings, e.g. ice in a thermos flask.

Surroundings and Boundary

The part of the universe other than the system, is known as its surroundings. A system is separated from the surroundings by a real or imaginary boundary.

Thermodynamic Properties

Intensive and Extensive Properties

An intensive property is that which does not depend upon the quantity of matter present in the system, e.g. temperature, density, refractive index, boiling point, viscosity, specific heat etc. While extensive properties are those properties, which depend upon the quantity of matter present in the system, e.g. mass, volume, energy, heat capacity, enthalpy, entropy etc.

State functions

These are the properties which depend on the state and not on the path followed to obtain that state, e.g. internal energy, enthalpy, entropy, free energy etc.

Processes

The state of variable can be changed by means of an operation called process.

These are of following types :

- (i) **Adiabatic process** The process in which system does not exchange heat with its surroundings, i.e. $dQ = 0$.
- (ii) **Isothermal process** The process in which temperature remains constant, i.e. $dT = 0$.
- (iii) **Isobaric process** The process in which change of state is brought about at constant pressure, i.e. $dp = 0$.
- (iv) **Isochoric process** The process in which volume of the system remains constant, i.e. $dV = 0$.
- (v) **Cyclic process** This is the process in which a system undergoes a number of different states and finally returns to its initial state. For such a process, change in internal energy and enthalpy is zero, i.e. $dE = 0$ and $dH = 0$.
- (vi) **Reversible process** It is an ideal process and here, every intermediate state is in equilibrium with others, if any. This is a slow process.
- (vii) **Irreversible process** That process, cannot be reversed in which amount of energy increases. All natural processes are irreversible in nature.

First Law of Thermodynamics

It states that energy can neither be created nor be destroyed although, it can be changed from one form to another. Mathematically,

$$\Delta E = q + W \quad \dots(i)$$

where, ΔE = change in internal energy

q = heat absorbed

W = work done

Concept of Work

Work is a medium to transfer energy from a system to surrounding.

1. Work done in isothermal reversible expansion

$$W = -2.303nRT \log \frac{V_2}{V_1} = -2.303nRT \log \frac{p_1}{p_2}$$

where, V_1 = initial volume, V_2 = final volume

p_1 = initial pressure, p_2 = final pressure

R = real gas constant, T = temperature

2. Work done in isothermal irreversible expansion

$$W = -p_{\text{ext}} \times \Delta V$$

If expansion occurs in vacuum, i.e. at zero pressure, the value of work done is zero.

$$W = -p_{\text{ext}} \times \Delta V = 0$$

3. Work done in adiabatic expansion

$$W = \frac{nR}{\gamma - 1} (T_2 - T_1)$$

Work done by the system, $W = -ve$; $\therefore \Delta U = -ve$

Work done on the system, $W = +ve$; $\therefore \Delta U = +ve$

4. Work done in cyclic process is always zero

$$\oint dW = 0$$

Internal Energy (E or U)

The total amount of energy associated with a molecule is known as internal energy. It is denoted by U .

$$U = U_{\text{trans}} + U_{\text{vib}} + U_{\text{elec}} + U_{\text{rot}} + \dots$$

$$T = \text{constant}, \Delta U = 0$$

Internal energy depends on temperature, pressure, volume and quantity of matter.

Heat

It is defined as the quantity of energy, which flows between system and surroundings on account of temperature difference. It is also a path function, i.e. depends upon the path followed.

It is given as

$$H = ms\Delta t$$

where, m = mass of substance

s = specific heat

Δt = temperature difference

Enthalpy

The total heat content of a system at constant pressure is called the enthalpy of the system. Indeed, it is the sum of internal energy and the product of pressure-volume work. It is an extensive quantity and is represented by the symbol H . The equation is

$$H = E + pV$$

$$\Delta H = \Delta E + p\Delta V$$

$$\Delta H = \Delta E + \Delta n_g RT$$

where, ΔH = enthalpy change

Δn_g = gaseous moles of products

– gaseous moles of reactants

If $\Delta n_g = 0$, then $\Delta H = \Delta E$; If $\Delta n_g > 0$ then $\Delta H > \Delta E$ and if $\Delta n_g < 0$ then, $\Delta H < \Delta E$.

For reaction involving solids and liquids only, $\Delta H = \Delta E$.

Heat Capacity

Heat capacity (C) of a system is defined as the amount of heat required to raise the temperature of the system by 1°C .

$$C = \frac{q}{\Delta T}$$

If the system consists of a single substance or a solution and weighs 1 mole, the heat capacity of the system is known as **molar heat capacity**. If the system consists of a single substance or a solution and weighs 1 g, the heat capacity of the system is known as **specific heat** of the system.

$$\sigma_L = C \times m \times \Delta T$$

where, m = mass of substance, C = specific heat capacity and ΔT = temperature difference

Enthalpies for Different Types of Reactions

Enthalpy Change of Formation ($\Delta_f H^\circ$) The enthalpy change during the formation of one mole of the compound from constituent element in their standard state is known as enthalpy change of formation.

Enthalpy of Phase Transition ($\Delta_t H$) The enthalpy change during the conversion of one mole of a substance from one phase to another phase is known as enthalpy of phase transition.

Enthalpy of Fusion Change in heat enthalpy when 1 mole of a substance is completely converted from solid state into liquid state at its melting or freezing point is known as enthalpy of fusion.

Enthalpy of Sublimation ($\Delta_{\text{sub}} H$) The enthalpy change during sublimation of 1 mole of solid substance to gaseous substance directly is known as enthalpy of sublimation.

$$\Delta_{\text{sub}} H = \Delta_{\text{fus}} H + \Delta_{\text{vap}} H$$

Enthalpy of Ionisation ($\Delta_{\text{ion}} H^\circ$) The enthalpy change during complete conversion of one mole of weak acid or base into its constituent ions is known as enthalpy of ionisation. It is denoted by $\Delta_{\text{ion}} H^\circ$.

$$\Delta_{\text{ion}} H^\circ = -55.43 \text{ kJ/mol}$$

Thermochemistry

It is the branch of physical chemistry which is concerned with energy change between a chemical system and its surroundings when a change of a phase or a chemical reaction takes place within the system. It is also termed as chemical energetics. It is based on the first law of thermodynamics.

Hess's Law of Constant Heat Summation

Total enthalpy change during the complete course of reaction in a single step and several steps are equal.

$$\Delta H = \Delta H_1 + \Delta H_2 + \Delta H_3$$

Applications

- In determination of enthalpy of reaction, enthalpy of formation, enthalpy of transformation etc.
- In determination of bond energy,

$$\Delta_r H = \Sigma \text{ bond energy of reactants} - \Sigma \text{ bond energy of products}$$

Second Law of Thermodynamics

For a spontaneous process of an isolated system, the entropy change is always positive.

$$\Delta S_{\text{univ}} = \Delta S_{\text{sys}} + \Delta S_{\text{surr}} > 0$$

Entropy

It is the property of a system which measures the degree of randomness in a system. It is a state function, therefore change in entropy depends only on the initial and final states.

$$\Delta S = S_{\text{final}} - S_{\text{initial}} = \frac{q_{\text{sys rev}}}{T}$$

1. Entropy change for an ideal gas

(i) For isothermal process,

$$\Delta S = 2.303 n R \log \frac{V_2}{V_1} = 2.303 n R \log \frac{p_1}{p_2}$$

(ii) For isobaric process, $\Delta S = 2.303 n C_p \log \frac{T_2}{T_1}$

(iii) For isochoric process, $\Delta S = 2.303 n C_v \log \frac{T_2}{T_1}$

2. Entropy change during phase transition

$$\Delta S = \frac{\Delta H}{T}$$

Criteria of Spontaneity : Gibbs Energy

In most of the chemical reactions, change in enthalpy and entropy occurs simultaneously.

Thus, a new thermodynamic function is introduced to define spontaneity of chemical process known as **Gibbs free energy (G)**.

$$G = H - TS$$

$\therefore$

$$\Delta G = \Delta H - T\Delta S$$

This equation is also known as **Gibbs Helmholtz equation**.

The spontaneity of process is related to Gibbs free energy change as

$\Delta G = +ve$	Non-spontaneous process
$\Delta G = 0$	Equilibrium state
$\Delta G = -ve$	Spontaneous process

NOTE If $\Delta H = +ve$, $\Delta S = +ve$, $\Delta S > \Delta H$
Then, $\Delta G < 0$ hence, reaction becomes spontaneous.

Effect of temperature on spontaneity of process

$\Delta_r H^\circ$	$\Delta_r S^\circ$	$\Delta_r G^\circ$	Reaction will be spontaneous at
-	+	-	All temperature
-	-	-	Low temperature
-	-	+	High temperature
+	+	+	Low temperature
+	+	-	High temperature
+	-	+	All temperature

Percentage efficiency of fuel

$$\% \text{ efficiency} = \frac{\Delta G}{\Delta H} \times 100$$

Third law of Thermodynamics

This law states that the entropy of a substance becomes zero at absolute zero temperature (perfectly crystalline state), i.e.

$$\lim_{T \rightarrow 0} S = 0$$

The importance of the third law is that it is used in calculating absolute entropies of pure substances at different temperatures.

For a solid at TK

$$S_T - S_0 = \Delta S = \int_0^T \frac{C_p \cdot dT}{T}$$

Practice Exercise

- Thermodynamics is not concerned about
 - energy changes involved in a chemical reaction
 - the extent to which a chemical reaction proceeds
 - the rate at which a reaction proceeds
 - the feasibility of a chemical reaction
- What is ΔE for a system that does 500 cal of work on surrounding and 300 cal of heat is absorbed by the system?
 - 200 cal
 - 300 cal
 - +200 cal
 - +300 cal
- Flying bird is an example of
 - closed system
 - open system
 - isolated system
 - microscopic system
- For an adiabatic process, which of the following is correct?
 - $p\Delta V = 0$
 - $q = +W$
 - $\Delta q = 0$
 - $\Delta E = q$
- A gas expands, isothermally and reversibly. The work done by the gas is
 - zero
 - maximum
 - minimum
 - cannot be determined
- Which of the following statement is correct?
 - The presence of reacting species in a covered beaker is an example of open system
 - There is an exchange of energy as well as matter between the system and the surroundings in a closed system
 - The presence of reactants in a closed vessel made up of copper is an example of a closed system
 - The presence of reactants in a thermos flask or any other closed insulated vessel is an example of a closed system
- 1 mole of CO_2 gas at 300 K is expanded under adiabatic conditions such that its volume becomes 27 times. What is work done? ($\gamma = 1.33$ and $C_V = 6 \text{ cal mol}^{-1}$ for CO_2)
 - 900 cal
 - 1000 cal
 - 1200 cal
 - 1400 cal
- The heat of combustion of benzene determined in a bomb calorimeter is $-870 \text{ kcal mol}^{-1}$ at 298K. The value of ΔE for reaction is
 - $-1740 \text{ kcal mol}^{-1}$
 - $+870 \text{ kcal mol}^{-1}$
 - $-870 \text{ kcal mol}^{-1}$
 - $+1740 \text{ kcal mol}^{-1}$
- Enthalpy of combustion of $\text{C}_6\text{H}_6(l)$ is -3264.64 kJ/mol . The heat produced by burning 3.9 g of benzene is
 - -163.23 kJ
 - -326.4 kJ
 - -32.64 kJ
 - -3.264 kJ
- A molecule with highest bond energy is
 - Br_2
 - F_2
 - Cl_2
 - I_2
- For the reaction $\text{C} + \text{O}_2 \longrightarrow \text{CO}_2$,
 - $\Delta H > \Delta E$
 - $\Delta H < \Delta E$
 - $\Delta H = \Delta E$
 - None of these
- Given that ΔH_{comb} of $\text{C}(s)$, $\text{H}_2(g)$ and $\text{CH}_4(g)$ are -394 , -284 and -892 kJ/mol respectively. The heat of formation of CH_4 is
 - -70 kJ/mol
 - -71.8 kJ/mol
 - -244 kJ/mol
 - -782 kJ/mol

13. For which of the following reactions ΔH is less than ΔE ?
- $\text{HCl}(aq) + \text{NaOH}(aq) \longrightarrow \text{NaCl}(aq) + \text{H}_2\text{O}(l)$
 - $\text{H}_2(g) + \text{I}_2(g) \longrightarrow 2\text{HI}(g)$
 - $\text{C}(s) + \text{O}_2(g) \longrightarrow \text{CO}_2(g)$
 - $\text{N}_2(g) + 3\text{H}_2(g) \longrightarrow 2\text{NH}_3(g)$
14. Enthalpy change, when 1 g water is frozen at 0°C is ($\Delta H_{\text{fus}} = 1.435 \text{ kcal mol}^{-1}$)
- 0.0797 kcal
 - 0.0797 kcal
 - 1.435 kcal
 - 1.435 kcal
15. $\text{S}_{\text{rhombic}} + \text{O}_2(g) \longrightarrow \text{SO}_2(g)$, $\Delta H = -297.5 \text{ kJ}$
 $\text{S}_{\text{monoclinic}} + \text{O}_2(g) \longrightarrow \text{SO}_2(g)$, $\Delta H = -300 \text{ kJ}$
 The data can predict that
- rhombic sulphur is yellow in colour
 - monoclinic sulphur has metallic lustre
 - monoclinic sulphur is more stable
 - $\Delta H_{\text{transition}}$ of S_R of S_M is endothermic
16. When ammonium chloride is dissolved in water, the solution becomes cold. The change is
- endothermic
 - exothermic
 - supercooling
 - None of these
17. If a refrigerator's door is kept opened, then we get
- room cooled
 - room heated
 - more heat is passed out
 - no effect on room
18. Internal energy and pressure of a gas of unit volume are related as
- $p = \frac{2}{3}E$
 - $p = \frac{E}{2}$
 - $p = \frac{3}{2}E$
 - $p = 2E$
19. Latent heat of vaporisation of a liquid at 500 K and 1 atm pressure is 10.0 kcal/mol. What will be the change in internal energy (ΔE) of 3 moles of liquid at same temperature?
- 30 kcal
 - 54 kcal
 - 27.0 kcal
 - 50 kcal
20. Water is brought to boil under a pressure of 1.0 atm. When an electric current of 0.50 A from a 12 V supply is passed for 300 s through a resistance in thermal contact with it, it is found that 0.798 g of water is vaporised. Calculate the molar internal energy change at boiling point (373.15 K).
- 37.5 kJ mol^{-1}
 - 3.75 kJ mol^{-1}
 - 42.6 kJ mol^{-1}
 - 4.26 kJ mol^{-1}
21. Enthalpy of solution of $\text{NaOH}(s)$ in water is $-41.6 \text{ kJ mol}^{-1}$. When NaOH is dissolved in water, the temperature of water
- increases
 - decreases
 - does not change
 - fluctuates indefinitely
22. The heat of combustion of carbon to CO_2 is -393.5 kJ/mol . The heat released upon formation of 35.2 g of CO_2 from carbon and oxygen gas is
- +315 kJ
 - 31.5 kJ
 - 315 kJ
 - +31.5 kJ
23. If the heat of neutralisation for a strong acid-base reaction is -57.1 kJ , what would be the heat released when 350 cm^3 of 0.20 M of a dibasic strong acid is mixed with 650 cm^3 of 0.10 M monoacidic base?
- 57.1 kJ
 - 3.71 kJ
 - 57.1 kJ
 - 0.317 kJ
24. If enthalpies of formation of $\text{C}_2\text{H}_4(g)$, $\text{CO}_2(g)$ and $\text{H}_2\text{O}(l)$ at 250°C and 1 atm pressure be 52, -394 and -286 kJ mol^{-1} respectively, the enthalpy of combustion of $\text{C}_2\text{H}_4(g)$ will be
- 1412 kJ mol^{-1}
 - 1412 kJ mol^{-1}
 - +141.2 kJ mol^{-1}
 - 141.2 kJ mol^{-1}
25. The bond dissociation energies of gaseous H_2 , Cl_2 and HCl are 104.58 and 103 kcal respectively. The enthalpy of formation of HCl gas would be
- 44 kcal
 - 44 kcal
 - 22 kcal
 - 22 kcal
26. The ΔH_f° for $\text{CO}_2(g)$, $\text{CO}(g)$ and $\text{H}_2\text{O}(g)$ are -393.5, -110.5 and $-241.8 \text{ kJ mol}^{-1}$ respectively, the standard enthalpy change (in kJ) for the reaction, $\text{CO}_2(g) + \text{H}_2(g) \longrightarrow \text{CO}(g) + \text{H}_2\text{O}(g)$, is
- 524.1
 - 41.2
 - 262.5
 - 412
27. Heat of formation of H_2O is -188 kJ/mol and H_2O_2 is -286 kJ/mol . The enthalpy change for the reaction $2\text{H}_2\text{O}_2 \longrightarrow 2\text{H}_2\text{O} + \text{O}_2$, is
- 196 kJ
 - 196 kJ
 - 984 kJ
 - 984 kJ
28. The enthalpy of dissolution of $\text{BaCl}_2(s)$ and $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}(s)$ are -20.6 and 8.8 kJ/mol respectively. The enthalpy of hydration for, $\text{BaCl}_2(s) + 2\text{H}_2\text{O} \longrightarrow \text{BaCl}_2 \cdot 2\text{H}_2\text{O}(s)$, is
- 29.4 kJ
 - 29.4 kJ
 - 11.8 kJ
 - 38.2 kJ
29. $\Delta_f U^\circ$ of formation of $\text{CH}_4(g)$ at certain temperature is -393 kJ mol^{-1} . The value of $\Delta_f H^\circ$ is
- zero
 - $< \Delta_f U^\circ$
 - $> \Delta_f U^\circ$
 - equal to $\Delta_f U^\circ$
30. Find the entropy change when 2 moles of ideal gas at 27°C temperature is expanded reversibly from 2 L to 20 L
- 92.1
 - 0
 - 4
 - 9.2
31. When a gas expands from 1.5 L to 6.5 L against a constant pressure of 0.50 atm and during this process, the gas also absorbs 100 J of heat. The change in internal energy is
- 153.3 J
 - 353.3 J
 - 153.3 J
 - 353.3 J
32. The reaction between cyanamide, $\text{NH}_2\text{CN}(s)$ and oxygen was allowed to complete and ΔU at 300 K was observed to be -743 kJ mol^{-1} . The value of ΔH at 300 K for the combustion reaction
- $$\text{NH}_2\text{CN}(s) + \frac{3}{2}\text{O}_2(g) \longrightarrow \text{N}_2(g) + \text{CO}_2(g) + \text{H}_2\text{O}(l)$$
- would be
- 741.75 kJ mol^{-1}
 - 743 kJ mol^{-1}
 - 744.25 kJ mol^{-1}
 - 740.5 kJ mol^{-1}

33. The following data (s) are given as the standard enthalpies of combustion of $C(s)$, $H_2(g)$ and $CH_4(g)$ are $-393.5 \text{ kJ mol}^{-1}$, $-285.8 \text{ kJ mol}^{-1}$ and $-890.4 \text{ kJ mol}^{-1}$ respectively at 298 K. The standard enthalpy of formation of methane $[CH_4(g)]$ is

a. $+724.42 \text{ kJ mol}^{-1}$ b. $+74.7 \text{ kJ mol}^{-1}$
c. $-114.82 \text{ kJ mol}^{-1}$ d. $-194.62 \text{ kJ mol}^{-1}$

34. If for a given substance, melting point is T_B and freezing point is T_A then correct variation of entropy by graph between entropy change and temperature is

35. Mark out the enthalpy for the formation of carbon monoxide (CO) Given, $C(s) + \frac{1}{2}O_2(g) \rightarrow CO(g)$;

$$\Delta H = -393.3 \text{ kJ / mol}$$

a. 110.5 kJ/mol b. 676.1 kJ/mol
c. 282.8 kJ/mol d. 300.0 kJ/mol

36. In the reaction, $Na(s) \rightarrow Na(g)$

the enthalpy of atomisation is same as the

a. enthalpy of dissociation b. enthalpy of sublimation
c. enthalpy of association d. enthalpy of vaporisation

37. Calculate the bond enthalpy of Xe—F bond as given in the equation,

$$\Delta_r H = 292 \text{ kcal mol}^{-1}$$

Ionisation energy of Xe = $279 \text{ kcal mol}^{-1}$

Bond energy (F—F) = 38 kcal/mol

Electron affinity of F = 85 kcal/mol

a. 8.5 kcal/mol b. 34 kcal/mol
c. 24 kcal/mol d. None of these

38. Calculate the resonance energy of N_2O .

$$\Delta_f H^\circ \text{ of } N_2O = 82 \text{ kJ mol}^{-1}$$

Bond energy of $N=O$ = 607 kJ mol^{-1}

Bond energy of $O=O$ = 498 kJ mol^{-1}

Bond energy of $N=N$ = 418 kJ mol^{-1}

Bond energy of $N \equiv N$ = 946 kJ mol^{-1}

a. 82 kJ mol^{-1}
b. -88 kJ mol^{-1}
c. -82 kJ mol^{-1}
d. $+88 \text{ kJ mol}^{-1}$

39. Use the following data to calculate $\Delta_{\text{lattice}} H^\circ$ for NaBr. $\Delta_{\text{sub}} H^\circ$ for sodium metal = $108.4 \text{ kJ mol}^{-1}$

Ionisation enthalpy of sodium = 496 kJ mol^{-1}

Electron gain enthalpy of bromine = 325 kJ mol^{-1}

Bond dissociation enthalpy of bromine = 192 kJ mol^{-1}

$$\Delta_f H^\circ \text{ for NaBr (s)} = -360.1 \text{ kJ mol}^{-1}$$

a. $-735.5 \text{ kJ mol}^{-1}$ b. $+735.5 \text{ kJ mol}^{-1}$
c. $-735.5 \text{ J mol}^{-1}$ d. $+735.5 \text{ J mol}^{-1}$

40. Find out the standard free energy change at 60°C and at 1 atm if the N_2O_4 is 50% dissociated.

a. $-800.0 \text{ kJ mol}^{-1}$ b. $+800.0 \text{ kJ mol}^{-1}$
c. $-789.89 \text{ JK}^{-1} \text{ mol}^{-1}$ d. $+789.98 \text{ JK}^{-1} \text{ mol}^{-1}$

41. Moles of an ideal gas expand isothermally and reversibly from pressure of 5 atm to 1 atm at 300 K. Calculate the largest mass that can be lifted through a height of 1 m by this expansion.

a. 4092.76 kg b. 8730.9368 kg
c. 4492.76 kg d. 8170.2344 kg

42. At 27°C , one mole of an ideal gas is compressed isothermally and reversibly from a pressure of 2 atm to 10 atm. The value of ΔE and q are ($R = 2 \text{ cal}$)

a. -965.84 cal
b. $-965.84 \text{ cal}, -865.58 \text{ cal}$
c. $865.58 \text{ cal}, -865.58 \text{ cal}$
d. $965.84 \text{ cal}, +865.58 \text{ cal}$

43. The enthalpy of vaporisation of water is 186.5 J/mol . The entropy of its vaporisation will be

a. $0.5 \text{ JK}^{-1} \text{ mol}^{-1}$ b. $1.0 \text{ JK}^{-1} \text{ mol}^{-1}$
c. $1.5 \text{ JK}^{-1} \text{ mol}^{-1}$ d. $2.0 \text{ JK}^{-1} \text{ mol}^{-1}$

44. The reaction which proceeds in the forward direction is

a. $Fe_2O_3 + 6HCl \rightarrow 2FeCl_3 + 3H_2O$
b. $NH_3 + H_2O + NaCl \rightarrow NH_4Cl + NaOH$
c. $SnCl_4 + Hg_2Cl_2 \rightarrow SnCl_2 + 2HgCl_2$
d. $2CuI + I_2 + 4K^+ \rightarrow 2Cu^+ + 4KI$

45. Ammonium chloride, when dissolved in water, leads to a cooling sensation. The dissolution of ammonium chloride at constant temperature is accompanied by

a. increase in entropy b. decrease in entropy
c. no change in entropy d. no change in enthalpy

46. At 27°C , the reaction

proceeds spontaneously because the magnitude of

a. $\Delta H = T \cdot \Delta S$ b. $\Delta H > T \cdot \Delta S$
c. $\Delta H < T \cdot \Delta S$ d. $\Delta H > 0$ and $T \cdot \Delta S < 0$

47. The sign of ΔG for the process of melting of ice at 273 K and 1 atm pressure is

a. positive
b. negative
c. neither negative nor positive
d. either negative or positive

48. The initial state A has the temperature T_A , U_A as the internal energy of the system. By applying the mechanical work, new state B is achieved with the temperature T_B and having the internal energy U_B . Given that $T_B > T_A$. What is the correct expression for the change in internal energy (ΔU)?
- $U_B = U_A$
 - $U_B - U_A$
 - $U_A - U_B$
 - None of the above
49. When 1.8 g of steam at the normal boiling point of water is converted into water, at the same temperature, enthalpy and entropy changes respectively will be
[Given, ΔH_{vap} for water = 40.8 kJ mol^{-1}]
- -8.12 kJ , 11.89 JK^{-1}
 - 10.25 kJ , 12.95 JK^{-1}
 - -4.08 kJ , -10.93 JK^{-1}
 - 10.93 kJ , -4.08 JK^{-1}
50. When the heat of a reaction at constant pressure is $-2.5 \times 10^3 \text{ cal}$ and entropy change for the reaction is 7.4 cal deg^{-1} , it is predicted that the reaction at 25°C is
- reversible
 - spontaneous
 - non-spontaneous
 - irreversible
51. What will be the change of entropy $\Delta_r S^\circ$ at 298 K for the reaction in which urea is formed from NH_3 and CO_2 ?
 $2\text{NH}_3(g) + \text{CO}_2(g) \longrightarrow \text{NH}_2\text{CONH}_2(aq) + \text{H}_2\text{O}(l)$
 [Given, the standard entropy of $\text{NH}_2\text{CONH}_2(aq)$, $\text{CO}_2(g)$, $\text{NH}_3(g)$ and $\text{H}_2\text{O}(l)$ are 174.0 , 213.7 , 192.3 and $69.9 \text{ JK}^{-1} \text{ mol}^{-1}$ respectively]
- $200 \text{ JK}^{-1} \text{ mol}^{-1}$
 - $-35.44 \text{ JK}^{-1} \text{ mol}^{-1}$
 - $-354.4 \text{ JK}^{-1} \text{ mol}^{-1}$
 - $425.2 \text{ JK}^{-1} \text{ mol}^{-1}$
52. For an isomerisation reaction $A \rightleftharpoons B$, the temperature dependence of equilibrium constant is given by $\log_e K = 4.0 - \frac{2000}{T}$. The value of ΔS° at 300 K is therefore,
- $4R$
 - $5R$
 - $400R$
 - $2000R$
53. ΔG , in process of melting of ice at -15°C , is
- $\Delta G = -ve$
 - $\Delta G = +ve$
 - $\Delta G = 0$
 - All of these
54. Using following data
 $\text{H}_2\text{O}(l)[373.15 \text{ K}, 1\text{atm}] \longrightarrow \text{H}_2\text{O}(g)[373.15 \text{ K}, 1\text{atm}]; \Delta S_1$
 $\text{H}_2\text{O}(s)[273.15 \text{ K}, 1\text{atm}] \longrightarrow \text{H}_2\text{O}(l)[273.15 \text{ K}, 1\text{atm}]; \Delta S_2$
 Predict which of the following is correct?
- $\Delta S_1 = \Delta S_2$
 - $\Delta S_1 > \Delta S_2$
 - $\Delta S_1 < \Delta S_2$
 - ΔS_1 may be greater or smaller than ΔS_2
55. On the basis of thermochemical equations a , b and c , find out which of the algebraic relationships given in option a . to d . is correct?
- $\text{C}(\text{graphite}) + \text{O}_2(g) \longrightarrow \text{CO}_2(g); \Delta_c H = x \text{ kJ mol}^{-1}$
 - $\text{C}(\text{graphite}) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{CO}(g); \Delta_c H = y \text{ kJ mol}^{-1}$
 - $\text{CO}(g) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{CO}_2(g); \Delta_c H = z \text{ kJ mol}^{-1}$
- $z = x + y$
 - $x = y - z$
 - $x = y + z$
 - $y = 2z - x$
56. The heat of atomisation of $\text{P}_4\text{H}_4(g)$ and $\text{PH}_3(g)$ are 355 kcal/mol and 228 kcal/mol respectively. The energy of $\text{P}-\text{P}$ bond is
- $102 \text{ kcal mol}^{-1}$
 - 51 kcal mol^{-1}
 - 26 kcal mol^{-1}
 - $204 \text{ kcal mol}^{-1}$
57. In the given equation,
 $4\text{Fe}(s) + 3\text{O}_2(g) \longrightarrow 2\text{Fe}_2\text{O}_3(s)$
 The entropy change is $-549.4 \text{ JK}^{-1} \text{ mol}^{-1}$ at 298K .
 $(\Delta_r H^\circ = -1648 \times 10^3 \text{ Jmol}^{-1})$. The above reactions is
- spontaneous
 - non-spontaneous
 - Both (a) and (b)
 - None of the above
58. Find out the entropy change in surroundings when 1 mole of $\text{H}_2\text{O}(l)$ is formed under standard conditions
 $\Delta_r H^\circ = -286 \text{ kJ mol}^{-1}$
- $959.7 \text{ JK}^{-1} \text{ mol}^{-1}$
 - $286 \text{ JK}^{-1} \text{ mol}^{-1}$
 - $-959.7 \text{ JK}^{-1} \text{ mol}^{-1}$
 - $-286 \text{ JK}^{-1} \text{ mol}^{-1}$

BITSAT Archives

- A swimmer coming out from a pool is covered with a film of water weighing about 18 g. Calculate the internal energy of vaporisation at 100°C. [2014]
[$\Delta_{\text{vap}}H^\circ$ for water at 373 K = 40.66 kJ mol⁻¹]
a. 35.67 kJmol⁻¹ b. 37.56 kJmol⁻¹
c. 36.57 kJmol⁻¹ d. 38.75 kJmol⁻¹
- The heat of combustion of sucrose, C₁₂H₂₂O₁₁(s) at constant volume is 1348.9 kcal mol⁻¹ at 25°C, then the heat of reaction at constant pressure when steam is produced is [2014]
a. - 1348.9 kcal b. - 1342.34 kcal
c. + 1250 kcal d. None of these
- At constant temperature and pressure which one of the following statements is correct for the reaction?
 $\text{CO}(g) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{CO}_2(g)$ [2013]
a. $\Delta H = \Delta E$
b. $\Delta H < \Delta E$
c. $\Delta H > \Delta E$
d. ΔH is independent of physical state of reactant
- The equilibrium constant K_p for the reaction,
 $\text{N}_2(g) + 3\text{H}_2(g) \rightleftharpoons 2\text{NH}_3(g)$
 $1.6 \times 10^{-4} \text{ (atm)}^{-2}$ at 400°C. What will be the equilibrium constant at 500°C, if heat of the reaction in this temperature range is - 25.14 kcal? [2013]
a. $1.231 \times 10^{-4} \text{ (atm)}^{-2}$ b. $1.876 \times 10^{-7} \text{ (atm)}^{-2}$
c. $1.462 \times 10^{-5} \text{ (atm)}^{-2}$ d. $3.462 \times 10^{-5} \text{ (atm)}^{-2}$
- Given that
 $\text{H}_2\text{O}(l) \longrightarrow \text{H}^+(aq) + \text{OH}^-(aq); \Delta H = 57.32 \text{ kJ}$
 $\text{H}_2(g) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{H}_2\text{O}(l); \Delta H = - 286.02 \text{ kJ}$
Then, calculate the enthalpy of formation of OH⁻ at 25°C. [2013]
a. - 228.8 kJ b. - 343.52 kJ
c. + 228.8 kJ d. + 343.52 kJ
- Calculate the amount of heat evolved when 500 cm³ of 0.1 M HCl is mixed with 200 cm³ of 0.2 M NaOH. [2013]
a. 57.3 kJ b. 2.865 kJ
c. 2.292 kJ d. 0.573 kJ
- The mutual heat of neutralisation of 40 g NaOH and 60 g CH₃COOH will be [2011]
a. 57.1 kJ b. less than 57.1 kJ
c. more than 57.1 kJ d. 13.7 kJ
- For the dissociation reaction, [2010]
 $\text{H}_2(g) \rightleftharpoons 2\text{H}(g); \Delta H = 162 \text{ kcal}$
heat of atomisation of H is
a. 81 kcal b. 162 kcal c. 208 kcal d. 218 kcal
- Internal energy does not include [2009]
a. vibrational energy
b. rotational energy
c. energy arising by gravitational pull
d. nuclear energy
- A reaction has both ΔH and ΔS negative. The rate of reaction [2009]
a. increases with increase of temperature
b. increases with decrease of temperature
c. remains unaffected by change of temperature
d. cannot be predicted for change in temperature
- One mole of an anhydrous salt AB dissolves in water with the evolution of 21.0 J mol⁻¹ of heat. If the heat of hydration of AB is - 29.4 J mol⁻¹, then the heat of dissociation of hydrated salt AB is [2009]
a. 50.4 Jmol⁻¹ b. 8.4 Jmol⁻¹
c. - 50.4 Jmol⁻¹ d. - 8.4 Jmol⁻¹
- Calculate the ΔH in kJ for the following reaction, [2008]
 $\text{C}(g) + \text{O}_2(g) \longrightarrow \text{CO}_2(g)$
Given that,
 $\text{H}_2\text{O}(g) + \text{C}(g) \longrightarrow \text{CO}(g) + \text{H}_2(g); \Delta H = + 131 \text{ kJ}$
 $\text{CO}(g) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{CO}_2(g); \Delta H = - 282 \text{ kJ}$
 $\text{H}_2(g) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{H}_2\text{O}(g); \Delta H = - 242 \text{ kJ}$
a. - 393 b. + 393 c. + 655 d. - 655
- For a reversible reaction $A \rightleftharpoons B$, [2008]
which one of the following statements is wrong from the given energy profile diagram?

a. Activation energy of forward reaction is greater than backward reaction
b. The forward reaction is endothermic
c. The threshold energy is less than that of activation energy
d. The energy of activation of forward reaction is equal to the sum of heat of reaction and the energy of activation of backward reaction
- A 27°C one mole of an ideal gas is compressed isothermally and reversibly from a pressure of 2 atm to 10 atm. The value of ΔE and q are ($R = 2 \text{ cal}$) [2007]
a. 0, - 965.84 cal
b. - 965.58 cal, - 865.58 cal
c. + 865.58 cal, - 865.58 cal
d. + 965.84 cal, + 865.58 cal
- Gibbs free energy G , enthalpy H and entropy S are interrelated as in [2007]
a. $G = H + TS$
b. $G = H - TS$
c. $G - TS = H$
d. $G = S = H$

Answer with Solutions

Practice Exercise

- (c) Thermodynamics is not concerned with the rate at which a reaction proceeds.
- (a) $\Delta E = q + W = 300 + (-500) = -200 \text{ cal}$
- (b) Flying bird gives up energy and takes in air (O_2).
- (c) In adiabatic process, heat is not exchanged with surroundings, hence $\Delta q = 0$
- (b) Work done, during isothermal reversible expansion of a gas, is maximum.
- (c) The presence of reactants in a closed vessel made up of conducting material. e.g. copper or steel is an example of a closed system.
- (c) For adiabatic condition, $\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1} = \left(\frac{1}{27}\right)^{1/3} = \frac{1}{3}$
 $\therefore T_2 = 300 \times \frac{1}{3} = 100 \text{ K}$
 Thus, $T_2 < T_1$, hence cooling takes place due to expansion under adiabatic condition.
 $\therefore W = -\Delta E = -C_V(T_2 - T_1)$ [$\Delta E = (-)$ ve, expansion]
 $= -6(100 - 300) = 1200 \text{ cal}$
- (c) The heat change determined in a bomb calorimeter is ΔE , value. Thus, $\Delta E = -870 \text{ kcal mol}^{-1}$
- (a) Since, heat evolved when 78 g benzene is burnt
 $= -3264.6 \text{ kJ}$
 Therefore, heat produced, by burning 3.9 g benzene
 $= \frac{3.9}{78} \times (-3264.6) = -163.23 \text{ kJ}$
- (c) The bond energy of Cl_2 is the highest among the given.
- (c) For the reaction, $\Delta n = 1 - 1 = 0$
 $\therefore \Delta H = \Delta E$
- (a) The formation of CH_4 is represented as:
 $\text{C}(s) + 2\text{H}_2(g) \longrightarrow \text{CH}_4(g)$
 $\Delta H_f = (\Delta H_{\text{comb}})_R - (\Delta H_{\text{comb}})_P$
 $= [-394 + 2(-284) - (-892)] \text{ kJ}$
 $= -962 + 892 = -70 \text{ kJ mol}^{-1}$
- (d) For $\text{N}_2(g) + 3\text{H}_2(g) \longrightarrow 2\text{NH}_3(g)$
 Hence, $\Delta n = -2$
 $\therefore \Delta H < \Delta E$
- (b) $\Delta H = -\frac{1.435}{18} \text{ kcal g}^{-1}$
 $= -0.0797 \text{ kcal g}^{-1}$
- (d) Subtracting second equation from first, we get
 $\text{S}_{(R)} \longrightarrow \text{S}_{(M)} \Delta H = +2.5 \text{ kJ}$; endothermic
- (a) The process is endothermic and takes up heat from solution so that the solution becomes cold.
- (b) The room gets heated because heat is released to the surroundings.
- (a) Internal energy, $E = \frac{3}{2}RT = \frac{3}{2}p \Rightarrow p = \frac{2}{3}E$
- (c) $\Delta H = \Delta E + \Delta n_g RT$, $30 = \Delta E + 3 \times 2 \times 500 \times 10^{-3}$
 $\Delta E = 27 \text{ kcal}$
- (a) $\Delta H = \text{work done} = i \times V \times t = 0.50 \text{ A} \times 12 \text{ V} \times 300 \text{ s}$
 $= 1800 \text{ J} = +1.8 \text{ kJ}$
 Molar enthalpy of vaporisation,
 $\Delta H_m = \frac{\Delta H}{\text{Moles of H}_2\text{O}} = \frac{\Delta H}{n_{\text{H}_2\text{O}}} = \frac{1.8 \text{ kJ}}{\frac{0.798}{18}} = 40.6 \text{ kJ mol}^{-1}$
 $\Delta H_m = \Delta E_m + p \Delta V$
 $\Delta H_m = \Delta E_m + \Delta n_g RT$ [$\Delta n_g = 1$]
 $\Delta H_m = \Delta E_m + RT$
 Molar internal energy change, $\Delta E_m = \Delta H_m - RT$
 $= 40.6 - 8.314 \times 10^{-3} \times 373.15 = 37.5 \text{ kJ mol}^{-1}$
- (a) Since, the process is exothermic, heat is evolved due to this temperature of water increases.
- (c) $\text{C} + \text{O}_2 \longrightarrow \text{CO}_2$; $\Delta H = -393.5 \text{ kJ/mol}$
 $\therefore$ Heat released during the formation of 44 g of CO_2
 $= -393.5 \text{ kJ}$
 Heat released during the formation of 35.2 g (given) of $\text{CO}_2 = -\frac{393.5 \times 35.2}{44} = -315 \text{ kJ}$
- (b) Millimoles of dibasic strong acid
 $= M \times V = 0.20 \times 350 = 70 \text{ mmol}$
 $\therefore$ Amount of H^+ ions in the acid $= 2 \times 70 = 140 \text{ mmol}$
 Similarly, amount of OH^- ions in monobasic strong base
 $= 0.10 \times 650 = 65 \text{ mmol}$
 [Here, OH^- is the limiting reactant]
 $\therefore$ 1 mole of OH^- ions produces $= 57.1 \text{ kJ heat}$
 $65 \times 10^{-3} \text{ mole of OH}^-$ ions will produce
 $= 57.1 \times 65 \times 10^{-3} = 3.71 \text{ kJ}$
- (b) $\text{C}_2\text{H}_4 + 3\text{O}_2 \longrightarrow 2\text{CO}_2 + 2\text{H}_2\text{O}$
 $\Delta H_{\text{reaction}} = [2 \times \Delta H_f^\circ(\text{CO}_2) + 2 \times \Delta H_f^\circ(\text{H}_2\text{O})]$
 $- [\Delta H_f^\circ(\text{C}_2\text{H}_4) + 3 \times \Delta H_f^\circ(\text{O}_2)]$
 $= [2(-394) + 2(-286)] - [52 + 0] = -1412 \text{ kJ mol}^{-1}$
- (c) $\frac{1}{2} \text{H}_2 + \frac{1}{2} \text{Cl}_2 \longrightarrow \text{HCl}$
 $\Delta H = \left[\frac{1}{2} \text{BE}(\text{H}_2) + \frac{1}{2} \text{BE}(\text{Cl}_2) \right] - \text{BE}(\text{HCl})$
 $= \left[\left(\frac{1}{2} \times 104 \right) + \left(\frac{1}{2} \times 58 \right) \right] - 103 = -22 \text{ kcal}$

Eq. (ii) + Eq. (iii) - Eq. (i)

Multiply Eqs. (i) and (ii) by 2,

Eq. (iii) - Eq. (iv)

Eq. (i) can be split as

$$\Delta H = H_1 + H_2 = -20.6; H_1 = 8.8 \text{ kJ}$$

$$H_2 = -20.6 - 8.8 = -29.4 \text{ kJ}$$

30. (d) $\Delta S = 2.303 nR \log \frac{V_2}{V_1} = 2.303 \times 2 \times 2 \times \log \frac{20}{2} = 9.2$

$$= 2.5 \text{ L} \cdot \text{atm} = 2.5 \times 101.3 \text{ J} = 253.25 \text{ J}$$

$$\Delta U = q + W = 100 - 253.25 = -153.25 \text{ J}$$

$$= -743 + \frac{1}{2} \times 8.314 \times 300 \times 10^{-3} \text{ kJ mol}^{-1}$$

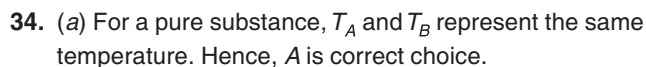

$$= -741.75 \text{ kJ mol}^{-1}$$

$$\Delta_f H(CH_4(g)) = \Delta_c H^\circ(CH_4) - \Delta_c H^\circ(C) - \Delta_c H^\circ(H_2(g)) \times 2$$

$$= -890.4 - (-393.5) - (-285.8 \times 2)$$

$$= +74.7 \text{ kJ/mol}$$

The above equation can be obtained by subtraction of

$$\Delta H_f = [+393.3 - (282.8)] = 110.5 \text{ kJ mol}^{-1}$$

The enthalpy of atomisation is same as the enthalpy of sublimation.

$$292 = (x + 279) - (38 + 85), x = 34 \text{ kcal mol}^{-1}$$

Calculated value of $\Delta_f H^\circ =$

$$\Delta_f H^\circ = \left[BE(N \equiv N) + \frac{1}{2} BE(O = O) \right] - [BE(N = N) + BE(N = O)]$$

$$= \left[946 + \frac{1}{2} (498) \right] - [418 + 607] = 170 \text{ kJ mol}^{-1}$$

Resonance energy = Observed $\Delta_f H^\circ$ - Calculated $\Delta_f H^\circ$

$$= 82 - 170 = -88 \text{ kJ mol}^{-1}$$

$$\Delta_f H^\circ = \Delta_{\text{sub}} H^\circ + IE + \Delta_{\text{diss}} H^\circ + \Delta_{\text{eq}} H^\circ + U$$

$$-360.1 = 108.4 + 496 + 96 + (-325) + U$$

$$U = +735.5 \text{ kJ mol}^{-1}$$

N_2O_4 is 50% dissociated, the mole fraction of the substances is given by

$$x_{N_2O_4} = \frac{1-0.5}{1+0.5}, x_{NO_2} = \frac{2 \times 0.5}{1+0.5}$$

$$p_{N_2O_4} = \frac{0.5}{1.5} \times 1 \text{ atm}, p_{NO_2} = \frac{1}{1.5} \times 1 \text{ atm}$$

The equilibrium constant K_p is given by

$$K_p = \frac{(p_{NO_2})^2}{p_{N_2O_4}} = \frac{1.5}{(1.5)^2(0.5)} = \frac{1}{0.75} = 1.33$$

$$\Delta_a G^\circ = -RT \ln K_p$$

$$= -8.314 \text{ JK}^{-1} \text{ mol}^{-1} \times 333 \text{ K} \times 2.303 \times 0.1239$$

$$= -789.89 \text{ JK}^{-1} \text{ mol}^{-1}$$

$$= -2.303 \times 20 \times 8.314 \text{ JK}^{-1} \text{ mol}^{-1} \times 300 \text{ K} \log \frac{5}{1}$$

$$= 80.15 \times 10^3 \text{ J}$$

Work done = mgh

$$80.15 \times 10^3 = m \times 9.81 \text{ ms}^{-2} \times 1 \text{ m}$$

$$m = \frac{80.15 \times 10^3 \text{ kgm}^2 \text{ s}^{-2}}{9.81 \text{ ms}^{-2} \times 1 \text{ m}} = 8.17023 \times 10^3$$

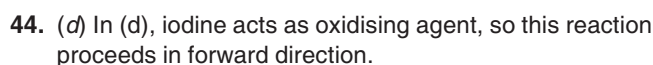

$$= 8170.2344 \text{ kg}$$

$$W = 2.303 nRT \log(p_2 / p_1)$$

$$= 2.303 \times 1 \times 2 \times 300 \log(10/2) = 965.84$$

At constant temperature, $\Delta E = 0$, $q = -W = -965.84 \text{ cal}$

45. (a) In dissolution, solid changes to ions in solution, which have more randomness.
 46. (b) In the reaction, $\Delta S = -ve$
 Hence, for the reaction to be spontaneous, ΔH should be negative and higher than $T \cdot \Delta S$ i.e. $\Delta H > T \cdot \Delta S$
 47. (c) At 273 K, water and ice are in equilibrium, hence, $\Delta G = 0$.

48. (b) The change in the internal energy is $\Delta U = U_B - U_A$.

49. (c) $\Delta H_{\text{condensation}}$ for 1.8 g of steam

$$= (-40.8) \text{ kJ} \times \left(\frac{1.8}{18} \right) \text{ mol} = -4.08 \text{ kJ}$$

$$\Delta S = \frac{\Delta H}{T_b} = \frac{-4.08 \times 10^3 \text{ J}}{373.15 \text{ K}} = -10.93 \text{ JK}^{-1}$$

50. (b) Heat at constant pressure means enthalpy, i.e. we have, $\Delta G = \Delta H - T\Delta S$

$$= -2.5 \times 10^3 - 298 \times 7.4 = -4705 \text{ cal}$$

Hence, the process is spontaneous.

51. (c) For the given change

$$\begin{aligned} \Delta_r S^\circ &= \Sigma n_P S_P^\circ - \Sigma n_R S_R^\circ \\ &= S_{\text{NH}_2\text{CONH}_2}^\circ + S_{\text{H}_2\text{O}}^\circ - [2 \times S_{\text{NH}_3}^\circ + S_{\text{CO}_2}^\circ] \\ &= 174.0 + 69.9 - [2 \times 192.3 + 213.7] \\ &= -354.4 \text{ JK}^{-1} \text{ mol}^{-1} \end{aligned}$$

52. (a) Variation of K with temperature is given by

$$\log K = \frac{\Delta S^\circ}{R} - \frac{\Delta H^\circ}{RT} = 4.0 - \frac{2000}{T}$$

$$\text{On comparing, } \frac{\Delta S^\circ}{R} = 4 \text{ or } \Delta S^\circ = 4R$$

53. (b) Because melting of ice at -15°C is a non-spontaneous process.

54. (b) Vaporisation of water creates more randomness. Hence, has more entropy.

55. (c) $\text{C} + \text{O}_2 \longrightarrow \text{CO}_2(g); \Delta_r H = x \text{ kJ mol}^{-1} \dots \text{(i)}$

$\text{C}(\text{graphite}) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{CO}(g); \Delta_r H = y \text{ kJ mol}^{-1} \dots \text{(ii)}$

$\text{CO}(g) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{CO}_2(g); \Delta_r H = z \text{ kJ mol}^{-1} \dots \text{(iii)}$

$$(i) = (ii) + (iii)$$

$$\Rightarrow x = y + z$$

56. (b) P—H bond energy = $\frac{228}{3} = 76 \text{ kcal mol}^{-1}$ For P_4H_4

bond energy of $4(\text{P—H}) + (\text{P—P})$
 $= 355 \text{ kcal mol}^{-1}$

$$\Rightarrow 4 \times 76 + (\text{P—P}) = 355 \text{ kcal mol}^{-1}$$

$$\therefore (\text{P—P}) \text{ bond energy} = 51 \text{ kcal mol}^{-1}$$

57. (a) At temperature, T entropy change of the surroundings is

$$\Delta S_{\text{surr}} = - \frac{\Delta_r H^\circ}{T} \text{ (at constant pressure)}$$

$$= \frac{-(-1648 \times 10^3 \text{ J mol}^{-1})}{298 \text{ K}}$$

$$= 5530 \text{ JK}^{-1} \text{ mol}^{-1}$$

$$\Delta_r S_{\text{total}} = 5530 + (-549.4)$$

$$= 4980.6 \text{ JK}^{-1} \text{ mol}^{-1}$$

Hence, the above reaction is spontaneous.

58. (a) $\text{H}_2(g) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{H}_2\text{O}(l)$

$$\Delta_r H^\circ = -286 \text{ kJ mol}^{-1}$$

When 1 mole of $\text{H}_2\text{O}(l)$ is formed, 286 kJ of heat is released. This heat is absorbed by the surrounding,

i.e. $q_{\text{surr}} = +286 \text{ kJ mol}^{-1}$

$$\Delta S = \frac{q_{\text{surr}}}{T} = \frac{286 \text{ kJ mol}^{-1}}{298 \text{ K}}$$

$$= 959.7 \text{ JK}^{-1} \text{ mol}^{-1}$$

BITSAT Archives

1. (b) We can represent the process of evaporation as

Number of moles in 18g $\text{H}_2\text{O}(l)$

$$= \frac{18 \text{ g}}{18 \text{ g mol}^{-1}} = 1 \text{ mol}$$

$$\Delta_{\text{vap}} U = \Delta_{\text{vap}} H^\circ - p\Delta V$$

$$= \Delta_{\text{vap}} H^\circ - \Delta n_g RT$$

Assume steam behave as an ideal gas

$$\Delta_{\text{vap}} U = (40.66) - (1)(8.314 \times 10^{-3})(373)$$

$$= 40.66 - 3.10$$

$$= 37.56 \text{ kJ mol}^{-1}$$

2. (b) The combustion equation of sucrose is

Here, $\Delta n = 12 + 11 - 12 = 11$

As we know, $\Delta H = \Delta E + \Delta n RT$

$$\Delta H = (-1348.9 \times 10^3) + 11 \times 2 \times 298 = -1342.34 \text{ kcal}$$

3. (b) As we know, $\Delta H = \Delta E + \Delta n_g RT$

For the reaction, $\text{CO}(g) + \frac{1}{2} \text{O}_2(g) \longrightarrow \text{CO}_2(g)$

$$\Delta n = 1 - \left(1 + \frac{1}{2} \right) = -\frac{1}{2}$$

$$\therefore \Delta H = \Delta E - \frac{1}{2} RT$$

Hence, $\Delta H < \Delta E$

4. (c) Equilibrium constants at different temperature and heat of the reaction are related by the equation

$$2.303 \log \frac{K_{p_2}}{K_{p_1}} = \frac{\Delta H^\circ}{R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

$$\log K_{p_2} = -4.835$$

$$K_{p_2} = 1.462 \times 10^{-5} (\text{atm})^{-2}$$

5. (a) Consider the formation of H_2O

$$\Delta H_f = \Delta H_f [\text{H}_2\text{O}(\text{l})] - \Delta H_f [\text{H}_2(\text{g})] - \frac{1}{2} \Delta H_f [\text{O}_2(\text{g})]$$

$$\therefore \Delta H_f (\text{H}_2\text{O}(\text{l})) = -286.20$$

Now consider the ionisation of H_2O

$$\Delta H_r = \Delta H_f (\text{H}^+(\text{aq}) + \text{OH}^-(\text{aq})) - \Delta H_f (\text{H}_2\text{O}(\text{l}))$$

$$57.32 = 0 + \Delta H_f (\text{OH}^-, \text{aq}) - (-286.20)$$

$$\text{or } \Delta H_f (\text{OH}^-, \text{aq}) = 57.32 - 286.20 \text{ e}$$

$$= -228.8 \text{ kJ}$$

6. (c) $\text{HCl} + \text{NaOH} \longrightarrow \text{NaCl} + \text{H}_2\text{O}$

At $t = 0$,

$$\begin{aligned} \text{Number of moles} &= \frac{500 \times 0.1}{1000} = \frac{200 \times 0.2}{1000} \\ &= 0.05 = 0.04 \end{aligned}$$

$\therefore$ During neutralisation of 1 mole of NaOH by 1 mole of HCl, heat evolved = 57.3 kJ

$\therefore$ To neutralised 0.04 moles of NaOH by 0.04 mole of NaOH, heat evolved

$$= 57.3 \times 0.04$$

$$= 2.292 \text{ kJ}$$

7. (b) $40 \text{ g NaOH} = \frac{40}{40} = 1 \text{ mol NaOH}$

$$60 \text{ g CH}_3\text{COOH} = \frac{60}{60} = 1 \text{ mol CH}_3\text{COOH}$$

Since, acetic acid is a weak acid, some of the heat is utilised to ionise it. So, enthalpy of neutralisation of 1 mole of NaOH by 1 mole CH_3COOH is less than 57.1 kJ.

Enthalpy of neutralisation of a strong acid by a strong base is always 57.1 kJ.

8. (a) $\Delta H = \Delta H_{(\text{product})} - \Delta H_{(\text{reactant})}$

$$162 = 2 \times \Delta H_{\text{H}} - \Delta H_{\text{H}_2}$$

$$\Delta H_{\text{H}} = \frac{162}{2} = 81 \text{ kcal} \quad (\because \Delta H_{\text{H}_2} = 0)$$

9. (c) Thus, internal energy does not include energy due to gravitational pull.

10. (b) $\Delta G = \Delta H - T\Delta S$

Negative ΔH favours the process. Negative ΔS opposes the process. If temperature is decreased, opposing factor decreases. Hence, rate of reaction increases.

11. (b) (i) $\text{AB}(\text{s}) + (\text{aq}) \longrightarrow \text{AB}(\text{aq}); \Delta H = -21 \text{ J mol}^{-1}$

Required equation is

Eq. (i) is equivalent to

$$\Delta H_1 + \Delta H_2 = -21$$

$$-29.4 + \Delta H_2 = -21 \quad \text{or} \quad \Delta H_2 = 8.4 \text{ J mol}^{-1}$$

12. (a) On adding Eqs. (i), (ii) and (iii) we get

$$\Delta H = (131 - 282 - 242) \text{ kJ} = -393 \text{ kJ}$$

13. (c)

where,

E_a = activation energy of forward reaction

E'_a = activation energy of backward reaction

The above energy profile diagram shows that $E_a > E'_a$

The potential energy of the product is greater than that of the reactant, so the reaction is endothermic.

$$E_a = E'_a + \Delta E$$

$$E_t = E_a \text{ or } E_t > E'_a$$

14. (a) Isothermally (at constant temperature) and reversibly work is

$$W = 2.303 nRT \log \frac{p_2}{p_1} = 2.303 \times 1 \times 2 \times 300 \log \frac{10}{2}$$

$$= 965.84$$

at constant temperature, $\Delta E = 0$

$$\Delta E = q + W, q = -W = -965.84 \text{ cal}$$

15. (b) Gibbs free energy G , enthalpy H and entropy S are interrelated as $G = H - TS$

8

Chemical and Ionic Equilibria

Chemical Equilibrium

The state of reversible reactions at which the concentration of the reactants and products do not change with time, is known as chemical equilibrium.

Law of Chemical Equilibrium

This law states that, the rate at which a chemical reaction proceeds, is proportional to the product of active masses of reacting substances with each concentration term raised to the power of stoichiometric coefficient of that species in chemical reaction,

For a reversible reaction, $aA + bB \rightleftharpoons cC + dD$,

Rate of forward reaction, $R_f \propto [A]^a [B]^b = K_f [A]^a [B]^b$ (law of mass action)

Rate of backward reaction, $R_b \propto [C]^c [D]^d = K_b [C]^c [D]^d$

At equilibrium,

$$R_f = R_b$$
$$K_f [A]^a [B]^b = K_b [C]^c [D]^d$$

$$\frac{K_f}{K_b} = \frac{[C]^c [D]^d}{[A]^a [B]^b}$$

$$\frac{K_f}{K_b} = K_C = \text{equilibrium constant}$$

Equilibrium Constants (K_p and K_C)

For a reaction, $aA + bB \rightleftharpoons cC + dD$

Equilibrium constants, $K_C = \frac{[C]^c [D]^d}{[A]^a [B]^b}$, $K_p = \frac{(p_C)^c \times (p_D)^d}{(p_A)^a \times (p_B)^b}$

Relation between K_p and K_C

$$K_p = K_C (RT)^{\Delta n_g}$$

R = gas constant,

T = temperature in kelvin

Δn_g = gaseous moles of products – gaseous moles of reactants

Hence, (i) If $\Delta n_g = 0$, $K_p = K_C$

(ii) If $\Delta n_g = +ve$, $K_p > K_C$

(iii) If $\Delta n_g = -ve$, $K_p < K_C$

Units of Equilibrium Constants

- If $\Delta n_g = 0$, then $K_p = K_C$, no units for both K_C and K_p
- If $\Delta n_g > 0$, unit of K_C is $(\text{mol L}^{-1})^{\Delta n_g}$ and that of K_p is $(\text{atm})^{\Delta n_g}$.
- If $\Delta n_g < 0$, unit of K_C is $(\text{L mol}^{-1})^{\Delta n_g}$ and that of K_p is $(\text{atm})^{\Delta n_g}$.

Characteristics of equilibrium constant

Characteristics	Reaction	Equilibrium constant
If reaction is reversed	$A + B \rightleftharpoons C + D$	$K' = 1/K$
If reaction is divided by factor n	$\frac{1}{n} A + \frac{1}{n} B \rightleftharpoons \frac{1}{n} C + \frac{1}{n} D$	$K' = \sqrt[n]{K}$
If reaction is multiplied by factor n	$nA + nB \rightleftharpoons nC + nD$	$K' = K^n$
If reaction is written in n number of steps	$A + B \xrightleftharpoons{K_1} X + Y$ $X + Y \xrightleftharpoons{K_2} P + Q \dots$ $\xrightleftharpoons{K_n} C + D$	$K' = K_1 \times K_2 \times \dots K_n$

Reaction Quotient (Q)

It is the ratio of the molar concentration or partial pressure of the product species to that of reactant species at any stage in the reaction.

For a general reaction,

$$aA + bB \rightleftharpoons cC + dD$$

$$Q_C = \frac{[C]^c [D]^d}{[A]^a [B]^b} \quad \text{and} \quad Q_p = \frac{p_C^c \cdot p_D^d}{p_A^a \cdot p_B^b}$$

At any stage of the reaction,

- If $Q_C > K_C$, the reaction will proceed in the direction of reactants (reverse reaction).
- If $Q_C < K_C$, the reaction will move in the direction of the products.
- If $Q_C = K_C$, reaction mixture is already at equilibrium.

Relation between K and ΔG°

Gibbs free energy change and reaction quotient are related as

$$\Delta G = \Delta G^\circ + 2.303 RT \log Q_C$$

At equilibrium, $\Delta G = 0$

$$Q_C = K_C$$

$$\Delta G^\circ = -2.303 RT \log K_C$$

or

$$\Delta G^\circ = -2.303 RT \log K_p$$

Significance of ΔG° are given below :

- If $\Delta G^\circ < 0$, $\log K > 0 \Rightarrow K > 1$
Therefore, forward reaction is spontaneous.
- If $\Delta G^\circ > 0$, $\log K < 0 \Rightarrow K < 1$
Therefore, backward reaction is spontaneous.
- If $\Delta G^\circ = 0$, $\log K = 0 \Rightarrow K = 1$
Therefore, reaction is at equilibrium.

Le-Chatelier's Principle

The Le-Chatelier's principle states that "a change in any of the factors that determine the equilibrium conditions of a system will cause the system to change in such a manner so as to reduce or to counteract the effect of the change".

This law is applicable to all physical and chemical equilibria.

Factors Affecting the Equilibrium

Following are the various factors which affect on the state of equilibrium :

- Effect of change in concentration** If concentration of the reactants are increased or products are removed, the equilibrium will shift in the forward direction and *vice-versa*.
- Effect of change in pressure** In a reaction at equilibrium, on increasing pressure, equilibrium shifts in that direction where number of gaseous molecules decreases and *vice-versa*.
- Effect of change in temperature**
 - An increase in temperature for exothermic reactions decreases the concentration of products at equilibrium and *vice-versa*.
 - An increase in temperature for endothermic reactions increases the concentration of products at equilibrium and *vice-versa*.
- Effect of catalyst** Catalyst increases (or decreases) in both forward and backward reactions equally, therefore equilibrium will be attained in less (or more) time. Catalyst does not affect the equilibrium constant.

(v) Effect of the addition of inert gas

- (a) Addition of inert gas to an equilibrium (if $\Delta n = 0$) has no effect.
- (b) Addition of inert gas to an equilibrium (if $\Delta n \neq 0$) has no effect, if addition is made at constant volume, but addition at constant pressure will favour the direction of reaction where total number of moles at equilibrium show an increase.

Weak and Strong Electrolytes and their Ionisation

Weak electrolytes dissociate partially in the solutions and such solutions are poor conductor of electricity, e.g. CH_3COOH , H_3PO_4 , H_3BO_3 , NH_4OH , HCN etc.

Strong electrolytes dissociate completely into their ions in solution and such solutions are very good conductor of electricity, e.g. HCl , H_2SO_4 , NaOH , KOH , NaCl , KCl etc.

Separation of an electrolyte into their ions either on fusion or dissolution is called **ionisation** or **dissociation**.

Degree of Ionisation (α)

$$\alpha = \frac{\text{Number of moles of electrolyte dissociated as ions}}{\text{Total number of moles of electrolyte dissolved}}$$

or
$$\alpha = \frac{\text{Amount of electrolyte dissociated}}{\text{Initial amount}}$$

Ostwald's Dilution Law

It states that degree of dissociation of weak electrolyte is inversely proportional to the square root of concentration.

$$\alpha \propto \frac{1}{\sqrt{c}}, \quad \alpha = \sqrt{\frac{k}{c}} = \sqrt{kV}$$

where, α = degree of dissociation

V = volume containing 1 mole of weak electrolyte

k = dissociation constant

Various Concepts of Acids and Bases and their Ionisation

The various concepts of acids and bases are as follows :

Arrhenius Concept

According to Arrhenius concept, all substances which give H^+ ions when dissolved in water are called **acids** while those which ionise in water to furnish OH^- are called **bases**.

Bronsted-Lowry Concept

According to Bronsted-Lowry concept, an acid is a substance (molecule or ion) that can donate a proton and a base, is a substance that can accept a proton from an acid.

e.g.

Generally, a strong base has a weak conjugate acid and *vice-versa*.

Lewis Acids and Bases Concept

An acid is a species which accepts an electron pair and base which donates an electron pair, e.g.

Relative Strength of Acids and Bases

Relative strength of two acids is written as

$$\frac{\text{Strength of acid 1}(\text{HA}_1)}{\text{Strength of acid 2}(\text{HA}_2)} = \frac{\alpha_1}{\alpha_2} = \sqrt{\frac{K_{a1}/C}{K_{a2}/C}} = \sqrt{\frac{K_{a1}}{K_{a2}}}$$

where, K_{a1} and K_{a2} are the dissociation constants of two acids at the same concentration C while α_1 and α_2 are their degrees of dissociation. Similarly, for equimolar weak bases,

$$\frac{\text{Strength of base 1}(\text{B}_1\text{OH})}{\text{Strength of base 2}(\text{B}_2\text{OH})} = \sqrt{\frac{K_{b1}}{K_{b2}}}$$

Relative strength of some of the acids are as follows :

Relative strength of some of the bases are as follows :

Ionisation of Water

For an equilibrium,

The dissociation constant is represented by

$$K = \frac{[\text{H}_3\text{O}^+][\text{OH}^-]}{[\text{H}_2\text{O}]^2}$$

But $[\text{H}_2\text{O}] = 1$, therefore $K_w = [\text{H}_3\text{O}^+] [\text{OH}^-]$

where, K_w = ionic product of water

The value of K_w at 298 K

$$K_w = [\text{H}_3\text{O}^+] [\text{OH}^-] = (1 \times 10^{-7})^2 = 1 \times 10^{-14} \text{ mol}^2 \text{ L}^{-2}$$

Important points related to ionic product of water are :

The value of K_w is temperature dependent. It increases with increase in temperature.

For acidic solutions, $[\text{H}_3\text{O}^+] > [\text{OH}^-]$

For neutral solutions, $[\text{H}_3\text{O}^+] = [\text{OH}^-]$

For basic solutions, $[\text{H}_3\text{O}^+] < [\text{OH}^-]$

pH Scale

pH of a solution is negative logarithm of hydrogen ion concentration of solution.

$$\text{Thus, } \text{pH} = -\log [\text{H}^+] = \log \frac{1}{[\text{H}^+]}$$

$$\text{or } [\text{H}^+] = 10^{-\text{pH}}$$

pOH Scale

pOH represents the OH^- ion concentration.

$$\therefore \text{pOH} = -\log [\text{OH}^-] = \log \frac{1}{[\text{OH}^-]}$$

$$\text{or } [\text{OH}^-] = 10^{-\text{pOH}}$$

$$\text{and } \text{p}K_w = \text{pH} + \text{pOH} = 14 \text{ at } 25^\circ\text{C}$$

Relationship between $[\text{H}^+]$, $[\text{OH}^-]$ and pH

$$\text{pH of a weak monobasic acid base } \text{pH} = \frac{1}{2} [\text{p}K_a - \log C]$$

$$\text{pOH of a weak monoacidic base } \text{pOH} = \frac{1}{2} [\text{p}K_b - \log C]$$

$$\text{pH} = 14 - \text{pOH} = 14 - \frac{1}{2} [\text{p}K_b - \log C]$$

Total $[\text{OH}^-]$ in a mixture of two weak bases

$$[\text{OH}^-] = \sqrt{K_1 C_1 + K_2 C_2}$$

Common Ion Effect

It states that if to the solution of a weak electrolyte, a solution of strong electrolyte is added which furnishes an ion common to that furnished by the weak electrolyte, the ionisation of the weak electrolyte is suppressed.

e.g. In IInd group of qualitative analysis, H_2S is passed in the presence of HCl . This is due to the fact that HCl suppresses the ionisation of weakly dissociated H_2S . Due to this, only sulphides of II group radicals are precipitated. Sulphides of III, IV etc., groups are not precipitated because of their high solubility product.

Salt Hydrolysis and pH of their Solution

The process of salt hydrolysis is actually the reverse process of neutralisation. The reaction of an anion or cation with water accompanied by cleavage of O—H bond is called hydrolysis.

Salt hydrolysis affects the pH of the solution.

Neutral Salts

Salts of strong acids and strong bases (i.e. neutral salts) do not undergo hydrolysis, e.g. NaCl , CaSO_4 etc.

$$\text{pH} = 7$$

Acidic Salts

Salt of a strong acid and weak base, e.g. NH_4Cl , is called acidic salt, which undergoes cationic hydrolysis.

$$\text{pH} < 7$$

$$\text{For such salts, } [\text{H}_3\text{O}^+] = \sqrt{K_h \times C}$$

$$K_h = \frac{K_w}{K_b}$$

$$\text{pH} = 7 - \frac{1}{2} [\text{p}K_b + \log C]$$

where, K_h = hydrolysis constant

K_b = ionisation constant for weak base

C = molar concentration of salt

Basic Salts

Salt of strong base and weak acid, e.g. NaNO_2 , NaCN , CH_3COONa are termed as basic salts.

Such salts undergo anionic hydrolysis.

$$\text{pH} > 7$$

$$\text{For basic salts, } [\text{OH}^-] = \sqrt{K_h \times C} \text{ or } K_h = \frac{K_w}{K_a}$$

$$\text{pH} = 7 + \frac{1}{2} [\text{p}K_a + \log C]$$

Solubility Product (S)

It is defined as the product of molar concentration of its ions in a concentrated solution, each concentration terms raised to the power equal to the number of ions produced on dissociation of one molecule of electrolyte.

$$\therefore K_{sp} = [A^+]^x [B^-]^y$$

$$\therefore K_{sp} = S^{x+y}$$

$$\text{or } S = \sqrt{(x+y) K_{sp}}$$

where, S = solubility, K_{sp} = solubility product

Buffer Solution

The solution, which maintains its pH constant or reserve acidic or basic nature even upon addition of small amounts of acid or base, is called buffer solution. The ability of buffer solution to resist changes in pH on addition of acid or base is called buffer action.

Types of buffer solutions —
 — Acidic buffer [HCN + NaCN] (pH < 7)
 — Basic buffer [NH₄OH + NH₄Cl] (pH > 7)

Henderson's Equation for Buffer Solution

(i) For acidic buffer,

$$\text{pH} = \text{p}K_a + \log \frac{[\text{salt}]}{[\text{acid}]}$$

(ii) For basic buffer,

$$\text{pOH} = \text{p}K_b + \log \frac{[\text{salt}]}{[\text{base}]}$$

Buffer Capacity

Buffer capacity

$$= \frac{\text{Number of moles of acid / base added to 1 L of buffer}}{\text{Change in pH}}$$

Buffer capacity is maximum when

(a) [salt] = [acid], pH = pK_a for acidic buffer

(b) [salt] = [base], pH = pK_b for basic buffer

Greater the buffer capacity, larger is its capacity to resist the change in pH value.

Acid-Base Titration

Acid-Base Indicators

An acid-base indicator is a substance which possess one colour in acidic solution and altogether different colours in alkaline medium, i.e. its colour changes with pH.

Ostwald's Theory

According to this theory :

- Indicators are either weak acid or weak base.
- Their unionised molecules possess different colour from those of the ions which they give in the solution.
- An acidic indicator yields a coloured anion while a basic indicator yields a coloured cation in solution.
- Since, they are weak electrolytes, they are not sufficiently ionised in solution. But in the presence of strong acid or alkali, their degree of ionisation is considerably increased and they produce a large number of coloured ions.
- An indicator changes colour when the concentration of hydrogen ion (in mol/L) solution is equal to the ionisation constant of the indicator, i.e. indicator is 50% dissociated.

Practice Exercise

- In which of the following reaction, K_p and K_c are equal?
 - $\text{N}_2(g) + 3\text{H}_2(g) \rightleftharpoons 2\text{NH}_3(g)$
 - $2\text{SO}_2(g) + \text{O}_2(g) \rightleftharpoons 2\text{SO}_3(g)$
 - $\text{N}_2(g) + \text{O}_2(g) \rightleftharpoons 2\text{NO}(g)$
 - $2\text{NO}(g) + \text{O}_2(g) \rightleftharpoons 2\text{NO}_2(g)$
- The number of gram molecules of a substance present in unit volume is termed as
 - activity
 - normal solution
 - molal solution
 - active mass
- The active mass 10 g of CaCO_3 is
 - 1
 - 0.1
 - 10
 - 100
- If the equilibrium constant for the reaction $\text{A} + 2\text{B} \rightleftharpoons 2\text{C}$, is 40 then the equilibrium constant for reaction $\text{C} \rightleftharpoons \text{B} + \frac{1}{2}\text{A}$ will be
 - $1/\sqrt{40}$
 - 1/40
 - $(1/40)^2$
 - 40
- At a certain temperature in $2\text{HI} \rightleftharpoons \text{H}_2 + \text{I}_2$, only 50% HI is dissociated at equilibrium. The equilibrium constant is
 - 1.0
 - 0.25
 - 3.0
 - 0.50
- For the reaction, $2\text{N}_2\text{O}_4 \rightleftharpoons 4\text{NO}_2$, $\frac{-d(\text{N}_2\text{O}_4)}{dt} = K$ and $\frac{d'(\text{NO}_2)}{dt} = K'$, then
 - $K' = 2K$
 - $2K' = K$
 - $K' = K$
 - None of these

7. The equilibrium constant K for the reaction $2\text{HI}(g) \rightleftharpoons \text{H}_2(g) + \text{I}_2(g)$, at room temperature, is 2.85 and that at 698 K is 1.4×10^{-2} . This implies that the forward reaction is
- exothermic
 - endothermic
 - exergonic
 - unpredictable
8. When pressure is applied to the equilibrium system $\text{Ice} \rightleftharpoons \text{water}$, which of the following phenomenon will happen?
- More ice will be formed
 - Water will evaporate
 - Equilibrium will not be established
 - More water will be formed
9. For $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$, 1 mole of N_2 and 3 moles of H_2 are at 4 atm. Equilibrium pressure is found to be 3 atm. The value of K_p is
- $\frac{1}{(0.5)(0.15)^3}$
 - $\frac{1}{(0.5)(1.5)^3}$
 - $\frac{3 \times 3}{(0.5)(1.5)^3}$
 - None of these
10. The unit of equilibrium constant, (K) for the reaction $\text{A} + \text{B} \rightleftharpoons \text{C}$, would be
- mol L^{-1}
 - mol L
 - $\text{mol}^{-1} \text{L}$
 - $\frac{1}{\text{mol L}}$
11. In any chemical reaction, equilibrium is supposed to be attained when
- mutual opposite reactions undergo
 - velocity of mutual reactions become equal
 - concentration of reactants and resulting products are equal
 - the temperature of mutual opposite reactions become equal
12. When 3 moles of ethyl alcohol are mixed with 3 moles of acetic acid, 2 moles of ester are formed at equilibrium according to the equation
- $$\text{CH}_3\text{COOH}(l) + \text{C}_2\text{H}_5\text{OH}(l) \rightleftharpoons \text{CH}_3\text{COOC}_2\text{H}_5(l) + \text{H}_2\text{O}(l)$$
- The value of the equilibrium constant for the reaction is
- 4
 - 2/9
 - 2
 - 4/9
13. The reaction $2\text{SO}_2(g) + \text{O}_2(g) \rightleftharpoons 2\text{SO}_3(g)$, is carried out in 1 dm^3 and 2 dm^3 vessels respectively. The ratio of the reaction velocities will be
- 1 : 4
 - 4 : 1
 - 1 : 8
 - 8 : 1
14. The equilibrium constant for the reaction $\text{H}_2(g) + \text{I}_2(g) \rightleftharpoons 2\text{HI}(g)$, is 64. If the volume of the container is reduced to half of the original volume, the value of the equilibrium constant will be
- 16
 - 32
 - 64
 - 128
15. The ratio of K_p/K_C for the reaction $\text{CO}(g) + \frac{1}{2}\text{O}_2(g) \rightleftharpoons \text{CO}_2(g)$, is
- 1
 - RT
 - $(RT)^{1/2}$
 - $(RT)^{-1/2}$
16. The equilibrium constant K_p for the reaction $\text{A} \rightleftharpoons 2\text{B}$, is related to degree of dissociation α of A and total pressure p as
- $\frac{4\alpha^2 p}{1-\alpha^2}$
 - $\frac{4\alpha^2 p^2}{1-\alpha^2}$
 - $\frac{4\alpha^2 p^2}{1-\alpha}$
 - $\frac{4\alpha^2 p}{1-\alpha}$
17. At 30°C , K_p for the dissociation reaction $\text{SO}_2\text{Cl}_2(g) \rightleftharpoons \text{SO}_2(g) + \text{Cl}_2$ is $2.9 \times 10^{-2} \text{ atm}$. If the total pressure is 1 atm, the degree of dissociation of SO_2Cl_2 is (assume, $1-\alpha^2 = 1$)
- 87%
 - 13%
 - 0.17%
 - 29%
18. XY_2 dissociates as $\text{XY}_2(g) \rightleftharpoons \text{XY}(g) + \text{Y}(g)$. When the initial pressure of XY_2 is 600 mm Hg, the total equilibrium pressure is 800 mm Hg. Calculate K for the reaction assuming that the volume of the system remains unchanged.
- 50
 - 100
 - 166.6
 - 400.0
19. For these reactions,
- $\text{H}_2(g) + \text{I}_2 \rightleftharpoons 2\text{HI}(g); K_C = \frac{[\text{HI}]^2}{[\text{H}_2][\text{I}_2]}$
 - $2\text{HI}(g) \rightleftharpoons \text{H}_2(g) + \text{I}_2(g); K_C = \frac{[\text{H}_2][\text{I}_2]}{[\text{HI}]^2}$
- K_C and K'_C are related as
- $K = K_C \times K'_C$
 - $K = K_C + K'_C$
 - $K = K'_C - K_C$
 - $K'_C = \frac{1}{K_C}$
20. For the reversible reaction, $\text{N}_2(g) + 3\text{H}_2(g) \rightleftharpoons 2\text{NH}_3(g)$ at 500°C , the value of K_p is 1.44×10^{-5} . When partial pressure is measured in atmospheres, the corresponding value of K_C with concentration in mol L^{-1} is
- $1.44 \times 10^{-5} / (0.082 \times 500)^{-2}$
 - $1.44 \times 10^{-5} / (8.314 \times 773)^{-2}$
 - $1.44 \times 10^{-5} / (0.082 \times 773)^2$
 - $1.44 \times 10^{-5} / (0.082 \times 773)^{-2}$
21. PCl_5 , PCl_3 and Cl_2 are at equilibrium at 500 K and having concentration 1.59 M, 1.59 M and 1.41 M respectively. Calculate the K_C for the following reaction :
- $$\text{PCl}_5 \rightleftharpoons \text{PCl}_3 + \text{Cl}_2$$
- 2.79
 - 3.75
 - 4.57
 - 1.79

22. What is the relation between K_p and K_C for a general reaction, $aA + bB \rightleftharpoons cC + dD$?
- a. $K_p = K_C (RT)^{\Delta n}$ b. $K_C = K_p (RT)^{\Delta n}$
 c. $K_p = \frac{1}{K_C (RT)^{\Delta n}}$ d. $K_C = \frac{1}{K_p (RT)^{\Delta n}}$
23. Consider the following reaction in a closed container at equilibrium. $\text{CaCO}_3(s) \rightleftharpoons \text{CaO}(s) + \text{CO}_2(g)$
 What would be the effect of addition of CaCO_3 on the equilibrium concentration of CO_2 ?
- a. Increases
 b. Decreases
 c. Data is not sufficient to predict it
 d. Remains unaffected
24. According to Le-Chatelier's principle, if heat is given to solid-liquid system, then
- a. quantity of solid will reduce
 b. quantity of solid will increase
 c. temperature will increase
 d. temperature will decrease
25. Which of the following will not change the concentration of ammonia in the equilibrium?
- $$4\text{NH}_3(g) + 5\text{O}_2(g) \rightleftharpoons 4\text{NO}(g) + 6\text{H}_2\text{O}(l); \Delta H = +ve$$
- a. Increase of pressure
 b. Increase of volume
 c. Addition of catalyst
 d. Decrease of temperature
26. The Bronsted acid which gives the weakest conjugate base, is
- a. HF b. H_2S
 c. HCl d. H_2O
27. Which one of the following is the strongest Lewis acid?
- a. BF_3 b. BCl_3 c. BBr_3 d. BI_3
28. Arrange the following acids in decreasing order of acidity :
- (I) H_2SO_3 , (II) H_3PO_3 and (III) HClO_3
- a. I > III > II b. I > II > III
 c. III > I > II d. II > III > I
29. Among the given anions, the strongest Bronsted base is
- a. ClO^- b. ClO_2^- c. ClO_3^- d. ClO_4^-
30. What will be the conjugate bases for the following Bronsted acids?
- HF , H_2SO_4 and HCO_3^-
- a. F^- , SO_4^{2-} and CO_3^{2-} b. F^- , SO_4^{2-} and H_2CO_3
 c. F^- , HSO_4^- and H_2CO_3 d. F^- , HSO_4^- and CO_3^{2-}
31. The vapour density of N_2O_4 at a certain temperature is 30. What is the percentage dissociation of N_2O_4 at this temperature?
- a. 53.3% b. 106.6%
 c. 26.7% d. None of these
32. For the reaction $\text{NO}_2(g) \rightleftharpoons 2\text{NO}(g)$, the degree of dissociation at equilibrium is 0.2 at 1 atmospheric pressure. The equilibrium constant K_p will be
- a. 1/2 b. 1/4
 c. 1/6 d. 1/8
33. If a 0.1 M solution of HCN is 0.01% ionised, the ionisation constant for HCN is
- a. 10^{-9} b. 10^{-7}
 c. 10^{-5} d. 10^{-3}
34. An aqueous solution contains the following ions:
 Hg_2^{2+} , Hg^{2+} , Pb^{2+} and Cd^{2+}
 On adding HCl, which of these will precipitate?
- a. Hg_2Cl_2 and PbCl_2 b. Only Hg_2Cl_2
 c. Only PbCl_2 d. PbCl_2 and HgCl_2
35. What is correct about ionic product of an electrolyte?
- a. It is always equal to its solubility product
 b. It can be less than or equal to K_{sp}
 c. It is always less than K_{sp}
 d. It can be less than or equal to or greater than K_{sp}
36. A solution was prepared by mixing 50 mL of 0.2 M HCl and 50 mL 0.10 M NaOH. The pH of the solution is
- a. 7.0 b. 2.0
 c. 3.0 d. 1.3
37. What is $[\text{H}^+]$ in mol/L of a solution that is 0.20 M in CH_3COONa and 0.10 M CH_3COOH ?
 K_a for $\text{CH}_3\text{COOH} = 1.8 \times 10^{-5}$
- a. 9.0×10^{-6} b. 3.5×10^{-4}
 c. 1.1×10^{-5} d. 1.8×10^{-5}
38. A weak acid, HA, has a K_a of 1.00×10^{-5} . If 0.100 mole of this acid is dissolving in 1 L of water, the percentage of acid dissociated at equilibrium is closed to
- a. 99.0% b. 1.00%
 c. 99.9% d. 0.100%
39. How many gram equivalents of NaOH are required to neutralise 25 cm³ of a decinormal HCl solution?
- a. 0.00125 b. 0.0025
 c. 0.0050 d. 0.025
40. The first and second dissociation constants of an acid H_2A are 1.0×10^{-5} and 5.0×10^{-10} respectively. The overall dissociation constant of the acid will be
- a. 5.0×10^5 b. 5.0×10^{-5}
 c. 5.0×10^{15} d. 5.0×10^{-15}
41. The pH of 0.1 M solution of a weak acid is 3. What is the value of the ionisation constant for the acid?
- a. 0.1 b. 10^{-3}
 c. 10^{-5} d. 10^{-7}
42. What will be the pH at which an acid indicator with $K_a = 1 \times 10^{-5}$ changes colour when the indicator concentration is $1 \times 10^{-3} \text{ M}$?
- a. 5 b. 7 c. 3 d. 6.5

43. The pH of a 10^{-9} M solution of HCl in water is
 a. 8
 b. -8
 c. between 7 and 8
 d. between 6 and 7

44. The following concentrations were obtained for the formation of NH_3 from Na and H_2 at equilibrium at 500 K : $[\text{N}_2] = 1.5 \times 10^{-2}$ M, $[\text{H}_2] = 3.0 \times 10^{-2}$ M and $[\text{NH}_3] = 1.2 \times 10^{-2}$ M

Calculate the equilibrium constant.

- a. 1.08×10^4 b. 3.98×10^2
 c. 1.06×10^3 d. 2.93×10^4

45. Which of the following relations represent correct relation between standard electrode potential and equilibrium constant?

- I. $\log K = \frac{nFE^\circ}{2.303 RT}$ II. $K = e^{\frac{-nFE^\circ}{RT}}$
 III. $\log K = \frac{-nFE^\circ}{2.303 RT}$ IV. $\log K = 0.4342 \frac{nFE^\circ}{RT}$
 a. I, II and III b. II and III
 c. I, II and IV d. I and IV

46. If the ionisation constant of acetic acid is 1.8×10^{-5} , at what concentration will it be dissociated to 2%?
 a. 1 M b. 0.018 M c. 0.18 M d. 0.045 M

47. The dissociation constant of acetic acid at a given temperature is 1.69×10^{-5} . The degree of dissociation of 0.01 M acetic acid in the presence of 0.01 M HCl is equal to
 a. 0.41 b. 0.13
 c. 0.169×10^{-2} d. 0.013

48. The concentration of hydrogen ion in a sample of soft drink is 3.8×10^{-3} M. What is its pH?
 a. 4.32 b. 5.12 c. 3.31 d. 2.42

49. The pK_a of acetic acid and pK_b of ammonium hydroxide are 4.76 and 4.75 respectively. Calculate the pH of ammonium acetate solution.
 a. 4.765 b. 5.012 c. 7.005 d. 6.098

50. For a reaction,

Evaluate the pH of the solution resulting on addition of 0.05 M acetate ion to 0.05 M acid solution ($K_a = 1.8 \times 10^{-5}$)

- a. 5.72 b. 3.87 c. 4.24 d. 4.74

51. pH of an acidic buffer is given by

- a. $\text{pH} = \text{p}K_a + \log \frac{[\text{salt}]}{[\text{acid}]}$ b. $\text{pH} = \text{p}K_a - \log \frac{[\text{salt}]}{[\text{acid}]}$
 c. $\text{pH} = \frac{1}{2} \text{p}K_a + \log \frac{[\text{salt}]}{[\text{acid}]}$ d. $\text{pH} = \log K_a + \log \frac{[\text{salt}]}{[\text{acid}]}$

52. The pH of buffer solution containing 4×10^{-3} and 0.4 mole of acetic acid ($\text{p}K_a = 4.76$) and sodium acetate respectively will be
 a. 6.76 b. 4.76 c. 2.76 d. 0.76

53. For the pair of reactions given below,

If at a particular temperature, K_{p1} and K_{p2} are the equilibrium constants for reaction I and II respectively, then

- a. $K_{p1} = 2K_{p2}$ b. $K_{p1} = K_{p2}^2$
 c. $2K_{p1} = K_{p2}$ d. $K_{p1}^2 = K_{p2}$

54. Solubility of BaF_2 in a solution of $\text{Ba}(\text{NO}_3)_2$ will be represented by the concentration term

- a. $[\text{Ba}^{2+}]$ b. $[\text{F}^-]^2$
 c. $\frac{1}{2}[\text{F}^-]$ d. $2[\text{NO}_3^-]$

55. For anionic hydrolysis, pH is given by

- a. $\text{pH} = \frac{1}{2} \text{p}K_a - \frac{1}{2} \text{p}K_b + \frac{1}{2} \log C$
 b. $\text{pH} = \frac{1}{2} \text{p}K_w + \frac{1}{2} \text{p}K_a - \frac{1}{2} \text{p}K_b$
 c. $\text{pH} = \frac{1}{2} \text{p}K_w + \frac{1}{2} \text{p}K_a + \frac{1}{2} \log C$
 d. $\text{pH} = -\frac{1}{2} \text{p}K_w + \frac{1}{2} \text{p}K_a + \frac{1}{2} \text{p}K_b$

56. The solubility of AgBrO_3 in an aqueous solution of NaBrO_3 (as compared to that in water) is
 a. the same
 b. more
 c. less
 d. unpredicted due to a new chemical reaction

57. Which of the following salts undergo anionic hydrolysis?

- a. CuSO_4 b. NH_4Cl
 c. FeCl_3 d. Na_2CO_3

58. How do we differentiate between Fe^{3+} and Cr^{3+} in group III?

- a. By taking excess of NH_4OH
 b. By increasing NH_4^+ ion concentration
 c. By decreasing OH^- ion concentration
 d. Both (a) and (c)

59. What will be the degree of ionisation of 0.05 M acetic acid if its $\text{p}K_a$ value is 4.74 ?

- a. 0.019% b. 1.9% c. 3.0% d. 4.74%

60. A certain buffer solution contains equal concentrations of X^- and HX , K_b for X^- is 10^{-10} . The pH of the buffer solution is

- a. 4 b. 6
 c. 7 d. 14

61. The buffering action of an acidic buffer is maximum when its pH equals to
 a. 5
 b. 7
 c. 1
 d. pK_a
62. The expression for the solubility product of Ag_2CrO_3 will be
 a. $K_{sp} = S^2$
 b. $K_{sp} = 4S^3$
 c. $K_{sp} = 27S^4$
 d. $K_{sp} = S$
63. Amphoteric behaviour is shown by
 a. H_2CO_3 and Al_2O_3
 b. HCO_3^- and H_2O
 c. HCO_3^- and H_3O^+
 d. H_2CO_3 and H_2O
64. The value of pK_w of water
 a. increases with increase in temperature
 b. decreases with rise in temperature
 c. does not change with variation in temperature
 d. increases till $50^\circ C$ and there after decreases
65. At $20^\circ C$, Ag^+ ion concentration in a saturated solution of Ag_2CrO_4 is 1.5×10^{-4} mol/L. At $20^\circ C$, the solubility product of Ag_2CrO_4 will be
 a. 3.3750×10^{-12}
 b. 1.6875×10^{-10}
 c. 1.6875×10^{-12}
 d. 1.6875×10^{-11}
66. If the solubility of Ag_2CrO_4 is S mol/L, its solubility product will be
 a. S^2
 b. S^3
 c. $4S^3$
 d. $2S^3$

BITSAT Archives

1. Calculate the pH at the equivalence point during the titration of 0.1 M, 25 mL CH_3COOH with 0.05 M NaOH solution. [$K_a(CH_3COOH) = 1.8 \times 10^{-5}$] [2014]
 a. 9.63
 b. 8.63
 c. 10.63
 d. 11.63
2. Gastric juice in human stomach has pH value about 1.8 and pH of small intestine is about 7.8. The pK_a value of aspirin is 3.5. Aspirin will be [2013]
 a. ionised in the small intestine and stomach
 b. ionised in the stomach and almost unionised in the small intestine
 c. unionised in small intestine and stomach
 d. completely ionised in small intestine and stomach
3. At $27^\circ C$, K_p value for the reaction $CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$, is 0.1 atm. K_c value for this reaction is [2013]
 a. 4×10^{-3}
 b. 6×10^{-3}
 c. 2×10^{-3}
 d. 9×10^{-3}
4. In the titration of NaOH and HCl, which of the following indicators will be used? [2012]
 a. Methyl orange
 b. Methyl red
 c. Both (a) and (b)
 d. None of (a) and (b)
5. For $2NOBr(g) \rightleftharpoons 2NO(g) + Br_2(g)$ at equilibrium, $p_{Br_2} = \frac{p}{q}$ and p is the total pressure, the ratio $\frac{K_p}{p}$ will be [2012]
 a. $\frac{1}{3}$
 b. $\frac{1}{9}$
 c. $\frac{1}{27}$
 d. $\frac{1}{81}$
6. For the reaction $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$, the unit of K are [2011]
 a. $L \text{ mol}^{-1}$
 b. $L^2 \text{ mol}^{-2}$
 c. mol L^{-1}
 d. No units
7. A sulphuric acid solution has pH = 3. Its normality is [2011]
 a. 1/1000
 b. 1/200
 c. 1/2000
 d. 1/100
8. The pH of 0.01 M HCN solution for which pK_a is 4, is [2011]
 a. 0.47
 b. 1.2
 c. 3.0
 d. 4.0
9. If dissociation constant of ammonia is 10^{-5} , its pK_b and pK_a values respectively are [2010]
 a. 5 and 9
 b. 9 and 5
 c. 7 and 7
 d. 4 and 10
10. $[H^+]$ of 0.2 N CH_3COOH which is 4% dissociated, is [2010]
 a. 0.08 M
 b. 0.12 M
 c. 0.008 M
 d. 0.8 M
11. 50 mL of H_2O is added to 50 mL of 1×10^{-3} M barium hydroxide solution. What is the pH of the resulting solution? [2008]
 a. 3.0
 b. 3.3
 c. 11.0
 d. 11.7
12. **Assertion (A)** The aqueous solution of CH_3COONa is alkaline in nature.
Reason (R) Acetate ion undergoes anionic hydrolysis. [2008]
 a. Both (A) and (R) are true and (R) is the correct explanation of (A)
 b. Both (A) and (R) are true and (R) is not the correct explanation of (A)
 c. (A) is true but (R) is not true
 d. (A) is not true but (R) is true
13. In a 500 mL flask, the degree of dissociation of PCl_5 at equilibrium is 40% and the initial amount is 5 moles. The value of equilibrium constant in mol L^{-1} for the decomposition of PCl_5 is [2008]
 a. 2.33
 b. 2.66
 c. 5.32
 d. 4.66

14. For an equilibrium reaction, $\text{N}_2\text{O}_4(g) \rightleftharpoons 2\text{NO}_2(g)$, the concentrations of N_2O_4 and NO_2 at equilibrium are 4.8×10^{-2} and 1.2×10^{-2} mol/L respectively. The value of K_C for the reaction is [2007]
 a. 3×10^{-3} mol/L b. 3.3×10^{-3} mol/L
 c. 3×10^{-1} mol/L d. 3.3×10^{-1} mol/L
15. In $2\text{HI} \rightleftharpoons \text{H}_2 + \text{I}_2$, the forward reaction is not affected by change in [2006]
 a. catalyst b. pressure
 c. volume d. temperature

16. In which of the following reactions is $K_p < K_C$? [2005]
 a. $\text{I}_2(g) \rightleftharpoons 2\text{I}(g)$
 b. $2\text{BrCl}(g) \rightleftharpoons \text{Cl}_2(g) + \text{Br}_2(g)$
 c. $\text{CO}(g) + 3\text{H}_2(g) \rightleftharpoons \text{CH}_4(g) + \text{H}_2\text{O}(g)$
 d. All of the above
17. The change in pressure will not affect the equilibrium constant for [2005]
 a. $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$ b. $\text{PCl}_5 \rightleftharpoons \text{PCl}_3 + \text{Cl}_2$
 c. $\text{H}_2 + \text{I}_2 \rightleftharpoons 2\text{HI}$ d. All of these

Answer with Solutions

Practice Exercise

1. (c) Only for this reaction, $\Delta n_g = 2 - 2 = 0$
 Hence, $K_p = K_C (RT)^{\Delta n_g} = K_C (RT)^0 = K_C$
2. (d)
3. (a) Active mass of a pure solid is always taken unity.
4. (a) For $A + 2B \rightleftharpoons 2C$, $K_C = \frac{[C]^2}{[A][B]^2}$... (i)
 For $C \rightleftharpoons B + \frac{1}{2}A$, $K'_C = \frac{[B][A]^{1/2}}{[C]}$... (ii)
 On comparing Eqs. (i) and (ii), we get

$$K'_C = \frac{1}{\sqrt{K_C}} = \frac{1}{\sqrt{40}}$$
5. (b) $2\text{HI} \rightleftharpoons \text{H}_2 + \text{I}_2$
 At equilibrium (1 - 0.5) 0.25 0.25
 $\therefore K_C = \frac{[\text{H}_2][\text{I}_2]}{[\text{HI}]^2} = \frac{0.25 \times 0.25}{(0.5)^2} = \frac{0.25 \times 0.25}{0.25} = 0.25$
6. (a) Rate = $-\frac{1}{2} \frac{d(\text{N}_2\text{O}_4)}{dt} = \frac{1}{4} \frac{d(\text{NO}_2)}{dt}$
 or $\frac{1}{2} K = \frac{1}{4} K'$
 $\Rightarrow K' = 2K$
7. (a)
8. (a) Ice has greater volume than water. Hence, equilibrium will shift towards right. (lesser volume).
9. (b) $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$
 At equilibrium (1 - x) (3 - 3x) 2x
 Initial pressure = 4 atm
 Total moles at equilibrium = (1 - x) + (3 - 3x) + 2x = 4 - 2x
 Equilibrium pressure = 3 atm

$$\frac{n_2}{n_1} = \frac{p_2}{p_1}$$

$$\Rightarrow \frac{4 - 2x}{4} = \frac{3}{4} \Rightarrow x = 0.5$$

$$\therefore \text{Total moles} = (4 - 2x) = 3$$

Hence,
$$p_{\text{NH}_3} = 3 \times \frac{1}{3} = 1$$

$$p_{\text{N}_2} = 3 \times \frac{1}{6} = 0.5$$

$$p_{\text{H}_2} = 3 \times \frac{1}{2} = 1.5$$

$$K_p = \frac{p_{\text{NH}_3}^2}{p_{\text{N}_2} \cdot p_{\text{H}_2}^3} = \frac{1}{(0.5)(1.5)^3}$$

10. (c) $K = \frac{[C]}{[A][B]} = \frac{\text{mol L}^{-1}}{\text{mol L}^{-1} \times \text{mol L}^{-1}} = (\text{mol L}^{-1})^{-1} = \text{mol}^{-1} \text{L}$

11. (b)

13. (d) $2\text{SO}_2(g) + \text{O}_2(g) \rightleftharpoons 2\text{SO}_3(g)$

For 1 dm³, $R = K[\text{SO}_2]^2 [\text{O}_2]$

$$R = K \left[\frac{1}{1} \right]^2 \left[\frac{1}{1} \right] = 1$$

For 2 dm³, $R = K \left[\frac{1}{2} \right]^2 \left[\frac{1}{2} \right] = \frac{1}{8}$

So, the ratio is 8 : 1.

14. (c) $\text{H}_2(g) + \text{I}_2(g) \rightleftharpoons 2\text{HI}(g)$; $\Delta n_g = 0$

$\therefore$ The reaction and its equilibrium constant are not affected by change in volume.

$$15. (d) \Delta n_g = 1 - \left(1 + \frac{1}{2}\right) = -\frac{1}{2}$$

$$\therefore K_p = K_C (RT)^{\frac{1}{2}} \text{ or } \frac{K_p}{K_C} = (RT)^{-\frac{1}{2}}$$

$$\text{Initially} \quad 1 \quad 0$$

$$\text{At equilibrium} \quad 1 - \alpha \quad 2\alpha$$

$$\text{Total moles} = 1 + \alpha$$

$$p_A = \frac{(1 - \alpha) \cdot p}{1 + \alpha}, \text{ and } p_B = \frac{2\alpha}{1 + \alpha} \cdot p$$

$$K_p = \frac{p_B^2}{p_A} = \frac{\left(\frac{2\alpha}{1 + \alpha} \cdot p\right)^2}{\left[\frac{1 - \alpha}{1 + \alpha} p\right]} = \frac{4\alpha^2 p}{1 - \alpha^2}$$

$$\text{At equilibrium} \quad 1 - \alpha \quad \alpha \quad \alpha$$

$$\text{Total moles} = 1 + \alpha$$

$$p_{\text{SO}_2\text{Cl}_2} = \frac{1 - \alpha}{1 + \alpha}, p_{\text{SO}_2} = \frac{\alpha}{1 + \alpha}, p_{\text{Cl}_2} = \frac{\alpha}{1 + \alpha}$$

$$K_p = \left(\frac{\alpha}{1 + \alpha}\right)^2 \bigg/ \left(\frac{1 - \alpha}{1 + \alpha}\right) = \frac{\alpha^2}{1 - \alpha^2}$$

$$= \alpha^2; (1 - \alpha^2 = 1)$$

$$\alpha = \sqrt{K_p} = \sqrt{2.9 \times 10^{-2}} = 0.17$$

$$\therefore \text{Degree of dissociation} = 17\%$$

$$\text{Initially} \quad 600 \text{ mm} \quad 0 \quad 0$$

$$\text{At equilibrium} \quad 600 - p \quad p \quad p$$

$$\text{Total pressure} = 600 - p + p + p = 600 + p$$

$$\text{or } 600 + p = 800 \text{ mm} \Rightarrow p = 200 \text{ mm}$$

$$\text{and, } p \text{ due to } \text{XY}_2 = 400 \text{ mm}$$

$$K = \frac{200 \times 200}{400} = 100$$

19. (d) Equilibrium constant for the reaction,

$$\text{as, } K_C = \frac{[\text{HI}]^2}{[\text{H}_2][\text{I}_2]} = x$$

The equilibrium constant for the reverse reaction, $2\text{HI}(g) \rightleftharpoons \text{H}_2 + \text{I}_2(g)$, at the same temperature is

$$K'_C = \frac{[\text{H}][\text{I}]_2}{[\text{HI}]^2} = \frac{1}{x} = \frac{1}{K_C}$$

$$\text{Thus, } K'_C = \frac{1}{K_C}$$

$$20. (d) \Delta n_g = 2 - 4 = -2$$

$$K_C = \frac{K_p}{(RT)^{\Delta n}} = \frac{144 \times 10^{-5}}{(0.082 \times 773)^{-2}}$$

21. (d) The equilibrium constant K_C for the reaction can be written as,

$$K_C = \frac{[\text{PCl}_3][\text{Cl}_2]}{[\text{PCl}_5]} = \frac{(1.59)^2}{(1.41)} = 1.79$$

22. (a)

23. (d) This is a heterogeneous equilibrium. Hence, equilibrium constant for it is

$$K_C = [\text{CO}_2]$$

Hence, CaCO_3 has no effect on equilibrium concentration.

24. (b) A reaction which is in equilibrium will shift in reverse or backward direction, when we give heat to the solid, quantity of solid will increase.

25. (c)

26. (c)

27. (d) Among these in BI_3 , $p\pi - p\pi$ back-bonding is least effective as it occurs between $5p - 2p$ (B) orbitals. Hence, BI_3 is the most acidic.

28. (c)

29. (a) $\text{ClO}^- > \text{ClO}_2^- > \text{ClO}_3^- > \text{ClO}_4^-$

30. (d) F^- , HSO_4^- and CO_3^{2-} respectively.

31. (a) The reaction is $\text{N}_2\text{O}_4 \rightleftharpoons 2\text{NO}_2$.

$$\text{Molecular weight of } \text{N}_2\text{O}_4 = 14 \times 2 + 16 \times 4 = 92$$

$$\therefore \text{Vapour density (D) of } \text{N}_2\text{O}_4 = 92 / 2 = 46$$

$$\alpha = \frac{D - d}{(n - 1)d} = \frac{46 - 30}{(2 - 1)30} = \frac{16}{30}$$

$$\therefore \alpha = 0.533 = 53.3\%$$

$$\text{At equilibrium} \quad (1 - 0.2) = 0.8 \quad 2 \times 0.2 = 0.4$$

$$\text{Total moles at equilibrium} = 0.8 + 0.4 = 1.2$$

$$\text{Total pressure} = 1 \text{ atm}$$

$$\text{Hence, } p_{\text{N}_2\text{O}_4} = \frac{0.8}{1.2} = \frac{2}{3}$$

$$\text{and } p_{\text{NO}_2} = \frac{0.4}{1.2} = \frac{1}{3}$$

$$K_p = \frac{p_{\text{NO}_2}}{p_{\text{N}_2\text{O}_4}} = \frac{(1/3)^2}{2/3} = \frac{1}{9} \times \frac{3}{2} = \frac{1}{6}$$

$$\text{Initially} \quad 0.1 \quad 0 \quad 0$$

$$\text{At equilibrium} \quad (0.1 - \alpha) \quad \alpha \quad \alpha$$

$$\therefore K = \frac{[\text{H}^+][\text{CN}^-]}{[\text{HCN}]} = \frac{\alpha \cdot \alpha}{(0.1 - \alpha)}$$

$$\text{As, } \alpha \ll 0.1$$

$$K = \frac{10^{-5} \times 10^{-5}}{0.1} \quad \left(\alpha = 0.1 \times \frac{0.01}{100} \right)$$

$$K = 10^{-9}$$

34. (a) Hg_2^{2+} and Pb^{2+} have been placed in 1st group as their K_{sp} are less than the IIInd group ions (Hg^{2+} , Cd^{2+}).

Hence, only these will precipitate.

35. (d)

36. (d) 50 mL of 0.1 M NaOH $\approx$ 25 mL of 0.2 M HCl

Since, the resultant solution will have volume = 100 mL

$$\text{Molarity} = \frac{25 \times 0.2}{100} = 0.05$$

$$\text{pH} = -\log [\text{H}^+] = -\log 0.05 = 1.3010$$

37. (a) $\text{CH}_3\text{COOH} \rightleftharpoons \text{CH}_3\text{COO}^- + \text{H}^+$

$$K_a = \frac{[\text{CH}_3\text{COO}^-][\text{H}^+]}{[\text{CH}_3\text{COOH}]}$$

$$[\text{CH}_3\text{COOH}] = C - x \approx C = 0.1 \text{ M}$$

$$[\text{CH}_3\text{COO}^-] = 0.2 + x \approx 0.2 \text{ M}$$

$$[\text{H}^+] = \frac{K_a [\text{CH}_3\text{COOH}]}{[\text{CH}_3\text{COO}^-]} = \frac{1.8 \times 10^{-5} \times 0.1}{0.2}$$

$$[\text{H}^+] = 9 \times 10^{-6}$$

38. (b) $\text{HA} \rightleftharpoons \text{H}^+ + \text{A}^-$

$$K_a = \frac{[\text{H}^+][\text{A}^-]}{[\text{HA}]} = \frac{[\text{H}^+]^2}{[\text{HA}]}$$

$$[\text{H}^+] = \sqrt{K_a [\text{HA}]} = \sqrt{1 \times 10^{-5} \times 0.1}$$

$$= 1 \times 10^{-3}$$

$$\alpha = \frac{\text{Actual ionisation}}{\text{Molar concentration}} = \frac{10^{-3}}{0.1} = 10^{-2}$$

$$\% \text{ of acid dissociated} = 10^{-2} \times 100 = 1\%$$

39. (b) For acid-base reactions, g-equivalent of acid (HCl) = g-equivalent of base (NaOH)

$$\therefore \text{g-equivalent of acid} = (25 \times 10^{-3}) \text{ dm}^3 \times \frac{1}{10}$$

$$= 0.0025 = \text{g-equivalent of (NaOH)}$$

40. (d) $\text{H}_2\text{A} \rightleftharpoons \text{H}^+ + \text{HA}^-$

$$K_1 = \frac{[\text{H}^+][\text{HA}^-]}{[\text{H}_2\text{A}]} = 1.0 \times 10^{-5}$$

$$K_2 = \frac{[\text{H}^+][\text{A}^{2-}]}{[\text{HA}^-]} = 5.0 \times 10^{-10}$$

$$K_{\text{overall}} = \frac{[\text{H}^+]^2 [\text{A}^{2-}]}{[\text{H}_2\text{A}]} = K_1 \times K_2$$

$$= 1.0 \times 10^{-5} \times 5.0 \times 10^{-10}$$

$$= 5.0 \times 10^{-15}$$

41. (c) $\text{HA} \rightleftharpoons \text{H}^+ + \text{A}^-$

$$[\text{H}^+] = 10^{-3} \text{ M}, [\text{A}^-] = 10^{-3} \text{ M}$$

Hence, $K_a = \frac{[\text{H}^+][\text{A}^-]}{[\text{HA}]} = \frac{10^{-3} \times 10^{-3}}{0.1} = 10^{-5}$

42. (a) An acid indicator dissociates at equilibrium as

$$\therefore K_{\text{In}} = \frac{[\text{H}^+][\text{In}^-]}{[\text{HIn}]}$$

At the mid point, $[\text{In}^-] = [\text{HIn}]$

$$\therefore K_{\text{In}} = [\text{H}^+] = 1 \times 10^{-5}$$

$$\therefore [\text{H}^+] = 1 \times 10^{-5} \text{ or } \text{pH} = 5$$

43. (d) As the solution is acidic, $\text{pH} < 7$. This is because $[\text{H}^+]$ from H_2O [10^{-7} M] cannot be neglected in comparison to 10^{-9} M .

44. (b) The equilibrium constant for the reaction $\text{N}_2(\text{g}) + 3\text{H}_2(\text{g}) \rightleftharpoons 2\text{NH}_3(\text{g})$ can be written as

$$K_c = \frac{[\text{NH}_3(\text{g})]^2}{[\text{N}_2(\text{g})][\text{H}_2(\text{g})]^3}$$

$$= \frac{(1.2 \times 10^{-2})^2}{(1.5 \times 10^{-2})(3.0 \times 10^{-2})^3}$$

$$= 0.0355 \times 10^4 = 3.55 \times 10^2$$

$$= 3.98 \times 10^2$$

45. (c) $\Delta G = -2.303 RT \log K$; $-nFE^\circ = -2.303 RT \log K$

$$\log K = \frac{nFE^\circ}{2.303 RT} = 0.4342 \frac{nFE^\circ}{RT} \quad \dots(\text{v})$$

$$\ln K = \frac{nFE^\circ}{RT}$$

$$K = \frac{-nFE^\circ}{e^{RT}} \quad \dots(\text{ii})$$

46. (d) $\text{CH}_3\text{COOH} \rightleftharpoons \text{CH}_3\text{COO}^- + \text{H}^+$

Initially	C	0	0
At equilibrium	$C(1 - \alpha)$	$C\alpha$	$C\alpha$

$$K = \frac{C\alpha \cdot C\alpha}{C(1 - \alpha)} = \frac{C\alpha^2}{1 - \alpha} = C\alpha^2$$

or $C = \frac{K}{\alpha^2} = \frac{1.8 \times 10^{-5}}{(0.02)^2} = 0.045 \text{ M}$

47. (c) Or $\alpha = \frac{K_a}{C} = \frac{1.69 \times 10^{-5}}{0.01} = 0.169 \times 10^{-2}$

48. (d) $\text{pH} = -\log [3.8 \times 10^{-3}] = 2.42$

Therefore, the pH of the soft drink is 2.42 and it is acidic.

49. (c) $\text{pH} = 7 + \frac{1}{2} [\text{p}K_a - \text{p}K_b] = 7 + \frac{1}{2} [4.76 - 4.75]$
- $$= 7.005$$

50. (d) $\text{HAc}(\text{aq}) \rightleftharpoons \text{H}^+(\text{aq}) + \text{Ac}^-(\text{aq})$

Initial conc. (M)	0.05	0	0.05
At equilibrium	$0.05 - x$	x	$0.05 + x$

concentration (M)

$$K_a = \frac{[\text{H}^+][\text{Ac}^-]}{[\text{HAc}]} = \frac{[x](0.05 + x)}{(0.05 - x)}$$

As K_a is small for a very weak acid, $x \ll 0.05$

Hence, $(0.05 + x) \approx (0.05 - x) \approx 0.05$

$$\begin{aligned}\text{Thus, } 1.8 \times 10^{-5} &= \frac{(x)(0.05 + x)}{(0.05 - x)} = \frac{x(0.05)}{(0.05)} = x = [\text{H}^+] \\ &= 1.8 \times 10^{-5} \text{ M} \\ \text{pH} &= -\log(1.8 \times 10^{-5}) = 4.74\end{aligned}$$

51. (a) By Henderson equation

$$\text{pH} = \text{p}K_a + \log \frac{[\text{salt}]}{[\text{acid}]}$$

52. (a) $\text{pH} = \text{p}K_a + \log \frac{[\text{salt}]}{[\text{acid}]} = 4.76 + \log \frac{0.4}{4 \times 10^{-3}} = 6.76$

53. (b) $K_{p_1} = \frac{p_{\text{NH}_3}^2}{p_{\text{N}_2} \cdot p_{\text{H}_2}^3} \quad \dots(i)$

$$K_{p_2} = \frac{p_{\text{NH}_3}}{p_{\text{N}_2}^{1/2} \cdot p_{\text{H}_2}^{3/2}}$$

$$K_{p_2}^2 = \frac{p_{\text{NH}_3}^2}{p_{\text{N}_2} \cdot p_{\text{H}_2}^3} \quad \dots(ii)$$

On dividing Eq.(ii) by Eq(i)

$$\frac{K_{p_1}}{K_{p_2}^2} = 1 \text{ or } K_{p_1} = K_{p_2}^2$$

54. (c) $\text{Ba}(\text{NO}_3)_2$ gives Ba^{2+} and NO_3^- ions, hence, concentration of Ba^{2+} ion increases. To keep K_{sp} constant, $[\text{F}^-]$ decreases.

Thus, it is represented as $\frac{1}{2}[\text{F}^-]$.

55. (c) For anionic hydrolysis,

$$\text{pH} = \frac{1}{2}\text{p}K_w + \frac{1}{2}\text{p}K_a + \frac{1}{2}\log C$$

56. (c) NaBrO_3 gives BrO_3^- ions. Hence, $[\text{BrO}_3^-]$ increases. To keep K_{sp} constant, $[\text{Ag}^+]$ decreases.

57. (d) Anionic hydrolysis means anion reacts with water.

58. (d)

$$\text{p}K_a = -\log K_a = 4.74$$

$$\therefore K_a = 1.82 \times 10^{-5}$$

From, $K_a = \frac{C\alpha^2}{(1-\alpha)} = C\alpha^2 \quad (\because 1-\alpha = 1)$

$$\begin{aligned}\alpha &= \sqrt{\frac{K_a}{C}} = \sqrt{\frac{1.82 \times 10^{-5}}{0.05}} \\ &= 0.019 \text{ or } 1.9\%\end{aligned}$$

60. (a) $\text{X}^- + \text{H}_2\text{O} \rightleftharpoons \text{OH}^- + \text{HX}$

$$K_b = \frac{[\text{OH}^-][\text{HX}]}{[\text{X}^-]}$$

$$K_a = \frac{[\text{H}^+][\text{X}^-]}{[\text{HX}]}$$

$$\begin{aligned}\therefore K_a \times K_b &= [\text{H}^+][\text{OH}^-] \\ &= K_w = 10^{-14}\end{aligned}$$

Hence, $K_a = 10^{-4}$

Now, as $[\text{X}^-] = [\text{HX}]$, $\text{pH} = \text{p}K_a = 4$

61. (d) Buffer capacity of an acidic buffer is maximum when the ratio of HA to A^- is unity since, pH of acidic buffer

$$= \text{p}K_a + \log \frac{[\text{A}^-]}{[\text{HA}]}$$

For maximum buffer capacity, $[\text{A}^-] = [\text{HA}]$

$$\therefore \text{pH} = \text{p}K_a$$

$$K_{\text{sp}} = [\text{Ag}^+]^2[\text{CO}_3^{2-}]$$

$$= (2\text{S})^2 \text{S}$$

$$K_{\text{sp}} = 4\text{S}^3$$

63. (b) Amphoteric behaviour is that any species which acts as an acid as well as base.

64. (b) On increasing temperature, K_w of water increases and hence $\text{p}K_w$ decreases.

$$[\text{CrO}_4^{2-}] = \frac{1}{2}[\text{Ag}^+]$$

$$= \frac{1.5 \times 10^{-4}}{2} = 0.75 \times 10^{-4}$$

$$K_{\text{sp}} = [\text{Ag}^+]^2[\text{CrO}_4^{2-}]$$

$$= (1.5 \times 10^{-4})^2 (0.75 \times 10^{-4})$$

$$= 1.6875 \times 10^{-12}$$

$$K_{\text{sp}} = [\text{Ag}^+]^2[\text{CrO}_4^{2-}]$$

$$= (2\text{S})^2 (\text{S}) = 4\text{S}^3$$

BITSAT Archives

1. (b) Since, at equivalence point

$$N_1 V_1 = N_2 V_2$$

(for acid) (for base)

$$\therefore \text{Volume of NaOH required to reach equivalence point} = \frac{0.1 \times 25}{0.05} = 50 \text{ mL}$$

$$\therefore \text{Concentration of salt formed} = \frac{\text{Millimolars of acid}}{\text{Total volume in mL}} = \frac{25 \times 0.1}{75} = \frac{0.1}{3}$$

$$\text{Since, } [H^+] = \sqrt{\frac{K_w \times K_a}{C}} = \sqrt{\frac{10^{-14} \times 1.8 \times 10^{-5} \times 3}{0.1}}$$

$$\therefore \text{pH} = 8.63$$

2. (a)

3. (a) $K_p = K_c (RT)^{\Delta n}; \Delta n = 1$

$$K_c = \frac{K_p}{RT} = \frac{0.1}{0.082 \times 300} = 4 \times 10^{-3}$$

4. (c)

$$p - \left(\frac{2p}{9} + \frac{p}{9} \right) = \frac{2p}{9} - \frac{p}{9}$$

$$= \frac{6p}{9} - \frac{p}{9} = \frac{5p}{9}$$

$$\text{and } K_p = \frac{(p_{\text{NO}})^2 \times (p_{\text{Br}_2})}{(p_{\text{NOBr}})^2} = \frac{\left(\frac{2p}{9} \right)^2 \times \left(\frac{p}{9} \right)}{\left(\frac{6p}{9} \right)^2} = \frac{p}{81}$$

$$\therefore \frac{K_p}{p} = \frac{1}{81}$$

$$K = \frac{[\text{NH}_3]^2}{[\text{N}_2][\text{H}_2]^3} = \frac{\left[\frac{\text{mol}}{\text{L}} \right]^2}{\left[\frac{\text{mol}}{\text{L}} \right] \left[\frac{\text{mol}}{\text{L}} \right]^3} = \left[\frac{\text{mol}}{\text{L}} \right]^{-2} = \text{L}^2 \text{ mol}^{-2}$$

7. (a) pH = 3

$$[H^+] = 1 \times 10^{-3} \text{ mol/L}$$

$$\text{H}_2\text{SO}_4 \longrightarrow 2\text{H}^+ + \text{SO}_4^{2-}$$

$$[\text{H}_2\text{SO}_4] = \frac{1 \times 10^{-3}}{2} = \frac{1}{2000} \text{ M}$$

$$N = 2 \text{ M}$$

$$\text{Normality} = \frac{2}{2000} = \frac{1}{1000} \text{ N}$$

(for H_2SO_4)

8. (c) Given,
- $\text{p}K_a = 4$

$$\therefore K_a = 1 \times 10^{-4}$$

$$[H^+] = \sqrt{K_a \times C} = \sqrt{1 \times 10^{-4} \times 0.01}$$

$$= \sqrt{10^{-6}} = 10^{-3} \text{ M}$$

$$\text{pH} = -\log [H^+] = -\log 10^{-3} = 3$$

9. (a)
- K_b
- of
- NH_3
- is
- 10^{-5}
- . (given)

$$\therefore \text{p}K_b = 5 \text{ and } \text{p}K_a = 14 - 5 = 9$$

Hence, $\text{p}K_b$ and $\text{p}K_a$ values are 5 and 9 respectively.

10. (c)
- $\alpha = 4\% = \frac{4}{100} = 0.04$
- , Normality = 0.2

$$\therefore [H^+] = \alpha \times N = 0.04 \times 0.2 = 0.008 \text{ M}$$

11. (c) In water, barium hydroxide is hydrolysed as follows:

$$\text{Concentration of } [\text{OH}^-] = 2 \times 1 \times 10^{-3} \text{ M} = 2 \times 10^{-3} \text{ M}$$

$$\text{pOH} = -\log [\text{OH}^-] = -\log (2 \times 10^{-3}) = 2.69$$

$$\text{pH} + \text{pOH} = 14$$

$$\text{pH} = 14 - \text{pOH} = 14 - 2.69 = 11.3 \approx 11.0$$

12. (a)
- $\text{CH}_3\text{COONa} \xrightleftharpoons[\text{in aqueous solution}]{\text{ionisation}} \text{CH}_3\text{COO}^- + \text{Na}^+$
-
- Strong base

Acetate ion undergoes anionic hydrolysis and the resulting solution is slightly basic due to excess of OH^- ions. Hence, both (A) and (R) are true and (R) is the correct explanation of (A).

13. (b)

$$\alpha = 40\% = 0.4$$

$$K_c = \frac{[\text{PCl}_3][\text{Cl}_2]}{[\text{PCl}_5]} = \frac{\left(\frac{5 \times 0.4}{0.5} \right) \left(\frac{5 \times 0.4}{0.5} \right)}{\left(\frac{5 \times 0.6}{0.5} \right)} = 2.66 \text{ mol/L}$$

14. (a) According to law of active mass

$$K_c = \frac{[\text{NO}_2]^2}{[\text{N}_2\text{O}_4]} = \frac{[1.2 \times 10^{-2}]^2}{4.8 \times 10^{-2}}$$

$$= 0.3 \times 10^{-2} = 3 \times 10^{-3} \text{ mol/L}$$

15. (a)

16. (c) We have,
- $K_p = K_c (RT)^{\Delta n}$

$$\Delta n = -2$$

$$K_p = \frac{K_c}{(RT)^2}$$

$$K_p < K_c$$

 $\therefore$

17. (d)

9

Chemical Kinetics

Rate of a Reaction

The rate or speed or velocity of a reaction is the rate of change of concentration of reactants or products in unit time. Consider the following reaction,

Rate of reaction can be defined in two ways :

(i) Average rate of reaction, $r_{\text{av}} = -\frac{\Delta[A]}{\Delta t} = \frac{\Delta[B]}{\Delta t}$

(ii) Instantaneous rate of reaction (r_{inst}) can be calculated from r_{av} in the limit $\Delta t \rightarrow 0$ and is represented as

$$r_{\text{inst}} = -\frac{d[A]}{dt} = \frac{d[B]}{dt}$$

In general for a reaction $aA + bB \longrightarrow cC + dD$,

$$\text{Rate} = -\frac{1}{a} \frac{d[A]}{dt} = -\frac{1}{b} \frac{d[B]}{dt} = \frac{1}{c} \frac{d[C]}{dt} = \frac{1}{d} \frac{d[D]}{dt}$$

The rate of chemical reaction depends upon a number of factors such as:

- | | |
|----------------------------|---------------------------|
| (i) Concentration | (ii) Nature of reactants |
| (iii) Temperature | (iv) Presence of catalyst |
| (v) Exposure to radiations | |

Rate Law and Rate Constant

According to the law of mass action, the rate of a chemical reaction is directly proportional to the product of effective concentrations of reacting species, each raised to a suitable power may or may not be equal to the respective stoichiometric coefficients.

For a general reaction, $aA + bB \longrightarrow \text{products}$

$$\text{Rate} = k[A]^a[B]^b$$

where, k is rate constant or velocity constant or specific reaction rate.

The above expression is called **rate law** as it describes the functional dependence of the reaction rate upon concentration of various reactants. Rate law cannot be deduced from balanced equation. It is obtained experimentally.

Molecularity of a Reaction

The number of atoms, ions or molecules colliding with each other simultaneously in a single or elementary step of a chemical reaction, is known as molecularity of a reaction.

NOTE

Molecularity of a reaction — is always a whole number.
— can never be zero or fractional.
— does not tell about the rate or mechanism of the reaction.

Classification of the Reactions Based on Molecularity

The reaction can be classified on the basis of the number of molecules participating in the reaction.

Order of a Reaction

The sum of the powers of the concentration of the reactants contained in the rate law expression is called order of that chemical reaction. Consider the following reaction,

$$\text{Rate} = k[A]^a [B]^b$$

Order of the reaction = $a + b$

Order of a reaction is an experimental entity.

It may be 0, 1, 2, 3 and even a fraction.

Units of Rate Constant for Different Order of Reactions

The unit of rate constant for different order of reactions can be given by a generalised formula

$$\text{Unit of } k = (\text{mol L}^{-1})^{1-n} \text{ s}^{-1} \quad [\because n = \text{order of a reaction}]$$

e.g. (a) $n = 0$, unit of $k = \text{mol L}^{-1} \text{ s}^{-1}$

(b) $n = 1$, unit of $k = \text{s}^{-1}$

(c) $n = 2$, unit of $k = \text{mol}^{-1} \text{ L s}^{-1}$

(d) $n = 3$, unit of $k = \text{mol}^{-2} \text{ L}^2 \text{ s}^{-1}$

Integrated Rate Expressions

(i) Zero order reaction

(a) The reaction in which the rate of a reaction is independent of the concentration of the reactants is called zero order reaction.

(b) For a zero order reaction,

$$\text{or} \quad k = \frac{1}{t} \{ [A]_0 - [A] \}$$

$$\text{Rate} = - \frac{\Delta[R]}{\Delta t} = k$$

$$\text{or,} \quad k = \frac{1}{t} \{ [A]_0 - [A] \}$$

(c) The graph between the concentration of reactants and time is a straight line with slope = $-k$

(d) The graph between the concentration and rate of the reaction is shown as follows

(ii) First order reaction

(a) The reaction in which the rate of a reaction depends upon the concentration of one reactant is called first order reaction.

(b) The rate constant for first order reaction is given by

$$k = \frac{2.303}{t} \log_{10} \frac{a}{a-x}$$

where, a = initial concentration of a reactant
($a - x$) = concentration of reactant left after time t .

A graph showing the relationship between $\log_{10}\left(\frac{a}{a-x}\right)$ on the vertical axis and Time on the horizontal axis. The graph is a straight line passing through the origin, indicating a linear relationship.

$$k = \frac{2.303}{t(a-b)} \log_{10} \frac{b(a-x)}{a(b-x)}$$

A graph showing the relationship between the reciprocal of the concentration of reactant A, $\frac{1}{[A]}$, and Time. The y-axis is labeled $\frac{1}{[A]}$ and the x-axis is labeled Time. The plot is a straight line with a positive slope, indicating a first-order reaction.

$$k = \frac{1}{t} \cdot \frac{x(2a - x)}{2a^2(a - x)^2}$$

A graph showing the relationship between the reciprocal of the square of the concentration of A, $\frac{1}{[A]^2}$, and Time. The y-axis is labeled $\frac{1}{[A]^2}$ and the x-axis is labeled Time. A straight line starts from the origin (0,0) and extends upwards and to the right, indicating a linear relationship between $\frac{1}{[A]^2}$ and Time.

$$t_{1/2} \propto \frac{1}{[A_0]^{n-1}}$$

For first order reaction, $t_{1/2} = \frac{0.693}{k}$

$$t_{87.5\%} = 3t_{1/2}$$
$$t_{1/2n} = \frac{2.303}{k} \log \frac{a}{a-x}$$

When a graph is drawn between kinetic energy and fraction of molecules, a peak of curve is obtained which represents the kinetic energy possessed by the maximum number of molecules in the reaction.

This peak of curve is called **probable kinetic energy**.

When temperature rises to $(t + 10^\circ\text{C})$, the curve broadens and proportion of molecules with higher energies increases. This leads to an increase in the number of effective collisions and hence the rate of the reaction increases.

Arrhenius Equation

The effect of temperature on the rate of a reaction and rate constant (k) was given by Arrhenius in terms of

$$k = Ae^{-E_a/RT}$$

where, A = Arrhenius factor or pre-exponential factor or frequency factor

E_a = activation energy, R = gas constant

The term $e^{-E_a/RT}$ provides the fraction of molecules having energy equal to or greater than the activation energy. Taking natural logarithm of Arrhenius equation,

$$\ln k = \ln A - \frac{E_a}{RT}$$

When a graph is plotted between $\ln k$ and $1/T$, a straight line is obtained.

If at temperature T_1 , the value of rate constant is k_1 and at T_2 , the value of rate constant is k_2 , hence

$$\ln \frac{k_2}{k_1} = \frac{E_a}{R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

or

$$\log \frac{k_2}{k_1} = \frac{E_a}{2.303R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

This equation is used only when rate constants at two different temperatures are provided.

Activation Energy

The minimum amount of energy absorbed by the reactant molecules such that this energy becomes equal to threshold energy, thereby undergoing effective collisions for a reaction to take place is called activation energy.

Mathematically,
Activation energy

= threshold energy – average energy of the reactants

Hence, lower the activation energy, faster is the reaction and *vice-versa*.

Effect of Catalyst on the Rate of Reaction

The substance which alters the rate of reaction without itself undergoing any chemical change is called **catalyst**.

According to this theory of intermediate complex formation, reactants combine with catalyst through temporary bonds to form an intermediate complex which is short-lived and decomposes to give products and catalyst.

Catalyst provides an alternate pathway by lowering the potential energy barrier through the reduction of activation energy between the reactants and products. Hence, catalyst increases the rate of a reaction.

NOTE Catalyst neither alter the Gibbs free energy change $[\Delta G]$ of the reaction or the enthalpy change (ΔH) of the reaction.

Collision Theory of Bimolecular Gaseous Reactions

This theory is based upon the kinetic theory of gases assuming that the reactant molecules are hard spheres.

The main postulates of this theory are as follows:

- (i) The reaction between the molecules, occurs only when they collide with each other in a proper orientation.
- (ii) Only those collisions result in chemical reaction in which the molecules acquire energy greater than the activation energy.
- (iii) For an effective collision, the colliding molecules must possess threshold energy.

- (iv) An activation energy is supplied to the molecules for attaining this threshold energy. During collisions, this energy is acquired by the molecules as a result of interchange of energies. The rate of a reaction in terms of collision frequency is given by

$$\text{Rate} = Z_{AB} e^{-E_a/RT}$$

where, Z_{AB} refers to the collision frequency of reactants A and B , $e^{-E_a/RT}$ represents the fraction of molecules with energy either equal to or greater than E_a .

For an effective collision, probability or steric factor is introduced in the above equation for proper orientation of colliding molecules.

$$\text{Rate} = pZ_{AB}e^{-E_a/RT}$$

where, p = probability or steric factor or orientation factor

Other Important Terms and Relations

- Temperature coefficient** The ratio of rate constants of a reaction at two temperatures (i.e. at 298 K and 308 K) is known as temperature coefficient i.e.

$$\text{Temperature coefficient} = \frac{\text{Rate constant at 308 K}}{\text{Rate constant at 298 K}}$$

- Quantum efficiency of a photochemical reaction

$$\phi = \frac{\text{Number of molecules reacting in a given time}}{\text{Number of quanta absorbed in the same time}}$$

Practice Exercise

- For a chemical reaction $2X + Y \longrightarrow Z$, the rate of appearance of Z is $0.05 \text{ mol L}^{-1} \text{ min}^{-1}$. The rate of disappearance of X will be
 a. $0.05 \text{ mol L}^{-1} \text{ min}^{-1}$ b. $0.05 \text{ mol L}^{-1} \text{ h}^{-1}$
 c. $0.1 \text{ mol L}^{-1} \text{ min}^{-1}$ d. $0.25 \text{ mol L}^{-1} \text{ min}^{-1}$
- A gaseous reaction $A_2(g) \longrightarrow B(g) + \frac{1}{2}C(g)$, shows increase in pressure from 100 mm to 120 mm in 5 min. The rate of disappearance of A_2 is
 a. 4 mm min^{-1} b. 8 mm min^{-1}
 c. 16 mm min^{-1} d. 2 mm min^{-1}
- For the reaction $2N_2O_4 \rightleftharpoons 4NO_2$, given that $\frac{-d[N_2O_4]}{dt} = K$ and $\frac{d[NO_2]}{dt} = K'$, then
 a. $K' = 2K$ b. $K' = K$
 c. $2K' = K$ d. None of these
- The rate constant of a first order reaction is $2.0 \times 10^{-5} \text{ s}^{-1}$ and the initial concentration is 0.10 mol L^{-1} . The initial rate is
 a. $2.0 \times 10^{-6} \text{ mol L}^{-1} \text{ s}^{-1}$ b. $1.0 \times 10^{-6} \text{ mol L}^{-1} \text{ s}^{-1}$
 c. $1.5 \times 10^{-6} \text{ mol L}^{-1} \text{ s}^{-1}$ d. $0.5 \times 10^{-6} \text{ mol L}^{-1} \text{ s}^{-1}$
- The chemical reaction $2O_3 \longrightarrow 3O_2$, proceeds as follows:

$$O_3 \rightleftharpoons O_2 + O \text{ (fast)}$$

$$O + O_3 \longrightarrow 2O_2 \text{ (slow)}$$
 The rate law expression should be
 a. $r = k'[O_3]^2$ b. $r = k'[O_3]^2 [O_2]^{-1}$
 c. $r = k'[O_3][O_2]$ d. Unpredictable
- The rate for the decomposition of NH_3 on platinum surface is zero order. What are the rates of production of N_2 and H_2 respectively, if $k = 2.5 \times 10^{-4} \text{ mol L}^{-1} \text{ s}^{-1}$?
 a. $1.25 \times 10^{-4} \text{ and } \text{mol L}^{-1} \text{ s}^{-1}$ and $3.75 \times 10^{-4} \text{ and } \text{mol L}^{-1} \text{ s}^{-1}$
 b. $3.75 \times 10^{-4} \text{ and } \text{mol L}^{-1} \text{ s}^{-1}$ and $1.25 \times 10^{-4} \text{ and } \text{mol L}^{-1} \text{ s}^{-1}$
 c. $2.5 \times 10^{-4} \text{ and } \text{mol L}^{-1} \text{ s}^{-1}$ and $3.75 \times 10^{-4} \text{ and } \text{mol L}^{-1} \text{ s}^{-1}$
 d. $1.25 \times 10^{-4} \text{ and } \text{mol L}^{-1} \text{ s}^{-1}$ and $2.5 \times 10^{-4} \text{ and } \text{mol L}^{-1} \text{ s}^{-1}$
- In a reversible reaction $2NO_2 \xrightleftharpoons[k_2]{k_1} N_2O_4$, the rate of disappearance of NO_2 is equal to
 a. $\frac{2k_1}{k_2} [NO_2]^2$ b. $2k_1[NO_2]^2 - 2k_2[N_2O_4]$
 c. $2k_1[NO_2]^2 - k_2[N_2O_4]$ d. $(2k_1 - k_2) [NO_2]$
- For the reaction $R \longrightarrow P$, the concentration of a reactant changes from 0.03 M to 0.02 M in 25 min. Calculate the average rate of reaction using units of time in seconds.
 a. $6.66 \times 10^{-5} \text{ Ms}^{-1}$
 b. $6.6 \times 10^{-6} \text{ Ms}^{-1}$
 c. $5.67 \times 10^{-5} \text{ Ms}^{-1}$
 d. $7.26 \times 10^{-6} \text{ Ms}^{-1}$
- Rate law for the reaction $A + 2B \longrightarrow C$, is found to be $\text{Rate} = k[A][B]$. If the concentration of reactant B is doubled keeping the concentration of A constant, the value of rate constant will be
 a. the same b. doubled
 c. quadrupled d. halved

10. For the reaction $2\text{H}_2 + \text{O}_2 \longrightarrow 2\text{H}_2\text{O}$, the rate law expression is, $r = k[\text{H}_2]^n$. When the concentration of H_2 is doubled, the rate of reaction found to be quadrupled. The value of n is
 a. 0 b. 1 c. 2 d. 3
11. Consider the following reaction,
 $2\text{N}_2\text{O}_5 \longrightarrow 4\text{NO}_2 + \text{O}_2$; $\frac{d[\text{NO}_2]}{dt} = k_2[\text{N}_2\text{O}_5]$,
 $\frac{d[\text{O}_2]}{dt} = k_3[\text{N}_2\text{O}_5]$ and $\frac{d[\text{N}_2\text{O}_5]}{dt} = k_1$
 The relation between k_1 , k_2 and k_3 is
 a. $k_1 = k_2 = k_3$ b. $2k_1 = k_2 = 4k_3$
 c. $2k_1 = 4k_2 = k_3$ d. None of these
12. The rate of formation of SO_3 in the following reaction is 100 g min^{-1} . $2\text{SO}_2 + \text{O}_2 \longrightarrow 2\text{SO}_3$
 The rate of disappearance of O_2 is
 a. 29 g min^{-1} b. 20 g min^{-1}
 c. 50 g min^{-1} d. 200 g min^{-1}
13. Consider the following reaction,
 $2\text{A} + \text{B} + \text{C} \longrightarrow \text{Products}$
 How will the rate of reaction changes when the concentration of A is doubled and that of B is tripled while C is taken in excess?
 a. The rate reduces 8 times of its original value
 b. The rate reduces 12 times of its original value
 c. The rate increases 8 times of its original value
 d. The rate increases 12 times of its original value
14. In the reaction $2\text{A} \longrightarrow \text{Products}$, the concentration of A decreases from 1.0 mol L^{-1} to 0.8 mol L^{-1} in 20 min. Calculate the rate during this interval.
 a. $0.5 \text{ mol L}^{-1} \text{ min}^{-1}$ b. $0.005 \text{ mol L}^{-1} \text{ min}^{-1}$
 c. $0.05 \text{ mol L}^{-1} \text{ min}^{-1}$ d. $0.0005 \text{ mol L}^{-1} \text{ min}^{-1}$
15. The unit of the rate constant of n th order is
 a. $\text{mol}^{1-n} \text{ L}^{n-1} \text{ s}^{-1}$ b. $\text{mol}^{n-1} \text{ L}^{1-n} \text{ s}^{-1}$
 c. $\text{mol}^{n-1} \text{ L}^{n-1} \text{ s}$ d. $\text{mol}^n \text{ L}^{1-n} \text{ s}^{-1}$
16. In the presence of acid, the initial concentration of cane sugar was reduced from 0.2 M to 0.1 M in 5 h and to 0.05 M in 10 h. The reaction must be of
 a. zero order b. first order
 c. second order d. fractional order
17. The rate constant of a reaction is $3.25 \times 10^{-3} \text{ mol}^{-2} \text{ L}^2 \text{ min}^{-1}$. The order of reaction is
 a. zero b. 1 c. 2 d. 3
18. The half-life period of a first order process is 1.6 min. It will be 90% completed in
 a. 0.8 min b. 3.2 min c. 5.3 min d. 1.6 min
19. The hydrolysis of ester in alkaline medium is a
 a. first order reaction with molecularity 1
 b. second order reaction with molecularity 2
 c. first order reaction with molecularity 2
 d. second order reaction with molecularity 1
20. The rate constant of first order reaction whose half-life is 480 s, is
 a. $1.44 \times 10^{-3} \text{ s}^{-1}$ b. 1.44 s^{-1}
 c. $0.72 \times 10^{-3} \text{ s}^{-1}$ d. $2.88 \times 10^{-3} \text{ s}^{-1}$
21. In accordance to Arrhenius equation, the plot of $\log k$ against $\frac{1}{T}$ is a straight line. The slope of the line is equal to
 a. $\frac{-E_a}{R}$ b. $\frac{-2.303}{E_a \cdot R}$
 c. $\frac{-E_a}{2.303R}$ d. $\frac{-E_a}{2.303}$
22. For the first order reaction, $k = 5.48 \times 10^{-4} \text{ s}^{-1}$, the two-third life time for this reaction is
 a. 2005 s b. 1000 s c. 2000 s d. 3005 s
23. The rate constant for a zero order reaction is
 a. $k = \frac{C_0}{2t}$ b. $k = \frac{C_0 - C_t}{t}$
 c. $k = \ln \frac{C_0 - C_t}{t}$ d. $k = \frac{C_0}{C_t}$
24. The time required for 100% completion of a zero order reaction is
 a. ak b. $\frac{a}{2k}$
 c. $\frac{a}{k}$ d. $\frac{2k}{a}$
25. Pieces of wood burn faster than a log of wood of the same mass because
 a. surface area of log of wood is larger and needs more time to burn
 b. pieces of wood have larger surface area
 c. all pieces of wood catch fire at the same time
 d. log of wood has higher density than pieces of the same wood
26. What is the order of a reaction which has a rate expression, i.e. $\text{rate} = k[\text{A}]^{3/2}[\text{B}]^{-1}$?
 a. $\frac{3}{2}$ b. $\frac{1}{2}$
 c. Zero d. None of these
27. If initial concentration is doubled, the time for half-reaction is also doubled, the order of reaction is
 a. zero b. first c. second d. third
28. If the graph of concentration of $[\text{A}]$ vs T for completion of reaction is a straight line, then the order of reaction is
 a. zero b. second c. first d. third
29. For a reaction, temperature increases by 10°C , the equilibrium will be attained faster
 a. 2 times b. same c. $\frac{1}{2}$ times d. 4 times
30. 75% of a first order reaction was completed in 32 min. When was 50% of the reaction completed?
 a. 16 min b. 24 min c. 8 min d. 4 min

31. The rate of a reaction becomes 4 times when temperature is raised from 293 K to 313 K. The activation energy for such reaction would be
 a. 50.855 kJ mol⁻¹
 b. 52.849 kJ mol⁻¹
 c. 54.855 kJ mol⁻¹
 d. 56.855 kJ mol⁻¹

32. Half-life of a hypothetical reaction is found to be inversely proportional to the cube of initial concentration. The order of reaction is
 a. 4
 b. 3
 c. 5
 d. 2

33. H₂O and O-atom react in upper atmosphere bimolecularly to form two OH radicals. ΔH for the reaction is 72 kJ at 500 K and energy of activation is 77 kJ mol⁻¹. E_a for bimolecular recombination of two OH radicals to form H₂O and O-atom, will be
 a. 5 kJ mol⁻¹
 b. 72 kJ mol⁻¹
 c. 77 kJ mol⁻¹
 d. 149 kJ mol⁻¹

34. Calculate the half-life of the first order reaction, $C_2H_4O(g) \longrightarrow CH_4(g) + CO(g)$. If the initial pressure of $C_2H_4O(g)$ is 80 mm and the total pressure at the end of 20 min is 120 mm.
 a. 40 min
 b. 120 min
 c. 20 min
 d. 80 min

35. The half-lives for two samples are 0.1 and 0.8 s whose concentrations are 400 and 50 mol L⁻¹ respectively. The order of the reaction is
 a. 0
 b. 1
 c. 2
 d. 3

36. The rate constant for the first order reaction is 60 s⁻¹. How much time will it take to reduce the concentration of the reactant to 1/16th value?
 a. 4.6×10^4 s
 b. 4.6×10^{-4} s
 c. 4.6×10^{-2} s
 d. 4.6×10^2 s

37. The half-time of the following first order decomposition of nitramide is 2.1 h at 15°C:

If 6.2 g of nitramide is allowed to decompose then time taken for it to decompose 99%, will be

- a. 2.1 h
 b. 12 h
 c. 13.96 h
 d. 33 h
38. A first order reaction is found to have a rate constant, $k = 4.2 \times 10^{-12} \text{ s}^{-1}$. Find the half-life of the reaction.
 a. $1.26 \times 10^{13} \text{ s}$
 b. $1.65 \times 10^{11} \text{ s}$
 c. $1.65 \times 10^{-11} \text{ s}$
 d. $1.26 \times 10^{-13} \text{ s}$

39. The value of $\log \frac{k_2}{k_1}$ is equal to

a. $\frac{E_a}{2.303R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$
 b. $\frac{E_a}{2.303R} \left[\frac{T_1 T_2}{T_2 - T_1} \right]$
 c. $\frac{E_a}{2.303R} \left[\frac{T_2 + T_1}{T_1 T_2} \right]$
 d. $\frac{E_a}{2.303R} \left[\frac{T_1 T_2}{T_1 + T_2} \right]$

40. A graph plotted between $\log k$ vs $\frac{1}{T}$ is represented by

41. Rate of a reaction can be expressed by Arrhenius equation, $k = Ae^{-E_a/RT}$. Here, E is
 a. the total energy of the reacting molecules at a temperature T
 b. the energy above which all the colliding molecules will react
 c. the energy below which colliding molecules will not react
 d. the fraction of molecules with energy greater than the activation energy of the reaction

42. Compounds A and B react according to the following chemical equation:

Concentration of either A or B were changed keeping the concentrations of one of the reactant constants and rates were measured as a function of initial concentration. Following results were obtained.

Experiment	Initial concentration of [A] / mol L ⁻¹	Initial concentration of [B] / mol L ⁻¹	Initial rate of formation of [C] / mol L ⁻¹ s ⁻¹
1.	0.30	0.30	0.10
2.	0.30	0.60	0.40
3.	0.60	0.30	0.20

Choose the correct option for the rate equations for this reaction.

- a. Rate = $k[A]^2[B]$
 b. Rate = $k[A][B]^2$
 c. Rate = $k[A][B]$
 d. Rate = $k[A]^2[B]^0$

BITSAT Archives

1. Following is the graph between $\log T_{50}$ and $\log a$ (a = initial concentration) for a given reaction at 27°C . [2014]

Hence, order is

- a. 1 b. 2 c. 3 d. 0
2. Choose the law that corresponds to data shown for the reaction, $A + B \longrightarrow \text{products}$. [2013]

Experiment	[A]	[B]	Initial rate
1	0.012	0.035	0.1
2	0.024	0.070	0.8
3	0.024	0.035	0.1
4	0.012	0.070	0.8

- a. Rate = $k[B]^3$ b. Rate = $k[B]^4$
 c. Rate = $k[A][B]^3$ d. Rate = $k[A]^3[B]$
3. A reaction takes place in three steps. The rate constants are k_1, k_2 and k_3 . The overall rate constant $k = \frac{k_1 k_3}{k_2}$. If E_1, E_2 and E_3 (energy of activation) are 60, 30 and 10 kJ, respectively, the overall energy of activation is [2013]
- a. 40 kJ b. 30 kJ c. 400 kJ d. 300 kJ

4. Consider the following reaction,

If rate and rate constant for above reaction are $2.40 \times 10^{-5} \text{ mol L}^{-1} \text{ s}^{-1}$ and $3 \times 10^{-5} \text{ s}^{-1}$ respectively, then calculate the concentration of N_2O_5 . [2012]

- a. 1.4 mol L^{-1}
 b. 1.2 mol L^{-1}
 c. 0.04 mol L^{-1}
 d. 0.8 mol L^{-1}
5. For a given reaction, $t_{1/2} = 1/ka$. The order of this reaction is [2011]
- a. 0 b. 1 c. 2 d. 3
6. The time taken for 90% of a first order reaction to be completed is approximately [2011]
- a. 1.1 times that of half-life
 b. 2.2 times that of half-life
 c. 3.3 times that of half-life
 d. 4.4 times that of half-life
7. What is the energy of activation of a reaction if its rate doubles when the temperature is raised from 290 K to 300 K? [2010]
- a. 12 kcal
 b. 15 kcal
 c. 10 kcal
 d. 20 kcal
8. The active mass of solid is generally taken as [2010]
- a. > 1
 b. $= 1$
 c. < 1
 d. 0

Answer with Solutions

Practice Exercise

1. (c) $2X + Y \longrightarrow Z$

Hence, rate expression for the reaction will be

$$-\frac{1}{2} \frac{d[X]}{dt} = \frac{d[Y]}{dt} = + \frac{d[Z]}{dt}$$

$$\therefore -\frac{d[X]}{dt} = 2 \times 0.05 \text{ mol L}^{-1} \text{ min}^{-1}$$

$$= 0.1 \text{ mol L}^{-1} \text{ min}^{-1}$$

2. (b)
- | | | | | | |
|-------------|------------|-------------------|--------|-----|--------------------|
| | $A_2(g)$ | $\longrightarrow$ | $B(g)$ | $+$ | $\frac{1}{2} C(g)$ |
| Initially | 100 mm | | 0 | | 0 |
| After 5 min | (100-p) mm | | p | | $\frac{1}{2}p$ |

$$\text{Total pressure} = 100 - p + p + \frac{1}{2}p = 100 + \frac{1}{2}p$$

$$\therefore \text{Increase in pressure} = \frac{1}{2}p = 120 - 100 = 20 \text{ mm}$$

$$\therefore \text{Decrease in pressure of } A_2 = 2 \times 20 = 40 \text{ mm}$$

$$\therefore \text{Rate of disappearance of } A_2 = \frac{dx}{dt} = \frac{40}{5} = 8 \text{ mm min}^{-1}$$

3. (a) For this reaction,

$$\text{Rate expression} = -\frac{1}{2} \frac{d[N_2O_4]}{dt} = \frac{1}{4} \frac{d[NO_2]}{dt}$$

$$\text{or} \quad -\frac{d[N_2O_4]}{dt} = \frac{1}{2} \frac{d[NO_2]}{dt}$$

$$\text{or} \quad K = \frac{1}{2} K'$$

$$\text{or} \quad K' = 2K$$

4. (a) $\text{Rate} \left(\frac{dx}{dt} \right) = \text{Rate constant } (k) \times \text{Concentration}$

$$= 2.0 \times 10^{-5} \text{ s}^{-1} \times 0.10 \text{ mol L}^{-1}$$

$$= 2.0 \times 10^{-6} \text{ mol L}^{-1} \text{ s}^{-1}$$

5. (b)

6. (a)

7. (b)

8. (b) For the reaction $R \longrightarrow P$,

Average rate of reaction

$$= \frac{\text{Change in concentration of reactant or product}}{\text{Time taken}}$$

$$= \frac{-\Delta[R]}{t} = -\frac{[R_2] - [R_1]}{t} = -\frac{(0.02 - 0.03) \text{ M}}{(25 \times 60) \text{ s}}$$

$$= 6.6 \times 10^{-6} \text{ Ms}^{-1}$$

9. (b) Rate of reactions, $r_1 = k[A][B]$

$$r_2 = k[A][2B]$$

$$r_2 = 2r_1$$

10. (c) $r = k[H_2]^n \quad \dots(i)$

On doubling the concentration of H_2 ,

$$4r = k[2H_2]^n \quad \dots(ii)$$

On dividing Eq. (ii) by Eq. (i), we get,

$$4 = (2)^n$$

$$(2)^2 = (2)^n$$

$$n = 2$$

11. (b) $2N_2O_5 \longrightarrow 4NO_2 + O_2$

$$\text{Rate} = -\frac{1}{2} \frac{d[N_2O_5]}{dt} = \frac{1}{4} \frac{d[NO_2]}{dt} = \frac{d[O_2]}{dt}$$

$$\Rightarrow 2k_1 = k_2 = 4k_3$$

12. (b) $2SO_2 + O_2 \longrightarrow 2SO_3$

$$\text{Rate} = -\frac{d[O_2]}{dt} = \frac{1}{2} \frac{d[SO_3]}{dt}$$

$$-\frac{d[O_2]}{dt} = \frac{1}{2} \left(\frac{100}{80} \right) \text{ mol min}^{-1} = \frac{1}{2} \left(\frac{100}{80} \right) \times 32 \text{ g min}^{-1}$$

$$[\because \text{Molar mass of } O_2 = 32 \text{ g/mol}]$$

$$= 20 \text{ g min}^{-1}$$

13. (d) $2A + B + C \longrightarrow \text{Products}$

$$r_1 = k[A]^2[B]$$

[$\because C$ is taken in excess, rate does not depend on C]

$$r_2 = k[2A]^2[3B]$$

$$\frac{r_2}{r_1} = \frac{12k[A]^2[B]}{k[A]^2[B]} \Rightarrow r_2 = 12r_1$$

14. (b) Rate of reaction = Rate of disappearance of A

$$= -\frac{1}{2} \frac{\Delta(A)}{\Delta t} = -\frac{1}{2} \frac{(0.8 - 1.0) \text{ mol L}^{-1}}{20 \text{ min}}$$

$$= 0.005 \text{ mol L}^{-1} \text{ min}^{-1}$$

15. (a) The units of rate constant of n th order is $\text{mol}^{1-n} \text{ L}^{n-1} \text{ s}^{-1}$

16. (b) For the first order reaction

$$\text{Rate} \propto [A] \Rightarrow \frac{[A]}{\text{Rate}} = \text{Constant } (k)$$

- (i) When $\Delta x = 0.2 - 0.1 = 0.1$, $\Delta t = 5 \text{ h}$, $[A] = 0.2$

$$\text{Hence, } \frac{0.2}{0.1/5} = 10 = k$$

- (ii) When $\Delta x = 0.1 - 0.05 = 0.05$, $\Delta t = 5 \text{ h}$, $[A] = 0.1$

$$\text{Hence, } \frac{0.1}{0.05/5} = 10 = k$$

Hence, reaction follows first order rate law.

17. (d) The unit of rate constant for n th order reaction

$$= (\text{mol})^{1-n} \text{ L}^{n-1} \text{ min}^{-1}$$

On putting $n = 3$, we get the unit of given rate constant.
Hence, the order of reaction is 3.

18. (c) For first order reaction, $t_{1/2} = \frac{0.693}{k}$
 $\Rightarrow k = \frac{0.693}{1.6} = 0.4332 \text{ min}^{-1}$

Now, for 90% completion, $k = \frac{2.303}{t} \log \frac{a}{a-x}$
 $\Rightarrow 0.4332 = \frac{2.303}{t} \log \frac{100}{10} \Rightarrow t = 5.3 \text{ min}$

19. (b) Alkaline hydrolysis of ester (saponification) is a bimolecular and second order reaction.

20. (a) For the first order reaction
 $\Rightarrow k = \frac{0.693}{t_{1/2}} = \frac{0.693}{480 \text{ sec}} = 1.44 \times 10^{-3} \text{ s}^{-1}$

21. (c) Arrhenius equation can be written as

$$\log k = \log A - \frac{E_a}{2.303RT}$$

On comparing this equation with the straight line equation,

$$y = mx + c$$

we get, $y = \log k$, $m = -\frac{E_a}{2.303R}$, $x = \frac{1}{T}$, $C = \log A$

22. (a) For first order reaction, we know that

$$k = \frac{2.303}{t} \log \frac{a}{(a-x)}$$

Hence, $t = \frac{2.303}{5.48 \times 10^{-4}} \times \log \frac{a}{a - \frac{2}{3}a}$
 $= \frac{2.303 \times 10^4}{5.48} \times \log 3$
 $= \frac{2.303 \times 10^4}{5.48} \times 0.4771 = 2005 \text{ s}$

23. (b) For a zero order reaction,

$$C_0 - C_t = kt \Rightarrow k = \frac{C_0 - C_t}{t}$$

24. (c) For a zero order reaction,

$$x = kt$$

For 100% completion of the reaction, $x = a$

Therefore, $a = kt$ or $t = \frac{a}{k}$

25. (b) More the surface area of reactant, more will be the rate of reaction.

26. (b) Order of reaction $= \left(\frac{3}{2}\right) + (-1) = \frac{1}{2}$

27. (a) For n th order reaction, $t_{1/2} \propto a^{1-n}$

Here, $t_{1/2} \propto a$

Hence, $1 - n = 1$ or $n = 0$ (i.e. zero order reaction)

28. (a) In the zero order reaction, concentration decreases linearly with time as the rate of reaction is constant (does not depend on concentration of reactant).

29. (a) Rate of reaction becomes almost twice with an increase of 10°C in temperature (from 298 K to 308 K).

30. (a) For the reaction ,

$$k = \frac{2.303}{t} \log \frac{a}{a-x} = \frac{2.303}{32} \log 4 = 0.04332$$

Hence, time required for 50% completion,

$$t = \frac{2.303}{0.04332} \log \frac{a}{a - \frac{a}{2}}$$

$$= \frac{2.303}{0.04332} \times 0.3010 = 16 \text{ min}$$

31. (b) From the Arrhenius equation,

$$\log \frac{k_2}{k_1} = \frac{E_a}{2.303R} \left[\frac{T_2 - T_1}{T_1 \cdot T_2} \right]$$

Hence, $\log 4 = \frac{E_a}{2.303 \times 8.314} \left[\frac{313 - 293}{293 \times 313} \right]$

$$E_a = \frac{11.521}{0.000218} = 52.849 \text{ kJ mol}^{-1}$$

32. (a) $t_{1/2} \propto \frac{1}{a^{n-1}}$

Hence, $t_{1/2} \propto \frac{1}{a^3}$, only when $n = 4$

Also $E_a - E_b = \Delta H$ or $77 - E_b = 72$

$\therefore E_b = 5 \text{ kJ mol}^{-1}$

34. (c)

35. (c) The ratio of two half-lives and their concentrations are

related as $\frac{(t_{1/2})_1}{(t_{1/2})_2} = \left[\frac{a_2}{a_1} \right]^{n-1}$ [Here, n = order]

Therefore, $\frac{0.1}{0.8} = \left[\frac{50}{400} \right]^{n-1}$

On taking log of both sides

$$\log \frac{0.1}{0.8} = (n-1) \log \frac{50}{400}$$

$$1 = n - 1 \Rightarrow n = 2$$

36. (c) For the first order reaction, $k = \frac{2.303}{t} \log \frac{[A_0]}{[A]}$

Then, $k = \frac{2.303}{t} \log \left(\frac{a}{a/16} \right) = 0.0462 = 4.62 \times 10^{-2} \text{ s}$

37. (c) For the first order reaction,

$$k = \frac{0.693}{t_{1/2}} = \frac{0.693}{2.1} = 0.33 \text{ h}^{-1}$$

and

$$k = \frac{2.303}{t} \log_{10} \frac{a}{(a-x)}$$

or

$$t = \frac{2.303}{k} \log_{10} \frac{100}{(100-99)}$$

$$= \frac{2.303}{0.33} \times 2 = 13.96 \text{ h}$$

38. (b) For the first order reaction

$$t_{1/2} = \frac{0.693}{k} = \frac{0.693}{4.2 \times 10^{-12} \text{ s}^{-1}}$$

$$= 1.65 \times 10^{11} \text{ s}$$

39. (a) The value of $\log \frac{k_2}{k_1}$ is equal to $\frac{E_a}{2.303 R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$.

40. (c) On the basis of Arrhenius equation,

41. (c) In the Arrhenius equation for the rate of reaction, E is the energy below which colliding molecules will not react.

42. (b) Let, Rate law, $r = k[A]^x[B]^y$... (i)

On putting values, we get

$$0.10 = K[0.30]^x [0.30]^y \quad \dots (ii)$$

$$0.40 = K[0.30]^x [0.60]^y \quad \dots (iii)$$

$$0.20 = K[0.60]^x [0.30]^y \quad \dots (iv)$$

From Eqs. (ii) and (iii), we get

$$\frac{0.1}{0.4} = \left[\frac{0.30}{0.30} \right]^x \left[\frac{0.30}{0.60} \right]^y$$

$$\frac{1}{4} = \left[\frac{1}{2} \right]^y \Rightarrow y = 2$$

From Eqs. (iii) and (iv), we get

$$\frac{0.40}{0.20} = \left(\frac{0.30}{0.60} \right)^x \left(\frac{0.60}{0.30} \right)^y$$

$$2 = \left(\frac{1}{2} \right)^x (2)^y$$

On putting the values of y , we get

$$2 = \left(\frac{1}{2} \right)^x (2)^2$$

$$\Rightarrow x = 1$$

On putting the values of x and y in Eq. (i), we get

$$r = k[A]^1[B]^2 = k[A][B]^2$$

BITSAT Archives

1. (d) $t_{1/2} \propto \left(\frac{1}{a} \right)^{n-1}$ or $t_{1/2} = k(a)^{1-n}$
 $\log t_{1/2} = \log k + (1-n) \log a$
 (It represents straight line equation, $y = c + mx$)
 Slope $= (1-n) = \tan 45^\circ = 1$
 $\therefore (1-n) = 1 \Rightarrow n = 0$

2. (a) It is seen that, in experiments (3) and (2), $[A]$ is constant and $[B]$ is doubled and rate becomes 8 times, so order with respect to $[B] = 3$. In experiments (1) and (3), $[B]$ is constant and $[A]$ is doubled, but rate does not change, so order with respect to $[A] = 0$

Thus, rate $= k[B]^3$

3. (a) $k_1 = Ae^{-E_{a1}/RT}$, $k_2 = Ae^{-E_{a2}/RT}$, $k_3 = Ae^{-E_{a3}/RT}$

$$\text{Overall rate} = k = \frac{k_1 k_3}{k_2}$$

$$\text{Therefore, overall } E_a = E_{a1} + E_{a3} - E_{a2}$$

$$= 60 + 10 - 30 = 40 \text{ kJ}$$

4. (d) For a first order reaction, Rate, $= k[N_2O_5]$

$$2.4 \times 10^{-5} = 3 \times 10^{-5} \times [N_2O_5]$$

$$[N_2O_5] = \frac{2.4 \times 10^{-5}}{3 \times 10^{-5}} = 0.8 \text{ mol L}^{-1}$$

5. (c) $t_{1/2} \propto \frac{1}{(a)^{n-1}} \cdot \frac{1}{k^n}$

$$\text{Given, } t_{1/2} \propto \frac{1}{a}$$

$$\text{On comparing, } a^{n-1} = a^1, n-1=1, n=1+1=2$$

6. (c) For a first order reaction,

$$k = \frac{2.303}{t} \log \frac{a}{a-x}$$

$$t = \frac{2.303 \times t_{1/2}}{0.693} \log \frac{100}{(100-90)} \quad \left[\because k = \frac{0.693}{t_{1/2}} \right]$$

$$= 3.3 t_{1/2}$$

= 3.3 times that of half-life

7. (a) $\log \frac{k_2}{k_1} = \frac{E_a}{2.303R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$

$$\log 2 = \frac{E_a}{2.303 \times 2} \left[\frac{300 - 290}{290 \times 300} \right]$$

$$E_a = 12062 \text{ cal}$$

$$= 12.0 \text{ kcal}$$

8. (b) The active mass of solids is usually taken as unity..

10

Solution

Solutions in Chemistry

Solution is a homogeneous mixture of two or more substances on molecular level. A solution of two substances is called a binary solution. The substances forming the solution are called **components** of the solution. As a generalisation, the component present in smaller amount is called **solute** and the other present in larger amount is called **solvent**.

Different Methods for Expressing Concentration of Solutions

1. **Molality (m)** = $\frac{\text{Number of moles of solute}}{\text{Weight of solvent (in kg)}}$
2. **Molarity (M)** = $\frac{\text{Number of moles of solute}}{\text{Volume of solution (in L)}}$

Relation between molality (m) and molarity (M)

$$\text{Molarity (M)} = \frac{m \times d}{1 + \frac{m \times M_2}{1000}}$$

where, M_2 = molar mass of solute

and d = density of the solution

3. **Mole fraction of solute in the solution**

$$\chi_{\text{solute}} = \frac{\text{Moles of solute } (n_{\text{solute}})}{\text{Total moles of solution } (n_{\text{solute}} + n_{\text{solvent}})}$$

Mole fraction of solvent in the solution

$$\chi_{\text{solvent}} = \frac{\text{Moles of solvent } (n_{\text{solvent}})}{\text{Total moles of solution } (n_{\text{solute}} + n_{\text{solvent}})}$$

Sum of mole fractions is always equal to 1,

i.e. $\chi_{\text{solute}} + \chi_{\text{solvent}} = 1$

Relation between molarity (M) and mole fraction (χ) of the solute

$$\chi = \frac{MM_1}{M(M_1 - M_2) + d}$$

where, M_1 = molar mass of solvent

and M_2 = molar mass of solute

4. **Percentage by weight** = $\frac{\text{Weight of solute} \times 100}{\text{Weight of solution}}$

5. **Percentage by volume**

(a) Weight of solute per 100 mL of solution (w/V)

(b) Volume of solute per 100 mL of solution (V/V)

6. **ppm concentration** = $\frac{10^6 \times \text{mass of solute}}{\text{Mass of (solute + solvent)}}$

7. **Normality** = $\frac{\text{Number of gram-equivalents of solute}}{\text{Volume of solution (in L)}}$

Solubility

Maximum amount of a solute that can be dissolved in a given amount of solvent (usually 100 g) at a given temperature is called solubility at that temperature.

Solubility of Gas in Liquid

All gases are soluble in water and in other liquids upto a greater or lesser extent.

The solubility of a gas depends upon the following factors:

- (i) **Nature of the gas** The gases which can be easily liquefied, are more soluble in common solvents, e.g. CO_2 is more soluble than H_2 and O_2 in water.
- (ii) **Nature of the solvent** The gases which are capable of producing ions in aqueous solutions, are much more soluble than in other solvent.
- (iii) **Temperature** The solubility of most of the gases in liquids decreases with rise in temperature.
- (iv) **Pressure** The solubility of a gas in liquid is influenced by pressure. The relation between the solubility and pressure is given by **Henry's law**. It states that 'the partial pressure (p) of the gas in vapour phase is proportional to the mole fraction of the gas (χ) in the solution' and is expressed as $p = k_H \chi$
where, k_H is the Henry's law constant.

Vapour Pressure

The pressure exerted by the vapours of a liquid which are in equilibrium with it at a given temperature, is called vapour pressure. Vapour pressure variation with temperature is given as

$$2.303 \log_{10} \frac{p_2}{p_1} = \frac{\Delta H}{R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

where, p_1 and p_2 are vapour pressures at T_1 and T_2 respectively and ΔH is heat of vaporisation.

Factors Affecting Vapour Pressure

Vapour pressure gets affected by following factors:

Temperature

The vapour pressure of a liquid increases with increase in temperature. This is because on increasing the temperature, kinetic energy of molecules increases that results into the fact that more molecules of the liquid can go into vapour phase.

Effect of Adding Solute

When a liquid contains a solute, some of the solvent molecules are replaced by the solute particles on the liquid surface and therefore, the available surface area for the escape of solvent molecules decreases.

Due to the less available area on the surface of liquid for escape, rate of evaporation and hence, the rate of condensation both lowers.

The vapour pressure of liquid in solution is known as its **partial vapour pressure** and is less than the vapour pressure of the pure liquid at the same temperature.

If p° be the vapour pressure of pure liquid and p_s be that of liquid in solution then lowering of vapour pressure of the liquid = $p^\circ - p_s$

$$\therefore \text{Relative lowering in pressure} = \frac{p^\circ - p_s}{p^\circ}$$

Raoult's Law

The partial vapour pressure of a volatile component is directly proportional to its mole fraction in solution.

For a solution possessing two components A and B , the partial vapour pressure of A is

$$p_A \propto \chi_A$$

$$p_A = k \cdot \chi_A$$

where, χ_A = mole fraction of components A

If $\chi_A = 1$, then k (proportionality constant) = p_A° (vapour pressure of pure component A), thus,

$$p_A = p_A^\circ \chi_A$$

Similarly,

$$p_B = p_B^\circ \chi_B$$

According to Dalton's law,

$$p_{\text{total}} = p_A + p_B$$

$$p_{\text{total}} = \chi_A p_A^\circ + \chi_B p_B^\circ$$

$$= (1 - \chi_B) p_A^\circ + \chi_B p_B^\circ$$

$$= p_A^\circ + (p_B^\circ - p_A^\circ) \chi_B$$

Limitations of Raoult's Law

- It is valid only for very diluted solutions.
- It is valid only for the solution having non-volatile and non-electrolyte solute which exists as a single molecule.
- It is not valid for those solutes which associate or dissociate in the particular solution.

Ideal and Non-ideal Solutions

Ideal Solutions

The solutions which obey Raoult's law over the entire range of concentration are called ideal solutions.

For ideal solutions,

$$\Delta H_{\text{mix}} = 0, \Delta V_{\text{mix}} = 0$$

Solute-solute and solvent-solvent interactions
 $\approx$ solute-solvent interactions

Non-ideal Solutions

The solution which shows deviation from Raoult's law, is called non-ideal solution.

For such solutions, $\Delta H_{\text{mix}} \neq 0, \Delta V_{\text{mix}} \neq 0$

Non-ideal Solutions Showing Positive Deviation

When the observed vapour pressure is more than that expected by Raoult's law, positive deviation is observed.

- For such a deviation, $p_A > p_A^\circ \chi_A$, $p_B > p_B^\circ \chi_B$
 $p_{\text{total}} > p_A^\circ \chi_A + p_B^\circ \chi_B$

In this case, the intermolecular attractive forces between the solute-solvent molecules are weaker than those between the solute-solute and solvent-solvent molecules.

For such solutions, $\Delta H_{\text{mix}} > 0$, i.e. energy is absorbed on mixing and $\Delta V_{\text{mix}} > 0$. These are usually obtained by mixing of polar liquids with non-polar ones.

e.g. Cyclohexane and ethanol, H_2O and $\text{C}_2\text{H}_5\text{OH}$.

- Minimum boiling azeotropes** are formed by those liquid pairs which show positive deviation from ideal behaviour. Such azeotropes have boiling points lower than either of the components.
 e.g. $\text{C}_2\text{H}_5\text{OH}$ (95.57%) + H_2O (4.43%) (by mass)

Non-ideal Solutions Showing Negative Deviation

When the observed vapour pressure is less than that expected by Raoult's law, negative deviation is observed.

For such solutions, $\Delta H_{\text{mix}} < 0$, i.e. energy is released on mixing and $\Delta V_{\text{mix}} < 0$, i.e. attractive forces between unlike molecules are greater than the forces of attraction between like molecules.

e.g. Chloroform and acetone

For a solution showing negative deviation,

$$p_A < p_A^\circ \chi_A \text{ or } p_B < p_B^\circ \chi_B$$

$$p_{\text{total}} < p_A^\circ \chi_A + p_B^\circ \chi_B$$

- Maximum boiling azeotropes** are formed by those liquid pairs which show negative deviation from ideal behaviour. Such azeotropes have boiling points higher than either of the components.
 e.g. H_2O (20.22% by mass) + HCl .

Colligative Properties

The properties which depend only on the number of moles of non-volatile solute, are referred as colligative properties.

There are four types of colligative properties as given below:

1. Relative Lowering of Vapour Pressure

Addition of non-volatile solute leads to the lowering of vapour pressure.

$$\frac{p^\circ - p}{p^\circ} = \chi_{\text{solute}}$$

$$\text{or } \frac{p^\circ - p}{p^\circ} = \frac{n_A}{N} = \frac{w_A \cdot M_B}{M_A \cdot w_B}$$

where, $\frac{p^\circ - p}{p^\circ}$ = relative lowering of vapour pressure

n = moles of solute

N = moles of solvent

p° = vapour pressure of pure solvent

w_B and w_A are masses of solute and solvent respectively

and M_B and M_A are molecular weights of solute and solvent respectively.

2. Elevation in Boiling Point (ΔT_b)

For dilute solutions,

$$\Delta T_b = K_b \times \text{molality}$$

$$\Delta T_b = T_b - T_b^\circ$$

where, T_b = boiling point of solution

and T_b° = boiling point of pure solvent

K_b is ebullioscopic constant or molal elevation constant (K_b depends only on solvent).

$$\therefore M_B = \frac{K_b \times w_B \times 1000}{\Delta T_b \times w_A}$$

$$K_b = \frac{RT_0^2}{1000 \Delta H_V}$$

where, R = gas constant

and ΔH_V = latent heat of vaporisation

3. Depression in Freezing Point (ΔT_f)

For dilute solutions

$$\Delta T_f = K_f \times \text{molality}$$

$$\Delta T_f = T_f^\circ - T_f$$

where, T° = freezing point of pure solvent

T_f = freezing point of solution

K_f = cryoscopic constant or molal depression constant

$$\therefore M_B = \frac{K_f \times w_B \times 1000}{\Delta T_f \times w_A}$$

$$K_f = \frac{RT_0^2}{1000 \Delta H_f}$$

where, H_f = latent heat of fusion

4. Osmosis and Osmotic Pressure

Spontaneous flow of solvent molecules through a semipermeable membrane from a pure solvent to the solution (or from a dilute solution to concentrated solution) is termed as osmosis.

$$\text{Osmotic pressure } (\pi) = \frac{n}{V} RT = CRT$$

where, n = moles of solute, C = molar concentration

V = volume of solution (in litre), R = gas constant

T = temperature (in kelvin)

$$\therefore M_B = \frac{w_B RT}{\pi V}$$

Two solutions having same osmotic pressure at same temperature, are termed as **isotonic solutions**. When two solutions are being compared, the solution with higher osmotic pressure is termed as **hypertonic** and the solution with lower osmotic pressure is termed as **hypotonic**.

Osmotic pressure can be determined quite accurately, hence, it is used in the determination of molecular weights of large proteins and similar substances.

van't Hoff Factor (i)

In 1880, van't Hoff introduced a factor i , known as the van't Hoff factor, to account for the extent of dissociation or association. This factor i is defined as

$$i = \frac{\text{Number of particles after association or dissociation}}{\text{Number of particles before association or dissociation}}$$

$$\text{Degree of dissociation, } \alpha = \frac{i-1}{n-1}$$

where, n = number of particles after dissociation

$$\text{Degree of association, } \alpha = \frac{i-1}{\frac{1}{n}-1}$$

where, n = number of particles after association

Modified Expressions of Colligative Properties

1. Relative lowering of vapour pressure

$$\frac{p^\circ - p}{p^\circ} = i \frac{n_B}{n_B + n_A}; \quad \left(\begin{array}{l} n_B = n \\ n_B + n_A \approx N \end{array} \right)$$

2. Elevation in boiling point

$$\Delta T_b = i \cdot K_b \cdot m \quad \text{where, } m = \text{molality}$$

3. Depression in freezing point

$$\Delta T_f = i \cdot K_f \cdot m$$

4. Osmotic pressure (π) = $i \cdot CRT$

Practice Exercise

- The molarity of 720 g of pure water is
a. 40 M b. 4 M
c. 55.5 M d. unpredictable
- Molarity is expressed as
a. g / L b. L / mol
c. mol / L d. mol / 1000g
- The formula weight of H_2SO_4 is 98. The weight of the acid in 400 mL 0.1 M solution is
a. 2.45 g b. 3.92 g c. 4.90 g d. 9.8 g
- Out of molarity (M), molality (m), normality (N) and mole fraction (χ), those independent of temperature are
a. M and m b. N and χ c. m and χ d. M and χ
- A χ molal solution of a compound in benzene has mole fraction of solute equals to 0.2. The value of χ is
a. 14 b. 3.2 c. 1.4 d. 2
- On mixing 10 mL of acetone with 50 mL of chloroform, the total volume of the solution is
a. < 60 mL b. > 60 mL
c. = 60 mL d. unpredictable
- The normality of 10% (weight / volume) acetic acid is
a. 1 N b. 10 N c. 1.66 N d. 0.83 N
- Normality of 2 M H_2SO_4 is
a. 4 N b. 6 N c. $\frac{N}{4}$ d. $\frac{N}{6}$
- Suppose sea water contains 3.50 weight per cent of NaCl. Calculate the molarity of sea water.
a. 6.2 m b. 0.062 m c. 0.62 m d. 0.0062 m
- Which of the following statements is true about saturated solution?
a. A solution in which no more solute can be dissolved at the same temperature and pressure
b. The solution which is in dynamic equilibrium with undissolved solute and contains maximum amount of solute dissolved in solvent
c. The solution in which more solute can be dissolved at the same temperature
d. Both (a) and (b)
- Calculate the mass of urea (NH_2CONH_2) required in making 2.5 kg of 0.25 molal aqueous solution.
a. 37 g b. 35 g c. 34 g d. 32 g
- One litre of $N/2$ HCl solution is heated in a beaker and it is observed that when volume was reduced to 600 mL, 3.25 g of HCl is lost. Calculate the normality of new solution.
a. 0.50 N b. 0.60 N c. 0.68 N d. 0.70 N
- A substance will be deliquescent if its vapour pressure
a. is equal to the atmospheric pressure
b. is equal to that of water vapour in air
c. is less than that of water vapour in air
d. is greater than that of water vapour in air
- The aqueous solution that has the lowest vapour pressure at a given temperature, is
a. 0.1 M sodium phosphate
b. 0.1 M barium chloride
c. 0.1 M sodium chloride
d. 0.1 M glucose
- For determination of molecular mass, Raoult's law is applicable only to
a. dilute solutions of electrolytes
b. concentrated solutions of electrolytes
c. dilute solutions of non-electrolytes
d. concentrated solutions of non-electrolytes
- 100 mL of liquid A was mixed with 25 mL of liquid B to give non-ideal solution of A-B. The volume of this mixture will be
a. 75 mL
b. 125 mL exact
c. fluctuate between 75 mL and 125 mL
d. close to 125 mL but not to exceed 125 mL
- 6.0 g of urea (molecular weight = 60) was dissolved in 9.9 moles of water. If the vapour pressure of pure water is p_0 , the vapour pressure of solution is
a. $0.10 p_0$ b. $1.10 p_0$ c. $0.90 p_0$ d. $0.99 p_0$
- On mixing 25 mL of CCl_4 with 25 mL of toluene, the total volume of the solution is
a. = 50 mL b. > 50 mL
c. < 50 mL d. unpredictable
- An azeotropic mixture of two liquids has boiling point lower than either of them when it
a. shows a negative deviation from Raoult's law
b. shows no deviation from Raoult's law
c. shows positive deviation from Raoult's law
d. is saturated
- A sugar solution boils at 101°C . The molality of the sugar solution is (Given, $K_b = 0.52^\circ\text{C kg mol}^{-1}$)
a. 1.84 m b. 1.92 m c. 2.02 m d. 4.02 m
- An unknown compound is immiscible with water. It is steam distilled at 98.0°C . At 98.0°C , p and $p_{\text{H}_2\text{O}}^\circ$ are 737 and 707 torr respectively. This distillate was 75% by weight of water. The molecular weight of the unknown will be
a. $318.15 \text{ g mol}^{-1}$ b. 300 g mol^{-1}
c. $306.76 \text{ g mol}^{-1}$ d. None of these

22. The relative lowering of vapour pressure of an aqueous solution containing a non-volatile solute, is 0.0125. The molality of the solution is
a. 0.69 m b. 0.50 m c. 0.80 m d. 0.40 m
23. How many grams of H_2SO_4 is/are to be dissolved to prepare 200 mL aqueous solution having concentration of $[\text{H}_3\text{O}^+]$ ions is 1 M at 25°C temperature?
a. 19.6 g b. 0.98 g c. 4.9 g d. 9.8 g
24. Vapour pressure of pure A is 70 mm of Hg at 25°C . If it forms an ideal solution with B in which mole fraction of A is 0.8 and vapour pressure of the solution is 84 mm of Hg at 25°C , then the vapour pressure of pure B at 25°C is
a. 140 mm b. 70 mm c. 56 mm d. 28 mm
25. Lowering of vapour pressure is highest for
a. 0.1 M BaCl_2 b. 0.1 M glucose
c. 0.1 M MgSO_4 d. urea
26. Which of the following curves represent the Henry's law?

27. If p° and p_s are the vapour pressures of the solvent and solution respectively and n_1 and n_2 are the mole fractions of solvent and solute respectively. Then,
a. $p_s = p^\circ n_1$ b. $p_s = p^\circ n_2$
c. $p^\circ = p_s n_2$ d. $p_s = p^\circ \left(\frac{n_1}{n_2} \right)$
28. Arrange the following in the increasing order of their solubility in *n*-octane based on solute-solvent interaction:
a. $\text{KCl} < \text{CH}_3\text{CN} < \text{CH}_3\text{OH} < \text{Cyclohexane}$
b. $\text{KCl} < \text{Cyclohexane} < \text{CH}_3\text{OH} < \text{CH}_3\text{CN}$
c. $\text{KCl} < \text{CH}_3\text{OH} < \text{CH}_3\text{CN} < \text{Cyclohexane}$
d. $\text{KCl} < \text{Cyclohexane} < \text{CH}_3\text{CN} < \text{CH}_3\text{CN}$
29. Which one of them is more volatile component?
a. CH_2Cl_2 b. CHCl_3
c. Both a and b d. Not able to determine
30. The elevation in boiling point would be highest for
a. 0.08 m BaCl_2 b. 0.10 m glucose
c. 0.10 m KCl d. 0.06 m calcium nitrate

31. A 0.2 molal aqueous solution of weak acid (HX) is 20% ionised. The freezing point of this solution is (Given, $K_f = 1.86^\circ\text{C m}^{-1}$ for water)
a. -0.45°C b. -0.55°C c. -0.90°C d. -0.31°C
32. The van't Hoff factor for a very dilute solution of $\text{Fe}_2(\text{SO}_4)_3$ is
a. 9 b. 5
c. 24 d. None of these
33. The latent heat of vaporisation of water is 9700 cal/mol and if the boiling point is 100°C , the ebullioscopic constant of water is
a. 0.516°C b. 1.026°C c. 10.26°C d. 1.832°C
34. The relative lowering of vapour pressure of an aqueous solution containing a non-volatile solute is 0.0125. The molality of the solution is
a. 0.70 m b. 0.590 m c. 0.80 m d. 0.40 m
35. The osmotic pressure of one molar solution at 27°C is
a. 2.46 atm b. 24.6 atm c. 1.21 atm d. 12.1 atm
36. The freezing point of 0.1M solution of glucose is -1.86°C . If an equal volume of 0.3 M glucose solution is added, the freezing point of the mixture will be
a. -7.44°C b. -5.58°C c. -3.72°C d. -2.79°C
37. The van't Hoff factor for 0.1 M $\text{Ba}(\text{NO}_3)_2$ solution is 2.74. The degree of dissociation is
a. 91.3% b. 87% c. 100% d. 74%
38. In a 0.2 molal aqueous solution of a weak acid HX, the degree of ionisation is 0.3. Taking K_f for water as 1.85, the freezing point of the solution will be nearest to
a. -0.360°C b. -0.260°C
c. $+0.480^\circ\text{C}$ d. -0.481°C
39. Acetic acid exists in benzene solution in the dimeric form. In an actual experiment, the van't Hoff factor was found to be 0.52. Then, the degree of dissociation of acetic acid is
a. 0.48 b. 0.88 c. 0.96 d. 0.52
40. A compound X undergoes tetramerisation in a given organic solvent. The van't Hoff factor is
a. 4.0 b. 0.25 c. 0.125 d. 2.0
41. The freezing point (in $^\circ\text{C}$) of a solution containing 0.1 g of $\text{K}_3[\text{Fe}(\text{CN})_6]$ (molecular weight 329) in 100 g of water ($K_f = 1.86 \text{ K kg mol}^{-1}$) is
a. -2.3×10^{-2} b. -5.7×10^{-2}
c. -5.7×10^{-3} d. -1.2×10^{-2}
42. 0.004 M Na_2SO_4 is isotonic with 0.01 M glucose. Degree of dissociation of Na_2SO_4 is
a. 75% b. 50% c. 25% d. 85%
43. Colligative properties of a solution depends upon
a. nature of solute only
b. nature of both solute and solvent
c. number of solute particles
d. number of solvent particles

44. Among the following 0.10 m aqueous solutions, which one will exhibit the largest freezing point depression?
a. KCl b. $C_6H_{12}O_6$ c. $Al_2(SO_4)_3$ d. K_2SO_4
45. To observe an elevation of boiling point of $0.05^\circ C$, the amount of a solute (molecular weight = 100) to be added to 100 g of water ($K_b = 0.5$) is
a. 2 g b. 0.05 g c. 1 g d. 0.75 g
46. van't Hoff factor can be applied to the
a. relative lowering of vapour pressure of solvent
b. elevation of boiling point
c. osmotic pressure of solution
d. all colligative properties
47. Determine the amount of $CaCl_2$ ($i = 2.47$) dissolved in 2.5 L of water such that its osmotic pressure is 0.75 atm at $27^\circ C$.
a. 1.0 g b. 9.2 g c. 3.42 g d. 2.42 g
48. Find out the osmotic pressure of 0.1 M monobasic acid if $pH = 2.0$ at $25^\circ C$.
a. 2.69 atm b. 26.9 atm
c. 0.269 atm d. None of these

49. Elevation in boiling point was $0.52^\circ C$ when 6 g of a compound X was dissolved in 100 g of water. Molecular weight of X is (K_b of water is $5.2^\circ C$ per 100 g of water)
a. 120 b. 60 c. 600 d. 180
50. What does point A and B represent in the following diagram?

**Point A**

- a. Boiling point of solvent
b. Boiling point of solution
c. Boiling point of solute
d. Boiling point of solvent

Point B

- Boiling point of solution
Boiling point of solvent
Boiling point of solvent
Boiling point of solute

BITSAT Archives

1. Usually, $CaCl_2$ is preferred over NaCl for cleaning snow on roads particularly in very cold countries. This is because [2014]
a. NaCl makes the road slippery but $CaCl_2$ does not
b. $CaCl_2$ is hygroscopic but NaCl is not
c. $CaCl_2$ is less soluble in H_2O than NaCl
d. eutectic mixture of $CaCl_2/H_2O$ freezes at $-55^\circ C$ while that of $NaCl/H_2O$ freezes at $-18^\circ C$
2. The vapour pressure of a solvent decreased by 10 mm of Hg when a non-volatile solute was added to the solvent. The mole fraction of solute in solution is 0.2, what would be the mole fraction of solvent if the decrease in vapour pressure is 20 mm of Hg? [2013]
a. 0.8 b. 0.6 c. 0.4 d. 0.3
3. If the elevation in boiling point of a solution of 10 g of solute (molecular weight = 100) in 100 g of water is ΔT_b , the ebullioscopic constant of water is [2012]
a. $\Delta T_b/10$ b. ΔT_b c. $10\Delta T_b$ d. $100\Delta T_b$
4. 1.2% NaCl solution is isotonic with 7.2% glucose solution. What will be the van't Hoff factor, i ? [2012]
a. 0.5 b. 1 c. 2 d. 6
5. K_b for water is $0.52 K/m$. Then, 0.1 m solution of NaCl will boil approximately at [2011]
a. $100.52^\circ C$ b. $100.052^\circ C$ c. $101.04^\circ C$ d. $100.104^\circ C$
6. The molal freezing point for water is $1.86^\circ C mol^{-1}$. If 342 g of cane sugar is dissolved in 1000 mL of water, the solution will freeze at [2010]
a. $1.86^\circ C$ b. $-1.86^\circ C$ c. $2.42^\circ C$ d. $-2.42^\circ C$
7. $CaCl_2$ is preferred to NaCl for clearing snow on roads particularly in very cold countries. This is because
a. $CaCl_2$ is less soluble in H_2O than NaCl [2009]
b. $CaCl_2$ is hygroscopic but NaCl is not
c. eutectic mixture of $CaCl_2/H_2O$ freezes at $-55^\circ C$ while that of $NaCl/H_2O$ freezes at $-18^\circ C$
d. NaCl makes the road slippery but $CaCl_2$ does not
8. 100 cc of 1.5% solution of urea is found to have an osmotic pressure of 6.0 atm and 100 cc of 3.42% solution of cane sugar is found to have an osmotic pressure of 2.4 atm. If two solutions are mixed, the osmotic pressure of the resulting solution will be
a. 8.4 atm b. 4.2 atm [2009]
c. 16.8 atm d. 2.1 atm
9. When 25 g of a non-volatile solute is dissolved in 100 g of water, the vapour pressure is lowered by 2.25×10^{-1} mm. If the vapour pressure of water at $20^\circ C$ is 17.5 mm, what is the molecular weight of the solute? [2008]
a. 206 b. 302 c. 350 d. 276
10. A solution of sucrose (molar mass = 342 g/mol) is prepared by dissolving 68.4 g of it per litre of solution, what is its osmotic pressure at 273 K?
($R = 0.082 L atm K^{-1} mol^{-1}$) [2007]
a. 3.92 atm
b. 4.48 atm
c. 5.92 atm
d. 29.4 atm

Answer with Solutions

Practice Exercise

1. (c) Molarity = $\frac{w}{m \cdot V} = \frac{720}{18 \times 720/1000} = 55.5 \text{ M}$

(720 g water = 720 mL water)

2. (c)

3. (b) Molarity = $\frac{w}{m \cdot V \text{ (litre)}}$

Hence, $0.1 = \frac{w}{98 \times \frac{400}{1000}}$

$w = 0.1 \times 98 \times \frac{400}{1000}$
 $= 3.92 \text{ g}$

4. (c) Molality (m) and mole fraction (χ) involves only mass and do not depend upon volume. Hence, these are independent of temperature.

5. (b) Molality and mole fractions of solute (χ_A) are related as

$\chi_A = \frac{m \cdot M_B}{1000 + m \cdot M_B} \Rightarrow 0.2 = \frac{m \times 78}{1000 + m \times 78}$

$200 + 15.6m = 78m$

or $62.4m = 200$
 $m = 3.2$

6. (a) Chloroform and acetone show strong hydrogen bonding. Hence, for such solution ($\Delta V_{\text{mix}} = -\text{ve}$), volume decreases on mixing (Non-ideal solution with negative deviation).

7. (c) Normality = $\frac{w}{E \cdot V} = \frac{10 \text{ g}}{100 \text{ mL}} \times \frac{1}{60}$
 $= \frac{10 \text{ g}}{\frac{100}{1000} \times 60} = 1.66 \text{ N}$

8. (a) Basicity of $\text{H}_2\text{SO}_4 = 2$

Normality = Molarity $\times$ Basicity of acid = $2 \times 2 = 4 \text{ N}$

9. (c) NaCl solution contains 3.5 g of NaCl in 100 g of water.

Water in solution = $100 - 3.5 = 96.5 \text{ g} = 0.0965 \text{ kg}$

Molality = $\frac{3.5}{58.5 \times 0.0965} = 0.62 \text{ m}$

10. (d)

11. (a) Mass of solvent = 1000 g

Molar mass of urea (NH_2CONH_2) = 60 g mol^{-1}

$0.25 \text{ mole of urea} = 0.25 \times 60 = 15 \text{ g}$

Total mass of solution = $100 + 15 = 1.015 \text{ kg}$

$1.015 \text{ kg of solution contain urea} = 15 \text{ g}$

$2.5 \text{ kg of solution} = \frac{15}{1.015} \times 2.5 = 37 \text{ g}$

12. (c) 1 L of $N/2$ HCl contains = $\frac{1}{2} \times 36.5 = 18.25 \text{ g}$

HCl now present = $18.25 - 3.25 = 15 \text{ g}$

Now, volume = $600 \text{ mL} = 0.600 \text{ L}$

Normality = $\frac{15}{36.5} \times \frac{1}{0.600 \text{ L}} = 0.685 \text{ N}$

13. (c)

15. (c)

16. (d) For non-ideal solution, $\Delta V_{\text{mix}} < 0$. Hence, total volume will be little less than $(100 + 25 = 125 \text{ mL})$.

17. (d) Mole of urea = $\frac{6}{60} = 0.10$

According to Raoult's law

$\frac{p_{\text{solvent}} - p_{\text{solution}}}{p_{\text{solvent}}} = \chi_{\text{solute}} = \frac{n_A}{n_A + n_B}$

Hence, $\frac{p_0 - p_{\text{solution}}}{p_0} = \frac{0.10}{0.10 + 9.9}$

or $p_0 - p_{\text{solution}} = 0.01 p_0$ or $p_{\text{solution}} = 0.99 p_0$

18. (b) It is a non-ideal solution, hence, $\Delta V_{\text{mix}} = +\text{ve}$

19. (c)

20. (b) We know that $\Delta T_b = i \cdot K_b \cdot m$ (Here, $i = 1$)

$\therefore (101 - 100) = 0.52 \times m$

$\therefore \text{Molality } (m) = \frac{1}{0.52} = 1.92$

21. (a) Since, unknown compound is immiscible with water. Hence, vapour pressure $\propto$ moles

Given, $p_{\text{total}}^\circ = 737 \text{ torr}$

$p_{\text{H}_2\text{O}}^\circ = 707 \text{ torr}$

$\therefore p_{\text{unknown}}^\circ = 737 - 707 = 30 \text{ torr}$

$W_{\text{H}_2\text{O}} = 100 \text{ g}$

$W_{\text{unknown}} = 75 \text{ g}$

$\frac{p_{\text{unknown}}^\circ}{p_{\text{water}}^\circ} = \frac{n_{\text{unknown}}}{n_{\text{H}_2\text{O}}} = \frac{W_{\text{unknown}} \times m_{\text{H}_2\text{O}}}{W_{\text{H}_2\text{O}} \times m_{\text{unknown}}}$

or $\frac{30}{707} = \frac{75.0 \times 18}{100 \times m_{\text{unknown}}}$ or $m_{\text{unknown}} = 318.15 \text{ g mol}^{-1}$

22. (a) $\frac{p^\circ - p_s}{p^\circ} = \frac{m \times M}{1000}$

$0.0125 = \frac{m \times 18}{1000}$ (molecular weight of $\text{H}_2\text{O} = 18$)

$m = \frac{0.0125 \times 1000}{18} = 0.69$

23. (d) Molarity, $M = \frac{w_2 \times 1000}{M_2 \times V \text{ (in mL)}}$

where, w_2 is the mass of H_2SO_4 in g and M_2 is the molar mass of H_2SO_4 .

$$w_2 = \frac{1 \times 98 \times 200}{1000} = 19.6 \text{ g}$$

But according to equation, 1 mole of H_2SO_4 gives 2 moles of $[\text{H}_3\text{O}^+]$ ions. Thus, the amount of H_2SO_4 to prepare 200 mL solution having 1 M concentration of H_3O^+ ions is $19.6/2 = 9.8 \text{ g}$.

24. (a) $p = p_A^\circ \chi_A + p_B^\circ \chi_B$
 $\Rightarrow 84 = 70 \times 0.8 + p_B^\circ \times 0.2$
 $p_B^\circ = \frac{28}{0.2} = 140 \text{ mm}$

25. (a) Lowering of vapour pressure is directly proportional to the van't Hoff factor. For BaCl_2 , $i = 3$ (maximum) thus, BaCl_2 has highest value for relative lowering of vapour pressure.

26. (a) A graph between partial pressure of the gas *versus* mole fraction of the gas in solution is drawn, then we get plot of straight line.

27. (a) Raoult's law $\frac{p_0 - p_s}{p_0} = n_2$

$$1 - \frac{p_s}{p_0} = n_2$$

$$\frac{p_s}{p_0} = 1 - n_2 = n_1$$

$$p_s = n_1 \times p_0$$

28. (c) $\text{KCl} < \text{CH}_3\text{OH} < \text{CH}_3\text{CN} < \text{Cyclohexane}$

29. (a) Since, CH_2Cl_2 is a more volatile component than CHCl_3 , $[p_{\text{CH}_2\text{Cl}_2}^\circ = 415 \text{ mm Hg}$ and $p_{\text{CHCl}_3}^\circ = 200 \text{ mm Hg}]$ and the vapour phase is also richer in $[\chi_{\text{CH}_2\text{Cl}_2} = 0.82$ and $[\chi_{\text{CHCl}_3} = 0.18]$

30. (a) More the number of particles and concentration higher is the elevation in boiling point. Thus, 0.08 m KCl
 $= -0.08 \times 2 = 0.24 \text{ m (highest)}$

31. (a) 32. (b)

33. (a) $K_b = \frac{R \cdot T_b^2}{1000 \cdot L_v} = \frac{2 \times 373 \times 373 \times 18}{1000 \times 9700} = 0.516^\circ \text{C}$

34. (a) Relative lowering of vapour pressure of an aqueous solution containing non-volatile solute a is mole fraction of solute

As $\frac{p_0 - p_s}{p_0} = \frac{n}{n + N} = 0.0125$

$$\Rightarrow \frac{n + N}{N} = \frac{1}{0.0125} - \frac{N}{n} = \frac{1 - 1}{0.0125} = \frac{0.9875}{0.0125}$$

So $\frac{N}{n} = \frac{0.9875}{0.0125}$

Now, molality $= \frac{0.0125 \times 1000}{0.9875 \times 18} = 0.70$

35. (b) $p = \frac{n}{V} RT = MRT \left[\text{Molarity (M)} = \frac{n}{V} \right]$
 $= 1 \times 0.0821 \times 300 = 24.6 \text{ atm}$

36. (c) $K_f = \Delta T_f / M = 1.86 / 0.1 = 18.6$

$$0.1 \times V + 0.3 V = M_3 \times 2V$$

or

$$M_3 = 0.2$$

$$\Delta T_f = 18.6 \times 0.2 = 3.72^\circ \text{C}$$

$$T_f = -3.72^\circ \text{C}$$

Initially	1 mol	0	0
After dissociation	$1 - \alpha$	α	2α

Total number of moles $= 1 + 2\alpha$

$$\therefore i = 1 + 2\alpha$$

or $\alpha = \frac{i - 1}{2} = \frac{2.74 - 1}{2} = 0.87 = 87\%$

Initially	1 mol	0	0
After dissociation	$1 - 0.3$	0.3	0.3

Total moles $= 1 - 0.3 + 0.3 + 0.3 = 1.3$

$$i = \frac{1.3}{1} = 1.3$$

$$\Delta T_f = iK_f m = 1.3 \times 1.85 \times 0.2 = 0.481^\circ \text{C}$$

$$\therefore T_f = 0 - 0.481^\circ \text{C} = -0.481^\circ \text{C}$$

Initially	1	0
After dissociation	$1 - \alpha$	$\alpha / 2$

$$i = 1 - \frac{\alpha}{2}$$

or $\alpha = 2(1 - i) = 2(1 - 0.52) = 0.96$

$$1 - \alpha \quad \frac{\alpha}{4}$$

$$i = \frac{1 - \alpha + \frac{\alpha}{4}}{1} = 1 - \frac{3}{4}\alpha$$

where, α = degree of dissociation $= 1 = 100\%$

$$\therefore i = 1 - \frac{3}{4} = 0.25$$

41. (a) van't Hoff factor (i) $= 4 \{3\text{K}^+ + (\text{Fe}(\text{CN})_6\}^{3-}\}$

$$\text{Molality} = \frac{0.1 \times 1000}{329 \times 100} = \frac{1}{329}$$

$$-\Delta T_f = iK_f m = 4 \times 1.86 \times \frac{1}{329} = 2.3 \times 10^{-2}$$

$$\Rightarrow \Delta T_f = -2.3 \times 10^{-2}^\circ \text{C}$$

(As freezing point of water is 0°C)

42. (a) $0.004 \text{ M Na}_2\text{SO}_4$ solution is isotonic with 0.01 M solution of glucose, so their osmotic pressures are equal to each other. Osmotic pressure of 0.01 M glucose,

$$\pi_{\text{glucose}} = CRT = 0.01 \times 0.0821 \times T$$

$$= (\pi_{\text{obs}})_{\text{Na}_2\text{SO}_4} = \pi_{\text{glucose}} = 0.01 \times 0.0823 \times T$$

43. (c)

44. (c) As we know, $\Delta T_f = i \times K_f \times m$ where, K_f and m are constants.Hence, $\text{Al}_2(\text{SO}_4)_3$ will exhibit largest freezing point depression due to the highest value of i .

45. (c) Elevation of boiling point,

$$\Delta T_b = \frac{w \times K_b \times 1000}{M \times W(\text{gram})}$$

On substituting values, we get

$$0.05 = \frac{w \times 0.5 \times 1000}{100 \times 100} \text{ or } w = \frac{0.05 \times 100 \times 100}{0.5 \times 1000} = 1\text{g}$$

46. (d)

47. (c) $\pi = iCRT$ $\pi = inRT/V$

$$n = \frac{\pi V}{iRT} = \frac{0.75 \text{ atm} \times 2.5 \text{ L}}{2.47 \times 0.0821 \text{ L atm K}^{-1} \text{ mol}^{-1} \times 300 \text{ K}}$$

$$= 0.0308 \text{ mol}$$

Molar mass of $\text{CaCl}_2 = 111 \text{ g mol}^{-1}$ Amount dissolved = $0.0308 \times 111 = 3.42 \text{ g}$ 48. (a) $\text{HA} \rightleftharpoons \text{H}^+ + \text{A}^-$

$$\begin{array}{ccc} C & 0 & 0 \\ C(1 - \alpha) & C\alpha & C\alpha \end{array}$$

$$[\text{H}^+] = C\alpha = 10^{-2}$$

$$\text{pH} = 2$$

$$C\alpha = 10^{-2} \Rightarrow \alpha = \frac{10^{-2}}{0.1} = 0.1$$

Total number of moles after dissociation

$$= C - C\alpha + C\alpha + C\alpha = C(1 + \alpha)$$

$$\text{van't Hoff factor} = \frac{C(1 + \alpha)}{C} = 1 + \alpha = 1 + 0.1 = 1.1$$

$$\pi = iCRT = 1.1 \times 0.1 \times 0.0821 \times 298 = 2.69 \text{ atm}$$

49. (b) We know that

$$m = \frac{100K_b \cdot w}{\Delta T_b \cdot W}$$

$$= \frac{100 \times 5.2 \times 6}{0.52 \times 100} = 60$$

50. (a) The boiling point of a solution is always higher than that of the boiling point of pure solvent.

 $A \rightarrow$ Boiling point of solvent $B \rightarrow$ Boiling point of solution

BITSAT Archives

1. (d)

2. (b) From Raoult's law

$$p^\circ - p_s = p^\circ \times \text{mole fraction of solute}$$

$$10 = p^\circ \times 0.2 \Rightarrow 20 = p^\circ \times \chi_2$$

$$\therefore \chi_2 = 0.4 \text{ and } \chi_1 = 1 - 0.4 = 0.6$$

 $\chi_1 =$ mole fraction of solvent

$$3. (b) m = \frac{1000 \times K_b \times w}{W \times \Delta T_b}$$

$$\text{or } K_b = \frac{m \times W \times \Delta T_b}{1000 \times w} = \frac{100 \times 100 \times \Delta T_b}{1000 \times 10} = \Delta T_b$$

4. (c)

5. (d) $\Delta T_b = iK_b \cdot m = 2 \times 0.52 \times 0.1 = 0.104^\circ \text{C}$

$$T_b = 100 + 0.104^\circ \text{C}$$

$$= 100.104^\circ \text{C}$$

$$6. (b) m = \frac{1000 K_f w}{\Delta T_f W}$$

$$\Delta T_f = \frac{1000 K_f w}{mW} = \frac{1000 \times 1.86 \times 342}{342 \times 1000} = 1.86^\circ \text{C}$$

 $\therefore$ The solution will freeze at $0 - 1.86^\circ \text{C} = -1.86^\circ \text{C}$

7. (a)

8. (b) $p_{\text{urea}} = 3.0 \text{ atm}$, $p_{\text{cane sugar}} = 1.2 \text{ atm}$

$$\text{Total} = 4.2 \text{ atm}$$

9. (c)

10. (b) Osmotic pressure (π) = CRT Here, $C =$ concentration of solution

$$C = \frac{n}{V} = \frac{68.4}{342}$$

$$\pi = \frac{68.4}{342} \times 0.082 \times 273 = 4.48 \text{ atm}$$

11

Adsorption and Colloidal System

Concept of Surface Chemistry

Surface chemistry deals with the phenomenon that occurs at the surface or interfaces. There are several properties of substances, particularly of solids, liquids and solids, gases, which depend upon the nature of the surface of interface.

Concept of Adsorption

Retaining of the molecular species on the surface of the solid is known as adsorption. The solid substance on the surface of which adsorption occurs is called **adsorbent**. The molecular species that get adsorbed on the solid surface due to intermolecular attractions are called **adsorbate**.

Rate of adsorption decreases with time whereas rate of absorption remains constant with time.

Characteristics of Adsorption

- (i) Adsorption occurs due to unbalanced residual force on surface which allows to hold the adsorbate particle. These forces are generally chemical forces or physical van der Waals' forces.
- (ii) Adsorption occurs by decreasing ΔG° , ΔS° and ΔH° with condition ΔH has more negative value in comparison to $T\Delta S$.

$$\Delta G < 0, \quad \Delta H < 0, \quad \Delta S < 0, \quad -T\Delta S < \Delta H$$

- (iii) Extent of adsorption is directly proportional to surface area, i.e. increases with surface area. That's why finely divided metals and porous materials are better adsorbents.

NOTE At high temperature, physisorption can be converted into chemisorption. $\Delta H = -ve$ hence, adsorption is always an exothermic process.

Classification of Adsorption

Adsorption is of two types:

Adsorption Isotherm

The variation of extent of adsorption with pressure at constant temperature is known as adsorption isotherm.

Freundlich Adsorption Isotherm

According to this isotherm, the extent of adsorption is related to the pressure at constant temperature by the given formula,

$$\frac{x}{m} = k \cdot p^{1/n} \quad \dots(i)$$

where, $\frac{x}{m}$ = extent of adsorption
 p = pressure

k and n are constants which depend upon the nature of adsorbent and gas.

On taking log on both sides of Eq.(i), we get

$$\log \frac{x}{m} = \log k + \frac{1}{n} \log p$$

The Freundlich isotherm is valid for the value of $\frac{1}{n}$ in between 0 to 1. Probable range is 0.1 to 0.5, where maximum adsorption is observed.

Effect of Temperature on Freundlich Adsorption Isotherm

It has been found that as temperature increases, the extent of adsorption decreases, in

Effects of Pressure on Adsorption

Case I At high pressure, $\frac{1}{n} = 0$ or $\frac{x}{m} = k$ (constant)

At this condition, graph becomes almost constant and follow zero order kinetics.

Case II At low pressure, $\frac{1}{n} = 1$ or $\frac{x}{m} = kp$

$$\text{i.e. } \frac{x}{m} \propto p$$

Thus, the extent of adsorption is directly proportional to pressure which follow first order kinetics. The graph between extent of adsorption and pressure is a straight line.

Case III At intermediate range of pressure, the value of $\frac{1}{n}$ varies between 0 and 1, the graph can be expressed as

Langmuir Adsorption Isotherm

In order to explain the relation between extent of adsorption and pressure, Langmuir introduced an adsorption isotherm on the basis of the following assumptions :

- Adsorption is monolayered.
- Interaction between adjacent adsorbed molecule is negligible.
- Adsorption is uniform throughout the surface.
- At equilibrium, rate of adsorption is equal to rate of desorption.

On the basis of Langmuir adsorption isotherm, the fraction of surface covered by the adsorbed molecules (θ) represented as

$$(i) \text{ At equilibrium, } \theta = \frac{Kp}{1 + Kp}$$

where, K = equilibrium constant, known as adsorption coefficient

$$= \frac{k_a}{k_d} = \frac{\text{Rate constant for adsorption}}{\text{Rate constant for desorption}}$$

$$(ii) \theta = \frac{K'p}{1 + K'p}, \text{ where, } K' = kK = \text{constant}$$

Pressure Dependence of Langmuir Adsorption

Let us, consider the mathematical relation

$$\frac{x}{m} = \frac{K'p}{1 + Kp} \quad \left(\because \frac{x}{m} \propto \theta \right)$$

Case I At high pressure, $1 + Kp \approx Kp$

$$\frac{x}{m} = \frac{K'p}{Kp} = \frac{K'}{K} = \text{constant}$$

Thus, at high pressure, the extent of adsorption approaches to a limiting value.

Case II At low pressure,

The Kp becomes negligible in comparison to $1 + Kp = kp$

$$\frac{x}{m} = K'p, \quad \frac{x}{m} \propto p$$

Thus, at low pressure, the extent of adsorption is directly proportional to pressure.

Case III When pressure is moderate, then expression is in the form of $\frac{x}{m} = Kp^{1/n}$, where, $\frac{1}{n}$ lies between 0 and 1.

Adsorption from Solutions

Freundlich adsorption isotherm,

$$\frac{x}{m} = kC^{1/n} \quad (n > 1)$$

Langmuir adsorption isotherm,

$$\frac{x}{m} = \frac{aC}{(1 + bC)}$$

Langmuir adsorption isotherm is applicable only to chemisorption.

Catalysis

The term catalyst defined as a substance which alter the rate of reaction without taking part in it and phenomenon is called as catalysis.

**Types of Catalyst****1. Homogeneous Catalyst**

When the catalyst are in the same phase as the reactants and products then it is called homogeneous catalyst and the process is called **homogeneous catalytic reaction** or **homogeneous catalysis**.

2. Heterogeneous Catalyst

When the catalyst is in different phase than that of the reactants. It is called heterogeneous catalyst.

Important examples are:

**Enzyme Catalysis**

Enzymes are complex nitrogenous organic compounds which are produced by living plants and animals. They catalyse numerous biochemical reactions. The enzymes are thus, termed as biochemical catalysts and the phenomenon is known as biochemical catalysis.

Mechanism

Michaelis and Menton suggested the following steps for enzyme catalysis:

Step I Binding of enzyme to substrate to form an activated complex.

Step II Product formation in the activated complex.

Step III Decomposition of EP into products and enzyme again.

**Colloidal State**

A substance is said to be in the colloidal state, when it is dispersed in another medium in the form of very small particles having diameter between 10^{-4} to 10^{-7} cm, i.e. 1 to 100 nm.

Types of Colloidal System

The dispersed phase or dispersion medium can be a gas, liquid or solid. There are eight types of colloidal system.

These are as follows:

S. No.	Colloidal system	Dispersion phase	Dispersion medium	Examples
1.	Foam	Gas	Liquid	Soda water, froth, shaving cream
2.	Solid foam	Gas	Solid	Foam rubber, cork
3.	Aerosol	Liquid	Gas	Fog, mist, clouds
4.	Emulsion	Liquid	Liquid	Milk, hair cream
5.	Solid emulsion (gel)	Liquid	Solid	Butter, cheese
6.	Aerosol of solids	Solid	Gas	Dust in air, smoke
7.	Sol	Solid	Liquid	Paint, ink, colloidal gold,
8.	Solid sol	Solid	Solid	Ruby glass some gemstones, alloys, rock salt

Classification of Colloids

Colloids can be classified in a number of ways based upon some of their important characteristics as given below :

Based on Affinity of Phase

1. **Lyophilic colloids** represent such colloidal systems in which the particles of dispersed phase have great affinity for the dispersion medium. These are reversible colloids, e.g. gum, gelatin, rubber, proteins etc.
2. **Lyophobic colloids** represent such colloidal systems in which particles of the dispersed phase have no affinity for the dispersion medium. These are irreversible, e.g. sols of metals and their insoluble compounds like sulphides and oxides.

If water is the dispersion medium, the terms used are hydrophilic and hydrophobic colloids.

Lyophobic colloids are less stable due to the presence of electric charge on their particles. On the other hand, lyophilic colloids are stable due to the presence of charge as well as their extensive solvation.

Based on Molecular Size

1. **Multimolecular colloids** are the colloids in which colloidal particles consist of aggregate of atoms or small molecules with diameter less than 10^{-9} m or 1 nm, e.g. a sol of gold, a sol of sulphur.
2. **Macromolecular colloids** are the colloids in which colloidal particles themselves are large molecules.
3. **Associated colloids** or **micelles** are the substances which behave as normal electrolytes at low concentration but as colloids at higher concentration. This is because at higher concentration, they form associated particles called micelles, e.g. soap and synthetic detergents.

The concentration above which micelle formation occurs, is called CMC (critical micelle concentration) and the temperature above which micelle formation occurs is called **Kraft temperature**.

Preparation of Colloid

The various methods of preparation of colloids are as follows:

Dispersion Methods

The breaking down of a large solid particles into small colloidal particles by using mechanical or electrical methods are known as dispersion methods.

- (i) **Mechanical dispersion** It is done by using colloidal mill which causes breaking of large colloidal particles. e.g. Preparation of colloidal graphite (used as lubricant), preparation of printing ink.

- (ii) **Electrical dispersion** It is done by applying electric spark between the electrodes of metal which vaporises metal and converts metal into colloidal size. This process is known as Bredig's arc method.

e.g. Gold sol is prepared by this method.

- (iii) **Peptisation** This is a process of conversion of precipitate to the colloidal solution by means of shaking the solution of precipitate in the presence of small amount of electrolyte. Such electrolyte is known as peptising agent.

e.g. $\text{Fe}(\text{OH})_3 + \text{FeCl}_3 \longrightarrow \text{Sol}$

Chemical Methods

Some important examples are as follows:

- (i) Double decomposition of As_2O_3

- (ii) Oxidation

- (iii) Reduction of AgNO_3 and AuCl_3 by tannic acid

- (iv) Hydrolysis of FeCl_3

Properties of Colloidal Solutions

The important properties of the colloidal solutions are given below :

Brownian Movement

Colloidal particles are always in a state of rapid random motion, which is termed as Brownian movement.

Tyndall Effect

When a strong and converging beam of light is passed through a colloidal solution, its path becomes visible due to scattering of light by particles. It is called Tyndall effect.

Electrophoresis

The phenomenon involving the migration of colloidal particles under the influence of electric field towards the oppositely charged electrode, is called electrophoresis.

Coagulation or Flocculation

The precipitation of particles of the dispersed phase in a sol is known as coagulation.

The minimum amount of an electrolyte required to cause precipitation of one litre of a colloidal solution is called coagulation value or flocculation value. The reciprocal of coagulation value is regarded as the coagulating power.

Hardy-Schulze Rule

Higher the valency of the active ion, greater will be its power to precipitate the sol.

e.g. Order of coagulating power is

**Gold Number**

Protective power of any lyophilic colloid is determined in terms of gold number which is defined as "the milligrams of lyophobic colloid required to just prevent the precipitation of 10 mL of gold sol on the addition of 10 mL of 10% NaCl solution. Smaller the gold number of hydrophilic colloids, greater is its protective power.

Emulsion

Emulsion is a type of colloidal solution made by the addition or mixing of two immiscible or partially miscible

liquids. Generally, one of the two liquids is water and the liquid other than water is designated as oil.

Thus, the two types of emulsion may be formed as :

1. Oil dispersed in water (O/W type), e.g. milk.
2. Water dispersed in oil (W/O type), e.g. butter, cream.

Characteristics of Emulsion

The main characteristics of emulsion are as follows :

- (i) Commonly emulsions are unstable and stabilised by adding some third substance called emulsifying agents.

Some emulsifying agents are as follows:

- (a) **O/W type emulsion**, e.g. protein, gum, natural and synthetic soaps.
- (b) **W/O type emulsion**, e.g. lamp black, metal salt of fatty acids, long chain alcohols.

- (ii) Droplets of emulsion are often negatively charged.

Practice Exercise

1. The substance that gets adsorbed on the surface of the solid is called
 - a. adsorbate
 - b. adsorbent
 - c. micelle
 - d. inner phase
2. Adsorption is multilayered in the case of
 - a. physical adsorption
 - b. chemisorption
 - c. Both (a) and (b)
 - d. None of these
3. Which is favourable for van der Waals' adsorption?
 - a. High temperature, low pressure
 - b. Low temperature, high pressure
 - c. Low temperature, low pressure
 - d. High temperature, high pressure
4. In physical adsorption, the forces associated are
 - a. ionic
 - b. covalent
 - c. van der Waals'
 - d. H-bonding
5. Which adsorption takes place at higher temperatures?
 - a. Physical
 - b. Chemical
 - c. Both (a) and (b)
 - d. None of these
6. Which is adsorbed in minimum amount by the activated charcoal?
 - a. H_2
 - b. CO_2
 - c. SO_3
 - d. CO
7. Which of the following gas is adsorbed in maximum amount by charcoal?
 - a. SO_2
 - b. CO_2
 - c. CO
 - d. Water vapour
8. Which is true about chemisorption?
 - a. It is reversible in nature
 - b. It usually occurs at low temperatures
 - c. It is highly specific in nature
 - d. The attractive forces between adsorbate and adsorbent are van der Waals' forces
9. Adsorption is accompanied by

- a. decrease in entropy
- b. decrease in enthalpy
- c. decrease in free energy
- d. None of these

10. Amount of gas adsorbed per gram of adsorbent increases with pressure, but after certain limit is reached, adsorption becomes constant, it is due to
 - a. multilayers are formed
 - b. desorption takes place
 - c. temperature is increased
 - d. absorption also starts

11. Which of the following is the variation of physical adsorption with temperature?

12. According to Freundlich adsorption isotherm, which of the following is correct?

- a. $\frac{x}{m} \propto p^\circ$
- b. $\frac{x}{m} \propto p^1$
- c. $\frac{x}{m} \propto p^{1/n}$
- d. All of the above are correct for different ranges of pressure

13. 1g of charcoal adsorbs 100 mL of 0.5 M CH_3COOH to form a monolayer, and thereby the molarity of CH_3COOH reduces to 0.49 M. What is the surface area of charcoal used by each molecule of acetic acid?

[Surface area of charcoal = $3.01 \times 10^2 \text{ m}^2 / \text{g}$]

- $6.02 \times 10^{-30} \text{ m}^2$
 - $5.00 \times 10^{-19} \text{ m}^2$
 - $3.01 \times 10^{-2} \text{ m}^2$
 - $2.00 \times 10^{-19} \text{ m}^2$
14. Which of the following is not the true about the adsorption?
- During the process of adsorption, residual attractive forces decreases
 - During the adsorption surface energy decreases
 - It is an exothermic process
 - It is an endothermic process
15. Which of the following statements are correct?
- Silica gel adsorbs water molecules.
 - Anhy. CaCl_2 adsorbs the water molecules.
 - Adsorption is a surface phenomenon.
- I and II
 - II and III
 - I and III
 - All of these
16. Which of the following process will be observed, when a chalk stick is dipped in the solution of ink?
- Adsorption
 - Absorption
 - Desorption
 - Both (a) and (b)
17. A mixture of sand and water is an example of
- true solution
 - colloidal solution
 - suspension
 - All of the above
18. Freundlich adsorption isotherm is represented at temperatures T_1 , T_2 and T_3 .

Arrange the temperatures in the increasing order as shown in the graph.

- $T_1 < T_2 < T_3$
 - $T_3 < T_2 < T_1$
 - $T_2 < T_3 < T_1$
 - $T_3 < T_1 < T_2$
19. Identify the gas which is readily adsorbed by activated charcoal?
- H_2
 - N_2
 - SO_2
 - O_2

20. "Rate of adsorption is directly proportional to the fraction of area uncovered and rate of desorption is directly proportional to the fraction of area covered". This statement is true for

- Freundlich adsorption isotherm
 - Langmuir adsorption isotherm
 - BET isotherm
 - None of the above
21. The correct relationship which represents the Freundlich adsorption isotherm is
- $\log \left(\frac{x}{m} \right) = \log k + \frac{1}{n} \log p$
 - $\log \left(\frac{m}{x} \right) = \log k + \frac{1}{n} \log p$
 - $\log \left(\frac{x}{m} \right) = \log p + \frac{1}{k} \log p$
 - $\log \left(\frac{x}{m} \right) = \log c + \frac{1}{n} \log k$

22. Which of the following is correct statement?
- Physisorption occurs at low temperature and chemisorption occurs at high temperature
 - Physisorption occurs at very high temperature and chemisorption occurs at low temperature
 - Physisorption is irreversible and chemisorption is reversible
 - None of the above

23. For Freundlich adsorption isotherm, $\frac{x}{m} = kp^{1/n}$, the value of n is

- always greater than 1
 - always smaller than 1
 - always equal to 1
 - greater than 1 at low temperature and smaller than 1 at high temperature
24. In general, H_2 gas is adsorbed on activated charcoal to a less extent in comparison to the easily liquefiable gases due to
- very strong van der Waals' force and low critical temperature
 - very weak van der Waals' force and low critical temperature
 - very strong van der Waals' force and high critical temperature
 - very weak van der Waals' force and high temperature

25. Which of the following reaction requires catalyst?

- $\text{S} + \text{O}_2 \longrightarrow \text{SO}_2$
 - $2\text{SO}_2 + \text{O}_2 \longrightarrow 2\text{SO}_3$
 - $\text{C} + \text{O}_2 \longrightarrow \text{CO}_2$
 - All of the above
26. Hydrolysis of sugar to glucose and fructose is catalysed by
- invertase
 - zymase
 - lactic bacilli
 - diastase

27. The efficiency of an enzyme in catalysing a reaction is due to its capacity
 a. to form an enzyme substrate complex
 b. to decrease the bond energies of the substrate molecules
 c. to change the shape of the substrate molecule
 d. None of the above
28. In *Zeigler-Natta* polymerisation of ethylene, the active species is
 a. AlCl_3
 b. Et_3Al
 c. CH_2CH_2
 d. Ti^{3+}
29. Following reaction is catalysed by $\text{Br}^-(\text{aq})$

$$2\text{H}_2\text{O}_2(\text{aq}) \longrightarrow 2\text{H}_2\text{O}(\text{l}) + \text{O}_2(\text{g})$$

 This is an example of
 a. homogeneous catalysis
 b. heterogeneous catalysis
 c. Both (a) and (b)
 d. None of these
30. Vanishing cream is an example of
 a. solution
 b. foam
 c. lyophilic solution
 d. emulsion
31. Colloidal solution of gold is prepared by
 a. colloidal mill
 b. double decomposition method
 c. Bredig's arc method
 d. peptisation
32. When a beam of light is passed through colloidal solution,
 a. it gets scattered
 b. it gets adsorbed
 c. it is refracted
 d. it undergoes reflection
33. Fog is a colloidal solution of
 a. gas in gas
 b. solid in gas
 c. liquid in gas
 d. None of these
34. Which property is not shown by colloids?
 a. Adsorption
 b. Tyndall effect
 c. Flocculation
 d. Paramagnetism
35. The path of a beam of light through smoke is visible because
 a. carbon dioxide in the smoke scatters light
 b. carbon dioxide in the smoke absorbs light
 c. carbon particles in the smoke absorb light
 d. carbon particles in the smoke scatter light
36. Four different colloids have the following gold number, Which one has most effective action?
 a. 10
 b. 30
 c. 20
 d. 40
37. In coagulating the colloidal solution of As_2S_3 , which has the minimum coagulation value?
 a. NaCl
 b. KCl
 c. BaCl_2
 d. AlCl_3
38. Which of the following indicates the charge on colloidal particles?
 a. Brownian movement
 b. Electrophoresis
 c. Electrolysis
 d. Tyndall effect
39. Which of the following is not a colloid?
 a. Milk
 b. Blood
 c. Latex
 d. Vinegar
40. Which of the following has minimum gold number?
 a. Gelatin
 b. Egg albumin
 c. Gum arabic
 d. Starch
41. Which of the following represents homogeneous catalysis?
 a. $\text{Oil} + \text{H}_2 \xrightarrow{\text{Ni}} \text{Saturated fat}$
 b. $\text{N}_2 + 3\text{H}_2 \xrightarrow{\text{Fe}} 2\text{NH}_3$
 c. $\text{CH}_3\text{COOH} + \text{C}_2\text{H}_5\text{OH} \xrightarrow{\text{H}^+} \text{CH}_3\text{COOC}_2\text{H}_5 + \text{H}_2\text{O}$
 d. None of the above
42. Which of the following is not a colloid?
 a. Chlorophyll
 b. Smoke
 c. Ruby glass
 d. Milk
43. Lyophilic colloids are stable due to
 a. charge on the particles
 b. large size of particles
 c. small size of particles
 d. layer of dispersion medium on the particle
44. Which has the maximum coagulating power for ferric hydroxide colloid?
 a. AlCl_3
 b. $\text{K}_4[\text{Fe}(\text{CN})_6]$
 c. BaSO_4
 d. MgO
45. Gold number is the index for
 a. protective power of lyophilic colloid
 b. purity of gold
 c. metallic gold
 d. electroplated gold
46. Blue colour of sky and red colour of sunsets are due to
 a. scattering of light from the sun
 b. scattering of light from particles of dust in the atmosphere
 c. refraction of blue light by impurities in sea water
 d. scattering of light due to ozone layer
47. When dilute aqueous solution of AgNO_3 (excess) is added to KI solution, positively charged sol particles of AgI are formed due to adsorption of ion
 a. K^+
 b. Ag^+
 c. I^-
 d. NO_3^-
48. Gold sols and sulphur sols are the examples of
 a. multimolecular colloids
 b. macromolecular colloids
 c. associated colloids
 d. All of the above
49. Colloidion is a
 a. 100% solution of nitrocellulose
 b. 10% solution of nitrocellulose in mixture of alcohol and ether
 c. 4% solution of nitrocellulose in mixture of alcohol and ether
 d. 1% solution of nitrocellulose in mixture of alcohol and ether
50. Lyophilic solution is coagulated by
 a. adding an electrolyte
 b. adding a suitable solvent
 c. Both (a) and (b)
 d. None of the above

BITSAT Archives

1. The gold number of a few protective colloids are given
 $x = 0.005$, $y = 3.5$, $z = 40$

The protective nature of these colloidal solutions follow the order : [2014]

- a. $z > x > y$ b. $x < y < z$
 c. $z > y > x$ d. $x > y > z$

2. When equal volume of each of two sols of AgI, one obtained by adding AgNO_3 to slight excess of KI and another obtained by adding KI to slight excess of AgNO_3 are mixed together. It is observed that [2013]
 a. the sol particles acquired more electric charge
 b. the sols coagulated each other mutually
 c. a true solution is obtained
 d. the two sols stabilised each other

3. Which of the following will be the most effective in the coagulation of $\text{Fe}(\text{OH})_3$ sol? [2012]
 a. $\text{Mg}_3(\text{PO}_4)_2$ b. BaCl_2
 c. NaCl d. KCN

4. Which of the following is an example of homogeneous catalysis? [2010]

- a. Haber's process for the synthesis of NH_3
 b. Catalytic conversion of SO_2 to SO_3 in contact process
 c. Catalytic hydrogenation of oils
 d. Acid hydrolysis of methyl acetate

5. Which of the following graphs represents Freundlich adsorption isotherm? [2008]

Answer with Solutions

Practice Exercise

- (a)
- (a) Adsorption is multilayered in case of physical adsorption while it is almost monolayered in case of chemical adsorption.
- (b) van der Waals' adsorption is the physical adsorption which is favoured by low temperature as the phenomenon is exothermic. Increase in pressure favours the adsorption.
- (c) Adsorbate molecules are held by weak van der Waals' force of attraction.
- (b) Chemical adsorption takes place at higher temperature, in comparison of physical adsorption.
- (a) The gas, which is difficult to liquefy (i.e. having very low critical temperature), is adsorbed in less amount and *vice-versa*. Here, hydrogen has the minimum critical temperature, (-240°C) hence, is adsorbed in minimum amount.
- (a) Stronger the intermolecular forces, easier to liquefy and more strongly. It is adsorbed.
- (c) Chemisorption occurs through formation of chemical bonds, hence it is very specific in nature.
- (d)
- (a) Langmuir showed that at low pressure, the physically adsorbed gas forms only one molecule thick layer. However, above a certain pressure, multimolecular thick layer is formed.
- (b) Adsorption of gases decreases with increase in temperature.
- (d)
- (b) 100 mL of 0.5 CH_3COOH contains
 $\text{CH}_3\text{COOH} = 0.05 \text{ mol}$
 After adsorption, CH_3COOH remained = 0.049 mol
 $\therefore$ Acetic acid adsorbed = $0.001 \text{ mol} = 6.02 \times 10^{20}$ molecules
 $\therefore$ Surface area of charcoal adsorbed by each molecule

$$= \frac{3.01 \times 10^2 \text{ m}^2}{6.02 \times 10^{20}} = 5 \times 10^{-19} \text{ m}^2$$
- (d)
- (b) Anhy. CaCl_2 absorbs moisture and adsorption is a surface phenomenon.
- (d) When a chalk stick is dipped in ink, the surface retains the colour of ink due to adsorption of coloured molecules while the solvent of the ink goes deeper into the stick due to absorption.
- (c)
- (a) $\frac{x}{m}$ shows, extent of adsorption. Extent of adsorption increases by decrease of temperature. Order of temperature
 $T_1 < T_2 < T_3$
- (c) Easily liquefiable gases like SO_2 , NH_3 have greater value of critical temperature than elemental gases, i.e. N_2 , O_2 , H_2 thus, readily get adsorbed.

20. (a) 21. (a)
22. (a) At high temperature, kinetic energy of adsorbate increases and make a strong chemical bond between adsorbate and adsorbent, hence chemisorption occurs.
23. (a) If $n > 1$, then, $\frac{1}{n} < 1$
 $\therefore n$ is always greater than 1.
24. (b) H_2 is a permanent gas, hence, has low value of critical temperature and low van der Waals' force. Due to these factors, it shows low extent of adsorption.
25. (b) 26. (a)
27. (a) Enzyme + Substrate $\longrightarrow$ [Complex intermediate]
 $\longrightarrow$ [Product + enzyme]
28. (d) $(C_2H_5)_3Al + TiCl_4 \longrightarrow$ Active species
 Ti^{3+} has one active site vacant and thus accommodate one alkyl group (as $(C_2H_5)_3Al$ reduces $TiCl_4$ to $TiCl_3$).
29. (a) $2H_2O_2(aq) \xrightarrow{Br^-(aq)} 2H_2O(l) + O_2(g)$
 This is an example of homogeneous catalysis.
30. (d) Vanishing cream is an oil in water (O in W) type emulsion.
31. (c) Colloids of metals are generally prepared by Bredig's arc method.
32. (a)
33. (c) Fog is colloidal solution of water droplets (liquid) dispersed in air (gas) dispersion medium.
34. (d) Paramagnetism is not shown by colloids.
35. (d)
36. (a) Lesser the gold number, greater will be its protecting efficiency.
37. (d) As_2S_3 is a negative sol Hence, $AlCl_3$ with univalent Al^{3+} has least coagulation value.
38. (b) Electrophoresis shows that the colloidal particles have charge on them as they move towards oppositely charged electrode, when electric field is applied on them.
39. (d) Vinegar is approximately 10% solution of acetic acid in water.
40. (a) Gelatin is the best protective colloid as it has the least gold number (about 0.005).
41. (c)
42. (a) Chlorophyll is not a colloid.
43. (d)
44. (b) Ferric hydroxide is a positive sol, $[Fe(OH)_3]Fe^{3+}$.
 Hence, to coagulate it, an anion is needed. $K_4[Fe(CN)_6]$ gives the tetravalent anion $[Fe(CN)_6]^{4-}$, hence it has the greatest coagulating power among these (Hardy-Schulze law).
45. (a) Protective character of various lyophilic substances is expressed in terms of gold number.
46. (b) It is due to scattering of light from particles of dust in the atmosphere.
47. (b) Sol particles possess the tendency to adsorb preferentially the common ion present in solution.
48. (a) Gold sol and sulphur sol are the examples of multimolecular colloids.
49. (c) The usual colloidal solution is a 4% solution of nitrocellulose in the mixture of alcohol and ether.
50. (c) Lyophilic sol is coagulated by adding a suitable solvent or an electrolyte.

BITSAT Archives

1. (d) Smaller the gold number, greater is its protective power, Hence, the order would be
 $x > y > z$
 Gold number is used for calculating the protective powers of lyophilic colloids.
2. (b)
3. (a) According to Hardy Schulze rule, coagulation power of ions is directly proportional to charge on ion.
 $\therefore Fe(OH)_3$ is positively charged colloid.
 $\therefore$ It will be coagulated by anion.
- (a) $Mg_3(PO_4)_2 \rightleftharpoons 3Mg^{2+} + 2PO_4^{3-}$
 (b) $BaCl_2 \rightleftharpoons Ba^{2+} + 2Cl^-$
 (c) $NaCl \rightleftharpoons Na^+ + Cl^-$
 (d) $KCN \rightleftharpoons K^+ + CN^-$
4. (d) During acid hydrolysis of methyl acetate, reactants and catalyst (H_2SO_4) are in the same phase. Thus, it is an example of homogeneous catalysis.
5. (c) In Freundlich isotherm

12

Redox Reactions

Concepts of Oxidation and Reduction

Loss of electron by an atom is called oxidation or de-electronation while gain of electron by an atom is called reduction or electronation.

Oxidants or oxidising agents are the substances which

- (i) oxidise other,
- (ii) get reduced ,
- (iii) gain electrons (i.e. their oxidation number decreases during a reaction)

Reductants or reducing agents are the substances which

- (i) reduce others,
- (ii) get oxidised,
- (iii) loss electrons (i.e. their oxidation number increases during a reaction)

Oxidation Number

The real or imaginary charge, which an atom appears to have in its combined state is called oxidation number of that atom. Valency of an element is always a whole number. It can neither be zero nor fractional while oxidation number may be positive or negative. It can be zero or fractional.

Fractional oxidation state is only the average oxidation state of an element when two or more of its atoms are present in different oxidation states in a given compound.

Rules for Assigning Oxidation Number

The oxidation number of an element or atom can be calculated with the help of following rules:

- (i) The oxidation number of an element in its elementary state is zero, e.g. H_2 , S_8 and P_4
- (ii) Oxidation number of an ion is equal to the electrical charge present on it.
- (iii) Oxidation number of a compound is zero.
- (iv) Oxidation number of fluorine is always -1 in all of its compounds.
- (v) The oxidation number of alkali metals is always $+1$ and those of alkaline earth metals is $+2$.

- (vi) Oxidation number of hydrogen is +1 except in ionic hydrides, where it is -1.
- (vii) Two oxidation numbers of N are -3 and +3, when it is bonded with less electronegative and more electronegative atoms respectively.
- (viii) Oxidation number of oxygen is -2 except in OF_2 (+2), O_2F_2 (+1), peroxides (-1) and superoxides (-1/2).
- (ix) The oxidation number of halogens is always -1 in metal halides.
- (x) In interhalogen compounds, more electronegative metal of the two halogens gets the oxidation number of -1.

Redox Reactions

The reaction which involves oxidation and reduction as its two half-reactions is called redox reactions. A redox change occurs simultaneously.

Types of Redox Reactions

These are of three types as follows :

1. Intermolecular Redox Reactions

These involve the reaction between two substances, one of them is oxidant and other is reductant,

2. Intramolecular Redox Reactions

These involve oxidation of one element of a compound as well as reduction of other element of the same compound. Decomposition reactions are also intramolecular redox reactions but to be a redox reaction, it is essential that one of the products of decomposition must be in the elemental state.

e.g.

3. Autoredox or Disproportionation Reactions

These involve oxidation and reduction of the same element,

Balancing of Redox Reaction

1. Oxidation Number Method

In balancing redox reaction, following steps are used:

- (i) Indicate the oxidation number of all the atoms involved in the equation and identify the elements which undergo change in oxidation number.
- (ii) Calculate the increase and decrease in oxidation number per atom with respect to the reactants if more than one atom is involved, then multiply with the number of atoms undergoing the change to calculate the total change in oxidation number.
- (iii) Equate the increase and decrease in oxidation number on the reactant side by multiplying the suitable integers.
- (iv) Balance the equation with respect to all atoms except hydrogen and oxygen.
- (v) Finally, balance hydrogen and oxygen also.
- (vi) In acidic medium, hydrogen and oxygen are balanced by H^+ and H_2O respectively while in basic medium, these are balanced by using OH^- and H_2O .

2. Ion-Electron Method

In this method, the following steps are used :

- (i) Indicate the oxidation number of all the atoms involved in the reaction and determine the oxidising agent and reducing agent.
- (ii) Now, split the reaction into oxidation half-reaction and reduction half-reaction.
- (iii) Now, balance both the half-reactions in the following ways:
 - (a) Balance all the atoms except H and O by multiplying the suitable integer.
 - (b) Now, balance H and O by using H^+ (in acidic medium) or by using OH^- (in alkaline medium) and H_2O .
 - (c) Charge is balanced by using electrons in the side deficient in negative charge.
- (iv) Now, combine both the half-reactions so as to cancel the electrons.

Practice Exercise

- When zinc is added to CuSO_4 solution, copper is precipitated. It is because of
 - reduction of zinc
 - reduction of Cu^{2+}
 - hydrolysis of CuSO_4
 - reduction of SO_4^{2-}
- Which of the following is the most powerful oxidising agent?
 - F_2
 - Cl_2
 - Br_2
 - I_2
- The strongest reducing agent is
 - HNO_3
 - H_2S
 - H_2SO_3
 - SnCl_2
- Which of the following is a reducing agent?
 - NaHCO_3
 - NaHSO_3
 - Na_2O_2
 - NaHSO_4
- In which one of the following reactions, hydrogen is acts as an oxidising agent?
 - With Li to form LiH
 - With I_2 to form HI
 - With N_2 to form NH_3
 - With S to form H_2S
- Which of the following reactions has the underlined substance been reduced?
 - Carbon monoxide + Copper oxide $\longrightarrow$ Carbon dioxide + Copper
 - Copper oxide + Hydrochloric acid $\longrightarrow$ Copper chloride + Water
 - Hydrogen + Iron oxide $\longrightarrow$ Iron + Water
 - Steam + Iron $\longrightarrow$ Iron oxide + Hydrogen
- Nitric oxide acts as a reducing agent in which of the following reaction?
 - $4\text{NH}_3 + 5\text{O}_2 \longrightarrow 2\text{NO} + 6\text{H}_2\text{O}$
 - $2\text{NO} + 3\text{I}_2 + 4\text{H}_2\text{O} \longrightarrow 2\text{NO}_3^- + 6\text{I}^- + 8\text{H}^+$
 - $2\text{NO} + \text{H}_2\text{SO}_3 \longrightarrow \text{N}_2\text{O} + \text{H}_2\text{SO}_4$
 - $2\text{NO} + \text{H}_2\text{S} \longrightarrow \text{N}_2\text{O} + \text{S} + \text{H}_2\text{O}$
- In acidic medium, equivalent weight of $\text{K}_2\text{Cr}_2\text{O}_7$ (molecular weight = M) is
 - $M/3$
 - $M/4$
 - $M/6$
 - $M/2$
- In the reaction, $\text{I}_2 + 2\text{S}_2\text{O}_3^{2-} \longrightarrow 2\text{I}^- + \text{S}_4\text{O}_6^{2-}$, equivalent weight of iodine will be equal to
 - M
 - $M/2$
 - $M/4$
 - $2M$
 (where, M is the molecular weight of iodine)
- The process in which oxidation number increases, is
 - reduction
 - hydrolysis
 - oxidation
 - decomposition
- In which of the following, oxidation number of chlorine is +5?
 - Cl_2O_7
 - ClO_3^-
 - ClO^-
 - ClO_4^-
- Carbon has zero oxidation number in
 - CH_4
 - CH_3Cl
 - CCl_4
 - CH_2Cl_2
- Oxidation states of iodine vary from
 - 1 to +1
 - 1 to +7
 - +3 to +5
 - 1 to +5
- Oxidation number of S in $\text{Na}_2\text{S}_4\text{O}_6$ is
 - 1.5
 - 2.5
 - 3
 - 2
- The brown ring complex compound of iron is formulated as $[\text{Fe}(\text{H}_2\text{O})_5(\text{NO})]\text{SO}_4$. The oxidation state of iron is
 - 1
 - 2
 - 3
 - 0
- Oxidation number of oxygen in F_2O is
 - 1
 - +1
 - +2
 - 2
- The oxidation state of nitrogen in N_3H is
 - $+\frac{1}{2}$
 - +3
 - 1
 - $-\frac{1}{3}$
- The oxidation state of chromium in $\text{Cr}(\text{CO})_6$ is
 - 0
 - +2
 - 2
 - +6
- Phosphorus has the oxidation state +3 in
 - orthophosphoric acid
 - phosphorous acid
 - metaphosphoric acid
 - pyrophosphoric acid
- In which of the following, increasing orders the oxidation number of oxygen has been arranged?
 - $\text{BaO}_2 < \text{O}_3 < \text{OF}_2 < \text{KO}_2$
 - $\text{BaO}_2 < \text{KO}_2 < \text{O}_3 < \text{OF}_2$
 - $\text{OF}_2 < \text{KO}_2 < \text{BaO}_2 < \text{O}_3$
 - $\text{KO}_2 < \text{OF}_2 < \text{O}_3 < \text{BaO}_2$
- The oxidation number of an element in a compound is evaluated on the basis of certain rules. Which of the following rules is not correct in this respect?
 - The oxidation number of hydrogen is always +1
 - The algebraic sum of all the oxidation numbers in a compound is zero
 - An element in the free or the uncombined state bears oxidation number zero
 - In all of its compounds, the oxidation number of fluorine is -1
- In which of the following pairs, there is greatest difference in the oxidation number of the underlined elements?
 - NO_2 and $\underline{\text{N}}_2\text{O}_4$
 - $\underline{\text{P}}_2\text{O}_5$ and $\underline{\text{P}}_4\text{O}_{10}$
 - $\underline{\text{N}}_2\text{O}$ and $\underline{\text{N}}\text{O}$
 - $\underline{\text{S}}\text{O}_2$ and $\underline{\text{S}}\text{O}_3$

23. A compound contains atoms A , B and C . The oxidation number of A is $+2$, of B is $+5$ and of C is -2 . The possible formula of the compound is
 a. ABC_3 b. $B_2(AC_3)_2$
 c. $A_3(BC_4)_2$ d. $A_3(BC_3)_2$
24. Which of the following reactions is a redox reaction?
 a. $\text{NaBr} + \text{HCl} \longrightarrow \text{NaCl} + \text{HBr}$
 b. $\text{HBr} + \text{AgNO}_3 \longrightarrow \text{AgBr} + \text{HNO}_3$
 c. $\text{H}_2 + \text{Br}_2 \longrightarrow 2\text{HBr}$
 d. $\text{Na}_2\text{O} + \text{H}_2\text{SO}_4 \longrightarrow \text{Na}_2\text{SO}_4 + \text{H}_2\text{O}$
25. White phosphorus reacts with caustic soda to form PH_3 and NaH_2PO_2 . This reaction is an example of
 a. oxidation b. reduction
 c. hydrolysis d. disproportionation
26. Following reaction is an example of

$$\text{Ag}^{2+}(\text{aq}) + \text{Ag}(\text{s}) \rightleftharpoons 2\text{Ag}^+(\text{aq})$$

 a. reduction b. oxidation
 c. comproportionation d. disproportionation
27. Which of the following is a redox reaction?
 a. Formation of glucose from CO_2 and water
 b. Reaction of potassium cyanide with silver cyanide
 c. Hydration of rubidium
 d. Reaction of barium chloride with sulphuric acid
28. Identify the disproportionation reaction.
 a. $\text{CH}_4 + 2\text{O}_2 \longrightarrow \text{CO}_2 + 2\text{H}_2\text{O}$
 b. $\text{CH}_4 + 4\text{Cl}_2 \longrightarrow \text{CCl}_4 + 4\text{HCl}$
 c. $2\text{F}_2 + 2\text{OH}^- \longrightarrow 2\text{F}^- + \text{OF}_2 + \text{H}_2\text{O}$
 d. $2\text{NO}_2 + 2\text{OH}^- \longrightarrow \text{NO}_2^- + \text{NO}_3^- + \text{H}_2\text{O}$
29. Which of the following is not an intermolecular redox reaction?
 a. $\text{MgCO}_3 \longrightarrow \text{MgO} + \text{CO}_2$
 b. $\text{O}_2 + 3\text{H}_2 \longrightarrow 2\text{H}_3\text{O}^+$
 c. $\text{K} + \text{H}_2\text{O} \longrightarrow \text{KOH} + \left(\frac{1}{2}\right)\text{H}_2$
 d. $\text{MnBr}_3 \longrightarrow \text{MnBr}_2 + \left(\frac{1}{2}\right)\text{Br}_2$
30. Consider the following reactions,
 I. $2\text{Mn}_2\text{O}_7 \longrightarrow 4\text{MnO}_2 + 3\text{O}_2$
 II. $\text{SnCl}_2 + 2\text{FeCl}_3 \longrightarrow \text{SnCl}_4 + 2\text{FeCl}_2$
 The given reactions are the examples of
 a. intermolecular redox reaction and intramolecular redox reactions respectively
 b. Both reactions I and II are intermolecular redox reactions
 c. Both reactions I and II are intramolecular redox reactions
 d. intramolecular redox reactions and intermolecular redox reaction respectively
31. For the redox reaction,

$$\text{MnO}_4^- + \text{C}_2\text{O}_4^{2-} + \text{H}^+ \longrightarrow \text{Mn}^{2+} + \text{CO}_2 + \text{H}_2\text{O},$$

 the correct coefficients of the reactants for the balanced reaction are

	MnO_4^-	$\text{C}_2\text{O}_4^{2-}$	H^+
a.	2	5	16
b.	16	5	2
c.	5	16	2
d.	2	16	5
32. Consider the following reaction,

$$\text{C}_2\text{H}_6(\text{g}) + n\text{O}_2 \longrightarrow \text{CO}_2(\text{g}) + \text{H}_2\text{O}(\text{l})$$

 In this equation, ratio of the coefficients of CO_2 and H_2O is
 a. 1 : 1 b. 2 : 3 c. 3 : 2 d. 1 : 3
33. Which of the following statements is true regarding the following balanced half-reaction?

$$\text{CN}^- \longrightarrow \text{CNO}^-$$

 a. Carbon is losing two electrons per atom
 b. Oxidation number of carbon increases from $+1$ to $+3$
 c. Oxidation number of nitrogen remains constant
 d. Both (a) and (c)
34. In the ionic equation,

$$\text{BrO}_3^- + 6\text{H}^+ + x\text{e}^- \longrightarrow \text{Br}^{3+} + 3\text{H}_2\text{O},$$

 the value of x is
 a. 6 b. 2 c. 4 d. 3
35. In the redox reaction,

$$x\text{KMnO}_4 + \text{NH}_3 \longrightarrow y\text{KNO}_3 + \text{MnO}_2 + \text{KOH} + \text{H}_2\text{O},$$

 x and y are
 a. $x = 4, y = 6$
 b. $x = 3, y = 8$
 c. $x = 8, y = 6$
 d. $x = 8, y = 3$
36. Consider the following reaction,

$$2\text{Fe}^{3+} + 2\text{I}^- \longrightarrow 2\text{Fe}^{2+} + \text{I}_2$$

 The half-reactions for the given reaction are
 a. $2\text{I}^- \longrightarrow \text{I}_2 + 2\text{e}^-$ and $\text{Fe}^{3+} + \text{e}^- \longrightarrow \text{Fe}^{2+}$
 b. $\text{I}_2 \longrightarrow 2\text{I}^- + 2\text{e}^-$ and $\text{Fe}^{2+} + \text{e}^- \longrightarrow \text{Fe}^{3+}$
 c. $\text{I}_2 \longrightarrow 2\text{e}^- + 2\text{I}^-$ and $\text{Fe}^{2+} \longrightarrow \text{Fe}^{3+} + \text{e}^-$
 d. None of the above

BITSAT Archives

- The ratio of oxidation states of Cl in potassium chloride to that in potassium chlorate is [2014]
 - $+\frac{1}{5}$
 - $-\frac{1}{5}$
 - $-\frac{2}{5}$
 - $+\frac{3}{5}$
- The oxidation state of sulphur in $\text{Na}_2\text{S}_4\text{O}_6$ is [2013]
 - +6
 - $+\frac{3}{2}$
 - $+\frac{5}{2}$
 - 2
- $2\text{MnO}_4^- + 5\text{H}_2\text{O}_2 + 6\text{H}^+ \longrightarrow 2\text{Z} + 5\text{O}_2 + 8\text{H}_2\text{O}$
Identify Z in the above reaction. [2012]
 - Mn^{2+}
 - Mn^{4+}
 - Mn
 - MnO_2
- The oxidation number of N and Cl in NOClO_4 respectively are [2011]
 - +2 and +7
 - +3 and +7
 - 3 and +5
 - +2 and -7
- Which one of the following reactions represent the oxidising property of H_2O_2 ? [2008]
 - $2\text{KMnO}_4 + 3\text{H}_2\text{SO}_4 + 5\text{H}_2\text{O}_2 \longrightarrow \text{K}_2\text{SO}_4 + 2\text{MnSO}_4 + 8\text{H}_2\text{O} + 5\text{O}_2$
 - $2\text{K}_3[\text{Fe}(\text{CN})_6] + 2\text{KOH} + \text{H}_2\text{O}_2 \longrightarrow 2\text{K}_4[\text{Fe}(\text{CN})_6] + 2\text{H}_2\text{O} + \text{O}_2$
 - $\text{PbO}_2 + \text{H}_2\text{O}_2 \longrightarrow \text{PbO} + \text{H}_2\text{O} + \text{O}_2$
 - $2\text{KI} + \text{H}_2\text{SO}_4 + \text{H}_2\text{O}_2 \longrightarrow \text{K}_2\text{SO}_4 + \text{I}_2 + 2\text{H}_2\text{O}$
- The species that undergoes disproportionation in an alkaline medium is [2006]

 - XYZ_2
 - $\text{Y}_2(\text{XZ}_3)_2$
 - $\text{X}_3(\text{Y}_4\text{Z})_2$
 - $\text{X}_3(\text{YZ}_4)_3$
- The oxidation number of oxygen in hydrogen peroxide is [2005]
 - +1
 - 1
 - +2
 - 2

Answer with Solutions

Practice Exercise

- (b) The reaction is

Hence, in this reaction, Cu^{2+} is reduced to Cu.

- (a) Fluorine is the strongest oxidising agent. Its reduction potential (E_{red}°) is +2.87V, hence it is easily reduced to F^- by gaining electron.
- (b) H_2S is the strongest reducing agent among these as the oxidation state of S is minimum in H_2S , i.e. -2.
- (b) NaHSO_3 gives NaHSO_4 during reaction in which the oxidation number of S increase from +4 to +6. Hence, it is a reducing agent.
- (a)

Hence, in this reaction, hydrogen act as oxidising agent.

- (d) Steam (H_2O) is reduced to hydrogen by iron.

- (b) $2\overset{+2}{\text{NO}} + 3\text{I}_2 + 4\text{H}_2\text{O} \longrightarrow 2\overset{+5}{\text{NO}_3^-} + 6\text{I}^- + 8\text{H}^+$
Hence, NO acts as a reducing agent and reduces I_2 to I^- since, the oxidation number of nitrogen changes from +2 in NO to +5 in NO_3^- .

- (c) In acidic medium, $\text{K}_2\text{Cr}_2\text{O}_7$ gives following reaction,

$\therefore$ Decrease in ON of Cr per atom = 3

$\therefore$ Decrease in ON of Cr per molecule = $2 \times 3 = 6$

Hence, equivalent weight of $\text{K}_2\text{Cr}_2\text{O}_7 = \frac{M}{6}$

- (b) $\overset{0}{\text{I}_2} + 2\text{S}_2\text{O}_3^{2-} \longrightarrow \overset{-1}{2\text{I}^-} + \text{S}_4\text{O}_6^{2-}$

$\therefore$ Decrease in ON of iodine per atom = 1

$\therefore$ Decrease in ON of iodine per molecule = $2 \times 1 = 2$

Hence, equivalent weight of iodine

$$\frac{\text{Molecular weight of iodine}}{\text{Total decrease in ON of iodine per molecule}} = \frac{M}{2}$$

10. (c) Oxidation is the process in which oxidation number of effective element in the species increases.

11. (b) ClO_3^-

$$\begin{aligned}x + 3(-2) &= -1 \\x - 6 &= -1 \\x &= 6 - 1 \\x &= +5\end{aligned}$$

12. (d) CH_2Cl_2 ,

$$\begin{aligned}x + 2(+1) + 2(-1) &= 0 \\x + 2 - 2 &= 0 \\x &= 0\end{aligned}$$

13. (b) Iodine shows -1 oxidation state in iodides (KI etc), $+1$, $+3$, $+5$ and $+7$ oxidation states in interhalogen compounds and polyhalides like ICl , ICl_3 , IF_5 , IF_7 etc.

14. (b) $\text{Na}_2\text{S}_4\text{O}_6$, $2(+1) + 4x + 6(-2) = 0$

$$\begin{aligned}4x + 2 - 12 &= 0 \\4x &= 10 \\x &= 2.5\end{aligned}$$

$\Rightarrow$

15. (b) $[\text{Fe}(\text{H}_2\text{O})_5\text{NO}]\text{SO}_4$,

$$\begin{aligned}x + 0 + 0 + (-2) &= 0 \\x &= +2\end{aligned}$$

16. (c) Fluorine is the most electronegative element and oxygen is the second one. Hence, in F_2O , oxygen is the positive element.

$$x + 2(-1) = 0$$

$\Rightarrow$

$$x = +2$$

Oxidation state of oxygen in F_2O (or OF_2) is $+2$.

17. (d) The oxidation state of hydrogen is always $+1$ except in ionic hydrides (where ON of hydrogen is -1).

N_3H (hydrogen acid) is not an ionic compound, hence

$$\begin{aligned}3x + (+1) &= 0 \\3x &= -1, \quad x = -1/3\end{aligned}$$

18. (a) CO (carbonyl) is a neutral ligand, hence oxidation state of Cr in $\text{Cr}(\text{CO})_6$ is zero.

19. (b) Orthophosphoric acid (H_3PO_4), ON of P = $+5$

Phosphorous acid (H_3PO_3), ON of P = $+3$

Metaphosphoric acid (HPO_3), ON of P = $+5$

Pyrophosphoric acid ($\text{H}_4\text{P}_2\text{O}_7$), ON of P = $+5$

20. (b) $\text{BaO}_2 < \text{KO}_2 < \text{O}_3 < \text{OF}_2$

$$\begin{array}{cccc}-1 & -0.5 & 0 & +2\end{array}$$

21. (a) Oxidation number of hydrogen is $+1$ except in ionic hydrides, where it is -1 .

22. (d) (a) NO_2 and N_2O_4 ; Difference = 0

- (b) P_2O_5 and P_4O_{10} ; Difference = 0

- (c) N_2O and NO ; Difference = $+2 - 1 = +1$

- (d) SO_2 and SO_3 ; Difference = $+6 - 4 = +2$

23. (c) The oxidation states of A, B and C are $+2$, $+5$ and -2 respectively.

(a) In ABC_3 , $2 + 5 + 3 \times (-2) = +1 \neq 0$

(b) In $\text{B}_2(\text{AC}_3)_2$, $2 \times (+2) + 2\{(+5) + 3(-2)\} = +2 \neq 0$

(c) In $\text{A}_3(\text{BC}_4)_2$, $3 \times (+2) + 2\{(+5) + 4(-2)\} = 0$

(d) In $\text{A}_3(\text{BC}_3)_2$, $3 \times (+2) + 2\{(+5) + 3(-2)\} = +4 \neq 0$

$\therefore$ Possible formula of compound is $\text{A}_3(\text{BC}_4)_2$.

24. (c)

25. (d) Such reactions, in which a compound undergoes both oxidation and reduction simultaneously, are called disproportionation.

26. (c)

This is an example of comproportionation reaction which is reverse of disproportionation reaction.

27. (a)

Since, oxidation and reduction both occurs simultaneously in the above equation, so it is a redox reaction.

28. (d) Disproportionation reaction,

29. (a) Intermolecular redox reactions and redox reactions are same.

As there is no change in oxidation number of atoms, therefore, this reaction is not an intermolecular redox reaction.

30. (d) Same compound, e.g. Mn_2O_7 is dissociated into O_2 and MnO_2 , where oxidation and reduction take place, i.e.

It is an example of intramolecular redox reaction, while reaction, such as

is an example of intermolecular redox reaction.

31. (a) $\text{MnO}_4^- + 8\text{H}^+ + 5\text{e}^- \longrightarrow \text{Mn}^{2+} + 4\text{H}_2\text{O}] \times 2$

Thus, the coefficients of MnO_4^- , $\text{C}_2\text{O}_4^{2-}$ and H^+ in the above balanced equation respectively are 2, 5, 16.

32. (b) The balanced equation is

33. (d) In the given redox reaction,

Oxidation number of nitrogen is remaining unchanged at -3 .

Oxidation number of carbon is increasing from $+2$ to $+4$.

Hence, (a) and (c) are the only correct response.

Therefore, option (d) is correct.

BITSAT Archives

1. (b) Oxidation state of Cl in $\text{KCl} = -1$

Oxidation state of Cl in $\text{KClO}_3 = +5$

$$\therefore \text{Ratio of oxidation state of Cl} = \frac{-1}{5}$$

2. (c) Oxidation number of Na = $+1$

Oxidation number of O = -2

Let oxidation number of S = x

$$\therefore 2(\text{ON of Na}) + 4(\text{ON of S}) + 6(\text{ON of O}) = 0$$

$$2(+1) + 4x + 6(-2) = 0$$

$$+2 + 4x - 12 = 0$$

$$4x = +12 - 2$$

$$x = +\frac{10}{4}$$

$$\Rightarrow x = +\frac{5}{2}$$

3. (a) $2\text{MnO}_4^- + 5\text{H}_2\text{O}_2 + 6\text{H}^+ \longrightarrow 2\text{Mn}^{2+} + 5\text{O}_2 + 8\text{H}_2\text{O}$

4. (b) NOClO_4 is actually $\text{NO}^+\text{ClO}_4^-$.

Let the oxidation state of N in NO^+ is x .

$$\text{NO}^+: x + (-2) = +1$$

$$x = +1 + 2 = +3$$

Let the oxidation state of Cl in ClO_4^- is y .

$$\text{ClO}_4^-: y + (-2) \times 4 = -1$$

$$y - 8 = -1; y = +7$$

34. (b) Balanced reaction is

$\therefore$ Value of x is 2.

35. (d) The balanced reaction is as follows:

36. (a) The half-reactions are oxidation reaction as in

5. (d) The reaction in which H_2O_2 is reduced while the other reactant is oxidised, represents the oxidising property of H_2O_2 .

6. (c) $2\text{NO}_2(g) + 2\text{OH}^-(aq) \longrightarrow$

This reaction involves disproportionation of NO_2 (+4 state) into NO_2^- (+3 state) and NO_3^- (+5 state).

Therefore, this reaction is an example of disproportionation redox reaction.

7. (a) The oxidation number of X, Y and Z are +2, +2 and -2 respectively.

$$(a) \text{ In } \text{XYZ}_2 = (+2) + (+2) + 2(-2) = 0$$

$$(b) \text{ In } \text{Y}_2(\text{XZ}_3)_2 = 2(+2) + 2(+2) + 6(-2) \neq 0$$

$$(c) \text{ In } \text{X}_3(\text{YZ}_4)_2 = 3(+2) + 8(+2) + 2(-2) \neq 0$$

$$(d) \text{ In } \text{X}_3(\text{YZ}_4)_3 = 3(+2) + 3(+2) + 12(-2) \neq 0$$

8. (b) In H_2O_2 Let the ON of oxygen = x

$$\text{Then, } 2(+1) + 2(x) = 0$$

$$\text{or } 2 + 2x = 0$$

$$\text{or } 2x = -2$$

$$\text{or } x = -1$$

13

Electrochemistry

Electrochemistry is the study of production of electricity from energy released during spontaneous chemical reactions and the use of electrical energy to bring about non-spontaneous chemical transformations.

Section A : Conductor and Conductance

Electrical Conductors

Any substance, through which, we can pass electricity, is called electrical conductor.

Conductors are generally divided into two types with different properties which are tabulated as :

	Metallic conductors (e.g. metals)	Electrolytic conductors (e.g. NaCl)
(a)	In these, conduction takes place by the flow of electrons.	In these, conduction takes place by the flow of ions.
(b)	It does not involve transfer of matter.	It involves transfer of matter.
(c)	In these, conductance decreases with increase in temperature.	In these, conductance increases with increase in temperature.

Conductance and Conductivity of Electrolytic Solutions

The power of an electrolytes conduct electric current is called conductance or conductivity.

The resistance of any conductor varies directly as its length (l) and inversely as its cross-sectional area (a), i.e.

$$R \propto \frac{l}{a}$$

or

$$R = \rho \frac{l}{a}$$

where, ρ is called the resistivity or specific resistance.

If $l = 1 \text{ cm}$ and $a = 1 \text{ cm}^2$ then $R = \rho$

$\therefore$ Specific conductance (κ) = $\frac{1}{\rho} = \frac{l}{a} \times \text{conductance } (C)$

where, $\frac{l}{a}$ = cell constant

The unit of (κ) is $\text{ohm}^{-1} \text{cm}^{-1}$ or S cm^{-1} .

Molar Conductivity (λ_m or μ)

$$\lambda_m \text{ or } \mu = \frac{\kappa \times 1000}{M}$$

where, M = molarity of the solution

μ = molar conductivity

Its SI units are expressed in $\Omega^{-1} \text{cm}^2 \text{mol}^{-1}$ or $\text{mho cm}^2 \text{mol}^{-1}$ or $\text{S cm}^2 \text{mol}^{-1}$.

Equivalent Conductivity (λ_{eq} or Λ)

$$\lambda_{eq} \text{ or } \Lambda = \frac{\kappa \times 1000}{C_{eq} (N)}$$

where, C_{eq} = concentration of solution in equivalent per litre (i.e. normality)

eq = equivalent conductivity

Its SI unit are expressed in $\Omega^{-1} \text{cm}^2 (\text{equiv}^{-1})$ or $\text{mho cm}^2 (\text{equiv}^{-1})$ or $\text{S cm}^2 (\text{equiv}^{-1})$.

Variation of Conductivity and Molar Conductivity with Concentration

Equivalent as well as molar conductivity $\propto$ dilution and specific conductivity $\propto \frac{1}{\text{dilution}}$

Strong electrolytes like KCl, have high value of conductance even at low concentration and there is no rapid increase in their equivalent or molar conductance on dilution.

In case of **weak electrolytes**, like acetic acid, have a low value of conductance at high concentration and there is a rapid increase in the value of equivalent conductance (molar conductance) with dilution.

Limiting Molar Conductivity or Infinite Conductivity (Λ_m° or Λ_m^∞)

It is the molar conductivity of electrolyte when concentration of electrolyte approaches zero (i.e. at infinite dilution).

Kohlrausch's Law

It states that molar conductance at infinite dilution for any electrolyte is the sum of contribution of its constituent ions i.e. anions and cations.

Applications of Kohlrausch's Law

- (i) For the determination of equivalent/molar conductivity at infinite dilution.
- (ii) For the determination of degree of dissociation.

$$\text{Degree of dissociation } (\alpha) = \frac{\Lambda_m^c}{\Lambda_m^\circ}$$

- (iii) For the calculation of dissociation constant of a weak electrolyte.

$$K_a = \frac{C\alpha^2}{1-\alpha} = C\alpha^2 \quad [\because \text{For weak electrolyte, } \alpha \ll 1]$$

where, K_a = equilibrium dissociation constant

and C = molar concentration of weak electrolyte

- (iv) For the determination of solubility of sparingly soluble salt.

$$\text{Solubility} = \frac{\kappa \times 1000}{\Lambda_m^\circ}$$

- Transport number of cation (n_c)

$$= \frac{\text{Current carried by cation}}{\text{Total current}} = \frac{u_c}{u_c + u_a}$$

- Transport number of anion (n_a) = $\frac{u_a}{u_c + u_a}$

Section B : Conversion of Electrical Energy into Chemical Energy (Electrolytic Cell)

Electrolysis

It is a process in which electrical energy is used to bring some chemical changes. It is carried out in an electrolytic cell.

Electrolytic cell

⊕ Anode	⊖ Cathode
• Oxidation	• Reduction
• More E_{oxi}° , gets oxidised easily	• More E_{red}° , gets reduced easily

where, E_{oxi}° = standard oxidation potential

E_{red}° = standard reduction potential

- Decreasing order of oxidation potential :
 $I^- > Br^- > Cl^- > OH^- > F^- > NO_2^- > NO_3^- > SO_3^{2-} > SO_4^{2-}$
- Increasing order of reduction potential :
 All metals, more reactive than hydrogen
 $[E_{red}^\circ = \text{less than zero}] < \text{Hydrogen} [E_{red}^\circ = \text{zero}] < \text{metals less reactive than hydrogen} [E_{red}^\circ = +ve] \text{ like Cu, Ag etc.}$
- Besides the ions of electrolyte, if some cations or anions are present in the solution, then ions with lower discharge potential are discharged in preference to those which have high discharge potential.

Faraday's Laws of Electrolysis

There are two laws given by Faraday, are discussed below:

First Law

Deposited mass of the substance is directly proportional to passed charge in a voltameter.

$$w \propto Q$$

$$w = ZQ = Zit$$

where, w = mass, Q = charge (in coulomb)

i = current (in amperes)

t = time (in second)

Z = electrochemical equivalent

$$1 F = 6.022 \times 10^{23} \times 1.6 \times 10^{-19} = 96500 \text{ C (approx.)}$$

Number of gram equivalents = Number of Faraday's of electricity

Second Law

The number of equivalents of any substance produced by a given quantity of electricity during electrolysis, are same.

$$\frac{w_A}{w_B} = \frac{E_A}{E_B}$$

Section C : Conversion of Chemical Energy into Electrical Energy (Electrochemical or Galvanic Cells)

Electrochemical Cell

An electrochemical cell is a system or arrangement in which two electrodes are fitted in the same electrolyte or in two different electrolytes which are joined by a salt bridge.

Galvanic or Voltaic Cells

It is a device in which a redox reaction used to convert chemical energy into electrical energy.

Electrode and Half-Cell

A strip of metal, used in electrochemical studies, is called electrode. The combination of the metal electrode and solution, is called a half-cell.

	Electrolytic cell		Voltaic or Galvanic cell	
	Anode	Cathode	Anode	Cathode
Sign	+	-	-	+
Electron flow	Out	In	Out	In
Half-reaction	Oxidation	Reduction	Oxidation	Reduction

Salt-bridge

It is a U-shaped tube contains a gel permeated with a solution of an inert electrolyte such as Na_2SO_4 . The salt-bridge is necessary to complete the electrical circuit and to maintain electric neutrality in both compartments (by flow of ions).

Representation of a Cell

Consider the Daniell cell with following cell reaction :

In writing a cell diagram, following points are considered. We divide the cell into two half-cells.

	Anode	Cathode
Reaction	Oxidation takes place $Zn(s) \longrightarrow Zn^{2+}(aq) + 2e^-$	Reduction takes place $Cu^{2+}(aq) + 2e^- \longrightarrow Cu(s)$
Terminal	Negative	Positive
Side	LHS	RHS
Diagram	$Zn(s) / Zn^{2+}(aq)$	$Cu^{2+}(aq) / Cu(s)$

Complete cell diagram may be represented as follows :

If oxidised or reduced part is a gas, use Pt electrode saturated with that gas.

If oxidised and reduced parts are in ionic state, use Pt electrode.

EMF of Cell

The difference in electrode potential of electrodes due to different flow of electrons, is called electromotive force or cell potential of a cell. This is the driving force for all the cell reactions.

Standard Electrode Potential

Potential difference between the metal and the metal ion in which electrode is dipped, is called electrode potential denoted as E , which is related to density of negative electric charge.

When pressure is 1 bar and concentration is 1 M, electrode potential is called standard electrode potential denoted as E° . Temperature is generally taken as 298 K (i.e. 25°C).

For half-cell reaction $M^{n+} + ne^- \longrightarrow M$,

• If $E_{\text{oxi}}^\circ = x \text{ V}$, then $E_{\text{red}}^\circ = -x \text{ V}$

$E_{\text{Cu}^{2+}/\text{Cu}}^\circ = 0.34 \text{ V}$, then $E_{\text{Cu}^{2+}/\text{Cu}}^\circ = -0.34 \text{ V}$

• The SI unit of cell potential is the volt (V) and the potential of a galvanic cell is defined as the positive quantity.

$$E_{\text{cell}}^\circ = E_{\text{oxi}}^\circ + E_{\text{red}}^\circ, \quad E_{\text{cell}} = E_{\text{oxi}} + E_{\text{red}}$$

Electrochemical Series

The arrangement of metals in decreasing order of tendency to lose electrons, is called electrochemical series or it is the series in which the elements are arranged on the basis of the values of their standard reduction potentials at 25°C.

Element	Electrode reaction (Reduction)	Standard electrode reduction potential E° (volt)
Li	$\text{Li}^+ + e^- \longrightarrow \text{Li}$	-3.05
K	$\text{K}^+ + e^- \longrightarrow \text{K}$	-2.925
Ca	$\text{Ca}^{2+} + 2e^- \longrightarrow \text{Ca}$	-2.87
Na	$\text{Na}^+ + e^- \longrightarrow \text{Na}$	-2.714
Mg	$\text{Mg}^{2+} + 2e^- \longrightarrow \text{Mg}$	-2.37
Al	$\text{Al}^{3+} + 3e^- \longrightarrow \text{Al}$	-1.66
Zn	$\text{Zn}^{2+} + 2e^- \longrightarrow \text{Zn}$	-0.7628
Cr	$\text{Cr}^{3+} + 3e^- \longrightarrow \text{Cr}$	-0.74
Fe	$\text{Fe}^{2+} + 2e^- \longrightarrow \text{Fe}$	-0.44
Cd	$\text{Cd}^{2+} + 2e^- \longrightarrow \text{Cd}$	-0.403
Ni	$\text{Ni}^{2+} + 2e^- \longrightarrow \text{Ni}$	-0.25
Sn	$\text{Sn}^{2+} + 2e^- \longrightarrow \text{Sn}$	-0.14
H_2	$2\text{H}^+ + 2e^- \longrightarrow \text{H}_2$	0.00
Cu	$\text{Cu}^{2+} + 2e^- \longrightarrow \text{Cu}$	+0.337
I_2	$\text{I}_2 + 2e^- \longrightarrow 2\text{I}^-$	+0.535
Ag	$\text{Ag}^+ + e^- \longrightarrow \text{Ag}$	+0.799
Hg	$\text{Hg}^{2+} + 2e^- \longrightarrow \text{Hg}$	+0.885
Br_2	$\text{Br}_2 + e^- \longrightarrow 2\text{Br}^-$	+1.08
Cl_2	$\text{Cl}_2 + 2e^- \longrightarrow 2\text{Cl}^-$	+1.36
Au	$\text{Au}^{3+} + 3e^- \longrightarrow \text{Au}$	+1.50
F_2	$\text{F}_2 + 2e^- \longrightarrow 2\text{F}^-$	+2.87

Nernst Equation

The relationship between electrode potential and concentration of solution is called nernst equation.

$$E_{\text{cell}} \text{ or emf} = E_{\text{cell}}^\circ - \frac{2.303RT}{nF} \log Q$$

where, n = total number of electrons lost or gained

$$Q = \text{reaction coefficient of overall reaction} = \frac{[\text{OS}]}{[\text{RS}]}$$

where, [OS] = concentration of oxidised state

[RS] = concentration of reduced state

$$\therefore E_{\text{cell}} = E_{\text{cell}}^\circ - \frac{0.0591}{n} \log Q$$

- The emf of a standard cell does not change with temperature.
- The standard electrode potential of a half-cell has a fixed value. It does not change, if the half-reaction is multiplied with an integer.

Applications of Nernst Equation

There are two important applications of Nernst equation are given below:

(i) To find equilibrium constant

At equilibrium, $E_{\text{cell}} = \text{zero}$

$$\therefore E_{\text{cell}}^\circ - \frac{2.303RT}{nF} \log K = \frac{0.0591}{n} \log K$$

where, K = equilibrium constant

(ii) To find Gibbs free energy change

$$\Delta G^\circ = -n E_{\text{cell}}^\circ F$$

ΔG° = standard Gibbs free energy change

Relation between Standard Potentials of Half-cells Containing a Metal in Different Oxidation States

If two half-reactions having potentials E_1° and E_2° are combined to give a third half-reaction having a potential E_3° , then

$$E_3^\circ = \frac{n_1 E_1^\circ + n_2 E_2^\circ}{n_3}$$

Batteries

A cell or a battery (arrangement of one or more cells connected in series) is basically a galvanic cell and used where the chemical energy of redox reaction is converted into electrical energy.

There are two types of batteries :

1. Primary Batteries

The primary batteries are those in which the cell reaction occurs only once and the battery becomes dead after the use over a period of time and cannot be reused again.

- (i) **Dry cell or Leclanche cell** is also called primary voltaic cell.

In it, the electrode reactions are

The cell potential is 1.6 V.

- (ii) Another type of dry cell is **mercury cell**.

The electrode reactions for the cell are

The overall cell reaction is

2. Secondary Batteries

These are also called **reversible galvanic** or **voltaic cell**. Secondary batteries are rechargeable because on charging, reaction becomes reverse, e.g. lead storage battery, nickel cadmium cell etc. In **lead storage battery**, a solution of sulphuric acid surrounds the plates and acts as electrolyte. The cell potential is 2 V.

The half-cell reactions, when the battery is being used up are

Overall reaction

During charging, following reactions occur

Overall reaction

Fuel Cells

These are another means by which chemical energy may be converted into electrical energy, e.g. H_2 - O_2 fuel cell. This cell was used as a primary source of electrical energy on the moon flights. The overall cell reaction produces water, which was used for drinking by the astronauts.

The half-reactions are

Corrosion and Its Prevention

Corrosion – metal is oxidised by loss of electrons to oxygen and form metal oxide, e.g. conversion of iron to rust $[\text{Fe}_2\text{O}_3 \cdot x\text{H}_2\text{O}]$.

Corrosion of iron, known as **rusting**, occurs in the presence of water and oxygen.

Overall reaction

Fe^{2+} ions further oxidised by atmospheric oxygen to Fe^{3+} ions and form hydrated ferric oxide $[\text{Fe}_2\text{O}_3 \cdot x\text{H}_2\text{O}]$.

Hydrated ferric oxide (rust)

Rusting of iron can be prevented by the following methods :

- Barrier protection through coating of paints or electroplating.
- Galvanisation or coating of surface with tin metal.
- By the use of antirust solutions.

Practice Exercise

- Two electrodes are fitted in conductance cell 1.5 cm apart while the area of cross-section of each electrode is 0.75 cm^2 . The cell constant is
 a. 1.125 cm^{-1} b. 0.5 cm^{-1}
 c. 2.0 cm^{-1} d. 0.2 cm^{-1}
- Conductivity (unit siemens) is directly proportional to area of the vessel and the concentration of the solution in it and is inversely proportional to the length of the vessel, then the unit of constant of proportionality is
 a. Sm mol^{-1} b. $\text{Sm}^2 \text{ mol}^{-1}$
 c. $\text{S}^{-2} \text{ m}^2 \text{ mol}$ d. $\text{S}^2 \text{ m}^2 \text{ mol}^{-2}$
- Which of the following solutions has the highest equivalent conductance?
 a. 0.01 M NaCl b. 0.05 M NaCl
 c. 0.005 M NaCl d. 0.02 M NaCl
- The resistance of 0.1N solution of a salt is found to be $2.5 \times 10^3 \Omega$. The equivalent conductance of the solution is (Cell constant = 1.15 cm^{-1})
 a. $4.6 \text{ ohm}^{-1} \text{ cm}^2 \text{ equiv}^{-1}$ b. $5.6 \text{ ohm}^{-1} \text{ cm}^2 \text{ equiv}^{-1}$
 c. $6.6 \text{ ohm}^{-1} \text{ cm}^2 \text{ equiv}^{-1}$ d. $7.6 \text{ ohm}^{-1} \text{ cm}^2 \text{ equiv}^{-1}$
- The equivalent conductivity of a solution containing 2.54 g of CuSO_4 per litre, is $91.0 \Omega^{-1} \text{ cm}^2 \text{ eq}^{-1}$. Its conductivity would be
 a. $2.9 \times 10^{-3} \Omega^{-1} \text{ cm}^{-1}$ b. $1.9 \times 10^{-3} \Omega^{-1} \text{ cm}^{-1}$
 c. $2.4 \times 10^{-3} \Omega^{-1} \text{ cm}^{-1}$ d. $3.6 \times 10^{-3} \Omega^{-1} \text{ cm}^{-1}$
- Point out the correct statement.
 a. Equivalent conductance decreases with dilution
 b. Specific conductance increases with dilution
 c. Specific conductance decreases with dilution
 d. Equivalent conductance increases with increase in concentration
- The equivalent conductance of solution is
 [If cell constant is 1.25 cm^{-1} and resistance of $N/10$ solution is $2.5 \times 10^3 \Omega$].
 a. $2.5 \Omega^{-1} \text{ cm}^2 \text{ equiv}^{-1}$
 b. $2.5 \Omega^{-1} \text{ cm}^{-2} \text{ equiv}^{-1}$
 c. $50 \Omega^{-1} \text{ cm}^2 \text{ equiv}^{-1}$
 d. $5.0 \Omega^{-1} \text{ cm}^2 \text{ equiv}^{-1}$
- The increase in the molar conductivity of acetic acid with dilution is due to
 a. decrease in interionic forces
 b. increase in degree of ionisation
 c. increase in self ionisation of water
 d. None of the above
- The increase in the molar conductivity of HCl with dilution is due to
 a. increase in the self ionisation of water
 b. decrease in the self ionisation of water
 c. decrease in the interionic forces
 d. None of the above
- Molar conductance Λ_m is plotted against $\sqrt{C}$ (mol L^{-1}) for three electrolytes (NaCl, HCl, NH_4OH).

Which one of the following is correct?

I	II	III
a. NaCl	HCl	NH_4OH
b. HCl	NaCl	NH_4OH
c. NH_4OH	NaCl	HCl
d. NH_4OH	HCl	NaCl
- The plot of molar conductance vs $\sqrt{C}$ in strong electrolyte, is
 a. circular b. linear
 c. parabolic d. sinusoidal
- The values of $\Lambda_{\text{eq}}^\infty$ for NH_4Cl , NaOH and NaCl are 149.74, 248.1 and $126.4 \Omega^{-1} \text{ cm}^2 \text{ equiv}^{-1}$. The value of $\Lambda_{\text{eq}}^\infty$ of NH_4OH is
 a. $371.44 \Omega \text{ cm}^2 \text{ equiv}^{-1}$
 b. $271.44 \Omega \text{ cm}^2 \text{ equiv}^{-1}$
 c. $71.44 \Omega \text{ cm}^2 \text{ equiv}^{-1}$
 d. data is insufficient to calculate it
- The quantity of electricity required to liberate 0.1 g equivalent of an element at the electrode is
 a. 9650 C b. 96500 C
 c. 965 C d. 96.5 C
- On passing 3 A of electricity for 50 min, 1.8 g of metal deposits. The equivalent mass of metal is
 a. 20.5 b. 25.8 c. 19.3 d. 30.7
- One faraday of electricity will liberate one gram atom of a metal from a solution of
 a. AuCl_3 b. CuSO_4 c. BaCl_2 d. KCl
- The charge required for the reduction of 1 mole of $\text{Cr}_2\text{O}_7^{2-}$ ions to Cr^{3+} is
 a. 96500 C b. $2 \times 96500 \text{ C}$
 c. $3 \times 96500 \text{ C}$ d. $6 \times 96500 \text{ C}$
- On passing 0.1 F of electricity through aluminium chloride, the amount of aluminium metal deposited on cathode is (Atomic weight of Al = 27)

- a. 0.27 g b. 0.3 g c. 0.9 g d. 2.7 g
18. The current of 2 A is passed for 5 h through a molten tin salt to deposit 22.2 g tin. What is the oxidation state of tin in salt? [Atomic weight of Sn = 118.69 g]
a. +2 b. +5 c. +3 d. +4
19. What will be the weight of silver deposited, if 96.5 A of current is passed into aqueous solution of AgNO_3 for 100 s?
a. 1.08 g b. 10.8 g c. 108 g d. 1080 g
20. A certain amount of current liberates 0.5 g of H_2 in 2.0 h. How many gram(s) of oxygen can be liberated by the same current in the same time?
a. 0.5 g b. 8.0 g
c. 4.0 g d. 16.0 g
21. Pick the odd one out.
a. Daniell cell b. Voltaic cell
c. Galvanic cell d. Electrolytic cell
22. The EMF of a cell is
a. sum of two oxidation potentials
b. sum of two potentials
c. difference of two electrode potentials
d. None of the above
23. Consider the following reaction,
 $\text{Cu} | \text{Cu}^{2+} (1\text{M}) || (\text{Zn}^{2+} (1\text{M})) | \text{Zn}$
A cell represented above should have emf
a. positive b. negative
c. zero d. Cannot be predicted
24. The standard reduction potential of Pb and Zn electrodes are -0.126 and -0.763 V respectively. The cell equation will be
a. $\text{Pb}^{2+} + \text{Zn} \longrightarrow \text{Pb} + \text{Zn}^{2+}$
b. $\text{Pb}^{4+} + 2 \text{Zn} \longrightarrow \text{Pb} + 2 \text{Zn}^{2+}$
c. $\text{Zn}^{2+} + \text{Pb} \longrightarrow \text{Zn} + \text{Pb}^{2+}$
d. None of the above
25. Consider the following reaction,
 $\frac{1}{2} \text{H}_2(\text{g}) + \text{AgCl}(\text{s}) \longrightarrow \text{H}^+(\text{aq}) + \text{Cl}^-(\text{aq}) + \text{Ag}(\text{s})$
Above reaction occurs in the galvanic cell
a. $\text{Ag} | \text{AgCl}(\text{s}) | \text{KCl}(\text{aq}) || \text{AgNO}_3(\text{aq}) | \text{Ag}(\text{s})$
b. $\text{Pt} | \text{H}_2(\text{g}) | \text{HCl}(\text{aq}) || \text{AgNO}_3(\text{aq}) | \text{Ag}(\text{s})$
c. $\text{Pt} | \text{H}_2(\text{g}) | \text{HCl}(\text{aq}) || \text{AgCl}(\text{s}) | \text{Ag}(\text{s})$
d. $\text{Pt} | \text{H}_2(\text{g}) | \text{KCl}(\text{aq}) || \text{AgCl}(\text{s}) | \text{Ag}(\text{s})$
26. When the sample of copper with the zinc impurity is to be purified by electrolysis, the appropriate electrodes are

Cathode	Anode
a. Pure zinc	Pure copper
b. Impure zinc	Pure copper
c. Impure zinc	Impure sample
d. Pure copper	Impure sample
27. Cu^+ ion is not stable in aqueous solution because of disproportionation reaction. E° value of disproportionation of Cu^+ is
[$E^\circ_{\text{Cu}^{2+}/\text{Cu}^+} = +0.15$ V, $E^\circ_{\text{Cu}^{2+}/\text{Cu}} = 0.34$ V]
a. -0.38 V b. $+0.19$ V
c. -0.49 V d. $+0.38$ V
28. Calculate the emf of the following cell:
 $\text{Cu}(\text{s}) | \text{Cu}^{2+}(\text{aq}) || \text{Ag}^+(\text{aq}) | \text{Ag}(\text{s})$
Given that, $E^\circ_{\text{Cu}^{2+}/\text{Cu}} = 0.34$ V, $E^\circ_{\text{Ag}^+/\text{Ag}} = -0.80$ V
a. 0.046 V b. 0.46 V c. 0.57 V d. -0.46 V
29. A cell constituted by two electrodes $A(E^\circ_{\text{A}/\text{A}^+} = -0.35$ V) and $B(E^\circ_{\text{B}/\text{B}^+} = 0.42$ V). Calculate the emf of the cell.
a. 0.07 V b. 0.77 V
c. -0.77 V d. -0.07 V
30. Out of Cu, Ag, Fe and Zn, the metal which can displace all others from their salt solution is
a. Ag b. Cu c. Zn d. Fe
31. Which of the following solution will turn blue when placed in copper vessel?
a. AgNO_3 b. NaCl
c. ZnSO_4 d. KNO_3
32. A gas X at 1 atm is bubbled through a solution containing a mixture of 1 M Y^- and 1 M Z^- at 25°C . If the order of reduction potentials is $\text{Z} > \text{Y} > \text{X}$, then
a. Y will oxidise X but not Z
b. Y will oxidise Z but not X
c. Y will oxidise both X and Y
d. Y will reduce both X and Y
33. Using the standard electrode potential, find out the pair between which redox reaction is not feasible.
 E° values: $\text{Fe}^{3+}/\text{Fe}^{2+} = +0.77$, $\text{I}_2/\text{I}^- = +0.54$ V
 $\text{Cu}^{2+}/\text{Cu} = +0.34$ V, $\text{Ag}^+/\text{Ag} = +0.80$ V
a. Fe^{3+} and I^- b. Ag^+ and Cu
c. Fe^{3+} and Cu d. Ag^+ and Fe^{3+}
34. The emf of the cell involving the reaction
 $2\text{Ag}^+(\text{aq}) + \text{H}_2(\text{g}) \longrightarrow 2\text{Ag}(\text{s}) + 2\text{H}^+(\text{aq})$ is 0.80 V. The standard oxidation potential of silver electrode is
a. 0.80 V b. 0.40 V
c. -0.80 V d. 0.20 V
35. For a reaction $\text{A}(\text{s}) + 2\text{B}^+(\text{aq}) \longrightarrow \text{A}^{2+}(\text{aq}) + 2\text{B}$, K_c has been found to be 10^{12} . The E°_{cell} is
a. 0.354 V b. 0.708 V
c. 0.0098 V d. 1.36 V
36. The value of E_{cell} of hydrogen electrode at $\text{pH} = 0$, 298 K and 1 atm, is
a. 0.59 V b. 0 V
c. -0.59 V d. -0.059 V
37. The emf of a galvanic cell is positive when free energy change of reaction is
a. > 0
b. < 0
c. $= 0$

d. no relationship of free energy change and emf

38. What is the value of E°_{cell} in the following reaction?
 $\text{Cr} | \text{Cr}^{3+} (0.1\text{M}) || \text{Fe}^{2+} (0.01\text{M}) | \text{Fe}$

Given, $E^\circ_{\text{Cr}^{3+}/\text{Cr}} = -0.74\text{ V}$, $E^\circ_{\text{Fe}^{2+}/\text{Fe}} = -0.44\text{ V}$

- a. + 0.2606 V b. 0.5212 V
 c. + 0.1303 V d. - 0.2606 V

39. Consider the following reaction,

$\text{Zn(s)} + \text{Cu}^{2+}(0.1\text{M}) \longrightarrow \text{Zn}^{2+}(1\text{M}) + \text{Cu(s)}$ above
 reaction, taking place in a cell, E°_{cell} is 1.10 V. E_{cell} for
 the cell will be $\left(2.303 \frac{RT}{F} = 0.0591\right)$

- a. 1.80 V b. 1.07 V
 c. 0.82 V d. 2.14 V

40. The Edison storage cell is represented as

$\text{Fe(s)} | \text{FeO(s)} | \text{KOH(aq)} | \text{Ni}_2\text{O}_3(\text{s}) | \text{NiO(s)} | \text{Ni(s)}$
 the half-cell reactions are

$\text{Ni}_2\text{O}_3(\text{s}) + \text{H}_2\text{O(l)} + 2\text{e}^- \rightleftharpoons 2\text{NiO(s)} + 2\text{OH}^-;$
 $E^\circ = + 0.40\text{ V}$

$\text{FeO(s)} + \text{H}_2\text{O(l)} + 2\text{e}^- \rightleftharpoons \text{Fe(s)} + 2\text{OH}^-;$

$E^\circ = - 0.87\text{ V}$

What is the maximum amount of electrical energy that
 can be obtained from one mole of Ni_2O_3 ?

- a. 127 kJ b. 245.11 kJ
 c. 90.71 kJ d. 122.55 kJ

41. Consider the following cell reaction .

$\text{Cu(s)} + 2\text{Ag}^+(\text{aq}) \longrightarrow \text{Cu}^{2+}(\text{aq}) + 2\text{Ag(s)}$

$E^\circ_{\text{cell}} = 0.46\text{ V}$ By doubling the concentration of Cu^{2+} ,

E_{cell} is

- a. doubled
 b. halved
 c. increases but less than double
 d. decreases by a small fraction

42. The value of the reaction quotient, Q for the following
 cell is

$\text{Zn(s)} | \text{Zn}^{2+}(0.01\text{M}) || \text{Ag}^+(1.25\text{ M}) | \text{Ag(s)}$

- a. 156 b. 125 c. 1.25×10^{-2} d. 6.4×10^{-3}

43. The standard emf of a cell involving one electron
 change is found to be 0.591 V at 25°C. The
 equilibrium constant of the reaction is
 ($1F = 96500\text{ C mol}^{-1}$)

- a. 1.0×10^1 b. 1.0×10^5
 c. 1.0×10^{10} d. 1.0×10^{30}

44. Hydrogen electrode is placed in the solution whose pH
 is 10. The potential of this electrode will be

- a. + 0.591 V b. - 0.591 V
 c. 0 d. None of these

45. What is the Gibbs energy of the following reaction?

$\text{Zn(s)} + \text{Cu}^{2+}(\text{aq}) \longrightarrow \text{Zn}^{2+}(\text{aq}) + \text{Cu}^{2+}(\text{s});$

$E^\circ_{\text{cell}} = 1.1\text{ V}$

- a. 106135.75 J mol⁻¹ b. 21227 J mol⁻¹
 c. - 212.27 kJ mol⁻¹ d. 21227 J mol⁻¹

46. When a lead storage battery is charged, it acts as

- a. primary cell b. galvanic cell
 c. concentration cell d. electrolytic cell

47. In a hydrogen oxygen fuel cell, combustion of
 hydrogen occurs to

- a. produce high purity water
 b. remove adsorbed oxygen from electrode surface
 c. generate heat
 d. create potential difference between two electrodes

48. In which of the following, the corrosion of iron will be
 most rapid?

- a. In pure water
 b. In pure oxygen
 c. In air and moisture
 d. In air and saline water

49. On the basis of electrochemical theory of aqueous
 corrosion, the reaction occurring at the cathode is

- a. $\text{O}_2(\text{g}) + 4\text{H}^+(\text{aq}) + 4\text{e}^- \longrightarrow 2\text{H}_2\text{O(l)}$
 b. $\text{H}_2(\text{g}) + 2\text{OH}^-(\text{aq}) \longrightarrow 2\text{H}_2\text{O(l)} + 2\text{e}^-$
 c. $\text{Fe}^{2+}(\text{aq}) + 2\text{e}^- \longrightarrow \text{Fe(s)}$
 d. $\text{Fe}^{3+}(\text{aq}) + \text{e}^- \longrightarrow \text{Fe}^{2+}(\text{aq})$

BITSAT Archives

- A reaction, $\text{Cu}^{2+} + 2e^- \longrightarrow \text{Cu}$ is given. For this reaction, graph between E_{red} versus $\ln[\text{Cu}^{2+}]$ is a straight line of intercept 0.34 V, then the electrode oxidation potential of the half-cell Cu/Cu^{2+} (0.1 M) will be [2014]
 - 0.34
 - $0.34 + \frac{0.0591}{2}$
 - $-0.34 - \frac{0.0591}{2}$
 - $-0.34 + \frac{0.0591}{2}$
- If $E^\circ_{\text{Fe}^{3+}/\text{Fe}}$ and $E^\circ_{\text{Fe}^{2+}/\text{Fe}}$ are -0.36 V and 0.439 V respectively, then the value of $E^\circ_{\text{Fe}^{3+}/\text{Fe}^{2+}}$ is [2013]
 - $(-0.036 - 0.439)$ V
 - $[3(-0.36) + 2(0.439)]$ V
 - $(-0.36 - 0.439)$ V
 - $[(3 - 0.36) - 2(-0.439)]$ V
- The ionic conductance of Ba^{2+} and Cl^- respectively are 127 and $76 \Omega^{-1} \text{cm}^2$ at infinite dilution. The equivalent conductance (in $\Omega^{-1} \text{cm}^2$) of BaCl_2 at infinite dilution will be [2012]
 - $330 \Omega^{-1} \text{cm}^2$
 - $203 \Omega^{-1} \text{cm}^2$
 - $139.5 \Omega^{-1} \text{cm}^2$
 - $51 \Omega^{-1} \text{cm}^2$
- The equilibrium constant (K) for the reaction $\text{Cu}(s) + 2\text{Ag}^+(aq) \longrightarrow \text{Cu}^{2+}(aq) + 2\text{Ag}(s)$, will be [Given, $E^\circ_{\text{cell}} = 0.46$ V] [2011]
 - $K_c = \text{antilog } 15.6$
 - $K_c = \text{antilog } 2.5$
 - $K_c = \text{antilog } 1.5$
 - $K_c = \text{antilog } 12.2$
- E° for Fe/Fe^{2+} is $+0.44$ V and E° for Cu/Cu^{2+} is -0.32 V. Then, in the cell, [2011]
 - Cu oxidises Fe^{2+} ion
 - Cu^{2+} oxidises iron
 - Cu reduces Fe^{2+} ion
 - Cu^{2+} reduces Fe
- A current of 0.5 A when passed through AgNO_3 solution for 193 s deposited 0.108 g Ag. The equivalent weight of silver is [2010]
 - 108
 - 54
 - 10.8
 - 5.4
- When same quantity of electricity is passed through aqueous AgNO_3 and H_2SO_4 solutions connected in series, 5.4×10^{-2} g of H_2 is liberated. What is the mass of silver (in grams) deposited? (Equivalent weight of hydrogen = 1008, silver = 108) [2008]
 - 54
 - 0.54
 - 5.4
 - 10.8
- When electric current is passed through acidified water for 1930 s, 1120 mL of H_2 gas is collected (at STP) at the cathode. What is the current passed in amperes? [2008]
 - 0.05
 - 0.50
 - 5.0
 - 50
- Given, standard electrode potentials $\text{Fe}^{2+} + 2e^- \longrightarrow \text{Fe}$, $E^\circ = -0.440$ V
 $\text{Fe}^{3+} + 3e^- \longrightarrow \text{Fe}$, $E^\circ = -0.036$ V
 The standard electrode potential (E°) for $\text{Fe}^{2+} + e^- \longrightarrow \text{Fe}^{2+}$, is [2007]
 - $+0.772$ V
 - -0.772 V
 - $+0.417$ V
 - -0.417 V
- The specific conductivity of 0.1 N KCl solution is $0.0129 \Omega^{-1} \text{cm}^{-1}$. The resistance of the solution in the cell is 100Ω . The cell constant of the cell will be [2007]
 - 1.10
 - 1.29
 - 0.56
 - 2.80
- The cathodic reaction of a dry cell is represented as $2\text{MnO}_2(s) + \text{Zn}^{2+} + 2e^- \longrightarrow \text{ZnMn}_2\text{O}_4(s)$
 If there are 8 g MnO_2 in the cathodic compartment then the time for which the dry cell will continue to give current of 2 milliampere, is [2006]
 - 25.675 day
 - 51.35 day
 - 12.8 day
 - 6.423 day
- The standard reduction potential of the reaction $\text{H}_2\text{O} + e^- \longrightarrow \frac{1}{2} \text{H}_2 + \text{OH}^-$, at 298 K, is [2005]
 - $E^\circ = \frac{RT}{F} \ln K_w$
 - $E^\circ = \frac{RT}{F} \ln [p_{\text{H}_2}]^{1/2} [\text{OH}^-]$
 - $E^\circ = \frac{RT}{F} \ln \frac{[p_{\text{H}_2}]^{1/2}}{[\text{H}^+]}$
 - $E^\circ = -\frac{RT}{F} \ln K_w$

Answer with Solutions

Practice Exercise

1. (c) Cell constant (x) = $\frac{l}{a} = \frac{1.5}{0.75} = 2 \text{ cm}^{-1}$

2. (b) $\text{Sm}^2 \text{ mol}^{-1}$

3. (c)

4. (a) We know that, $k = C \left(\frac{l}{a} \right)$

$$= \frac{1}{2.5 \times 10^3} \times 1.155 \text{ cm}^{-1} \left(C = \frac{1}{R} \right)$$

$$\Lambda_{\text{eq}} = \frac{k \times 1000}{N} = \frac{1.15 \times 1000}{2.5 \times 10^3 \times 0.1}$$

$$= 4.6 \text{ ohm}^{-1} \text{ cm}^2 \text{ equiv}^{-1}$$

5. (a) $K = \Lambda_{\text{eq}} \times C = (91 \Omega^{-1} \text{ cm}^2 \text{ eq}^{-1}) \left(\frac{2.54}{159/2 \times 1000} \text{ eq} \right)$

$$= 2.9 \times 10^{-3} \Omega^{-1} \text{ cm}^{-1}$$

6. (c)

7. (d) $k = \frac{\text{Cell constant}}{\text{Resistance}} = \frac{1.25}{2.5 \times 10^3} = 5 \times 10^{-4} \Omega^{-1} \text{ cm}^{-1}$

$$\text{Equivalent conductance} = \frac{k \times 1000}{M}$$

$$= \frac{5 \times 10^{-4} \times 1000}{1/10}$$

$$= 5 \Omega^{-1} \text{ cm}^2 \text{ equiv}^{-1}$$

8. (b)

9. (c) Due to increase in volume of water, interionic forces of HCl will decrease. Hence, ionic mobility will increase and consequently, the molar conductivity will also increase.

10. (b)

11. (b) The plot of molar conductance vs $\sqrt{C}$ in strong electrolyte is linear.

12. (b) $\Lambda_{\text{eq}}^{\infty}(\text{NH}_4\text{OH}) = \Lambda_{\text{eq}}^{\infty}(\text{NH}_4\text{Cl}) + \Lambda_{\text{eq}}^{\infty} \text{ NaOH} - \Lambda_{\text{eq}}^{\infty}(\text{NaCl})$

$$= (149.74 + 248.1) - 126.4$$

$$= 271.44 \Omega \text{ cm}^2 \text{ equiv}^{-1}$$

13. (a) Electricity required to liberate 0.1 g equivalent of an element

$$= 96500 \times 0.1 = 9650 \text{ C}$$

14. (c) We know that,

$$E = \frac{F \cdot w}{it} = \frac{96500 \times 1.8}{3 \times 50 \times 60} = 19.3$$

15. (d) $\text{KCl} \rightleftharpoons \text{K}^+ + \text{Cl}^-$ and $\text{K}^+ + e^- \longrightarrow \text{K}$

Thus, one mole KCl need one mole electrons to liberate one gram metal atom. One mole electron charge is equal to 96500 C (1 F). Hence, 1 F charge will liberate one gram atom of metal from solution of KCl.

Hence, electrons involved in this reduction will be

$$= 2 \times [(+6) - (+3)] = 2 \times 3 = 6$$

$\therefore$ Charge required for one mole = $6 \times 96500 \text{ C}$

17. (c)

18. (a) Equivalent of tin = $\frac{i \cdot t}{96500}$

or $\frac{22 \cdot 2}{\text{Eq. wt.}} = \frac{2 \times 5 \times 60 \times 60}{96500}$

$\therefore$ Eq. wt. = 59.5

$\therefore$ Valency of tin = $\frac{\text{At. wt.}}{\text{Eq. wt.}} = \frac{118.69}{59.5} = 2$ (an integer)

19. (b) $Q = it = 96.5 \times 100 = 9650 \text{ C}$

96500 C deposited weight of Ag = 108 g

9650 C deposited weight of Ag = $\frac{108 \times 9650}{96500} = 10.8 \text{ g}$

20. (c) According to Faraday's first law, $w = Zit$

Given, it is same for H_2 and O_2 .

$$\frac{W_{\text{H}_2}}{W_{\text{O}_2}} = \frac{Z_{\text{H}_2}}{Z_{\text{O}_2}} = \frac{E_{\text{H}_2}}{E_{\text{O}_2}}$$

$$\frac{0.500}{W_{\text{O}_2}} = \frac{2}{16}, W_{\text{O}_2} = 4.00 \text{ g}$$

21. (d)

22. (c)

23. (b) If E_{red}° of Cu and Zn are known from ECS.

than,

$$E^{\circ} = E_{\text{cathode}}^{\circ} - E_{\text{anode}}^{\circ}$$

$$= E_{\text{right}}^{\circ} - E_{\text{left}}^{\circ}$$

$$= (-0.76) - (+0.34) \text{ (From ECS)}$$

$$= -0.76 - 0.34 = -1.10 \text{ V}$$

24. (c) The E_{red}° of Zn is lower than that of Pb, hence Zn is a better reducing agent than Pb.

$\therefore$ The correct cell reaction will be

25. (c) H_2 undergoes oxidation and $\text{AgCl}(\text{Ag}^+)$ undergoes reduction. Therefore, cell may be represented as

26. (d) Impure sample is made of the anode and pure copper acts as the cathode.

27. (b) The reaction of disproportionation is

$$\therefore E_{\text{Cu}^+/\text{Cu}^{2+}}^{\circ} = E_{\text{Cu}^+/\text{Cu}^{2+}}^{\circ} + E_{\text{Cu}^{2+}/\text{Cu}}^{\circ}$$

$$= (-E_{\text{Cu}^{2+}/\text{Cu}^+}^{\circ}) + E_{\text{Cu}^{2+}/\text{Cu}}^{\circ}$$

$$= -0.15 + 0.34 = +0.19 \text{ V}$$

28. (b)

29. (b) Since, reduction potential of electrode, A is lower than that of B.

$$\begin{aligned}\text{We have, } E_{\text{cell}}^{\circ} &= E_{\text{cathode}}^{\circ} - E_{\text{anode}}^{\circ} \\ &= 0.42 - (-0.35) = 0.77 \text{ V}\end{aligned}$$

30. (c) The metal placed above in electrochemical series, can displace the metals placed below, from their salt solution.

Hence, Zn can displace Fe, Ag, Cu.

31. (a) Cu is placed above Ag in electrochemical series. Hence, Cu can displace Ag from AgNO_3 and itself is oxidised to Cu^+ (blue) ions.

32. (a) Greater the reduction potential, stronger is the oxidising agent. Hence, Y is stronger oxidising agent than X but weaker than Z.

33. (d) Ag^+ and Fe^{3+} are not feasible because they have almost same standard electrode potential.

34. (c) From the equation, given cell represented as

$$\begin{aligned}\text{Hence, } E_{\text{cell}} &= E_{\text{Ag}^+/\text{Ag}} - E_{\text{H}^+/\frac{1}{2}\text{H}_2} \\ \text{or } 0.80 &= E_{\text{Ag}^+/\text{Ag}} - 0.0\end{aligned}$$

$$\therefore E_{\text{Ag}^+/\text{Ag}} = 0.80 \text{ V}$$

$$\text{Hence, } E_{\text{oxi}} = -0.80 \text{ V}$$

35. (a) We know that $\Delta G^{\circ} = -2.303 RT \log K_C$

$$= -2.303 RT \log 10^{12} = -12 \times 2.303 RT$$

$$\text{Also, } \Delta G^{\circ} = -nFE_{\text{cell}}^{\circ}$$

$$\text{or } E_{\text{cell}}^{\circ} = \frac{2.303 RT}{nF} \times 12 = \frac{0.059}{2} \times 12; (n=2) = 0.354 \text{ V}$$

36. (b) $E_{\text{cell}} = E^{\circ} - \text{pH} \times 0.059 = 0.00 - (0) \times 0.059$

$$(\text{For hydrogen electrode, } E^{\circ} = 0)$$

$$= 0.0 \text{ V}$$

37. (b) $\Delta G = -nFE$ If $E = +\text{ve}$, then $\Delta G = -\text{ve}$ or < 0

38. (a) The cell reaction is

From Nernst equation,

$$\begin{aligned}E_{\text{cell}} &= E_{\text{cell}}^{\circ} - \frac{0.059}{n} \log \frac{[\text{Cr}^{3+}]^2}{[\text{Fe}^{2+}]^3} \\ &= [-0.44 + 0.74] - \frac{0.059}{6} \times \log \frac{(0.1)^2}{(0.01)^3} \\ &= +0.2606 \text{ V}\end{aligned}$$

39. (b)

40. (b) Given, $E_{\text{FeO}/\text{Fe}}^{\circ} = -0.87 \text{ V}$ and $E_{\text{Ni}_2\text{O}_3/\text{NiO}}^{\circ} = 0.40 \text{ V}$

$$\therefore E_{\text{Fe}/\text{FeO}}^{\circ} = +0.87 \text{ V}$$

$$\text{and } E_{\text{NiO}/\text{Ni}_2\text{O}_3}^{\circ} = 0.40 \text{ V}$$

Since, E_{oxi}° for $\text{Fe}/\text{FeO} > E_{\text{oxi}}^{\circ}$ for $\text{NiO}/\text{Ni}_2\text{O}_3$ $\therefore$ Redox changes

$$\text{Hence, } E_{\text{cell}}^{\circ} = E_{\text{anode}}^{\circ} - E_{\text{cathode}}^{\circ} = 0.87 - (-0.40)$$

$$\text{or } E_{\text{cell}}^{\circ} = 1.27 \text{ V}$$

$$\begin{aligned}\text{and } \Delta G^{\circ} &= nFE_{\text{cell}}^{\circ} = 2 \times 1.27 \times 96500 \\ &= 245110 \text{ J} \\ &= 245.11 \text{ kJ}\end{aligned}$$

$$41. (d) E_{\text{cell}} = E_{\text{cell}}^{\circ} - \frac{RT}{nF} \ln \frac{[\text{Cu}^{2+}]}{[\text{Ag}^+]^2}$$

Doubling $[\text{Cu}^{2+}]$, decreases the emf by a small fraction.

42. (d) The cell reaction is

$$Q = \frac{[\text{Zn}^{2+}]}{[\text{Ag}^+]^2} = \frac{0.01}{(1.25)^2} = 6.4 \times 10^{-3}$$

43. (c) Relation between K_{eq} and E_{cell}° is

$$E_{\text{cell}}^{\circ} = \frac{0.0591}{n} \log K_{\text{eq}} (\text{at } 298 \text{ K})$$

$$0.591 = \frac{0.0591}{1} \log K_{\text{eq}}$$

$$\therefore K_{\text{eq}} = 1 \times 10^{10}$$

$$44. (b) E_{\text{H}^+/\frac{1}{2}\text{H}_2} = E_{\text{H}^+/\frac{1}{2}\text{H}_2}^{\circ} - \frac{0.0591}{1} \log \frac{1}{10^{-10}}$$

$$= -0.0591 \times 10 = -0.591 \text{ V}$$

45. (c) $\Delta_r G = -2 \times 1.1 \times 96487$

$$= -212.27 \text{ kJ mol}^{-1}$$

46. (d) When a lead storage battery is charged, it acts as an electrolytic cell.

47. (d) Fuel cell works when potential difference is developed.

48. (d) Corrosion is speed up by air, water, electrolytes and impurities in metal.

49. (a)

BITSAT Archives

$$E_{\text{Cu}^{2+}/\text{Cu}} = E^\circ_{\text{Cu}^{2+}/\text{Cu}} - \frac{0.059}{2} \log \frac{1}{[\text{Cu}^{2+}]}$$

$$= E^\circ_{\text{Cu}^{2+}/\text{Cu}} + \frac{RT}{2F} \ln [\text{Cu}^{2+}]$$

$$E_{\text{Cu}^{2+}/\text{Cu}} = 0.34 + \frac{0.059}{2} \log 0.1 = 0.31 \text{ V}$$

$$E_{\text{Cu}/\text{Cu}^{2+}} = -E_{\text{Cu}^{2+}/\text{Cu}} = -0.34 + \frac{0.059}{2} \text{ V}$$

2. (d) $E^\circ_{\text{Fe}^{3+}/\text{Fe}^{2+}} = 3E^\circ_{\text{Fe}^{3+}/\text{Fe}} - 2E^\circ_{\text{Fe}^{2+}/\text{Fe}}$
 $= [3 - 0.36] - 2(-0.439) \text{ V}$

3. (c) Λ_m^∞ for $\text{BaCl}_2 = \Lambda_m^\infty \text{Ba}^{2+} + 2\Lambda_m^\infty \text{Cl}^-$

$$\therefore \Lambda_{\text{eq}}^\infty \text{ for } \text{BaCl}_2 = \frac{1}{2} \Lambda_m^\infty \text{Ba}^{2+} + \Lambda_m^\infty \text{Cl}^-$$

$$= \frac{1}{2} \times 127 + 76 = 139.5 \Omega^{-1} \text{ cm}^2$$

4. (a) $E^\circ = \frac{0.059}{n} \log K_C$

$$0.46 = \frac{0.059}{2} \log K_C$$

$$\log K_C = \frac{0.46 \times 2}{0.059} = 15.6$$

$$K_C = \text{antilog } 15.6$$

$$E_{\text{cell}}^\circ = E^\circ_{\text{Fe}/\text{Fe}^{2+}} + E^\circ_{\text{Cu}^{2+}/\text{Cu}}$$

$$= 0.44 + 0.32$$

$$= 0.76 \text{ V}$$

6. (a) $w = \frac{i \times t \times E}{F} \Rightarrow E = \frac{w \times F}{i \times t}$
 $= \frac{0.108 \times 96500}{0.5 \times 193} = 108$

7. (c) As the reduction potential of hydrogen is lower than that of sodium, it will be discharged at the cathode and chloride will be discharged at the anode.

8. (c) According to Faraday's second law of electrolysis,
 $\frac{\text{Weight of silver deposited}}{\text{Weight of hydrogen liberated}} = \frac{\text{Eq. wt. of silver}}{\text{Eq. wt. of hydrogen}}$

$$\frac{w}{5.04 \times 10^{-2}} = \frac{108}{1.008}$$

$$w = \frac{108 \times 5.04 \times 10^{-2}}{1.008} = 5.4 \text{ g}$$

9. (c) Number of moles of hydrogen collected

$$= \frac{1120 \times 10^{-3}}{22.4} = 0.05$$

$\therefore$ 1 mole of hydrogen is deposited by 2 moles of electrons.

$\therefore$ 0.05 mole of hydrogen will be deposited by 2×0.05
 $= 0.10$ mole of electrons

$$\text{Charge, } Q = nF$$

$$= 0.1 \times 96500$$

$$\text{Charge, } Q = it$$

$$0.1 \times 96500 = i \times 1930$$

$$i = \frac{0.1 \times 96500}{1930} = 5.0 \text{ A}$$

$$\Delta G^\circ = -2 \times F \times (-0.440 \text{ V}) = 0.880 F$$

$$\Delta G^\circ = -3 \times F \times (-0.036)$$

$$= 0.108 F$$

On subtracting Eq. (ii) from Eq. (i) we get

$$\Delta G^\circ = 0.108 F - 0.880 F = -0.772 F$$

$$E^\circ = \frac{-\Delta G^\circ}{nF} = \frac{(-0.772F)}{1 \times F} = +0.772 \text{ V}$$

11. (b) Specific conductivity (κ) = $\frac{1}{R} \times \text{cell constant}$

$$\text{Cell constant} = \kappa \times R = 0.0129 \times 100 = 1.29$$

12. (b) According to Faraday's law of electrolysis

$$m = \left(\frac{It}{F} \right) \frac{M}{Z}$$

or,

$$t = \frac{mZF}{IM}$$

The factor of equivalence can be found dividing the number of electrons by the number of reacted particles.

In case of MnO_2 , the factor is $Z = \frac{2}{2} = 1$

The molar mass of MnO_2 is $M (\text{MnO}_2) = 55 + 16 \times 2$
 $= 87 \text{ g/mol}$

$$\text{Now, } t = \frac{8 \times 1 \times 96500}{0.002 \times 87} = 4.436 \times 10^6 \text{ s} = 1232 = 51.3 \text{ days}$$

13. (a) The standard reduction potential of the cell reaction is

$$E^\circ = \frac{RT}{F} \ln K_w$$

14

Hydrogen

Occurrence of Hydrogen

Dihydrogen (H_2) is the most abundant element in the universe (70% of the total mass of the universe) and is the principal element in the solar atmosphere. The giant planets, Jupiter and Saturn consist of mainly hydrogen.

Position of Hydrogen in Periodic Table

The position of hydrogen in periodic table is uncertain as it shows resemblance with alkali metals as well as with halogens. However, on the basis of electronic configuration ($1s^1$), it is placed above lithium in the periodic table but still it is not considered as the member of that group. It is the lightest element known.

Isotopes and Allotropes of Hydrogen

Hydrogen has three isotopes : protium (1_1H), deuterium or heavy hydrogen (2_1H or D) and tritium (3_1H or T). Out of these isotopes, only tritium is radioactive and emits low energy of β -particles. These three isotopes have different masses, hence, their rates of reaction and equilibrium constants are different. This is known as **isotopic effect**.

Dihydrogen or Hydrogen Gas (H_2)

Hydrogen being highly reactive, it exists in diatomic form, called the dihydrogen or hydrogen gas.

Methods of Preparation of Dihydrogen

Dihydrogen can be prepared by the following methods:

- (i) **Laboratory method** In laboratory, dihydrogen is produced by the reaction of Zn with dil. H_2SO_4 .

- (ii) **By the electrolysis of water** In electrolysis, acidified water is electrolysed by using platinum electrodes as

- (iii) High purity (> 99.95%) dihydrogen is obtained by electrolysing warm aqueous barium hydroxide solution between nickel electrodes.
- (iv) By the action of certain active metals on water or any other protic solvent.

- (v) **Industrial methods of preparation of dihydrogen**

It involve following processes :

- (a) **Bosch process**

The CO_2 is removed either by washing under pressure of 25-30 atm or by reacting with potassium hydroxide.

- (b) **Lane process**

- (c) **In Nelson or Castner Kellner cell**, H_2 is also produced by the electrolysis of brine solution (NaCl) in them.

Properties

Physical Properties of Dihydrogen

Some physical properties are given below:

- (i) Hydrogen is a diatomic $\left(\gamma = \frac{C_p}{C_v} = 1.40\right)$, colourless, tasteless gas with no characteristic odour. It is lighter than air and insoluble in water.
- (ii) Its critical temperature is very low (-236.9°C). It can be liquefied at or below -236.9°C by application of suitable pressure and solidifies at -259.8°C .
- (iii) Certain metals like Ni, Pt, Pd, Fe, Au etc., can adsorb or occlude large volumes of H_2 gas at different temperatures (Pd can occlude 1000 times of its own volume).

Chemical Properties of Dihydrogen

Important chemical reactions of dihydrogen are given below:

- (i) **Nature** Dihydrogen is neutral in nature.
- (ii) **Combustion** Dihydrogen is highly combustible and it burns with pale blue flame in the presence of air.
- $$2\text{H}_2 + \text{O}_2 \longrightarrow 2\text{H}_2\text{O}; \quad (\Delta H = -285.9 \text{ kJ mol}^{-1})$$
- (iii) **Reaction with non-metals** With non-metals (like O_2 , N_2 , F_2 , Cl_2 , Br_2 etc) hydrogen forms covalent

compounds (like H_2O , NH_3 , HX etc) at higher temperatures.

- (iv) **Reaction with metals** Under suitable condition, metals (like Li, Na, K, Cs, Ca etc) react with H_2 to form hydrides which are chiefly ionic, good reducing agents.

- (v) **Reducing action** Dihydrogen has the property to reduce the oxides of less electropositive elements.

Certain metal chlorides also get reduced as

However, hydrogen does not have the ability to reduce the oxides of more electropositive elements like alkali metals and alkaline earth metals.

Uses of Dihydrogen

The important uses of dihydrogen are as follows:

- (i) In the manufacturing of vanaspati fat by the hydrogenation of polyunsaturated vegetable oils like soyabean, cotton seeds etc.
- (ii) In oxyhydrogen and atomic hydrogen torches for cutting and welding of substances.
- (iii) Dihydrogen is considered as very good fuel as it does not cause any pollution and produces greater energy per unit mass of fuel as compared to gasoline or other fuels. H_2 - O_2 fuel cells generate electrical power with conversion efficiency of 70-85%.

Hydrides

Hydrogen combines with a number of metals and non-metals to form as hydrides.

Hydrides are mainly of three types :

Ionic or Saline Hydrides

These are formed by metals which are highly electropositive in character, i.e. alkali and alkaline earth metals (except Be and Mg), e.g. LiH , CaH_2 etc. These are crystalline solids with ionic lattices and behave like salts.

Molecular or Covalent Hydrides

These are formed by elements of comparatively higher electronegativity, generally p -block elements. In most cases, bonds are covalent in character, although in some cases (e.g. HF), bond is partly ionic in character. Molecules are held together by weak van der Waals' forces. These hydrides are soft, have low melting point and boiling point with low electrical conductivity.

These hydrides are of following three types:

- (i) Electron deficient hydrides
- (ii) Electron precise hydrides
- (iii) Electron rich hydrides

Metallic or Interstitial Hydrides

These are formed by Be, Mg (both are *s*-block elements) and transition (*d*-block) elements. These are interstitial compounds as the hydrogen atoms occupy interstitial places in the metal lattices. These are non-stoichiometric compounds (e.g. $\text{VH}_{0.56}$, $\text{NiH}_{0.6-0.7}$ etc.) and give out hydrogen easily and thus, used as reducing agents.

Water (H_2O)

Water is very essential for the existence of life. It constitutes about three-fourth of the earth's surface and two-third of human body.

Structure of Water

Water molecule is a bent molecule with a bond angle of 104.5° . In water molecules, the central atom (oxygen) is sp^3 -hybridised. Because of high electronegativity of oxygen, several H_2O molecules associated through hydrogen bonding ($\text{O}-\text{H}\cdots\text{O}$).

Ice has a highly ordered 3 dimensional H-bonded structure in which each oxygen atom is surrounded tetrahedrally by four other oxygen atoms.

Physical Properties of Water

Water is colourless, odourless and tasteless liquid. Due to its high dielectric constant and polar nature, water is an excellent solvent for polar and ionic substances.

Chemical Properties of Water

The chemical properties of water are below:

- (i) It behaves as an amphoteric substance.

- (ii) It is oxidised to O_2 with fluorine.

- (iii) The association of water is essentially of 5 types namely coordinated water, hydrogen bonded water, lattice water, zeolitic water and clathrate water.

Hard and Soft Water

The water which lathers with soap is soft, if not, is hard.

Hardness of water is of two types:

- (i) Temporary hardness
- (ii) Permanent hardness

Temporary Hardness of Water

It is due to the presence of magnesium and calcium hydrogen carbonates. It can be removed by **Clark's method**, which involves the addition of calculated amount of lime to hard water.

Permanent Hardness of Water

It is due to the presence of soluble salts of magnesium and calcium in the form of chlorides and sulphates.

It can be removed by the following methods:

- **Ion-exchange method or Permutit process** is also used to remove permanent hardness.

where, NaZ is sodium aluminium silicate (NaAlSiO_4). This is also known as sodium zeolite. It is regenerated for further use by treating with an aqueous NaCl solution (brine).

- Cation exchange resins contain large organic molecules with $-\text{SO}_3\text{H}$ group and are water insoluble. Ion-exchange resin (RSO_3H) is changed to RNa by treating it with NaCl .

The resin can be regenerated by adding aqueous NaCl solution.

Heavy Water (D_2O)

It has quite similar physical and chemical properties to those of H_2O . Dielectric constant of D_2O is lower than that of H_2O and rate of reactions are much slower than H_2O .

It is used as a moderator in nuclear reactions, as trace compound for studying reaction mechanism, for the preparation of deuterium.

Hydrogen Peroxide (H₂O₂)

It is a compound with an oxygen-oxygen single bond. It is also a strong oxidiser.

Preparation

H₂O₂ is commercially represented in terms of volume strength.

$$\begin{aligned} \text{(i) Volume strength} &= 5.6 \times \text{Normality} \\ &= 5.6 \times \frac{\text{Percentage strength}}{\text{Eq. wt. of H}_2\text{O}_2 \text{ (i.e. 17)}} \times 10 \end{aligned}$$

$$\begin{aligned} \text{(ii) Volume strength} &= 11.2 \times \text{Molarity} \\ &= 11.2 \times \frac{\text{Percentage strength}}{\text{Mol. wt. of H}_2\text{O}_2 \text{ (i.e. 34)}} \times 10 \end{aligned}$$

$$\text{(iii) \% strength} = \frac{17}{56} \times \text{Volume strength}$$

Chemical Properties

The chemical properties are shown below:

(i) Oxidising action in acidic medium

(ii) Reducing action in acidic medium

(iii) Oxidising action in basic medium

(iv) Reducing action in basic medium

Storage

H₂O₂ decomposes slowly on exposure to light.

In the presence of metal surfaces or traces of alkali (present in glass containers), the above is catalysed. It is therefore, stored in wax lined glass or plastic vessels in dark. Urea can be added as a stabiliser.

Uses of H₂O₂

1. Aqueous solution of H₂O₂ is used as germicide, antiseptic, preservative for milk and wine, bleaching agent for soft materials.
30% H₂O₂ is called perhydrol. Its volume strength is 100 and molarity is 8.8.
2. It is used as an antichlor and in refreshing old oil paintings which became black.

Structure of H₂O₂

Practice Exercise

1. Why does H⁺ ion always get associated with other atoms or molecules?
 - a. Ionisation enthalpy of hydrogen resembles to that of alkali metals
 - b. Its reactivity is similar to halogens
 - c. It resembles both alkali metals and halogens
 - d. Loss of an electron from hydrogen atom results in a nucleus of very small size as compared to other atoms or ions. Due to small size, it cannot exist free
2. Which of the following explanation justifies for not placing hydrogen in either the group of alkali metals or halogens?
 - a. Ionisation energy of the hydrogen is too high for group of alkali metals and too low for the halogen group
 - b. Hydrogen atom does not contain any neutron
 - c. Hydrogen is much lighter than the alkali metals or halogens
 - d. Hydrogen can form compounds with almost all other elements
3. *Ortho* and *para* hydrogens differ in the
 - a. number of protons
 - b. molecular weight
 - c. nature of spins of protons
 - d. nature of spins of electrons
4. Consider the following statements about *ortho* and *para*-hydrogen
 - I. In *ortho*-hydrogen, the spin of protons are in the same direction.
 - II. *ortho*-hydrogen is more stable than the *para* form in the ambient condition.
 - III. At ordinary temperature, ordinary hydrogen is a mixture of about 75% *para* and 25% *ortho* forms.
 - IV. Two forms have similar chemical properties but differ in physical properties like specific heat and thermal conductivity.

Which of the statements given above are correct?

- a. I, II and III b. II, III and IV
c. I, III and IV d. I, II and IV
5. Which of the following reactions increase production of dihydrogen from synthesis gas?
 a. $\text{CH}_4(g) + \text{H}_2\text{O}(g) \xrightarrow{1270\text{ K}} \text{CO}(g) + 3\text{H}_2(g)$
 b. $\text{C}(s) + \text{H}_2\text{O}(g) \xrightarrow[1270\text{ K}]{\text{Ni}} \text{CO}(g) + \text{H}_2(g)$
 c. $\text{CO}(g) + \text{H}_2\text{O}(g) \xrightarrow[673\text{ K}]{\text{Catalyst}} \text{CO}_2(g) + \text{H}_2(g)$
 d. $\text{C}_2\text{H}_6 + 2\text{H}_2\text{O} \xrightarrow[1270\text{ K}]{\text{Ni}} 2\text{CO} + 5\text{H}_2$
6. The ionisation of hydrogen atom gives
 a. hydride ion b. hydronium ion
 c. proton d. hydroxyl ion
7. Pure H_2 is obtained by the action of
 a. aluminium with potassium hydroxide
 b. sodium hydride with water
 c. electrolysis of warm solution of $\text{Ba}(\text{OH})_2$ using Ni electrodes
 d. All of the above
8. Hydrogen adsorbed on palladium is known as
 a. atomic H b. ortho H c. occluded H d. heavy H
9. The chemical reactions of dihydrogen is accomplished by the
 a. loss of the only one electron to give H^+
 b. gain of an electron to form H^-
 c. sharing electrons to form a single covalent bond
 d. All of the above
10. Consider the following reactions,
 I. $\text{H}_2(g) + \text{X}_2(g) \longrightarrow 2\text{HX}(g)$ ($\text{X} = \text{F}, \text{Cl}, \text{Br}, \text{I}$)
 II. $2\text{H}_2(g) + \text{O}_2(g) \xrightarrow[\text{heating}]{\text{Catalyst or}} 2\text{H}_2\text{O}(l)$
 III. $3\text{H}_2(g) + \text{N}_2(g) \xrightarrow[200\text{ atm}]{673\text{ K, Fe}} 2\text{NH}_3(g)$
 IV. $\text{H}_2(g) + 2\text{M}(g) \longrightarrow 2\text{MH}(s)$ ($\text{M} = \text{alkali metal}$)
 V. $\text{H}_2(g) + \text{Pd}^{2+}(aq) \longrightarrow \text{Pd}(s) + 2\text{H}^+(aq)$

The correct reactions are

- a. II, III and V b. IV and V
c. I, II and IV d. All of these
11. Hydrogenation of vegetable oils using nickel as a catalyst gives edible fats is known as
 a. coconut oil
 b. soyabean oil
 c. margarine and vanaspati ghee
 d. vanaspati ghee

What are X and Y in the above reaction?

- a. $\text{RCH}_2\text{CH}_2\text{CHO}$ and $\text{RCH}_2\text{CH}_2\text{CH}_2\text{OH}$
 b. $\text{RCH}_2\text{CH}_2\text{CHO}$ and $\text{RCH}_2\text{CH}_2\text{OH}$

- c. $\text{CH}_3\text{CH}_2\text{CHO}$ and $\text{CH}_3\text{CH}_2\text{OH}$
 d. $\text{CH}_3\text{CH}_2\text{CH}_2\text{CHO}$ and $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$

13. Dihydrogen is used in the
 I. manufacturing of nitric acid and nitrogenous fertilisers.
 II. manufacturing of vanaspati fat.
 III. manufacturing of methanol.
 IV. preparation of hydrogen chloride.

Choose the correct option.

- a. I, II and IV b. II, III and IV
c. I, II and III d. I, II, III and IV
14. H_2 gas is liberated at cathode and anode both by the electrolysis of the following aqueous solution except in
 a. NaH b. KH
 c. NaCl d. Both a and b
15. Hydrogen is prepared on large scale for an industrial use
 a. by $\text{Zn} + \text{H}_2\text{SO}_4$ b. by $\text{Al} + \text{NaOH}$
 c. by $\text{Na} + \text{C}_2\text{H}_5\text{OH}$ d. from water gas
16. Which of the following is incorrect statement?
 a. s-block elements, except Be and Mg, form ionic hydride
 b. BeH_4 , MgH_2 , CuH_2 , ZnH_2 , CaH_2 and HgH_2 are intermediate hydrides
 c. p-block elements form covalent hydride
 d. d and f-block elements form ionic hydride
17. The correct decreasing order of basic strength of hydrides is
 a. $\text{AsH}_3 > \text{SbH}_3 > \text{PH}_3 > \text{NH}_3$
 b. $\text{SbH}_3 > \text{AsH}_3 > \text{PH}_3 > \text{NH}_3$
 c. $\text{NH}_3 > \text{PH}_3 > \text{AsH}_3 > \text{SbH}_3$
 d. $\text{PH}_3 > \text{AsH}_3 > \text{SbH}_3 > \text{NH}_3$
18. The maximum possible number of hydrogen bonds in a water molecule can form in ice is
 a. 1 b. 2 c. 3 d. 4
19. Consider the following statements about intermolecular and intramolecular hydrogen bonds.
 I. Both types of H-bonds are temperature dependent.
 II. Intramolecular H-bond disappears on increasing the concentration.
 III. Intramolecular H-bond disappears on decreasing the concentration.
 IV. The boiling point of compounds having intramolecular H-bond are lower than that of those compounds which have intermolecular H-bond.

Which of the statements given above are correct?

- a. I, II and IV b. III and IV
c. I, III and IV d. I and II
20. The boiling point of water is high because
 a. water molecule is linear
 b. water molecule is not linear
 c. water molecule possess covalent bond between H and O
 d. water molecules associate due to H-bonding

21. When two ice cubes are pressed over each other, they united to form one cube. Which of the following forces are responsible to hold them together?
- Ionic interaction
 - van der Waals' forces
 - Covalent interaction
 - Hydrogen bond formation
22. If one assume linear structure instead of bent structure of water then which one of the following properties cannot be explained?
- Formation of intermolecular hydrogen bonding in water
 - High boiling point of water
 - Solubility of polar compounds in water
 - Ability of water to form coordinate covalent bonds
23. The strength of an oxo acid ($E—O—H$), where E is the central atom, depends upon the
- electronegativity of E
 - atomic size of E
 - ability of E to share electron pair with O
 - atomic size and electronegativity of E
24. Heavy water (D_2O) freezes at
- $0^\circ C$
 - $3.8^\circ C$
 - $-3.8^\circ C$
 - $38^\circ C$
25. Boiling point of heavy water is
- $100^\circ C$
 - $99^\circ C$
 - $101.4^\circ C$
 - $110^\circ C$
26. Which of the following statements are correct regarding D_2O and H_2O ?
- D_2O reacts with Al_4C_3 at a faster rate than does H_2O .
 - The freezing point of D_2O is higher than that of H_2O .
 - $NaCl$ is more soluble in D_2O than in H_2O .
 - Ionic product of D_2O is smaller than that of H_2O .
- Select the correct answer using the codes given below.
- I and II
 - I and III
 - II and III
 - II and IV
27. Mass percentage of deuterium in heavy water is
- same as that of protium in water
 - 11.1
 - 20.0
 - Cannot be predicted
28. A mixture of hydrazine (N_2H_4) and 58-60% solution of H_2O_2 is used as
- antiseptic
 - fertiliser
 - rocket fuel
 - None
29. Which of the following oxides is a peroxide?
- Na_2O_2
 - MnO_2
 - BaO
 - SO_2
30. Hydrogen peroxide is used as
- an oxidant only
 - a reductant only
 - an acid only
 - All of these
31. Which of the following statements are not correct?
- H_2O_2 oxidises Fe (II) to Fe (III)
 - H_2O_2 can be obtained by the electrolysis of dil. H_2SO_4
 - H_2O_2 reduces Mn (VII) to Mn (II)
 - H_2O_2 is a weak base

32. Which of the following is not correct regarding the electrolytic preparation of H_2O_2 ?
- Lead is used as cathode
 - 50% H_2SO_4 is used
 - Hydrogen is liberated at anode
 - Sulphuric acid undergoes oxidation
33. Match the Column I with Column II and select the correct option from the codes given below.

	Column I	Column II
A.	10 vol H_2O_2	1. Perhydrol
B.	20 vol H_2O_2	2. 5.358 N
C.	30 vol H_2O_2	3. 1.785 M
D.	100 vol H_2O_2	4. 3.03%

Codes

	A	B	C	D
a.	4	3	2	1
b.	1	2	3	4
c.	1	3	2	4
d.	4	2	3	1

34. Study the following reactions carefully

Point out the correct option.

- In (I), $HOCl$ is reduced and in (II), PbS is oxidised
 - In (I), $HOCl$ is oxidised and in (II), PbS is reduced
 - In both (I) and (II), $HOCl$ and PbS are reduced
 - In both (I) and (II), $HOCl$ and PbS are oxidised
35. 6 volume sample of H_2O_2
- would give 6 volumes of oxygen per unit volume of H_2O_2 sample at STP
 - will contain 6% V/V of H_2O_2
 - will contain 6% W/V of H_2O_2
 - would give 6 volumes of oxygen per unit weight of H_2O_2 sample at STP
36. When zeolite, which is hydrated sodium aluminium silicate, is treated with hard water, the sodium ions are exchanged with
- H^+ ion
 - Ca^{2+} ion
 - SO_4^{2-} ion
 - OH^- ion
37. 1000 g aqueous solution of $CaCO_3$ contains 10 g of calcium carbonate, hardness of the solution is
- 10 ppm
 - 100 ppm
 - 1000 ppm
 - 10000 ppm
38. 100 mL of tap water containing $Ca(HCO_3)_2$ was titrated with $\frac{N}{50}$ HCl with methyl orange as an indicator.
- If 30 mL of HCl was required, the temporary hardness of water, as parts of $CaCO_3$ per 10^6 parts of water was
- 150 ppm
 - 600 ppm
 - 275 ppm
 - 300 ppm
39. Excess of KI and dil. H_2SO_4 were mixed in 50 mL H_2O_2 . Thus, I_2 liberated requires 20 mL of 0.1 N $Na_2S_2O_3$. What will be the strength of H_2O_2 in $g L^{-1}$?
- 0.034
 - 0.68
 - 6.80
 - 5.80

40. H_2O_2 is marked '22.4 volume'. How much of it (in mL) are required to oxidise 3.4 g H_2S gas?
 a. 10 mL b. 70 mL c. 100 mL d. 1000 mL
41. Temporary hardness of water is caused due to the presence of
 a. CaSO_4 b. CaCl_2
 c. CaCO_3 d. $\text{Ca}(\text{HCO}_3)_2$
42. Both temporary and permanent hardness is removed on boiling water with
 a. CaSO_4 b. Na_2CO_3 c. CaCO_3 d. CaO
43. Which one of the following is used for reviving the exhausted permutit?
 a. HCl solution b. 10% CaCl_2 solution
 c. 10% MgCl_2 solution d. 10% NaCl solution

BITSAT Archives

1. Which one of the following is a covalent hydride? [2014]
 a. CaH_2 b. NaH c. BH_3 d. BeH_2
2. Calcium carbide reacts with heavy water to form [2013]
 a. C_2D_2 b. CaD_2 c. CaD_2O d. CD_2
3. H_2O_2 is always stored in black bottles because [2009]
 a. it is highly unstable
 b. its enthalpy of decomposition is high
 c. it undergoes autoxidation on prolonged standing
 d. None of the above
4. H_2O_2 used in rocket has the concentration [2007]
 a. 50%
 b. 70%
 c. 30%
 d. 90%
5. Calgon used as water softner is [2006]
 a. $\text{Na}_2[\text{Na}_4(\text{PO}_3)_6]$
 b. $\text{Na}_4[\text{Na}_2(\text{PO}_3)_6]$
 c. $\text{Na}_2[\text{Na}_4(\text{PO}_4)_5]$
 d. None of the above

Answer with Solutions

Practice Exercise

1. (d) 2. (a)
3. (c) *ortho* and *para* hydrogens differ in the nature of spins of protons.
4. (d) Statement (III) is incorrect at ordinary temperature (25°C), ordinary hydrogen contains 75% *ortho* and 25% *para* forms.
5. (c) $\text{CO}(\text{g}) + \text{H}_2\text{O}(\text{g}) \xrightarrow[\text{Catalyst}]{673\text{ K}} \text{CO}_2(\text{g}) + \text{H}_2(\text{g})$
6. (c) $\text{H}(\text{g}) \longrightarrow \text{H}^+(\text{g}) + e^-$
7. (d) 8. (c) 9. (d)
10. (d) All reactions are correct.
11. (c)
12. (a) Hydroformylation of olefins yields aldehydes which further undergo reduction to give alcohols.

$$\text{H}_2 + \text{CO} + \text{RCH}=\text{CH}_2 \longrightarrow \text{RCH}_2\text{CH}_2\text{CHO}$$

$$\text{H}_2 + \text{RCH}_2\text{CH}_2\text{CHO} \longrightarrow \text{RCH}_2\text{CH}_2\text{CH}_2\text{OH}$$
13. (d)
14. (c) Salt ionisation-3
 (i) $\text{NaH} \rightleftharpoons \text{Na}^+ + \text{H}^-$
 (ii) $\text{HCOONa} \rightleftharpoons \text{HCOO}^- + \text{Na}^+$
 (iii) $\text{NaCl} \rightleftharpoons \text{Na}^+ + \text{Cl}^-$
 (iv) $\text{LiH} \rightleftharpoons \text{Li}^+ + \text{H}^-$
15. (d)
16. (d)
17. (c) The correct order of basic strength is
 $\text{NH}_3 > \text{PH}_3 > \text{AsH}_3 > \text{SbH}_3$
18. (d)
19. (a) Statements I, II and IV are correct.
20. (d) Water molecules are associated with H-bonding, due to which boiling point of water becomes high.
21. (d) Two ice cubes (solid H_2O) united to form one cube due to the formation of H-bond.
22. (b) The high boiling point of water cannot be explained on the basis of bent structure instead of linear structure.
23. (a) Higher electronegativity reduces the strength of acid.
24. (b) Heavy water freezes at 3.8°C .
25. (c) Boiling point of heavy water is 101.4°C .
26. (d) D_2O reacts slower than H_2O due to greater mass, its freezing point is 3.8°C . NaCl is less soluble in D_2O as in H_2O and D_2O does not dissociate therefore, its ionic product is smaller than H_2O .
27. (c) Formula of heavy water is D_2O , i.e. molecular mass = 20

$$\% \text{ of deuterium} = \frac{4 \times 100}{20}$$

$$= 20\%$$

28. (c) A mixture of H_2O_2 and hydrazine (N_2H_4) is used as a rocket fuel.
29. (a) Na_2O_2 is a peroxide, all others are double oxides (MnO_2 , SO_2) and simple oxide (BaO).
30. (d) H_2O_2 acts as an oxidant, reductant and an acid (weak).
31. (d) H_2O_2 is not a weak base but a weak acid.
32. (c) H_2O_2 can be prepared by electrolysis of 50% H_2SO_4 . In this method, hydrogen is liberated at cathode.

33. (a)

34. (a)

35. (a) 6 volume sample of H_2O_2 means 6 volumes of oxygen are given out per unit volume of H_2O_2 sample at STP.

36. (b)

37. (d) Hardness of solution in ppm = $\frac{10 \times 10^6}{1000} = 10^4$ ppm

38. (d) Meq. of CaCO_3 = Meq. of $\text{Ca}(\text{HCO}_3)_2$ = Meq. of HCl

$$\frac{w}{100/2} \times 1000 = \frac{1}{50} \times 30$$

$$w_{\text{CaCO}_3} = \frac{3 \times 100}{5 \times 2000} = 0.03 \text{ g}$$

$\therefore$ 100 mL of H_2O contains $\text{Ca}^{2+} = 0.03 \text{ g}$

$$10^6 \text{ mL } \text{H}_2\text{O} \text{ contains } \text{Ca}^{2+} = \frac{0.03 \times 10^6}{100} = 300 \text{ ppm}$$

39. (b) For 20 mL of H_2O_2

Meq. of KI = Meq. of H_2O_2 in 50 mL = Meq. of $\text{Na}_2\text{S}_2\text{O}_3$

$$\frac{w \times 1000}{34/2} = 20 \times 0.1$$

$$\therefore w_{\text{H}_2\text{O}_2} \text{ in 50 mL} = \frac{20 \times 0.1 \times 34}{2000} = 0.034$$

$$\therefore w_{\text{H}_2\text{O}_2} \text{ in 1000 mL} = \frac{0.034 \times 1000}{50} = 0.68 \text{ g/L}$$

40. (c) Density of 'x volume' $\text{H}_2\text{O}_2 = \frac{68 \times x}{22400} \text{ g/mL}$

$$\text{Density of '22.4 volume'} = \frac{68 \times 22.4}{22400} = 0.068 \text{ g/mol}$$

34 g H_2S is oxidised by = 68 g H_2O_2

$$3.4 \text{ g } \text{H}_2\text{S} \text{ is oxidised by} = \frac{68 \times 3.4}{34} = 6.8 \text{ g } \text{H}_2\text{O}_2$$

0.068 g H_2O_2 is present in = 1 mL

$\therefore$ 6.8 g H_2O_2 is present in = 100 mL

41. (d) Temporary hardness of water is caused due to the presence of bicarbonates of Ca and Mg.

42. (b) $\text{Ca}(\text{HCO}_3)_2 + \text{Na}_2\text{CO}_3 \longrightarrow \text{CaCO}_3 + 2\text{Na}(\text{HCO}_3)$

Ca^{2+} or Mg^{2+} ions are removed as insoluble carbonates.

43. (d)

BITSAT Archives

1. (c) Hydrides are binary compounds of hydrogen.

These can be classified into four groups :

(i) Ionic hydrides : NaH , CaH_2 , LiH

(ii) Covalent hydrides : B_2H_6 , NH_3 , SbH_3

(iii) Polynuclear hydrides : LiAlH_4 , NaBH_4

(iv) Interstitial hydrides are those in which hydrogen is trapped in the interstitial spaces of transition metals.

2. (a)

3. (c) H_2O_2 is always stored in black bottles because H_2O_2 decomposes into water and oxygen in the presence of light.

4. (d) H_2O_2 is used as an oxidant for rocket fuel and has 90% concentration to be used in rockets.

5. (a) Calgon used as water softener. The chemical composition is $\text{Na}_2[\text{Na}_4(\text{PO}_3)_6]$.

15

s-Block Elements

General Introduction of *s*-Block Elements

The components in the long form of the periodic table have been partitioned into four blocks in particular *s*, *p*, *d* and *f*- blocks. The elements of Group 1 (I A) and 2 (II A) have their last electron in *s*-orbital thus, they are called *s*-block elements.

Group 1 Elements : Alkali Metals

The Group 1 elements comprising Li, Na, K, Rb, Cs and Fr are commonly called alkali metals. Francium is radioactive and has a very short life (half-life of 21 min). These are known as alkali metals because their water soluble hydroxides are strongly alkaline. Sodium and potassium are abundant and lithium, rubidium and caesium have much lower abundance.

Electronic Configuration of Alkali Metals

The general electronic configuration of alkali metals is [noble gas] ns^1 ($n = 2$ to 7) .

Group 2 Elements : Alkaline Earth Metals

Group 2 elements are basically called alkaline earth metals as their oxides and hydroxides are alkaline in nature and these metal oxides are found in the earth's crust. Calcium and magnesium rank fifth and sixth in abundance respectively in the earth's crust. Strontium and barium have much lower abundances. Beryllium is rare and radium is the rarest of all comprising only 10^{-10} per cent of igneous rocks.

Electronic Configuration of Alkaline Earth Metals

The general electronic configuration of alkaline earth metals is [noble gas] ns^2 ($n = 2$ to 7).

Chemical Properties of s-Block Elements

- (i) **Reaction with oxygen** (air) Except Li, all alkali metals are tarnish in air due to oxide formation at their surface and hence, they are stored in kerosene or paraffin oil.

Superoxide O_2^- ion is stable only in the presence of large cations such as K, Rb, Cs.

Alkaline earth metals get slowly oxidised on exposure to air forming oxides. These oxides are basic in nature. Basic nature of oxides increases on moving down the group.

NOTE Oxide of Be, i.e. BeO is amphoteric in nature due to smaller size of Be^{2+} ion.

- (ii) **Basic strength of hydroxides** Hydroxides of alkali metals are strongly basic and their basic strength increases down the group. And hydroxides of alkaline earth metals are less basic than alkali metals of the corresponding period.

- (iii) **Reaction with hydrogen** Alkali metals react with hydrogen and form ionic hydrides, M^+H^- .

Alkali metal hydrides attacked by water to give hydrogen.

Except Be, all alkaline earth metals react with hydrogen to form ionic hydrides of MH_2 type. The hydride of Mg bears some covalent character in it due to its smaller size.

- (iv) **Reaction with halogens** Alkali metals combine readily with halogens to form halides.

Alkaline earth metals combine with halogens at elevated temperature forming halides, MX_2 . Beryllium halide is covalent while others are ionic. The solubility of halides (except fluoride) decreases on moving top to bottom in the group (Lower solubility of LiF in water is due to its higher lattice energy).

- (v) **Solubility in liquid ammonia** All alkali metals are soluble in liquid ammonia. Dilute alkali metals-ammonia solution is of blue colour. These solutions are strong reducing agents due to the presence of free electrons.

The high conductivity and paramagnetic properties along with blue colour is attributed to the presence of these ammoniated electron as well as ammoniated cation.

Alkaline earth metals are also soluble in liquid ammonia and give bright blue solutions. When these metal-ammonia solutions are evaporated, hexammoniates $[M(\text{NH}_3)_6]$ are formed. The hexammoniates slowly decompose to give amides.

Concentrated solutions of the metals in ammonia impart bronze colour due to the formation of metal clusters and it is diamagnetic.

- (vi) **Reaction with nitrogen and carbon**

- (vii) **Reactivity and electrode potential** Reducing character or reactivity of alkali metals increases from Li to Cs, i.e. $\text{Li} < \text{Na} < \text{K} < \text{Rb} < \text{Cs}$.

Reducing character or reactivity of alkaline earth metals increases from Be to Ba, i.e.

$\text{Mg}(\text{ClO}_4)_2$ is used as drying agent under the name anhydron, it is a strong oxidising agent. So, it is not used with organic material.

Anomalous Properties of Lithium

Lithium due to its

- exceptionally small size (like Mg) and
- high polarising power (i.e. charge/radius ratio) (like Mg) exhibits some properties which are different from those of the other members of group 1 but similar to that of magnesium (present diagonally in the following group, i.e. group 2). The property of showing similarity in properties with the element present diagonally opposite in the periodic table is called **diagonal relationship**. These properties are :

- (a) Alkali metals do not react with nitrogen except Li.

(Li metal is used as scavenger in metallurgy to remove O_2 and N_2 gases.)

- (b) Alkali metal carbonates, nitrates and hydroxides do not decompose on heating into their oxides except lithium.

(c) MgCl_2 and LiCl are deliquescent and crystallise as their hydrates, $\text{LiCl} \cdot 2\text{H}_2\text{O}$ and $\text{MgCl}_2 \cdot 2\text{H}_2\text{O}$.

Anomalous behaviour of Beryllium

Beryllium due to its exceptionally small size (like Al) and high polarising power (like Al) shows similarities with aluminium in its properties and this relationship is called diagonal relationship. *These properties are :*

- BeO like Al_2O_3 , is amphoteric and covalent while oxides of other alkaline earth metals are ionic and basic in nature.
- Both BeCl_2 and AlCl_3 are soluble in organic solvents because of covalent nature and both have a bridged polymeric structure.
- Beryllium hydroxide dissolves in excess of alkali to give a beryllate ion, $[\text{Be}(\text{OH})_4]^{2-}$ just as aluminium hydroxide gives aluminate ion, $[\text{Al}(\text{OH})_4]^-$.
- Beryllium and aluminium ions have strong tendency to form complexes, BeF_4^{2-} , AlF_6^{3-} .
- Carbides of Be are covalent and react with water to produce methane gas whereas carbides of other members are ionic and produce acetylene with water.

Sodium (Na)

Compounds found in nature

Extraction

1. Castner's Process

Oxygen and H_2O are produced during electrolysis.

2. Down's Process

Cathode Fe

Anode Graphite

Fusion temperature is reduced to 600°C by adding CaCl_2 , KE.

Properties

Uses

- For extraction C, Be, Mg and Si.
- As lab reagent.
- In high temperature thermometers.

Compounds of Sodium

Sodium Carbonate

(Washing Soda, $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$)

Sodium carbonate is generally prepared by **Solvay process**.

Sodium hydrogen carbonate crystals separate out. These are heated to obtain sodium carbonate.

In this process, NH_3 is recovered when the solution containing NH_4Cl is treated with $\text{Ca}(\text{OH})_2$.

Uses of Na_2CO_3

- In laundries and in softening of water as washing soda.
- In the manufacturing of glass, sodium silicate, paper, borax, soap powders, caustic soda, etc.
- In textile and petroleum refining.
- For the preparation of various carbonates of metals.

Sodium Hydroxide (Caustic Soda, NaOH)

Sodium hydroxide is prepared commercially by the electrolysis of sodium chloride in **Castner-Kellner cell** (or mercury cathode cell).

The amalgam is treated with water to give sodium hydroxide and hydrogen gas.

- Sodium hydroxide is white, translucent solid and deliquescent. It is called caustic soda because it breaks down proteins of skin to a pasty mass.
- On exposure to atmosphere, it absorbs moisture and CO_2 . $2\text{NaOH} + \text{CO}_2 \longrightarrow \text{Na}_2\text{CO}_3 + \text{H}_2\text{O}$
- It reacts with metals like Zn, Al, Sn and Pb and evolve H_2 gas.
e.g. $\text{Zn} + \text{NaOH} \longrightarrow \text{Na}_2\text{ZnO}_2 + \text{H}_2$
- It also reacts with metallic salts to form hydroxides. It is used in soap manufacturing, purification of bauxite, manufacturing of rayon, etc.

Sodium Chloride

(Common salt or rock salt, NaCl)

The three major sources of NaCl are

- Sea water (3% NaCl)
- Water of inland lake
- Salt mines
 - It is a white crystalline solid, soluble in water.
 - Pure NaCl is not hygroscopic. It shows hygroscopic nature due to the presence of chlorides of Ca and Mg as an impurity.
 - It is used as the starting material for the preparation of NaOH, Na_2CO_3 , NaHCO_3 , etc.
 - It is used as a preservative for meat, fish, etc. It is also used as a salting out of soap and in making freezing mixtures.

Sodium Hydrogen Carbonate (Baking Soda, NaHCO_3)

It is prepared as an intermediate product in the Solvay ammonia soda process.

- It is a white crystalline solid, sparingly soluble in water.
- Its aqueous solution is alkaline in nature due to hydrolysis.

- It is used as a medicine to neutralise acidity in stomach.
- It is used as a constituent of baking powder and in fire extinguisher.

Compounds of Magnesium

Magnesium Chloride ($\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$)

Preparation

Properties

It is a colourless, crystalline, deliquescent and highly soluble in water.

Uses

It is used in the preparation of metallic magnesium and in making Sorel cement.

Magnesium Sulphate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$)

Preparation

Commercial method

Properties

It is a colourless crystalline solid, soluble in water.

Uses

It is used in

- Medicines (as purgative).
- Dyeing and tanning processes.
- Ceramic, cement, match industries.
- Treatment of textile fibres to make them non-inflammable.

Compounds of Calcium

Quicklime (CaO)

Preparation

Properties

It is white amorphous powder with melting point 2600°C .

Action of water

Basic nature

Uses

It is very useful as drying agent, in bleaching powder production (as used for the preparation of slaked lime and as a constituent of mortar).

Calcium Carbonate (CaCO_3)

Preparation

Properties

CaCO_3 is a white powder, insoluble in water but dissolves in the presence of CO_2 .

Uses

It is used

1. in manufacturing paints, quicklime, etc.
2. in toothpastes and cosmetics.
3. as a building material.

Calcium Sulphate (Gypsum) ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$)

Preparation

Properties

- It is a white crystalline solid, sparingly soluble in water but dissolves in dilute acids.
- $2\text{CaSO}_4 \xrightarrow[\text{heating}]{\text{Strong}} 2\text{CaO} + 2\text{SO}_2 + \text{O}_2$
- $\text{CaSO}_4 + 4\text{C} \longrightarrow \text{CaS} + 4\text{CO}$

Uses

It is used

1. In the preparation of plaster of Paris.
2. In the manufacturing of cement, H_2SO_4 , $(\text{NH}_4)_2\text{SO}_4$, etc.
3. For glazing paper.

Plaster of Paris ($2\text{CaSO}_4 \cdot \text{H}_2\text{O}$)

Preparation

Properties

It is a white powder, which sets to a hard mass when its paste (with water) is allowed to stand.

Uses

It is used

1. in making chalks, casts in dentistry, etc.
2. in surgery for setting broken/dislocated bones.
3. in making casts for statues, toys etc.

Calcium Hydroxide or Slaked Lime [Ca(OH)_2]

Preparation

It is prepared by adding water to quicklime as

Properties

1. It is a white powder, sparingly soluble in water and the aqueous solution is called lime water while the aqueous suspension is called milk of lime. CO_2 has the ability to turn lime water milky as

This milkiness disappears with excess of CO_2 as soluble calcium hydrogen carbonate is formed.

2. Being basic in nature, it reacts with acids and acidic gases forming their salts.
3. On reaction with chlorine, it forms hypochlorite, a constituent of bleaching powder, as

Uses

Slaked lime is used in mortar production, lime water production, disinfectant, bleaching powder production, etc.

Portland Cement

It was discovered by an English Mason, Joseph Aspdin (1824). When the mixture of CaCO_3 , clay and water is heated strongly and allowed to stand, it hardens to a stone like mass.

It resembles with Portland rock (a famous building stone of England) and so, it is named as Portland cement. It is a mixture of aluminates and silicates of Ca with small amount of gypsum.

Chemical Composition

CaO = 50-60%, SiO₂ = 20-25%,

Al₂O₃ = 5-10%, MgO = 2-3%,

Fe₂O₃ = 1-2%, SO₃ = 1-2%

Formation of Constituents of Cement

Setting of Cement Paste of water and cement gets hard on keeping it for some time. This is called setting of cement. Mechanism of setting of cement is as follows:

Practice Exercise

- Which of the following ions forms a hydroxide which is highly soluble in water?
a. Ni²⁺ b. K⁺ c. Zn²⁺ d. Al³⁺
- Solubility of alkaline earth metal sulphates decreases down the group 2 because
a. they become more ionic
b. lattice energy of sulphates does not vary significantly
c. hydration energy decreases rapidly from Be²⁺ to Ba²⁺
d. lattice energy plays more predominant role than hydration energy
- Which of the following compounds has the lowest anion to cation size ratio?
a. LiF b. NaF c. CsI d. CsF
- Which is the most basic among the following?
a. Na₂O b. BaO c. As₂O₃ d. Al₂O₃
- The stability of the following alkali metal chlorides follows the order
a. LiCl > KCl > NaCl > CsCl b. CsCl > KCl > NaCl > LiCl
c. NaCl > KCl > LiCl > CsCl d. KCl > CsCl > NaCl > LiCl
